**Broadening Electives (12 credits)**

At least 12 additional credits must be taken in areas such as Humanities, Social and Behavioral Science, Natural Science, arts, business, engineering, or other disciplines that serve to broaden the student’s background. Courses used to fulfill this requirement must not be from computer science, computer and electrical engineering, or math departments.

**Writing Requirement**

Students are required to fulfill the university’s requirement of two writing intensive courses, each at least 3 credits. Students must receive at least a C- grade or better in these writing courses. These courses may overlap other requirements. At least one of the following options must be chosen:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.060.113</td>
<td>Expository Writing</td>
<td></td>
</tr>
<tr>
<td>EN.661.110</td>
<td>Professional Communication for Science, Business and Industry</td>
<td></td>
</tr>
<tr>
<td>AS.220.105</td>
<td>Fiction Poetry Writing I</td>
<td></td>
</tr>
<tr>
<td>AS.220.106</td>
<td>Fiction Poetry Writing II</td>
<td></td>
</tr>
</tbody>
</table>

**Electives**
Electives to be chosen by the student with guidance and approval of his/her advisor.

Total Credits 126

* With the advisor’s explicit permission regarding course selections, up to 6 of the 42 required credits may be taken in the Department of Electrical and Computer Engineering or the Information Security Institute.

No more than 6 credits of independent study (including EN.600.491-EN.600.492) and no more than 3 credits of short courses can be counted toward this requirement. However, B.S. students doing the Senior Honors Thesis (EN.600.519-EN.600.520) may use an additional three credits of independent work toward their CS requirements, for a total of 9 credits.

No courses with grades below C- or with satisfactory/unsatisfactory grades can be used to fulfill this requirement unless they are not offered for a grade.

** AP Statistics credits may not be used to satisfy these credit requirements; however, they do meet the need for coverage of statistics (not probability).

Requirements for the B.A. Degree

To meet the course credit requirements for the B.A. in computer science, the student must complete a minimum of 120 credits. The basic requirements for the B.A. degree are:

<table>
<thead>
<tr>
<th>Component</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Science</td>
<td>32</td>
</tr>
<tr>

</tbody>
</table>

* To be chosen by the student with the guidance and approval of his/her advisor. Freshman majors are also expected to take EN.600.105 M & Ms: Freshman Experience (optional for transfers into the major).

This is a one credit Satisfactory/Unsatisfactory course that may only be counted as an elective.

Details and course recommendations of these distributional requirements are below. These requirements add up to 84 credits and fulfill general university distribution requirements.

Except for electives, courses should not be taken on a satisfactory/unsatisfactory basis. By university policy, no more than 18 D or D+ credits can be counted toward the total credit requirements for a degree.

**Computer Science (32 credits)**

The following foundational courses in computer science must be included in a student’s program:

- EN.600.107 Introductory Programming in Java (or AP credit) 3
- EN.600.120 Intermediate Programming 4
- EN.600.226 Data Structures 4
- EN.600.233 Computer System Fundamentals 3
- EN.600.271 Automata & Computation Theory 3
- EN.600.363 Introduction To Algorithms 3

or EN.600.463 Algorithms I

At least 15 credit hours must be at the 300-level or above, including EN.600.363/463.

**Mathematics (18 credits)**

The following courses must be included:

- AS.110.108 Calculus I 4
- AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
- EN.550.171 Discrete Mathematics 4

The remaining courses may be chosen from Mathematics (110.xxx) or Applied Math and Statistics (550.xxx). At least one course must be 200-level or above. **

**Basic Sciences (12 credits)**

At least two semesters of physics or chemistry or a combination of both, with the associated laboratories, must be included. The remaining courses must be chosen in accordance with the list posted on the department website, which includes most courses in Physics, Chemistry, Biology, Biophysics, Earth & Planetary Sciences, ‘N’ designated engineering courses, and some ‘N’ designated courses in Neuroscience and Cognitive Science, but not all. At most 2 credits from (S/U) intersession courses may be used to fulfill this requirement.

**Humanities/Social Sciences (18 credits)**

Six courses in the Humanities/Social Sciences must be taken, with each course at least 3 credits. At least two 3-credit courses at the 300-level or above are required. As bA’s a B.A. degree, students have ample flexibility to choose courses that broaden the scope of their study, in consultation with their advisors. A subset of the courses selected to satisfy this requirement should demonstrate coherence within an area. Any course with Humanities or Social Sciences area designators may fulfill these distributional requirements.

**Foreign Language (6 credits)**

Two courses in a foreign language, with a total of at least 6 credits are required. These foreign language credits are in addition to the 18 required Humanities/Social Sciences credits.

**Writing Requirement**

All B.A. candidates in computer science are required to fulfill the university’s requirement of four writing intensive courses, each at least 3 credits. Students must receive at least a C- grade in these courses. Highly recommended, at least one of:

- AS.060.113 Expository Writing
- AS.220.105 Fiction Poetry Writing I & AS.220.106 and Fiction Poetry Writing II
- EN.661.110 Professional Communication for Science, Business and Industry

**Electives**

Electives to be chosen by the student with guidance and approval of his/her advisor.

Total Credits 130
With the advisor’s permission, up to 3 of the 32 required credits may be taken in the Department of Electrical and Computer Engineering or the Information Security Institute.

No more than 3 credits of short courses or 3 credits of independent study (including EN.600.491–EN.600.492) may be applied toward this requirement. However, B.A. students doing the Senior Honors Thesis (EN.600.519–EN.600.520) may use an additional 3 credits of independent work toward their CS requirements, for a total of 6 credits.

No courses with grades below C- or with satisfactory/unsatisfactory grades may be used to fulfill this requirement unless they are not offered for a grade.

Highly recommended: Calculus III, Linear Algebra, Differential Equations, Probability/Statistics. Note that students will need at least five courses to fulfill the credit requirement.

**Minor in Computer Science**

To satisfy the course credit requirements for a minor in computer science, a student must take a minimum of seven courses, with a total of at least 23 credits, earning at least a C- in each course. These must include four core courses, to provide the student with a foundation, and three upper-level courses (300-level and above), to allow the student to pursue an advanced topic in depth.

### Core Courses

- **EN.600.107** Introductory Programming in Java (or AP credit) 3
- **EN.600.120** Intermediate Programming 4
- **EN.600.226** Data Structures 4

Choose one of the following:

- **EN.600.233** Computer System Fundamentals 3
- **EN.600.271** Automata & Computation Theory

### Upper-Level Courses

These courses should be chosen to form a cohesive minor and must be accepted by the computer science minor advisor. **

Total Credits 23

* With the approval of a faculty member in the Department of Computer Science, serving as a computer science minor advisor, substitutions for these core courses are possible.

** It is strongly recommended that students choose all three courses from within one of the three research areas of analysis, applications, and systems. Each upper-level course description in this catalog includes its area for reference. In addition, a current listing of courses with area designators is provided on the departmental website.

Short courses cannot be used toward the minor requirements. All courses must be taken for a grade, not Satisfactory/Unsatisfactory.

Students whose primary major is in the Whiting School may use the same courses to satisfy the requirements of the primary major and also those of a computer science minor. Students who plan to fulfill requirements for a minor must go to the Department of Computer Science director of undergraduate studies to declare the minor and be advised on course selections, and inform the Office of Academic Advising by the end of their junior year.

### Short Courses

The Department of Computer Science offers 1-credit short courses covering a variety of topics in computer science and engineering. The purpose of the short courses is to expose students to topics of current interest in the field of computer science and engineering. Short courses are taught not only by faculty and graduate students in the Department of Computer Science and visiting faculty from other universities, but by individuals from local government or industry who have demonstrable expertise in a given area and are practicing the application of computer science theory and concepts.

Students should be aware that short course offerings are likely to change from year to year, depending on instructor commitments: there is no guarantee that the same course will be available at a later time. Students interested in getting details about a particular short course can contact the instructor through the departmental office. No more than 3 credits of short courses may be applied toward the computer science course credit requirement for the B.S. or the B.A. degrees.

### Double Majors with Computer Science

It is possible for students to pursue a double major program in which one of the majors is computer science. The computer science requirements are flexible enough to allow for combination with most majors in the Whiting School of Engineering and the Krieger School of Arts and Sciences. Whether computer science is your primary or secondary major, you will be assigned a faculty advisor in the department. In order to declare a first or second major in computer science, students should see the Director of Undergraduate Studies before the start of senior year. Those students must also inform the Office of Academic Affairs of the Whiting School of Engineering and the Registrar of their double major status. Subject to restrictions set by the department offering a second major, students whose primary major is in the Whiting School may use courses to satisfy both the requirements of the student’s primary major and those of a double major.

### Concurrent Bachelor’s/Master’s Program

As early as the end of their sophomore year, qualified students may apply for admission to a concurrent bachelor’s/master’s program which combines a B.S. or B.A. degree (in any department) with a master of science in engineering degree in Computer Science. This program allows students to simultaneously pursue both an undergraduate and a graduate degree program of study. Generally, the concurrent B.S./M.S.E. or B.A./M.S.E. program is accomplished in five years, although some students take more or less time. Applicants are judged on the basis of their performance in courses and their letters of recommendation. Double counting of at most two courses is subject to current WSE and departmental policies. Students may not take a 600.3xx course as an undergraduate and the corresponding 600.4xx course for the M.S.E.; likewise for 600.4xx/6xx course offerings. Upon admission to the program students will be assigned a graduate faculty advisor in the Computer Science Department who must approve the courses to be applied toward the master’s degree. For information on the requirements of the M.S.E. degree, see the Graduate Programs tab on this page, or ask in the departmental office for the document that lists those requirements.

Every graduate student in the Department of Computer Science must follow a program approved by a faculty advisor in the department. The advisor assigned to a student may change, subject to the acceptance of the new advisor.
Requirements for the M.S.E. Degree

The Master of Science in Engineering (M.S.E.) is a full- or part-time day program offered by the Department of Computer Science. Most students complete the program in three full-time semesters. Two consecutive semesters of residence as a full-time graduate student are required. Those interested in part-time evening study should refer to Engineering for Professionals at ep.jhu.edu.

Entering students are expected to have completed a program of study equivalent to that required by the B.S. in computer science. Applicants from other disciplines are required to have course work (or equivalent experience) in intermediate programming (C++ and Java), data structures, and automata theory. Upon admission to the Master of Science in Engineering program, a student is assigned a graduate advisor from the Department of Computer Science who must approve the courses to be applied to the M.S.E. degree.

The Department of Computer Science classifies its courses into three sub-areas: Analysis, Applications, and Systems. All M.S.E. candidates must complete at least two graduate courses (6 credit hours, 400-level and above) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. M.S.E. students must also complete an additional two elective graduate courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) for a total of eight graduate courses. The course work program must be approved by the student's faculty advisor and the department.

In addition to the eight courses, a student must elect one of the following options in order to fulfill the degree requirements:

• Two additional graduate courses in Computer Science, approved as above.
• A supervised research project including an approved project report that will be made publicly available.
• An original, faculty-approved master's essay, submitted for binding to the Milton S. Eisenhower Library.

By satisfying the Ph.D. qualifying course requirements and the first qualifying project, a student will also satisfy the M.S.E. degree requirements (unless more than two course requirements have been satisfied using courses transferred from other institutions). Please refer to the Ph.D. program information for details.

All M.S.E. degree candidates are encouraged to regularly attend the department seminars. You may enroll in EN.600.601 Computer Science Seminar-EN.600.602 Computer Science Seminar; however, these courses may not be counted toward the degree course requirements.

Course Requirement Details

• All courses counted toward the M.S.E. degree requirement must be 400-level or above. At most, two courses with grades less than B- may be counted toward the course work requirements. No courses with grades less than C- may be counted.
• The overall grade point average of the courses counted toward the course work requirements must be a 3.0 or higher (B average).
• At most, two independent study courses (including EN.600.491 Computer Science Workshop I-EN.600.492 Comp Science Workshop II) can be counted toward the course requirements.
• Other than independent study courses and EN.600.464 Randomized Algorithms/EN.600.664 Randomized Algorithms, no courses with grades of P can be counted toward the course work requirement. Courses with grades of P will not be included in the grade point average calculation.
• One of the courses required for the M.S.E. degree, but only one, can be replaced by 3 credits from comparable short courses.
• A majority of the courses counted toward the degree must be taught in the Department of Computer Science.
• At most, two courses can be transferred from graduate programs of other institutions to be counted toward the degree requirements. Such transfer courses must be approved by the student’s faculty advisor and the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested.
• A grade of D or F results in probation; a second D or F is cause for being dropped from the program.
• Any master’s student engaged in research for payment or to help meet degree requirements is required to complete Responsible Conduct of Research training. Students receiving payment from NIH training grants or fellowships must take the in person course—AS.360.625 Responsible Conduct of Research. All other students can take the course online—AS.360.624 Responsible Conduct of Research (Online). Instructions for accessing and signing up for the course can be found here: http://eng.jhu.edu/wse/page/online-training-course-for-the-responsible-conduct-of-research. Additional information regarding this training can be found here: http://eng.jhu.edu/wse/page/conduct-of-research-training. Students who are required to complete this training will not receive a diploma until the course has been completed.

Tuition Support

M.S.E. students are not eligible for tuition waivers, but will be able to work on campus up to 20 hours per week for hourly rates. There are also course assistant positions available for qualified students who are seeking financial support. Those interested must apply at the start of each semester for specific courses in need.

Requirements for the Ph.D. Degree

The goal of the Doctor of Philosophy (Ph.D.) program in the Department of Computer Science is to prepare first-rate scholars in the analysis, systems, and applications areas of computer science. Successful graduates may assume significant positions in academia, research institutes, industry, or government laboratories.

Applications for admission to the Ph.D. program in Computer Science are reviewed by a faculty committee. Although the specific criteria are not rigid, all students admitted will exhibit exceptional intellectual achievements and promise. Applicants must submit letters of recommendation, GRE scores, and (for foreign applicants) TOEFL scores.

In keeping with Hopkins' traditions, program requirements are flexible, as described below.
University Residency

Two consecutive semesters of residence as a full-time graduate student are required.

Seminar Attendance

All Ph.D. degree candidates are required to enroll and maintain satisfactory attendance in Computer Science Seminar 600.601-602 each semester for the duration of their enrollment in the program. Although seminar attendance is required, the seminar may not be counted toward the qualifying course requirement.

Responsible Conduct of Research

All doctoral students are required to take AS.360.625 Responsible Conduct of Research. Students are expected to complete the course by the end of the first year but have until the start of the fourth semester to meet this requirement. Failure to do so may result in a loss of funding. Additional information regarding this requirement can be found here: http://eng.jhu.edu/wse/page/conduct-of-research-training.

Qualifying Course Requirements

The Department of Computer Science classifies its courses into three research areas: analysis, applications, and systems. All Ph.D. candidates must complete at least two graduate courses (400-level and above) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. Ph.D. students must also complete an additional two elective graduate courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) for a total of eight graduate courses. The course work program must be approved by the student’s advisor and the Department. The overall grade point average for these eight courses must be at least equivalent to a B+. No course with a grade of less than C- may be counted toward this Ph.D. qualifying course requirement. Other than independent study courses and EN.600.464/EN.600.664, no courses with grades of P can be counted toward the course work requirement. Courses with grades of P will not be included in the grade point average calculation. One of the courses required for the degree, but only one, may be replaced by 3 credits from comparable short courses. With approval of the student’s faculty advisor, up to two courses can be transferred from graduate programs of other institutions; more than two such courses can be transferred with approval of the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested. Students are expected to complete the course requirements by the end of their second year as a Ph.D. candidate.

Qualifying Project Requirements

A Ph.D. student must complete two projects, each under the supervision and with the written agreement of a different faculty member in the Department of Computer Science. Upon conclusion of each project, the student must write a “Project Report” describing the project in detail. This report will be a public document and will be kept on file in the department office. The supervising faculty member must approve the project report. Departmental approval of a given project will be determined collectively by the faculty of the Department of Computer Science following the spring semester of each academic year. A factor taken into account in the departmental review of a project is the stated willingness of each supervising faculty member to enter the initial stages of a Ph.D. research advisor/advisee relationship with the student. Students are expected to complete the qualifying projects by the end of their second year as a Ph.D. candidate.

Upon completion of the Ph.D. qualifying course requirements and the first qualifying project, students are ordinarily eligible to receive a master of science in engineering degree. The degree will be awarded upon student request.

Graduate Board Oral Examination (GBO)

This examination is a university requirement, to be taken within one year of passing the Ph.D. qualifying requirements. The oral exam is administered by a panel consisting of the research sponsor, two faculty members from the Department of Computer Science, and two from outside the department. The exam seeks to establish the student’s readiness to conduct original research in the area of his or her “Preliminary Research Proposal,” which should be distributed to the examiners in advance and presented by the student at the start of the exam.

Part-Tme Ph.D.

Two consecutive semesters of residence as a full-time graduate student are required by the university. Part-time students must pass both the Ph.D. qualifying requirements and the Graduate Board oral exam within four years of being admitted to the program. Attempting to obtain a Ph.D. is a major commitment and involves close coordination with a faculty advisor in the department. Part-time students must be able to establish and maintain these close links.

Departmental Seminar

Ph.D. students must give an official departmental seminar on their research area. This is to be done after the GBO and prior to the dissertation defense, or as part of the dissertation defense.

Dissertation and Defense

Ph.D. students must write a dissertation consisting of original research in their chosen area. They must deliver a public presentation of the dissertation before a dissertation committee consisting of the faculty advisor, a second faculty member in the Department of Computer Science (who must have a primary tenure-track appointment in the Department if the advisor does not), and one or more other members with Ph.D. degrees. In conformity with University requirements, the members of the dissertation committee must submit a referee’s letter to the Graduate Board recommending that the dissertation be accepted. Completed dissertations will be bound and submitted to the Milton S. Eisenhower Library.

Student Progress Review

Ph.D. students will be reviewed annually by the department faculty and notified by their advisors as to their standing in the program. Beginning in the third year of graduate study, this annual review is conducted primarily by the dissertation committee. The committee may establish milestones such as a written thesis proposal. While the membership of the committee may change, in general it should be chosen by the student, in consultation with the advisor and subject to the consent of the committee members.
Financial Aid

Financial aid is available for candidates of high promise. Fellowships provide a student with a stipend plus tuition. Teaching assistantships normally consist of tuition plus a stipend commensurate with the teaching or grading duties assigned. Research assistantships are available on sponsored research projects directed by members of the faculty. Students determined to have significant deficiency in spoken English may be required to take one or more semesters of English as a Second Language in order to qualify for employment as a teaching or research assistant.

For current faculty and contact information go to http://cs.jhu.edu/faculty/

Faculty

Chair

Gregory D. Hager
Professor: vision, robotics, human-machine systems, computer-integrated medicine.

Professors

Yair Amir
Distributed systems, resilient clouds and critical infrastructure, overlay networks, distributed algorithms.

S. Rao Kosaraju
Edward J. Schaefer Professor in Engineering: design of algorithms, pattern matching, and derandomization.

Nassir Navab
Augmented reality, vision, medical image computing and computer assisted interventions.

Aviel Rubin
Technical Director, Information Security Institute: system and networking security, computer privacy, applied cryptography.

Scott F. Smith
Programming languages, type systems, security in language design, component programming languages.

Russell H. Taylor
Director, LCSR, CISST ERC: medical robotics, computer-integrated interventional medicine, medical image analysis, human-machine robotic systems.

David Yarowsky
Natural language and speech processing, information retrieval, machine translation, and machine learning.

Associate Professors

Giuseppe Ateniese
Applied cryptography, network security, and secure e-commerce.

Randal Burns
Storage systems, high performance and scientific computing, and database federations.

Jason M. Eisner
Computational linguistics (syntax and phonology), natural language processing, statistical machine learning, programming language design.

Michael Kazhdan
Computer graphics, surface reconstruction, image and geometry processing.

Andreas Terzis
P2P, overlay and sensor networks, resilient internet infrastructure, NP-based architectures.

Assistant Professors

Yanil Ahmad
Data management, stream processing, declarative languages, parallel and distributed databases.

Raman Arora
Large-scale machine learning, big data, multiview learning, online learning, stochastic optimization, speech recognition, statistical signal processing, harmonic analysis, kernel methods, deep learning.

Vladimir Braverman
Algorithms, massive data sets, data streams, and database systems.

Michael Dinitz
Theoretical computer science, approximation algorithms, applications to networks and distributed computing.

Benjamin Langmead
Computational genomics, sequence alignment, text indexing, parallel and high performance computing.

Xin Li
Theory of computation, randomness, complexity theory, distributed computing, cryptography.

Suchi Saria
Machine learning, computational medicine, health informatics, and applications of machine learning in natural language processing, activity recognition and human-machine systems.

Research Professor

Amihood Amir
Algorithms design and analysis, multidimensional pattern matching, knowledge discovery algorithms, real time systems algorithms, computational molecular biology.

Kenneth Church
Natural language processing, speech, data mining.

Bharat Doshi
Optical and wireless networking technologies, internet protocols and architectures, speech technologies and signal processing, and network design and analysis algorithms and tools.

Lawrence B. Wolff
Computer vision, multi-sensor image fusion, augmented reality, biometrics.

Associate Research Professor

Philippe Burlina
Computer vision, visual analysis and communications, multi-modality image exploitation, enterprise software systems for content and e-process management.

Chris Callison-Burch
Statistical natural language processing, machine translation, paraphrasing, evaluation of human language technologies.

Susan Hohenberger-Waters
Cryptography, computer security, algorithms, and complexity theory.

Peter Kazanzides
Medical robots, computer-assisted surgery, real-time systems.

James Mayfield
Information retrieval, cross-language retrieval, information extraction, natural language processing.

**Assistant Research Professor**
Stephen Checkoway
Systems security, voting security, post-election auditing.

Mark Dredze
Machine learning, natural language processing, health informatics.

Ben Van Durme
Artificial intelligence, natural language processing (computational semantics), and streaming algorithms.

Matthew Green
Applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Adam Lopez
Natural language processing, machine learning, language and automata theory, algorithms.

Christine Piatko
Computational geometry, information visualization, information retrieval.

I-Jeng Wang
Wireless networking, Bayesian networks, probabilistic models.

Qinqing Zhang
Wireless communications and networking, Mobile Ad-hoc networks, cellular system and network technologies, multimedia applications and QoS, Internet protocol and algorithm design, performance analysis.

**Associate Teaching Professor**
Joanne Selinski
Director of Undergraduate Studies: CS education, software engineering.

**Senior Lecturer**
Peter Fröhlich
Programming languages, software engineering, systems software, video game design, web applications.

**Visiting Professor**
Mitra Basu
Computational biology, pattern recognition, neural networks, artificial intelligence.

**Associate Research Scientist**
Anton Dahbura
Information security, fault-tolerant computing, distributed systems, testing.

**Adjunct Professors**
Gabor Fichtinger
Applied surgical robotics, surgical CAD/CAM systems, percutaneous therapies, stereotactic radiosurgery.

John W. Sheppard
Artificial intelligence, machine learning, data mining.

**Adjunct Assistant professors**
Han Liu
Statistical machine learning, high dimensional nonparametric learning and massive-data analysis, multiple hypotheses testing, time series analysis, genomics, proteomics, cognitive neuroscience.

Nicolas Padouy
Computer vision, medical imaging, activity recognition, human-machine collaborative surgery.

**Assistant Research Scientist**
Sarana Nutanong
Spatial databases, distributed system, parallel algorithms.

Matt Post
Machine translation, syntax, parsing and language modeling.

**Part-Time Lecturer**
Sheela Kosaraju
Computer ethics.

Harold Lehmann
Medical informatics.

Michael Ochs
Medical informatics.

Christopher Pappacena
Cryptography.

**Joint Appointments**
Joel Bader
Associate Professor (Biomedical Engineering): bioinformatics and computational biology.

Emad Docto
Assistant Professor (Radiology-Medical Imaging Physics): image-guided intervention, ultrasound imaging, elasticity, and thermal imaging.

Gregory Chirikjian
Professor (Mechanical Engineering): robotics, kinematics, dynamics, control, motion planning.

Noah Cowan
Associate Professor (Mechanical Engineering): sensor-based control of locomotion and manipulation, and biologically inspired robotics.

Ralph Etienne-Cummings
Professor (Electrical and Computer Engineering): mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

James Fill
Professor (Applied Mathematics and Statistics): probability, stochastic processes, random structures, and algorithms.

Rachel Karchin
Assistant Professor (Biomedical Engineering): computational molecular biology, bioinformatics, genetic variation.

Sanjeev Khudanpur
Associate Professor (Electrical and Computer Engineering): information theory, statistical language modeling for speech recognition and machine translation

Xiangyang Li
Visiting Associate Professor (ISI): security informatics, heath service engineering, system modeling and simulation, machine intelligence.

Michael I Miller
Professor (Biomedical Engineering): image understanding, computer vision, medical imaging, computational anatomy.

Carey Priebe
Professor (Applied Mathematics and Statistics): computational statistics, kernel and mixture estimates, statistical pattern recognition, and statistical image analysis.

Jerry L. Prince
William B. Kouwenhoven Professor (Electrical and Computer Engineering) (Associate Director for Research, CISST ERC): image processing, computer vision, medical imaging.

Steven Salzberg
Professor (Medicine and Biostatistics): genomics, bioinformatics, gene finding, sequence assembly, genome evolution.

Rebecca Schulman
Assistant Professor (Chemical and Biomolecular Engineering): molecular programming, DNA nanotechnology, self-assembly (theory and experiment), theoretical and systems biology, smart materials, nanoscale robotics.

Ralph Semmel
Professor (Director, APL): artificial intelligence, database systems, software engineering.

Jeff Siewerdsen
Associate Professor (Biomedical Engineering): imaging physics, diagnostic radiology, image-guided interventions.

Alexander Szalay
Professor (Physics and Astronomy): theoretical astrophysics, galaxy formation.

Rene Vidal
Associate Professor (Biomedical Engineering): computer vision, machine learning, robotics, and control.

Louis Whitcomb
Professor (Mechanical Engineering): dynamics and control of mechanical systems.

Raimond L. Winslow
Professor (Biomedical Engineering): modeling of biological systems, nonlinear systems theory, grid computing and data management, biomedical ontologies.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.600.103. Fundamentals of Practical Computing. 3 Credits.
Intended audience: students majoring in science, engineering or medicine. This course will provide a sampling of the theory behind and practical use of a broad spectrum of computational tools and technologies. We will start with Scratch (a programming language for kids) and show how many of the same concepts show up in Web Programming (HTML & Javascript). There will be a taste of algorithms, databases (SQL), Unix, statistics packages (R), data mining and visualization tools (graphviz), natural language processing, web search, interpreted languages (Python & LISP), compiled languages (C), and more. Students should come away with a few tools and concepts that will prove useful in their major, as well as the confidence that they can search the web to find what they need, when they need it, just-in-time.
Instructor(s): A. Irvine
Area: Engineering.

EN.600.104. Computer Ethics. 1 Credit.
Students will examine a variety of topics regarding policy, legal, and moral issues related to the computer science profession itself and to the proliferation of computers in all aspects of society, especially in the era of the Internet. The course will cover various general issues related to ethical frameworks and apply those frameworks more specifically to the use of computers and the Internet. The topics will include privacy issues, computer crime, intellectual property law -- specifically copyright and patent issues, globalization, and ethical responsibilities for computer science professionals. Work in the course will consist of weekly assignments on one or more of the readings and a final paper on a topic chosen by the student and approved by the instructor.
Computer Science Majors Only
Instructor(s): S. Kosaraju
Area: Humanities.

EN.600.105. M & Ms: Freshman Experience. 1 Credit.
This course is required for all freshmen Computer Science majors. Transfers into the major and minors may enroll by permission only. Students will attend four 3-week blocks of meetings with different computer science professors, focused on a central theme. Active participation is required. Satisfactory/Unsatisfactory only.
Instructor(s): J. Selinski.

EN.600.107. Introductory Programming in Java. 3 Credits.
This course introduces the fundamental programming concepts and techniques in Java and is intended for all who plan to use computer programming in their studies and careers. Topics covered include control structures, arrays, functions, recursion, dynamic memory allocation, simple data structures, files, and structured program design. Elements of object-oriented design and programming are also introduced. Students without prior exposure are strongly advised to also take EN.600.108. Students should be familiar with computers
Instructor(s): B. Mitchell
Area: Engineering.

EN.600.108. Introduction to Programming Lab. 1 Credit.
The purpose of this course is to give novice programmers extra hands-on practice with guided supervision. Students will work in pairs each week to develop working programs, with checkpoints for each development phase. Sections 1-3 are for 107 students, sections 4-6 are for 112 students.
Satisfactory/Unsatisfactory only
Prerequisites: Coreq for EN.600.108: EN.600.107
Corequisites : Coreq: EN.600.107
Instructor(s): B. Mitchell
Area: Engineering.
EN.600.111. Python Scripting. 3 Credits.
For non-majors, this is an introductory "learning by doing" course focused on the quick prototyping of computational solutions to problems from a variety of disciplines. After an introduction to the UNIX and IDLE environments we briefly cover the basics of programming in Python. We then spend the rest of the semester surveying a variety of powerful Python libraries, frameworks, and tools. We use these building blocks to create, for example, systems for image and sound processing, data analysis and visualization, event-based simulation, or database-driven web applications. There will be several sizeable team-based programming projects. [Note: This course may not be used for the CS major or minor requirements, except perhaps as a substitute for 600.107.]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.112. Introductory Programming for Scientists and Engineers. 3 Credits.
An introductory "learning by doing" programming course for scientists, engineers, and everybody else who will need basic programming skills in their studies and careers. We cover the fundamentals of structured, modular, and (to some extent) object-oriented programming as well as important design principles and software development techniques such as unit testing and revision control. We will apply our shiny new programming skills by developing computational solutions to a number of real-world problems from a variety of disciplines. Students new to computer programming are encouraged to enroll into EN.600.108 Intro Programming Lab concurrently with this course. Students may receive credit for no more than one of the following: EN.600.107 or EN.600.111 or EN.600.112. [Note: This course may not be used for the CS major or minor requirements, except as a substitute for EN.600.107]
Prerequisites: Students who have taken EN.600.107 may not register for EN.600.112.
Instructor(s): J. Selinski
Area: Engineering.

EN.600.120. Intermediate Programming. 4 Credits.
This course teaches intermediate to advanced programming, using C and C++. (Prior knowledge of these languages is not expected.) We will cover low-level programming techniques, as well as object-oriented class design, and the use of class libraries. Specific topics include pointers, dynamic memory allocation, polymorphism, overloading, inheritance, templates, collections, exceptions, and others as time permits. Students are expected to learn syntax and some language specific features independently. Course work involves significant programming projects in both languages. Recommended Course Background: EN.600.107 or EN.600.226, EN.600.111/EN.600.112 or equivalent.
Instructor(s): Y. Amir
Area: Engineering.

EN.600.161. Exploring Vision Real World. 1 Credit.
This course is designed to introduce computer vision to students with or without a computer science background. The course will focus on real world applications of computer vision and image processing, in the areas of medicine, object recognition and automatic surveillance. The goal is to introduce students to basic concepts in computer vision and explain how these are used in practical applications. The class will consist of lectures, MATLAB tutorials and assignments.
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.202. Intro. to Public Health & Biomedical Informatics. 3 Credits.
Instructor(s): H. Lehmann
Area: Engineering.

EN.600.211. Unix System Programming. 3 Credits.
This course covers a variety of topics in UNIX programming, including process control, signal handling, daemon processes, and interprocess communication. Participants must be familiar with using the UNIX environment and be fluent in the C programming language.
Prerequisites: Prereq: EN.600.120
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.226. Data Structures. 4 Credits.
This course covers the design and implementation of data structures including collections, sequences, trees, and graphs. Other topics include sorting, searching, and hashing. Course work involves both written homework and Java programming assignments. Recommended Course Background: EN.600.107 or EN.600.120 or equivalent.
Instructor(s): P. Froehlich
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.233. Computer System Fundamentals. 3 Credits.
CSF addresses the design and performance of the principal operational components of a reduced-instruction-set computing system (RISC) which supports the efficient execution of widely used instruction sets. Arithmetic and logic units, memory hierarchy designs, state-machine controllers, and other related hardware and firmware components are studied, and the qualities of their combined processing capabilities are assessed by means of execution times associated with a range of benchmark programs. Assembly language programming projects, homework problems, and exams are employed to assess a student's fundamental understanding of the tradeoffs resulting from an assortment of variations in digital system design decisions that ultimately characterize the performance of the computing system architecture that is developed. Students may receive credit for only one of EN.600.233, EN.600.333 or EN.600.433.
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.245. Foundations of Computer Integrated Surgery. 3 Credits.
This course will give an introduction to the concepts and major elements of computer-integrated surgery (CIS) and its clinical applications. Major topics will include image processing, surgical planning, surgical robotics, surgical navigation, systems integration, and clinical validation. The class may include a clinical lab module. Grades will be calculated based on participation in class and three homework assignments. No computer programming will be necessary or required to complete the assignments. Recommended Course Background: Pre-calculus, Linear Algebra and Vector Calculus.
Instructor(s): R. Kumar
Area: Engineering.

EN.600.250. User Interfaces and Mobile Applications. 3 Credits.
This course will provide students with a rich development experience, focussed on the design and implementation of user interfaces and mobile applications. A brief overview of human computer interaction will provide context for designing, prototyping and evaluating user interfaces. Students will invent their own mobile applications and implement them using the Android SDK, which is JAVA based. An overview of the Android platform and available technologies will be provided, as well as XML for layouts, and general concepts for effective mobile development. Students will be expected to explore and experiment with outside resources in order to learn technical details independently. There will also be an emphasis on building teamwork skills, and on using modern development techniques and tools.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): J. Selinski
Area: Engineering.
EN.600.225. Introduction to Video Game Design. 3 Credits.
A broad survey course in video game design (as opposed to mathematical game theory), covering artistic, technical, as well as sociological aspects of video games. Students will learn about the history of video games, archetypal game styles, computer graphics and programming, user interface and interaction design, graphical design, spatial and object design, character animation, basic game physics, plotting and character development, as well as psychological and sociological impact of games. Students will design and implement an experimental video game in interdisciplinary teams of 3-4 students as part of a semester-long project. Section 1 requires technical skills, including at least one programming course (preferably 2 or more). Section 2 requires artistic skills, including at least one multimedia course (preferably 2 or more). Open to sophomores and above.
Corequisites: Co-req: 600.256
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.255. Introduction to Video Game Design Lab. 1 Credit.
A lab course in support of 600.255: Introduction to Video Game Design covering a variety of multi-media techniques and applications from image processing, through sound design, to 3D modeling and animation. See 600.255: Introduction to Video Game Design for details about enrolling.
Corequisites: Co-req: 600.255
Instructor(s): P. Froehlich.

EN.600.271. Automata & Computation Theory. 3 Credits.
This course is an introduction to the theory of computing. Topics include design of finite state automata, pushdown automata, linear bounded automata, Turing machines and phrase structure grammars; correspondence between automata and grammars; computable functions, decidable and undecidable problems, P and NP problems, NP-completeness, and randomization.
Instructor(s): S. Checkoway
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.306. Introduction to Speech. 1 Credit.
This course will introduce students to speech from an interdisciplinary perspective including Computer Science, Electrical Engineering, Linguistics and Psychology. Topics such as pitch will be discussed from a variety of perspectives including signal processing (estimating fundamental frequency), perception, linguistics and computational linguistics. Vowels will be described from multiple perspectives ranging from distinctive features in linguistics to formants in signal processing. Students will become familiar with a variety of topics ranging from spectrogram reading to using XML to program phones and Python (NLTK) to find interesting patterns in text corpora. To reach a diverse interdisciplinary audience, no background experience is required. Short course.
Instructor(s): K. Church
Area: Engineering.

EN.600.315. Databases. 3 Credits.
Introduction to database management systems and database design, focusing on the relational and object-oriented data models, query languages and query optimization, transaction processing, parallel and distributed databases, and data mining. [Systems] (www.cs.jhu.edu/~yarowsky/cs415.html) Students may receive credit for EN.600.315 or EN.600.415, but not both.
Prerequisites: EN.600.226.
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.316. Database Systems. 3 Credits.
This course serves as an introduction to the architecture and design of modern database management systems. Topics include query processing algorithms and data structures, data organization and storage, query optimization and cost modeling, transaction management and concurrency control, high-availability mechanisms, parallel and distributed databases, and a survey of modern architectures including NoSQL, column-oriented and streaming databases. Course work includes programming assignments and experimentation in a simple database framework written in Java. [Systems] Students may receive credit for EN.600.316 or EN.600.416, but not both.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): Y. Ahmad
Area: Engineering.

EN.600.318. Operating Systems. 4 Credits.
This course covers fundamental topics related to operating systems theory and practice. Topics include processor management, storage management, concurrency control, multi-programming and processing, device drivers, operating system components (e.g., file system, kernel), modeling and performance measurement, protection and security, and recent innovations in operating system structure. Course work includes the implementation of operating systems techniques and routines, and critical parts of a small but functional operating system. Students may receive credit for EN.600.318 or EN.600.418 but not both. Recommended Course Background: EN.600.211
Prerequisites: Prereqs: EN.600.120 AND EN.600.226 AND ( EN.600.233 OR EN.600.333)
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.320. Parallel Programming. 3 Credits.
This course prepares the programmer to tackle the massive data sets and huge problem size of modern scientific and enterprise computing. Google and IBM have commented that undergraduate CS majors are unable to "break the single server mindset" (http://www.google.com/intl/en/press/pressrel/20071008_ibm_univ.html). Students taking this course will abandon the comfort of serial algorithmic thinking and learn to harness the power of cutting-edge software and hardware technologies. The issue of parallelism spans many architectural levels. Even "single server" systems must parallelize computation in order to exploit the inherent parallelism of recent multi-core processors. The course will examine different forms of parallelism in four sections. These are: (1) massive data-parallel computations with Hadoop; (2) programming compute clusters with MPI; (3) thread-level parallelism in Java; and, (4) GPGPU parallel programming with NVIDIA's Cuda. Each section will be approximately 3 weeks and each section will involve a programming project. The course is also suitable for undergraduate and graduate students from other science and engineering disciplines that have prior programming experience. [Systems] EN.600.333 recommended. Students may receive credit for EN.600.320 or EN.600.420, but not both.
Prerequisites: Prereq: EN.600.120 and EN.600.226; recommended 600.333/433
Instructor(s): R. Burns
Area: Engineering.

EN.600.321. Automata & Computation Theory. 3 Credits.
This course is an introduction to the theory of computing. Topics include design of finite state automata, pushdown automata, linear bounded automata, Turing machines and phrase structure grammars; correspondence between automata and grammars; computable functions, decidable and undecidable problems, P and NP problems, NP-completeness, and randomization.
Instructor(s): S. Checkoway
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.350. Introduction to Speech. 1 Credit.
This course will introduce students to speech from an interdisciplinary perspective including Computer Science, Electrical Engineering, Linguistics and Psychology. Topics such as pitch will be discussed from a variety of perspectives including signal processing (estimating fundamental frequency), perception, linguistics and computational linguistics. Vowels will be described from multiple perspectives ranging from distinctive features in linguistics to formants in signal processing. Students will become familiar with a variety of topics ranging from spectrogram reading to using XML to program phones and Python (NLTK) to find interesting patterns in text corpora. To reach a diverse interdisciplinary audience, no background experience is required. Short course.
Instructor(s): K. Church
Area: Engineering.
EN.600.321. Object Oriented Software Engineering. 3 Credits.
This course covers object-oriented software construction methodologies and their application. The main component of the course is a large team project on a topic of your choosing. Course topics covered include object-oriented analysis and design, UML, design patterns, refactoring, program testing, code repositories, team programming, and code reviews. [Systems or Applications] Students may receive credit for EN.600.321 or EN.600.421, but not both.
**Prerequisites:** EN.600.120 AND EN.600.226
Instructor(s): S. Smith
Area: Engineering.

EN.600.323. Data-Intensive Computing. 3 Credits.
Data-Intensive Computing is an experiential education course in computing with massive data sets that covers the software, algorithms, and systems used to ingest, store, and analyze. Specific topics include: NoSQL software systems including key/value stores and graph databases, scientific python, array databases, (semi)-external memory array and graph algorithms, extract-transform-load (ETL) processing, spatial indexing, OpenCL GPU code acceleration, and performance management of clusters. The course will utilize the unique computing resources at JHU, including the DataScope (5PB of storage), the GPU cluster (110 TFlops), and the Homewood High Performance Computing Cluster (1600 cores). The entire course will take place in several lengthy lab sessions each week. Course time will be divided roughly into team projects (30%), ad-hoc tasks (50%), presentation (10%) and using collaboration tools for concurrent reading and authoring and interactive self-assessment. [Systems]
**Prerequisites:** EN.600.320 OR EN.600.420
Instructor(s): R. Burns
Area: Engineering.

EN.600.325. Declarative Methods. 3 Credits.
Suppose you could simply write down a description of your problem, and let the computer figure out how to solve it. What notation could you use? What strategy should the computer then use? In this survey class, you’ll learn to recognize when your problem is an instance of satisfiability, constraint programming, logic programming, dynamic programming, or mathematical programming (e.g., integer linear programming). For each of these related paradigms, you’ll learn to reformulate hard problems in the required notation and apply off-the-shelf software that can solve any problem in that notation — including NP-complete problems and many of the problems you’ll see in other courses and in the real world. You’ll also gain some understanding of the general-purpose algorithms that power the software. [Analysis] Students can only receive credit for EN.600.325 or EN.600.425, not both.
**Prerequisites:** EN.600.226
Instructor(s): J. Eisner
Area: Engineering.

EN.600.328. Compilers and Interpreters. 3 Credits.
Introduction to compiler design, including lexical analysis, parsing, syntax-directed translation, symbol tables, run-time environments, and code generation and optimization. Students are required to write a compiler as a course project.[Systems] Co-listed with EN.600.428
**Prerequisites:** Prereq: EN.600.120 AND EN.600.226
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.334. Computer Network Fundamentals. 3 Credits.
This course considers inter-system communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, modems, multiplexing; error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. [Systems] Students can only receive credit for EN.600.344 or EN.600.444, not both.
**Prerequisites:** Prereqs For EN.600.344: EN.600.233/333/433 or permission. Students can only receive credit for En.600.344 or EN.600.444, not both
Instructor(s): A. Terzis
Area: Engineering.

EN.600.335. Algorithms for Sensor-Based Robotics. 3 Credits.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently in a consistent manner over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. Students may receive credit for EN.600.336 or EN.600.436, but not both. Recommended Course Background: AS.110.106, probability/statistics.
**Prerequisites:** EN.600.226(C)
Instructor(s): G. Hager
Area: Engineering.

EN.600.336. Algorithms for Sensor-Based Robotics. 3 Credits.
This is an introductory course presenting a series of algorithms related to the representation and use of geometric models acquired from sensor data. Course topics include: basic sensing and estimation techniques, geometric model representations, and motion planning algorithms. The course will also discuss applications in diverse areas such as mobile systems, robot manipulation, and medicine. Students may receive credit for EN.600.336 or EN.600.436, but not both. Recommended Course Background: AS.110.106, probability/statistics.
**Prerequisites:** EN.600.226
Instructor(s): Y. Amir
Area: Engineering.

EN.600.337. Distributed Systems. 3 Credits.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently in a consistent manner over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. Students may receive credit for EN.600.337 or EN.600.437 but not both.
**Prerequisites:** EN.600.120 AND EN.600.226
Instructor(s): Y. Amir
Area: Engineering.

EN.600.344. Computer Network Fundamentals. 3 Credits.
This course considers inter-system communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, modems, multiplexing, error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. [Systems] Students can only receive credit for EN.600.344 or EN.600.444, not both.
**Prerequisites:** Prereqs For EN.600.344: EN.600.233/333/433 or permission. Students can only receive credit for En.600.344 or EN.600.444, not both
Instructor(s): A. Terzis
Area: Engineering.

EN.600.345. Artificial Intelligence. 3 Credits.
Artificial intelligence (AI) is introduced by studying automated reasoning, automatic problem solvers and planners, knowledge representation mechanisms, game playing, machine learning, and statistical pattern recognition. The class is a recommended for all scientists and engineers with a genuine curiosity about the fundamental obstacles to getting machines to perform tasks such as deduction, learning, and planning and navigation. Strong programming skills and a good grasp of the English language are expected; students will be asked to complete both programming assignments and writing assignments. The course will include a brief introduction to scientific writing and experimental design, including assignments to apply these concepts.[Applications] Recommended: linear algebra, prob/stat. Students can only receive credit for EN.600.335 or EN.600.435, not both.
**Prerequisites:** Prereq for EN.600.335: EN.600.226 AND EN.550.171
Recommended Linear Algebra, Prb/Stat
Instructor(s): B. Mitchell
Area: Engineering.

EN.600.346. Algorithms for Sensor-Based Robotics. 3 Credits.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently in a consistent manner over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. Students may receive credit for EN.600.336 or EN.600.436, but not both. Recommended Course Background: AS.110.106, probability/statistics.
**Prerequisites:** EN.600.226
Instructor(s): G. Hager
Area: Engineering.

EN.600.347. Distributed Systems. 3 Credits.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently in a consistent manner over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. Students may receive credit for EN.600.337 or EN.600.437 but not both.
**Prerequisites:** EN.600.120 AND EN.600.226
Instructor(s): Y. Amir
Area: Engineering.

EN.600.348. Computer Network Fundamentals. 3 Credits.
This course considers inter-system communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, modems, multiplexing, error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. [Systems] Students can only receive credit for EN.600.344 or EN.600.444, not both.
**Prerequisites:** Prereqs For EN.600.344: EN.600.233/333/433 or permission. Students can only receive credit for En.600.344 or EN.600.444, not both
Instructor(s): A. Terzis
Area: Engineering.
EN.600.355. Video Game Design Project. 3 Credits.
An intensive capstone design project experience in video game development. Students will work in groups of 4-8 on developing a complete video game of publishable quality. Teams will (hopefully) include programmers, visual artists, composers, and writers. Students will be mentored by experts from industry and academia. Aside from the project itself, project management and communication skills will be emphasized. Enrollment limited to ensure parity between the various disciplines. Junior or senior standing recommended.
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.357. Computer Graphics. 3 Credits.
This course introduces computer graphics techniques and applications, including image processing, rendering, modeling and animation. Students may receive credit for EN.600.357 or EN.600.457, but not both. No Audits.
Prerequisites: Prereq: EN.600.120 AND EN.600.226 and linear algebra
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.361. Computer Vision. 3 Credits.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling; computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] (https://crl.lcsr.jhu.edu/Vision_Syllabus)
Prerequisites: EN.600.226
Instructor(s): R. Vidal
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.363. Introduction To Algorithms. 3 Credits.
This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis; [Analysis] Students may receive credit for EN.600.363 or EN.600.463, but not both.
Prerequisites: EN.600.226 and EN.550.171 or permission
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.392. CS Design Project. 3 Credits.
This course will give junior and senior CS majors an intensive design project experience. Students will work in groups with real world customers to develop a working system. Project design, management and communication skills will be emphasized. Software development methodologies may also be presented. Recommended Course Background: EN.600.321
Prerequisites: EN.600.120 AND EN.600.226; Recommended 600.321
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.402. Medical Informatics. 1 Credit.
Advances in technology are driving a change in medicine, from personalized medicine to population health. Computers and information technology will be critical to this transition. We shall discuss some of the coming changes in terms of computer technology, including computer-based patient records, clinical practice guidelines, and region-wide health information exchanges. We will discuss the underlying technologies driving these developments - databases and warehouses, controlled vocabularies, and decision support.
Instructor(s): H. Lehmann
Area: Engineering.

EN.600.405. Applications of Probabilistic Models to Language and Speech Processing. 1 Credit.
Applications of Probabilistic Graphical Models in Language and Speech Processing Probabilistic graphical models (PGMs) combine ideas from statistics and computer science into a unifying framework for modeling complex real-world phenomena. PGMs are now widespread in language and speech processing. PGMs are well suited to handle the inherent challenges of linguistic problems: complex and structured relationships, a large number of relevant attributes, and large volumes of data. This short course will provide students with advanced training in several specific applications of graphical models that are important in natural language processing. After reviewing the essentials of directed and undirected graphical models, we will discuss complex CRFs, approximate inference including variational and MCMC methods, Bayesian models and non-parametric Bayesian models including Chinese Restaurant Processes. Students will also gain practical experience by solving problems using existing PGM software. Recommended Course Background: EN.600.465
Instructor(s): A. Klementiev; S. Bergsma; V. Stoyanov
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.411. Computer Science Innovation & Entrepreneurship II. 3 Credits.
This course is the second half of a two-course sequence and is a continuation of course EN.660.410, CS Innovation and Entrepreneurship, offered by the Center for Leadership Education (CLE). In this sequel course the student groups, directed by CS faculty, will implement the business idea which was developed in the first course and will present the implementations and business plans to an outside panel made up of practitioners, industry representatives, and venture capitalists. [General] Prerequisites: EN.660.410 AND (EN.600.321 OR EN.600.421)
Instructor(s): A. Dahbura; L. Aronhime
Area: Engineering.

EN.600.412. Security and Privacy in Cloud Computing. 1 Credit.
This course focuses on the security and privacy issues in Cloud Computing systems. While the cloud computing paradigm gains more popularity, there are many issues related to confidentiality, integrity, and availability of data and computations involving a cloud. In this course, we examine cloud computing models, look into the threat model and security issues related to data and computation outsourcing, and explore practical applications of secure cloud computing. Students should have some background in network and/or data security.
Instructor(s): R. Hasan
Area: Engineering.

EN.600.415. Databases. 3 Credits.
Graduate level version of EN.600.315. Students may receive credit for EN.600.315 or EN.600.415, but not both. Recommended Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.
EN.600.416. Database Systems. 3 Credits.
Similar material as EN.600.316, covered in more depth. Intended for upper-level undergraduates and graduate students. Students may receive credit for EN.600.316 or EN.600.416, but not both. Recommended Course Background: EN.600.120 and EN.600.226
Prerequisites: Students may receive credit for EN.600.316 or EN.600.416, but not both.
Instructor(s): Y. Ahmad
Area: Engineering.

EN.600.417. Data Stream Processing. 3 Credits.
Data stream processing has emerged as a model for building computing applications that face tremendous volumes of dynamically changing data, and are required to process such data in a timely fashion. Examples include a variety of web-driven applications, such as web advertising based on Facebook and Twitter status streams, and more generally, monitoring and analysis applications including algorithmic trading on stock ticks and order books, network monitoring for denial of service attacks, and location-based applications working with GPS data streams. This course will study data stream processing from a data management and algorithms perspective. Students will be introduced to the fundamentals of data stream processing systems and architectures, incremental (windowed) stream processing languages, and stream algorithms that embody the principle of "you only get one look" when having to continually deal with data arriving at high rates. This course will provide students with significant implementation experience, in the spirit of a practicum. Students will proceed through a series of homework projects to build a data stream processor from scratch, and will use the resulting stream engine along with stream mining algorithms to analyze Twitter feeds. This course is aimed at upper-level undergraduates with prior programming experience. Graduate students should consider taking EN.600.617 instead. Students may receive credit for EN.600.417 or EN.600.617, but not both.
Prerequisites: EN.600.120 AND EN.600.226 AND (EN.600.315 OR EN.600.415)
Instructor(s): Y. Ahmad
Area: Engineering.

EN.600.418. Operating Systems. 3 Credits.
Similar material as EN.600.318, covered in more depth. Intended for upper-level undergraduates and graduate students. Students may receive credit for EN.600.318 or EN.600.418, but not both. [Systems]
Prerequisites: Students may receive credit for EN.600.318 or EN.600.418, but not both.
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.420. Parallel Programming. 3 Credits.
Graduate level version of EN.600.320. Students may receive credit for EN.600.320 or EN.600.420, but not both. Recommended Course Background: EN.600.120 or equivalent.
Instructor(s): R. Burns
Area: Engineering.

EN.600.421. Object Oriented Software Engineering. 3 Credits.
Graduate level version of EN.600.321. Students may receive credit for EN.600.321 or EN.600.421, but not both. Recommended Course Background: EN.600.226 and EN.600.120
Instructor(s): S. Smith
Area: Engineering.

EN.600.423. Data-Intensive Computing. 3 Credits.
Graduate student version of EN.600.323. [Systems] Students may receive credit for EN.600.323 or EN.600.423, but not both.
Prerequisites: EN.600.320 OR EN.600.420
Instructor(s): R. Burns
Area: Engineering.

EN.600.424. Network Security. 3 Credits.
This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] EN.600.120 (or equivalent) recommended.
Prerequisites: 600.226 and (600.344 or 600.444) or permission; 600.120 (or equivalent) recommended.
Instructor(s): Staff
Area: Engineering.

EN.600.425. Declarative Methods. 3 Credits.
Students can only receive credit for EN.600.325 or EN.600.425, not both. Graduate level version of EN.600.325. Recommended Course Background: EN.600.226, EN.600.271, AS.110.107/AS.110.109
Instructor(s): J. Eisner
Area: Engineering.

EN.600.426. Principles of Programming Languages. 3 Credits.
Functional, object-oriented, and other language features are studied independent of a particular programming language. Students become familiar with these features by implementing them. Most of the implementations are in the form of small language interpreters. Some type checkers and a small compiler will also be written. The total amount of code written will not be overly large, as the emphasis is on concepts. The ML programming language is the implementation language used. [Analysis] No Freshmen or Sophomores. Recommended Course Background: EN.600.226
Instructor(s): S. Smith
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.427. Data Organization: Storage and External Memory Systems. 3 Credits.
This course will examine the complex relationship between computer architectures and software systems that store, organize, and access data. Storage systems have always co-evolved with technology. But, today's computing landscape places unique demands on next generation storage systems. Technology drivers include: new storage devices, such as solid-state drives and phase-change memory, cloud computing, virtualization, and modern multicore and manycore processors with steep hierarchies of shared caches. The course will provide an overview of modern storage systems, including parallel file systems, key/value stores, scan engines, in-memory databases, archival storage, and content-based storage. It will cover the techniques used to organizes storage in these systems, such as indexes, replication and coding, spatial trees, and space-filling curve. The course will also explore external memory data structures and algorithms that provide a framework for analyzing storage designs. Recommended Course Background: EN.600.226, EN.600.315/EN.600.415, and EN.600.333/EN.600.433 or permission of instructor.
Instructor(s): R. Burns
Area: Engineering.
EN.600.428. Compilers & Interpreters. 3 Credits.
Introduction to compiler design, including lexical analysis, parsing, syntax-directed translation, symbol tables, run-time environments, and code generation and optimization. Students are required to write a compiler as a course project. Co-listed with EN.600.328. Students should have knowledge of C/C++ programming and data structures. Graduate version of EN.600.328. Students may receive credit for EN.600.328 or EN.600.428, but not both.
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.429. Functional Programming at Work - Haskell and Domain-Specific Languages. 3 Credits.
This course studies pure functional programming in the Haskell language and the use of functional programming to build domain specific languages (DSLs): customized, application specific programming languages. This course starts with an introduction to Haskell and its essential ideas of lazy evaluation and type inference. Advanced functional programming topics will include type classes, monads and monad transformers, arrows, templates, dependent types, parser combinators, and multiple parameter type classes. The class will study existing DSLs and DSL implementation techniques, including languages for reactive programming, computer vision, hardware design, computer music, and parallel processing. Students will implement a DSL of their choice in Haskell.
Instructor(s): J. Peterson
Area: Engineering.

EN.600.430. Ontologies and Knowledge Representation. 3 Credits.
Knowledge representation (KR) deals with the possible structures by which the content of what is known can be formally represented in such a way that queries can be posed and inferences drawn. Ontology concerns the hierarchic classification of entities from given domains of knowledge together with the relations between various classes or subclasses. We begin with KR, examining the standard variety of frameworks developed or implemented over the last twenty years, including 1st-order logic and automated theorem proving, networks, frames, and description logics. Then we move on to a study of the problems inherent in ontology development and examine the some of the currently prevalent environments, including Universal Modeling Language, OWL and Protege. RDFs and semantic web applications. [Analysis] Recommended Course Background: EN.600.107 and EN.600.271
Instructor(s): R. Rynasiewicz
Area: Humanities, Quantitative and Mathematical Sciences.

EN.600.433. Computer Systems. 3 Credits.
Graduate version of 600.333. Students may receive credit for 600.333 or 600.433, but not both. [Systems]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.434. Artificial Intelligence. 3 Credits.
Students may receive credit for EN.600.335 or EN.600.435, not both. Graduate level version of EN.600.335 [Applications]. Prerequisite: EN.600.226, EN.550.171; Recommended: linear algebra, prob/stat.
Instructor(s): B. Mitchell
Area: Engineering.

EN.600.436. Algorithms for Sensor-Based Robotics. 3 Credits.
This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis] Formerly EN.600.336. Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Prerequisites: EN.600.226 and Linear Algebra and Probability
Instructor(s): G. Hager
Area: Engineering.

EN.600.437. Distributed Systems. 3 Credits.
Graduate version of 600.337. Students may receive credit for 600.337 or 600.437 but not both. Recommended Course Background: EN.600.120, EN.600.226
Instructor(s): Y. Amir
Area: Engineering.

EN.600.438. Adv Tpcs: Oper Systems. 4 Credits.
Area: Engineering.

EN.600.439. Computational Genomics. 3 Credits.
Your genome is the blueprint for the molecules in your body. It’s also a string of letters (A, C, G and T) about 3 billion letters long. How does this string give rise to you? Your heart, your brain, your health? This, broadly speaking, is what genomics research is about. This course will familiarize you with a breadth of topics from the field of computational genomics. The emphasis is on current research problems, real-world genomics data, and efficient software implementations for analyzing data. Topics will include: string matching, sequence alignment and indexing, assembly, and sequence models. Course will involve significant programming projects.
Instructor(s): B. Langmead
Area: Engineering.

EN.600.442. Modern Cryptography. 3 Credits.
This course focuses on cryptographic algorithms, formal definitions, hardness assumptions, and proofs of security. Topics include number-theoretic problems, pseudo-randomness, block and stream ciphers, public-key cryptography, message authentication codes, and digital signatures. Recommended Course Background: EN.600.226 and a 300-level or above systems course; EN.600.271/EN.600.471 and EN.550.171 or equivalent.
Instructor(s): C. Pappacena
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.443. Security & Privacy in Computing. 3 Credits.
Lecture topics will include computer security, network security, basic cryptography, system design methodology, and privacy. There will be a heavy work load, including written homework, programming assignments, exams and a comprehensive final. The class will also include a semester-long project that will be done in teams and will include a presentation by each group to the class. [Applications] Prerequisite: A basic course in operating systems and networking, or permission of instructor.
Instructor(s): A. Rubin
Area: Engineering.
EN.600.444. Computer Networks. 3 Credits.
This course considers intersystem communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, moderns, multiplexing, error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. Recommended Course Background: EN.600.333 or EN.600.433 or permission. Students can only receive credit for EN.600.344 or EN.600.444, not both. Instructor(s): A. Terzis Area: Engineering.

This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Recommended Course Background: EN.600.120, EN.600.226, and AS.110.201 or permission of instructor. Recommended: EN.600.457, EN.600.461, Image processing. Instructor(s): R. Taylor Area: Engineering.

EN.600.446. Computer Integrated Surgery II. 3 Credits.
This weekly lecture/seminar course addresses similar material to EN.600.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to take a seminar and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.600.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. Students may also take this course as EN.600.464. The only difference between EN.600.446 and EN.600.464 is the level of project undertaken. Typically, EN.600.464 projects require a greater degree of mathematical, image processing, or modeling background. Prospective students should consult with the instructor as to which course number is appropriate. [Applications] Prerequisites: Prereq for EN.600.446: EN.600.445 or permission Instructor(s): R. Taylor Area: Engineering.

EN.600.450. Network Embedded Systems & Sensor Networks. 3 Credits.
This course is an introduction to fundamental concepts of networked embedded systems and wireless sensor networks. It is intended for juniors, seniors and first year graduate students in Computer Science and other engineering majors with the prerequisite background. Covered topics include: embedded systems programming concepts, low power and power aware design, radio technologies, communication protocols for ubiquitous computing systems, and some of the mathematical foundation of sensor behavior. Laboratory work consists of a set of programming assignments that consider a set of the issues described in class. Recommended Course Background: EN.600.226, EN.600.120, and EN.600.344/EN.600.444 Instructor(s): M. Chang Area: Engineering.

EN.600.451. Performance of Computer-Communication Networks and Protocols. 3 Credits.
Prerequisites: (EN.600.344 AND EN.600.444) AND EN.550.310 Area: Engineering.

EN.600.452. Seminar: Computer Integrated Surgery II. 1 Credit.
Students may receive credit for EN.600.446 or EN.600.452, but not both. Lecture only version of EN.600.446 (no project). Recommended Course Background: EN.600.445 or instructor permission required. Instructor(s): M. Green Area: Engineering.

EN.600.454. Practical Cryptographic Systems. 3 Credits.
This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems] Instructor(s): M. Green Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.457. Computer Graphics. 3 Credits.
Graduate level version of EN.600.357. Students may receive credit for EN.600.357 or EN.600.457, but not both. Recommended Course Background: EN.600.120, EN.600.226, AS.110.201 or instructor permission. Instructor(s): M. Kazhdan Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.460. Software Vulnerability Analysis. 3 Credits.
This course will examine vulnerabilities in C source, stack overflows, writing shell code, etc. Also, vulnerabilities in web applications: SQL Injection, cookies, as well as vulnerabilities in C binary fuzzing, and exploit development without source among other topics. Co-listed with EN.650.460 Instructor(s): S. Checkoway Area: Engineering.

EN.600.461. Computer Vision. 3 Credits.
Graduate version of EN.600.361. Students may receive credit for EN.600.361 or EN.600.461, but not both. Recommended Course Background: EN.600.226 & linear algebra Instructor(s): R. Vidal Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.463. Algorithms I. 3 Credits.
Graduate version of EN.600.363. Students may receive credit for EN.600.363 or EN.600.463, but not both. Recommended Course Background: EN.600.226 and EN.550.171 or instructor permission required. Instructor(s): V. Braverman Area: Engineering, Quantitative and Mathematical Sciences.
EN.600.464. Randomized Algorithms. 3 Credits.
The course emphasizes algorithmic design aspects, and how randomization can be a helpful tool. The topics covered include: tail inequalities, linear programming relaxation & randomized rounding, de-randomization, existence proofs, universal hashing, markov chains, metropolis and metropolis-hastings methods, mixing by coupling and by eigenvalues, counting problems, semi-definite programming and rounding, lower bound arguments, and applications of expanders. [Analysis]
Instructor(s): S. Kosaraju
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.465. Natural Language Processing. 3 Credits.
This course is an in-depth overview of techniques for processing human language. How should linguistic structure and meaning be represented? What algorithms can recover them from text? And crucially, how can we build statistical models to choose among the many legal answers? The course covers methods for trees (parsing and semantic interpretation), sequences (finite-state transduction such as morphology), and words (sense and phrase induction), with applications to practical engineering tasks such as information retrieval and extraction, text classification, part-of-speech tagging, speech recognition and machine translation. There are a number of structured but challenging programming assignments. Recommended Course Background: EN.600.226
Instructor(s): J. Eisner
Area: Engineering.

EN.600.466. Information Retrieval and Web Agents. 3 Credits.
An in-depth, hands-on study of current information retrieval techniques and their application to developing intelligent WWW agents. Topics include a comprehensive study of current document retrieval models, mail/news routing and filtering, document clustering, automatic indexing, query expansion, relevance feedback, user modeling, information visualization and usage pattern analysis. In addition, the course explores the range of additional language processing steps useful for template filling and information extraction from retrieved documents, focusing on recent, primarily statistical methods. The course concludes with a study of current issues in information retrieval and data mining on the World Wide Web. Topics include web robots, spiders, agents and search engines, exploring both their practical implementation and the economic and legal issues surrounding their use. Recommended Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.467. Wireless Networks. 3 Credits.
This course covers the basics of mobile communication and wireless networking for computer science majors by keeping a balance between communication and networking topics. In this course the students will be exposed to wireless transmission fundamentals (path loss, shadowing, modulation, coding and channel models), wireless cellular networks (cellular concept, channel reuse, capacity limits, and cellular systems such as GSM, GPRS and UMTS), and learn about mobile network and transport layers, medium access control protocols, wireless local area networks (IEEE 802.11), wireless mesh networks (IEEE 802.16), and emerging dynamic spectrum access networks based on cognitive radios. Recommended Course Background: EN.600.344/EN.600.444 or equivalent.
Prerequisites: EN.600.344 OR EN.600.444 or equivalent
Instructor(s): A. Mishra
Area: Engineering.

EN.600.468. Machine Translation. 3 Credits.
Google translate can instantly translate between any pair of over fifty human languages (for instance, from French to English). How does it do that? Why does it make the errors that it does? And how can you build something better? Modern translation systems learn to translate by reading millions of words of already translated text, and this course will show you how they work. The course covers a diverse set of fundamental building blocks from linguistics, machine learning, algorithms, data structures, and formal language theory, along with their application to a real and difficult problem in artificial intelligence. Recommended Course Background: prob/stat, EN.600.226; EN.600.465
Instructor(s): A. Lopez; M. Post
Area: Engineering.

EN.600.469. Approximation Algorithms. 3 Credits.
This course provides an introduction to approximation algorithms. Topics include vertex cover, TSP, Steiner trees, cuts, greedy algorithm, linear and semi-definite programming, primal-dual method, and randomization. Additional topics will be covered as time permits. There will be a final project. Students may receive credit for EN.600.469 or EN.600.669, but not both. [Analysis]
Prerequisites: EN.600.363 OR EN.600.463 OR permission of instructor.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.471. Theory of Computation. 3 Credits.
This is a graduate-level course studying the theoretical foundations of computer science. Topics covered will be models of computation from automata to Turing machines, computability, complexity theory, randomized algorithms, inapproximability, interactive proof systems and probabilistically checkable proofs. Students may not take both EN.600.271 and EN.600.471, unless one is for an undergrad degree and the other for grad. Recommended Course Background: EN.550.171 or instructor permission.
Prerequisites: Students may not take both EN.600.271 and 600.471, unless one is for an undergrad degree and the other for grad.
Prerequisite: 550.171 or permission.
Instructor(s): V. Vazirani
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.475. Machine Learning. 3 Credits.
This course takes an application driven approach to current topics in machine learning. The course covers supervised learning (classification/structured prediction/regression/ranking), unsupervised learning (dimensionality reduction, bayesian modeling, clustering) and semi-supervised learning. Additional topics may include reinforcement learning and learning theory. The course will also consider challenges resulting from learning applications, such as transfer learning, multi-task learning and large datasets. We will cover popular algorithms (naive Bayes, SVM, perceptron, HMM, winnow, LDA, k-means, maximum entropy) and will focus on how statistical learning algorithms are applied to real world applications. Students in the course will implement several learning algorithms and develop a learning system for a final project. [Applications]
Recommended Course Background: multivariate calculus.
Instructor(s): M. Dredze
Area: Engineering.
EN.600.476. Machine Learning in Complex Domains. 3 Credits.
How can robots locate themselves in an indoor environment when navigating? How do you infer which patients need attention first in the ICU? How can one identify the start of an epidemic using tweets? How does one predict the way a traffic jam will spread through the local streets during an Orioles game? How can you communicate with your TV using only hand gestures? This class will cover the fundamental concepts of Probabilistic Graphical Models as a framework for addressing questions like the ones above. We will study algorithms for model estimation, exact and approximate inference. The class will have 4 interactive sessions during which students will learn through an open discussion format how to think about open-ended real-world problems with the tools learnt in class. Students are also required to tackle a project of their choice within which they will experiment with the ideas learnt in class. Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Recommended Course Background: EN.550.310, EN.550.311, EN.550.420, or EN.550.430 and EN.550.291 or AS.110.201
Instructor(s): S. Saria
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.478. Visual Imaging in Surgery and Medicine. 3 Credits.
Instructor(s): R. Kumar
Area: Engineering.

EN.600.488. Foundations of Computational Biology & Bioinformatics II. 3 Credits.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Foundations of Computational Biology I is not a prereq. [Analysis] Co-listed with EN.580.488. Recommended Course Background: math through linear algebra and differential equations, at least one prob/stat course, EN.580.221 or equivalent, EN.600.226 or equivalent.
Instructor(s): R. Karchin
Area: Engineering, Natural Sciences.

EN.600.490. Modern Software Development for Scientist and Engineers. 4 Credits.
Area: Engineering.

EN.600.491. Computer Science Workshop I.
An applications-oriented, computer science project done under the supervision and with the sponsorship of a faculty member in the Department of Computer Science. Computer Science Workshop provides a student with an opportunity to apply theory and concepts of computer science to a significant project of mutual interest to the student and a Computer Science faculty member. Permission to enroll in CSW is granted by the faculty sponsor after his/her approval of a project proposal from the student. Interested students are advised to consult with Computer Science faculty members before preparing a Computer Science Workshop project proposal.
Instructor(s): D. Yarowsky; P. Froehlich; S. Smith; Staff
Area: Engineering.

EN.600.492. Comp Science Workshop II.
Permission of faculty sponsor is required.
Instructor(s): D. Yarowsky; J. Selinski; P. Froehlich; S. Smith
Area: Engineering.

EN.600.501. Independent Study Fr/So.
Individual, guided study under the direction of a faculty member in the department. The program of study, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.600.502. Independent Study Fr/Sph. 0 - 3 Credit.

EN.600.503. Independent Study.
Individual guided study for undergraduate students under the direction of a faculty member in the department. The program of study, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.600.504. Undergraduate Independent Study. 3 Credits.
For undergraduate students. Permission of faculty sponsor is required.
Instructor(s): Staff.

EN.600.507. Independent Research.
Individual research for undergraduates under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.600.508. Undergraduate Research. 3 Credits.
Permission of faculty sponsor is required.
Instructor(s): Staff.

EN.600.509. Computer Science Internship. 1 Credit.
Individual work in the field with a learning component, supervised by a faculty member in the department. The program of study and credit assigned must be worked out in advance between the student and the faculty member involved. Students may not receive credit for work that they are paid to do. As a rule of thumb, 40 hours of work is equivalent to one credit. Permission required.
Instructor(s): Staff.

EN.600.510. Computer Science Internship. 1 Credit.
Individual work in the field with a learning component, supervised by a faculty member in the department. The program of study must be worked out in advance between the student and the faculty member involved. Students may not receive credit for work that they are paid to do. As a rule of thumb, 40 hours of work is equivalent to one credit, which is the limit per semester. Permission of faculty sponsor is required.
Instructor(s): Staff.
EN.600.519. Senior Honors Thesis. 3 Credits.
The student will undertake a substantial independent research project under the supervision of a faculty member, potentially leading to the notation “Departmental Honors with Thesis” on the final transcript. Students are expected to enroll in both semesters of this course during their senior year. Project proposals must be submitted and accepted in the preceding spring semester (junior year) before registration. Students will present their work publicly before April 1st of senior year. They will also submit a first draft of their project report (thesis document) at that time. Faculty will meet to decide if the thesis will be accepted for honors. Computer science majors only. Students should have a 3.5 GPA in computer science courses at the end of their junior year and permission of faculty sponsor. See EN.600.491 for faculty section numbers.
Instructor(s): Staff.

EN.600.520. Senior Honors Thesis. 3 Credits.
For computer science majors only, a continuation of EN.600.519. Recommended Course Background: EN.600.519. 
Instructor(s): Staff.

EN.600.546. Senior Thesis in CIS. 3 Credits.
Prerequisites: EN.600.445 or perm req’d.
Instructor(s): R. Taylor
Area: Engineering.

EN.600.585. Independent Study-Summer. 3 Credits.
Instructor(s): Staff.

EN.600.597. Research-Summer. 3 Credits.
Instructor(s): Staff.

EN.600.599. Internship. 1 Credit.
Instructor(s): Staff.

Required for all full-time CS PhD students. Recommended for MSE students.
Instructor(s): C. Thornton; S. Smith.

Required for all CS PhD students. Strongly recommended for MSE students.
Instructor(s): C. Thornton; S. Smith.

EN.600.603. Current Topics in Language and Speech Processing.
Instructor(s): S. Khudanpur
Area: Engineering.

CLSP seminar series, for any students interested in current topics in language and speech processing.
Instructor(s): S. Khudanpur.

EN.600.615. Big Data, Small Languages, Scalable Systems.
This class will study domain-specific data management tools, focusing on extremely scalable system design based on the domain’s semantic and structural properties. We will study a variety of data models including stream, graph, array and probabilistic data, and their processing on modern architectures such as column- and key-value stores, stream and XQuery engines. Further topics include the use of novel hardware such as solid state disks, phase change memory, GPUs, and FPGAs. The class includes a semester long group project to develop a query processor for an application of the group’s choice (e.g. on system log, finance, web, sensor, speech data). Recommended Course Background: EN.600.315/EN.600.415 or equivalent.
Instructor(s): Y. Ahmad.

EN.600.617. Data Stream Processing.
Advanced (graduate) version of EN.600.417. Students may receive credit for EN.600.417 or EN.600.617, but not both. Recommended Course Background: EN.600.315/EN.600.415.
Instructor(s): Y. Ahmad.

EN.600.620. External Memory Data Structures and Algorithms.
Prerequisites: ( EN.600.363 OR EN.600.463 ) AND ONE OF: ( EN.600.315 OR EN.600.415 ), ( EN.600.318 OR EN.600.418 ), ( EN.600.316 OR EN.600.416 ), ( EN.600.319 OR EN.600.419 ) OR PERMISSION OF INSTRUCTOR.
Instructor(s): R. Burns
Area: Engineering.

EN.600.625. Events Semantics in Theory and Practice.
This course explores selected topics in the nature of event representations from the perspective of cognitive science, computer science, linguistics, and philosophy. These fields have developed a rich array of scientific theories about the representation of events, and how humans make inferences about them. We investigate how (and if) such theories could be applied to current research topics and tasks in computational semantics such as inference from text, automated summarization, veridicality assessment, and so on. In addition to classic articles dealing with formal semantic theories, the course considers available machine-readable corpora, ontologies, and related resources that bear on event structure, such as WordNet, PropBank, FrameNet, etc.
The course is aimed to marry theory with practice: students with either a computational or linguistic background are encouraged to participate. [Applications]
Instructor(s): B. Van Durme; K. Rawlins.

Graduate level version of EN.600.436 (see description above). Formerly EN.600.436. Students may receive credit for only one of EN.600.336, EN.600.436 or EN.600.636. Recommended Course Background: EN.600.226, AS.110.106, and Prob/Stat.
Prerequisites: Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): G. Hager.

EN.600.639. Computational Genomics.
Graduate version of EN.600.439. Students may earn credit for EN.600.439 or EN.600.639, but not both. Recommended Course Background: EN.600.120 and EN.600.226
Instructor(s): B. Langmead
Area: Engineering.

EN.600.640. Frontiers of Sequencing Data Analysis.
Public archives now contain petabytes of valuable but hard-to-analyze DNA sequencing data. Analyzing even small datasets is complicated by sequencing errors, differences between individuals, and the fragmentary nature of the sequencing reads. In this course, we study recent algorithms and methods that seek to make sense of DNA sequencing datasets from small to very large. Topics covered will vary from year to year, but could include RNA sequencing data analysis, other functional genomics data analysis, metagenomics analysis, data compression, indexing, applications of streaming algorithms and sketch data structures, assembly, etc. There will be homework assignments and a course project. [Applications]
Prerequisites: EN.600.439 OR EN.600.639
Instructor(s): B. Langmead.
EN.600.642. Advanced Topics in Cryptography.  
This course will focus on advanced cryptographic topics with an emphasis on open research problems and student presentations.  
Instructor(s): G. Ateniese.

Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class.  
There will be homework assignments and a course project.  
Prerequisites: EN.600.443 OR EN.600.424 or permission of instructor.
Instructor(s): A. Amir.

This is a graduate level course on computer networking. The course involves both a reading/lecture/discussion component and a project component. We will read about 50 research papers on various aspects of computer networking: software defined networks, congestion/flow control, network measurements, routing, content distribution networks, wireless, and data center networks. Students are expected to read papers before the class, submit a one page summary for each paper, and participate in the discussion during the class. The class projects can be either of the following types: design/implementation, measurement, and simulation. The lecture will be conducted in an interactive fashion. The instructor will lead the discussion, but we expect everyone to participate. You will be graded for both the paper summaries and class discussion.  
[Systems]  
EN.600.646. Computer Integrated Surgery II.  
Students may receive credit for EN.600.446 or EN.600.646, but not both.  
Advanced version of EN.600.446. [Applications]  
Prerequisites: EN.600.445 OR PERMISSION OF INSTRUCTOR  
Instructor(s): R. Taylor.

EN.600.647. Advanced Topics Wireless Networks.  
A survey of current research in wireless communication networks. These types of networks have been growing exponentially in the past several years and include a host of different network types: ad hoc, cell phone, access point, sensor, etc. The class will build understanding of all layers of wireless networking and the interactions between them (including: physical, data link, medium access control, routing, transport, and application). Topics discussed: security, energy efficiency, mobility, scalability, and their unique characteristics in wireless networks.  
Instructor(s): A. Mishra.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Co-listed as 650.662. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor.

This course presents advanced methodologies and their applications to computer graphics. Recommended Course Background: any computer science courses above the 400-level in computer graphics & linear algebra; or permission of instructor.

This course will survey individual topics in computer graphics. Throughout most of the semester, students will present one to two papers in the area each week. Then, towards the end, the course will focus on the evaluation and comparison of the covered methods. Students will collaboratively design tools for analyzing the techniques and the class will jointly write up their findings in a survey paper. In addition to providing a deep study of a particular area in computer graphics, the goal of this course is to expose students to important aspects of research, including reviewing related work, designing metrics for evaluation, and writing scientific papers.  
Instructor(s): M. Kazhdan.

EN.600.659. Introduction to Computational Geometry.  
This course will provide an introduction to computational geometry. It will cover a number of topics in two- and three-dimensions, including polygon triangulations and partitions, convex hulls, Delaunay and Voronoi diagrams, arrangements, and spatial queries. [Analysis] Recommended Course Background: EN.600.363/463  
Instructor(s): M. Kazhdan.

EN.600.660. FFT in Graphics & Vision.  
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariances, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations.  
Instructor(s): M. Kazhdan.

EN.600.662. Topics in Illumination and Reflectance Modeling for Computer Vision and Medical Imaging Applications.  
The vast majority of all imagery on which computer vision is performed starts with a source of illumination in conjunction with a material reflectance property. Having a rigorous understanding of these phenomena is important for most students who want to be involved with further research in computer vision and computer integrated surgery, particularly for experimentation and development of new systems. This short course is for individuals who have already taken Computer Vision, and want to delve deeper into underlying physical modeling of light illumination, reflection, colorimetry, polarization and even sensor fusion of images taken at different Wavelengths.  
Prerequisites: EN.600.361 OR EN.600.461 or Instructor permission required.  
Instructor(s): L. Wolff.

EN.600.663. Pattern Matching Algorithms.  
Pattern matching problems are among the oldest in computer science. Yet, the area is still a fertile ground for very active current research. Part of its appeal is in its many application domains, such as text editing, computer vision, or molecular biology. Another aspect is that pattern matching has produced or incorporated some novel and powerful algorithmic techniques. We will investigate various pattern matching problems with particular emphasis on the techniques employed for their solutions. Recommended Course Background: EN.600.363/EN.600.463 or equivalent.  
Instructor(s): A. Amir.

EN.600.664. Randomized Algorithms.  
Graduate level version of EN.604.644. Recommended Course Background: EN.600.363 or EN.600.463. Students may receive credit for EN.600.464 or EN.600.664, but not both.  
Instructor(s): S. Kosaraju  
Area: Engineering.
EN.600.666. Information Extraction.
Introduction to statistical methods of speech recognition (automatic transcription of speech) and understanding. The course is a natural continuation of EN.600.465 but is independent of it. Topics include elementary information theory, hidden Markov models, the Baum and Viterbi algorithms, efficient hypothesis search methods, statistical decision trees, the estimation-maximization (EM) algorithm, maximum entropy estimation and estimation of discrete probabilities from sparse data for acoustic and language modeling. Weekly assignments and several programming projects. Co-listed as EN.520.666. Recommended Course Background: EN.600.120 and EN.550.310 or equivalent, expertise in C or C++ programming
Instructor(s): X. Li.

The course explores the state of the art in distributed systems, networks and Internet research and practice, trying to see what it would take to push the envelope a step further. The course is conducted as a discussion group, where the professor and students brainstorm and pick interesting semester-long projects with high potential future impact. Example areas include robust scalable infrastructure (distributed datacenters, cloud networking, scada systems), real-time performance (remote surgery, trading systems), hybrid networks (mesh networks, 3-G/Wifi/Bluetooth). Students should feel free to bring their own topics of interest and ideas. Recommended Course Background: a systems course (distributed systems, operating systems, computer networks, parallel programming) or permission of instructor.
Instructor(s): Y. Amir.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor
Instructor(s): S. Checkoway.

EN.600.669. Approximation Algorithms.
Graduate version of EN.600.469. Students may receive credit for EN.600.469 or EN.600.669, but not both.
Prerequisites: EN.600.363 OR EN.600.463 OR permission
Instructor(s): V. Braverman.

EN.600.670. Pseudorandomness and Combinatorial Constructions.
Randomness is very useful in almost all areas of computer science, such as algorithms, distributed computing and cryptography. However, computers generally do not have access to truly uniform random bits. To deal with this, we rely on various pseudorandom objects to reduce either the quantity or the quality of the random bits needed. In this course, we will develop provably good pseudorandom objects for a variety of tasks. We will frequently require explicit combinatorial constructions. That is, we will want to efficiently and deterministically construct such objects. Along the way, we will also explore the close connections of such objects to many other areas in computer science and mathematics, such as graph theory, coding theory, complexity theory and arithmetic combinatorics.
[Analysis] Recommended Course Background: EN.600.271/417, EN.600.363/463 and probability.
Instructor(s): X. Li.

EN.600.672. Advances in Computational Complexity.
Computational complexity theory focuses on understanding capabilities of resource bounded computation. In recent years there have been many important break-through results in this area: lower bounds for Boolean circuits, design of space efficient algorithm for undirected graph reachability problem, hardness based derandomization of randomized algorithms, probabilistic proof characterization of non-deterministic polynomial-time, to name a few. This course aims to get in detail regarding some of the very exciting recent developments in computational complexity theory. It will be useful for any student who is mathematically mature and has a keen interest in understanding the fundamental nature of computation. Recommended Course Background: EN.600.471 or equivalent.
Instructor(s): V. Vazirani.

Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. One should have taken at least an introductory course in probability theory and linear algebra. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Recommended Course Background: EN.550.310, EN.550.311, EN.550.420, or EN.550.430 and EN.550.291 or AS.110.201
Instructor(s): S. Saria.

EN.600.681. Advanced Topics in Computer Vision.
Prerequisites: Prereq: 600.461 linear algebra or permission.
Area: Engineering.

EN.600.688. Foundations of Computational Biology & Bioinformatics II.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Co-listed with EN.580.688. Recommended Course Background: math through linear algebra and differential equations, at least one prob/stat course, EN.580.221 or equivalent, EN.600.226 or equivalent.
Instructor(s): R. Karchin.

The aim of this course is to describe the foundations of computational methods for the statistical and dynamical modeling of multivariate data. The emphasis of this course is to use methods from algebraic geometry, probability theory and dynamical systems theory to build models of data. Topics include nonlinear dimensionality reduction (PCA, LLE), unsupervised learning (central clustering, subspace clustering, GPCA), and estimation and identification of dynamical systems (Kalman filtering, subspace identification, hybrid system identification). We will apply these tools to model data from computer vision, biomedical imaging, neuroscience, and computational biology.
Instructor(s): R. Vidal.
EN.600.707. Selected Topics in CS Education.  
This course will explore current issues and research in computer science education. Topics will be drawn from literature, news items, and participant experience. Current faculty and students with interests in academic careers are encouraged to attend.  
Instructor(s): A. Irvine; J. Selinskie.

EN.600.716. Selected Topics on Innovative Data Systems.  
This weekly reading group will survey and dissect the cutting-edge on innovative data systems research. Topics will encompass methods and abstraction in core systems and data management areas (eg, cloud computing, scalable programming and storage), as well as use-cases and "war" stories from industry, and science and engineering applications. View on web: Our semester schedule is posted at damsel.cs.jhu.edu/ blockparty  
Instructor(s): Y. Ahmad.

EN.600.726. Selected Topics in Programming Languages.  
This seminar course covers recent developments in the foundations of programming language design and implementation. Topics covered include type theory, process algebra, higher-order program analysis, and constraint systems. Students will be expected to present papers orally.  
Instructor(s): S. Smith.

EN.600.728. Selected Topics in Category Theory.  
Students in this course will read a sampling of standard texts in Category Theory (eg. the books by Awodey, Mac Lane, Pierce, or others) and papers relevant to the research of participants.  
Instructor(s): N. Filardo.

EN.600.735. Seminar in Machine Learning.  
This seminar course will look at research in machine learning. Topics will be selected from those of mutual interest between students and the instructor. Sample topics include reinforcement learning, kernel methods, experimental methods in machine learning, computational learning theory, lazy learning, evolutionary computation, and neural networks. Students are expected to select papers and lead discussion.  
Instructor(s): J. Sheppard.

EN.600.745. Seminar in Computational Sensing and Robotics.  
This weekly seminar will focus on research issues in computer integrated surgery, including subjects such as medical image analysis, statistical modeling, visualization, vision/sensing, surgical planning, medical robotics, and clinical applications. The purpose of the course is to widen the knowledge and awareness of the participants in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University and beyond. The format of the course is informal presentation by a pre-eminent invited speaker, followed by free discussion. Formerly Seminar in Computer Integrated Surgery (CISST)  
Instructor(s): P. Kazanzides.

EN.600.746. Selected Topics in Medical Image Analysis Seminar.  
This weekly seminar will focus on research issues in computer integrated surgery, including subjects such as medical image analysis, statistical modeling, visualization, vision/sensing, surgical planning, medical robotics, and clinical applications. The purpose of the course is to widen the knowledge and awareness of the participants in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University and beyond. The format of the course is informal presentation by a pre-eminent invited speaker, followed by free discussion.  
Instructor(s): J. Prince; R. Taylor.

EN.600.754. Seminar on Statistical Anatomic Models, Registration, and Reconstruction.  
This weekly research seminar will focus generally on statistical modeling of anatomic structures, image and model registration, 3D image reconstruction methods, and their interrelationships. We will concentrate primarily, though not exclusively, on x-ray based imaging modalities (x-ray fluoroscopy, CT, cone-beam tomography, "hybrid" reconstruction methods, etc.).  
Instructor(s): R. Taylor.

EN.600.757. Selected Topics in Computer Graphics.  
In this course we will review current research in computer graphics. We will meet for an hour once a week and one of the participants will lead the discussion for the week.  
Instructor(s): M. Kazhdan.

EN.600.763. Selected Topics in Streaming Algorithms.  
This course will focus on theoretical streaming algorithms and related methods. Examples of topics that we will address include sketching, sampling, frequency moments, heavy elements, k-wise independence, and the Johnson-Lindenstrauss lemma. Students will be required to select a paper and lead a discussion. This course is a good opportunity for motivated students to learn modern algorithmic methods. Recommended Course Background: EN.600.463 or equivalent.  
Instructor(s): V. Braverman.

This course will explore algorithms and theoretical computer science with a focus on algorithms for massive data. Examples of topics include streaming algorithms, approximation algorithms, online algorithms. Students will be encouraged to select a paper and lead a discussion. External speakers will be invited to present current work as well. This course is a good opportunity for motivated students to learn modern algorithmic methods.  
Prerequisites: EN.600.463 or equivalent.  
Instructor(s): V. Braverman  
Area: Engineering.

EN.600.765. Selected Topics in Natural Language Processing.  
A reading group exploring important current research in the field and potentially relevant material from related fields. Enrolled students are expected to present papers and lead discussion.  
Prerequisites: EN.600.465 or permission of instructor  
Instructor(s): J. Eisner.

EN.600.766. Selected Topics in Meaning, Translation and Generation of Text.  
This weekly reading group will review current research and survey articles on the topics of computational semantics, statistical machine translation, and natural language generation. Enrolled students will present papers and lead discussions.  
Instructor(s): B. Van Durme; C. Callison-Burch.
EN.600.771. Probability on Strings, Trees, and Sequences.
Many areas of practical computer science focus on discrete data that is sequential or tree-shaped: natural language processing (sentences and their analyses), computational biology (DNA and protein structures), programming languages (computer programs and their interpretations), and compression (sequences of bits). When the data is noisy or ambiguous, decision-making requires probabilistic methods. We will survey formal tools for manipulating sets of strings, trees, sequences, and defining probabilistic models over these sets. Much of the material covers advanced topics at the intersection of formal language and automata theory, probability, and algorithms. Respectively, these three areas will enable us to represent sets, represent uncertainty, and process everything efficiently.
Instructor(s): A. Lopez.

EN.600.772. Selected Topics in Linear Programming and Semi-definite Programming.
Linear programming and semi-definite programming are powerful techniques in convex optimization. They have been used to achieve the best known approximation results for many important combinatorial optimization problems, such as vertex cover, max cut, sparsest cut and MAX-2-SAT. In this course we will together explore the applications of these techniques in computer science, as well as some recent results about their limitations. Time permitting, we may also discuss their connections to the well-known unique games conjecture. This course will be in the form of a reading group, and students are encouraged to select a paper and lead a discussion. Recommended course background: EN.600.463 and EN.600.464.
Instructor(s): X. Li.

This seminar is recommended for all students interested in data intensive computing research areas (e.g., machine learning, computer vision, natural language processing, speech, computational social science). The meeting format is participatory. Papers that discuss best practices and the state-of-the-art across application areas of machine learning and data intensive computing will be read. Student volunteers lead individual meetings. Faculty and external speakers present from time-to-time. Recommended Course Background: machine learning or permission of the instructor.
Instructor(s): C. Priebe; J. Eisner; M. Dredze; S. Khudanpur; S. Saria.

EN.600.780. Special Topics in Computational Genomics.
This course will survey current areas where computer science approaches have been applied to genomics research. Chiefly, the course focuses on DNA sequencing data analysis, including sequence alignment, de novo assembly, error correction, and DNA data compression. Subject matter will be partially guided by student interests. Students will present papers orally.
Instructor(s): B. Langmead.

EN.600.801. Dissertation Research.
Instructor(s): Staff.

EN.600.802. Dissertation Research.
Instructor(s): Staff.

EN.600.803. Graduate Research.
Permission required. Independent research for masters or pre-dissertation PhD students.
Instructor(s): Staff.

EN.600.804. Graduate Research.
Independent research for masters or pre-dissertation PhD students. Permission required.
Instructor(s): Staff.

EN.600.809. Independent Study.
Permission required. Individual study in an area of mutual interest to a graduate student and a faculty member in the department.
Instructor(s): Staff.

EN.600.810. Graduate Independent Study.
Permission required.
Instructor(s): Staff.

EN.600.891. Independent Study-Summer.
Instructor(s): Staff.

EN.600.895. Research-Summer.
Instructor(s): Staff.

Cross Listed Courses

General Engineering

EN.520.447. Information Theory. 3 Credits.
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g. image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).
Instructor(s): S. Khudanpur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.701. Current Topics in Language and Speech Processing. This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing, and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U. Instructor(s): S. Khudanpur.

EN.520.702. Current Topics in Language and Speech Processing. This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing, and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Cross-listed with Computer Science. Grading will be S/U. Instructor(s): S. Khudanpur

Area: Engineering, Natural Sciences.

EN.520.744. Seminar in CISST. Current research topics in computer integrated surgery, presented primarily by pre-eminent invited speakers in the field.

Biomedical Engineering

EN.580.473. Modern Biomedical Imaging Instrumentation and Techniques. 3 Credits. An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.520.434 Recommended course background: EN.520.432 or EN.580.472

Prerequisites: EN.520.432 OR EN.580.472

Instructor(s): B. Tsui

Area: Engineering, Natural Sciences.

Electrical and Computer Engineering

The Department of Electrical and Computer Engineering at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and successful careers, and is dedicated to research that contributes to fundamental knowledge in both analytical and experimental aspects of the field. The mission of our undergraduate programs is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical and computer engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences. At the graduate level, our mission is to provide advanced training that prepares master’s graduates to work at the forefront of knowledge in their chosen specialty, and prepares doctoral students for original research that will advance the frontiers of knowledge in their chosen areas.

The department focuses its teaching and research programs in four major areas:

1. systems, communications, and signal processing;
2. photonics and optoelectronics;
3. integrated electronics and computer engineering; and
4. information extraction from acoustic and visual signals.

The faculty offers undergraduate courses at both the introductory and intermediate levels in these areas, and graduate courses leading to research topics at the forefront of current knowledge. Guided individual study projects available for undergraduates provide opportunities for student participation in activities in the department and in the research programs of the faculty. In the graduate program, original research in close association with individual faculty members is emphasized.

Current Research Activities

Systems, Communications, and Signal Processing

Current research in systems and control includes the development of analysis, design and state estimation techniques for hybrid and nonlinear systems; optimization methods in filtering, estimation, and control; efficient implementation and analysis of iterative algorithms on specialized computing structures; design and analysis of robust linear and hybrid control algorithms. There is also a significant effort in systems biology, particularly the analysis of signaling pathways in biological systems. Research in speech processing involves work in all aspects of language or speech science and technology, with fundamental studies under way in areas such as language modeling, pronunciation modeling, natural language processing, neural auditory processing, acoustic processing, optimality theory, and language acquisition. Image analysis efforts currently concern statistical analysis of restoration and reconstruction algorithms, development of statistical image models for image restoration and segmentation, geometric modeling for object detection and estimation, morphological image analysis, and magnetic resonance imaging. There is opportunity for joint work in image analysis with faculty in the Department of Radiology, School of Medicine.

Photonics and Optoelectronics

Current research activities include work in fiber optic sensors and endoscopic 3-D imaging devices for medical applications, theory of nonlinear waves, optical communications, and quantum well devices. Other areas of interest involve the study of the nonlinear interactions of light with matter and single elementary particles, X-ray sources and lasers, optical bi-stability, radiation protection, laser beam control and steering, the nonlinear optics of semiconductors, nonlinear optics of biological objects as well as research on sub-femtosecond pulses and devices based on single atoms. Semiconductor device studies include optical detectors, VLSI circuit design and modeling and microwave devices and circuits. Study of a laser radar and RF photonics is also being pursued. Theoretical and experimental studies involving linear optical properties of various materials and passive remote sensing of the atmosphere are being investigated.

Integrated Electronics and Computer Engineering

Computer engineering research activities include work on computer structures (with emphasis on microprocessors), parallel and distributed processing, fault-tolerant computing, analysis of algorithms, and VLSI
analog architectures for machine vision, associative processing, and micropower computing.

**Facilities**

The department maintains extensive facilities for teaching and research in Barton Hall and Hackerman Hall. The two main teaching labs (Electrical Engineering Lab and Computer Engineering Lab) make extensive use of state-of-the-art design environments such as CADENCE, Xilinx Tools, TI DSP systems, VHDL, and Verilog. In addition, the department includes the computational sensory motor system lab, the cellular signaling control lab, the parallel computing and imaging lab, the photonics and optoelectronics lab, the semiconductor microstructures lab, and the sensory communication and microsystem lab, adaptive and the sensory communication microsystem lab.

**Financial Aid**

Financial aid is available for candidates of high promise. Research assistantships are available on sponsored research projects directed by members of the faculty.

The Department of Electrical and Computer Engineering offers two bachelor’s degree programs: one in Electrical Engineering and one in Computer Engineering (with the close collaboration of the Computer Science Department (p. 712)). Each program is described below.

**Bachelor of Science in Electrical Engineering**

**Mission and Educational Objectives**

The faculty of the Electrical Engineering Program at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences; and to provide our electrical engineering graduates with the tools, skills and competencies necessary to understand and apply today’s technologies and become leaders in developing and deploying tomorrow’s technologies. The Electrical Engineering Program’s educational objectives are to educate students to prepare them for what graduates are expected to attain within a few years of graduation. The educational objectives of the EE program are:

- Our graduates will become successful practitioners in engineering and other diverse careers.
- Some graduates will pursue advanced degree programs in engineering and other disciplines.

Students graduating with a B.S. in electrical engineering will have demonstrated the ability to:

- Understand calculus-based mathematics, probability and statistics, basic science, and computer science, and apply this knowledge to electrical engineering disciplines.
- Design, conduct, evaluate and report experiments, including analysis and statistical interpretation of data.
- Identify, formulate and solve electrical engineering problems.
- Use basic concepts and modern engineering tools (laboratory instrumentation and computer hardware and software) to design electrical engineering systems, components and processes to meet specifications.
- Communicate effectively and work on multidisciplinary teams.
- Be aware of professional and ethical responsibilities and contemporary issues, and appreciate the societal, economic, and environmental impacts of engineering.
- Enter professional practice or graduate school with a set of skills to be successful.

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist are provided in a separate advising manual and illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits, students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student’s program will depend on effective faculty advising. Every undergraduate student in the Electrical Engineering Program must follow a program approved by the faculty advisor. The faculty advisor must be a member of the Electrical and Computer Engineering faculty.

**Requirements for the Bachelor of Science in Electrical Engineering**

The Bachelor of Science degree in electrical engineering requires a minimum of one hundred and twenty-six (126) credits that must include:

**Forty-five (45) credits of ECE courses including the following:**

<table>
<thead>
<tr>

</tbody>
</table>
Six (6) credits of advanced laboratory, design intensive, or senior design project courses from those given in the degree planning checklist. Up to six (6) credits of computer science courses may be used to satisfy the 45-credit requirement. A GPA of at least 2.0 must be maintained in ECE courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

Six (6) credits of engineering courses from School of Engineering departments other than ECE or Applied Mathematics and Statistics or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as “other engineering courses”). Students must complete enough of the approved non-ECE advanced design labs so that they have at least twelve (12) credits of combined ECE and non-ECE advanced laboratory, design intensive, or senior design project courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

Total Credits: 10

* Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics:Physical Science Major I-AS.171.102 General Physics: Physical Science Majors II, AS.173.111 General Physics Laboratory I-AS.173.112 General Physics Laboratory II, and . Courses in this group may not be taken Satisfactory/Unsatisfactory.

* At least six (6) three-credit courses in humanities and social sciences. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses, but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area with at least one of them at an advanced level.

- A programming language requirement must be met by taking or EN.600.120 Intermediate Programming.
- Two (2) writing intensive courses (at least 3 credits each) are required. The writing intensive courses may not be taken Satisfactory/Unsatisfactory and require a C- or better grade. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements. The course EN.661.315 The Culture of the Engineering Profession, is recommended by the ECE Faculty as a writing intensive course.

The sample program shown has an emphasis on systems and communications aspects of electrical engineering. Other sample programs can be found in the advising manual.

Students graduating with a B.S. in computer engineering will have demonstrated the ability to:

- identify, formulate and solve computer engineering problems.
- use basic concepts and modern engineering tools (laboratory instrumentation and computer hardware and software) to design computer engineering systems, components and processes to meet specifications.
- communicate effectively and work on multidisciplinary teams.
- be aware of professional and ethical responsibilities, and contemporary issues, and appreciate the societal, economic, and environmental impacts of engineering.
- enter professional practice or graduate school with a set of skills to be successful.

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist included in this advising manual illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits; students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student’s program will depend on effective faculty advising. Every undergraduate student in the Computer Engineering Program must follow a program approved by a faculty advisor.

Bachelor of Science in Computer Engineering Mission and Educational Objectives

The Computer Engineering Program at Johns Hopkins is supported by faculty in the Department of Electrical and Computer Engineering and the Department of Computer Science, who are committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide students with a broad, integrated education in the fundamentals and advanced topics in computer engineering, basic sciences, mathematics, and humanities in an environment that fosters the development of analytical, computational, and experimental skills, and that involves students in design projects and research experiences; and to provide our computer engineering graduates with the tools, skills and competencies necessary to understand and apply today’s technologies and become leaders in developing and deploying tomorrow’s technologies.

From this mission statement, the Computer Engineering faculty has determined educational objectives for the B.S. in Computer Engineering Program. Consistent with Johns Hopkins’ long-standing emphasis on the individual, the Computer Engineering program will provide a high-quality educational experience that is tailored to the needs and interests of each student. In addition, each student’s program of study is planned in consultation with a faculty advisor to educate students to prepare them for what graduates are expected to attain within a few years of graduation. The educational objectives of the CE program are:

- Our graduates will become successful practitioners in engineering and other diverse careers.
- Some graduates will pursue advanced degree programs in engineering and other disciplines.

Students graduating with a B.S. in computer engineering will have demonstrated the ability to:

- understand calculus and discrete mathematics, probability and statistics, basic science, and computer science, and apply this knowledge to computer engineering disciplines.
- design, conduct, evaluate, and report experiments, including analysis and statistical interpretation of data.

Bachelor of Science in Computer Engineering

The Bachelor of Science degree in Computer Engineering requires a minimum of 126 credits, which must include the following:

- Forty-two (42) credits in Computer Engineering, which must include:
  - Electrical and Computer Engineering courses (15 credits)
    - EN.520.142 Digital Systems Fundamentals 3
    - EN.520.213 Circuits 4
  - a. Fifteen (15) credits of Electrical and Computer Engineering courses, which must include EN.520.142 Digital Systems Fundamentals, and .
  - b. Fifteen (15) credits of Computer Science courses which must include EN.600.120 Intermediate Programming, EN.600.226 Data Structures and Computer System Fundamentals (EN.600.233 Computer System Fundamentals).
  - c. The program must also contain a substantial advanced laboratory and design experience component, appropriate for the student's interests.
  - This requirement can be met by taking twelve (12) credits of advanced laboratory, design intensive, or senior design project courses from those given in the degree planning checklist in Section I.C. At least six (6) of these 12 credits must be from ECE or CS courses. A GPA of at least 2.0 must be maintained in Computer Engineering courses. Courses in this category may not be taken Satisfactory/Unsatisfactory.
  - Six (6) credits of engineering courses from School of Engineering departments other than Computer Science, ECE, Applied Mathematics.
and Statistics, or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as “other engineering courses”). Students must complete enough of the approved non-CS/ECE advanced design labs so that they have at least twelve (12) credits of advanced laboratory, design intensive, or senior design project courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

- Twenty-four (24) credits in mathematics courses taken from the Mathematics Department or the Applied Mathematics and Statistics Department. AS.110.109 Calculus II (For Physical Sciences and Engineering), AS.110.202 Calculus III, AS.110.201 Linear Algebra or EN.550.291 Lin Alg & Diff Equations, EN.550.171 Discrete Mathematics, EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering/EN.550.311 Probability and Statistics for the Biological Sciences and Engineering or EN.550.420 Intro To Probability must be taken. Elementary or precalculus courses such as AS.110.105 or EN.550.111-EN.550.112 are not acceptable. (Calculus I may be waived through an examination taken during freshman orientation. If not waived, it must be taken as a prerequisite to Calculus II.) Courses in this category may not be taken Satisfactory/Unsatisfactory.

- Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics/Physical Science Major I-AS.171.102 General Physics: Physical Science Majors II, AS.173.111 General Physics Laboratory I-AS.173.112 General Physics Laboratory II, and AS.030.101 Introductory Chemistry I. Courses in this category may not be taken Satisfactory/Unsatisfactory.

- At least six (6) three-credit courses in humanities and social sciences. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area with at least one of them at an advanced level.

- At least two (2) writing intensive courses are required (at least 3 credits each). These courses may not be taken Pass/Fail and require a grade of C- or better. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements.

Additional details concerning advising and degree requirements are in the Computer Engineering Advising Manual. The B.S. in Computer Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The sample program shown has an emphasis on hardware/device aspects of computer engineering. Other sample programs can be found in the advising manual.

Total Credits: 127

**Bachelor of Arts Degree**

To meet the requirements for the B.A. degree, the program must include:
• Eighteen (18) credits of humanities and social sciences courses.
• Four writing intensive courses.
• Twenty (20) credits of mathematics or mathematical statistics courses. Typically these include AS.110.108 Calculus I, AS.110.109 Calculus II (For Physical Sciences and Engineering), and AS.110.202 Calculus III or equivalent, and AS.110.201 Linear Algebra. Elementary or pre-calculus courses such as AS.110.105 or EN.550.111-EN.550.112 are not acceptable.
• Thirty (30) credits of ECE courses. Three credits of computer science courses may be counted toward this 30-credit requirement.
• Additional credits giving a total of at least 120 credits.
• Additional information on academic policies and degree requirements, including academic ethics, may be found in the Undergraduate Academic Manual of The Johns Hopkins University. Students are urged to read the credit requirements, under the credit requirements section, in the academic manual section of the Compendium.

The student should be aware that the B.A. degree program is not accredited by the Accreditation Board for Engineering and Technology (ABET).

Minor in Robotics
A minor in Robotics is offered by the Laboratory for Computational Sensing and Robotics. Detailed information regarding this program can be found at: https://lcsr.jhu.edu/Robotics_Minor.

Minor in Computer-Integrated Surgery
A minor in Computer-Integrated Surgery is offered by the Department of Computer Science. Detailed information regarding this program can be found at: https://lcsr.jhu.edu/Education/Undergraduate/CISminor.

Bachelor’s/Master’s Program
At the end of their sophomore year, students who are majors in electrical and computer engineering may apply for admission to a concurrent bachelor’s/master’s program which combines a B.S. in electrical engineering with a master of science in engineering. If accepted, they must take at least two courses per semester that satisfy the requirements of the M.S.E. program.

Every graduate student in the Department of Electrical and Computer Engineering must follow a program approved by a faculty advisor in the department. The advisor assigned to the student upon admission may be changed, subject to the approval of the new advisor. Additional details are in the department’s Graduate Student Advising Manual.

Requirements for the M.S.E. Degree
The department has M.S.E. degree programs for both full-time and part-time students. A student who has completed a program of study similar to that required for the B.S. in electrical engineering degree must complete the following requirements for the M.S.E. degree:

• At least eight one-semester graduate-level courses approved by the student’s advisor.
• One of the following:
  a. an original master’s essay,
  b. a special project report, or
  c. two additional one-semester graduate courses.

Ph.D. in Electrical and Computer Engineering
The department admits students into the Ph.D. program directly. Most students working toward the Ph.D. degree are full-time, although a part-time program can be arranged subject to the university residency requirement. A guiding principle behind the department’s requirements for the Ph.D. degree is that performance in research, as distinct from course work, should be the primary criterion for assessing the student’s progress.

Requirements for the Ph.D. Degree
University requirements for the Ph.D. degree are listed under Academic Information for Graduate Students (http://e-catalog.jhu.edu/academic-info-graduate-students). In addition, the department requires satisfactory completion of the Ph.D. departmental examination and the university Graduate Board oral examination, preparation of a preliminary research proposal, a departmental seminar presentation, and an oral dissertation defense.

The departmental examination is offered twice yearly. Each faculty member prepares a set of questions, and the student must select and complete the sets of questions of three faculty members. This examination must be passed before the beginning of the fifth semester of full-time graduate study. After passing the examination, the student can be accepted by a faculty member who will oversee the student’s research. This research sponsor then guides the remainder of the student’s program leading to the Ph.D. degree.

The university Graduate Board oral examination is administered by a panel consisting of the research sponsor, another faculty member in Electrical and Computer Engineering, and three faculty members from other departments. This examination must be taken within one year of passing the departmental examination.

In the course of research leading to the Ph.D. degree, the student must submit a preliminary research proposal to the department, and present a departmental seminar. Finally, a public dissertation defense will be conducted before a panel of readers consisting of at least three Electrical and Computer Engineering faculty members. Further details concerning M.S.E. and Ph.D. degree requirements are published in a manual for graduate students in Electrical and Computer Engineering.

For current faculty and contact information go to http://www.ece-jhu.org/index.php/people

Faculty
Chair
Jin U. Kang
Jacob Suter Jammer Professor: fiber optic devices and lasers, biophotonics, optical imaging and sensing.

Director of Undergraduate Programs
Frederic M. Davidson
Professor: quantum optics, optical coherence, optical communications.

Director of Graduate Programs
Pablo A. Iglesias
Edward J. Schaefer Professor: systems biology, mathematical modeling of biological systems, control theory.
Professors

Andreas G. Andreou
CMOS devices and integrated circuits, bioelectronics, nanoelectronics, life science microsystems, natural and synthetic sensory systems, neural computation.

Ralph R. Etienne-Cummings
Mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

John Goutsias
Signal and image processing, computational systems biology, bioinformatics, modeling and analysis of complex networked systems.

Hynek Hermansky
Emulating and integrating human-like processing strategies into speech engineering systems; neural information processing; human sensory perception; speech and speaker recognition; speech coding and enhancement; and machine learning.

Alexander E. Kaplan

Jacob B. Khurgin
Quantum electronics, nonlinear optics.

Gerard G. L. Meyer
Parallel computing, computational methods, fault tolerant computing.

Trac Duy Tran
Filter banks, wavelets, multirate systems and applications.

Howard L. Weinert
Statistical signal and image processing.

Associate Professor

Sanjeev P. Khudanpur
Information theory, statistical language modeling.

Assistant Professors

Mounya Elhilali
Biological basis of sound and speech perception, neural signal processing, computational neuroscience, cognitive neuromorphic engineering.

Amy Foster
Silicon photonics, nonlinear optics, nanophotonics, integrated biophotonics.

Mark Foster
Ultrafast and nonlinear optics, all-optical signal processing, ultrafast phenomena and measurement, nonlinear dynamics.

Danielle C. Tarraf
Systems and control theory, with emphasis on hybrid systems; network analysis and control; automata theory, algebra, and combinatorics as they apply in systems and control.

Susanna M. Thon
Renewable energy conversion and storage, photovoltaics, optoelectronics, nanoengineering and nanophotonics, and scalable fabrication.

William B. Kouwenhoven Professor

Jerry L. Prince
Image processing and computer vision with application to medical imaging.

Joint, Part-Time, Visiting, and Emeritus Appointments

Paul Bottomley
Professor (Radiology): magnetic resonance imaging, metabolic MRI.

Sang Peter Chin
Assistant Research Professor; Ph.D., MIT. compressive sensing, Novel Signal Processing, Game Theory, Extremal graph theory, Differential geometry, and Quantum computing and verification.

Glenn A. Coppersmith
Assistant Research Scientist, Ph.D., Northeastern University.

Noah Cowan
Associate Professor (Mechanical Engineering): robotics, computer vision and control, mobile robotics and legged locomotion, biomechanics and bio-inspired robotics.

Yamac Dikmelik
Assistant Research Scientist.

Eric Frey
Professor (Radiology): algorithms for computed tomography, small animal X-ray microcomputed tomography, quantitative PET, SPECT and nuclear medicine imaging, image evaluation, scatter compensation in SPECT, simultaneous dual isotope SPECT and Monte Carlo simulation of radiation transport.

Donald Geman
Professor (Applied Mathematics and Statistics): computer vision, computational biology, statistical learning.

Robert E. Glaser
Lecturer: advanced digital logic systems.

Willis Gore
Professor Emeritus.

Gregory D. Hager
Professor and Chair, Computer Science; Ph.D., University of Pennsylvania. Computer vision and robotics, medical devices and human-machine systems.

A. Brinton Cooper III
Associate Research Professor: error control coding, coded wireless, and optical communication.

Aren Jansen
Assistant Research Professor: automatic speech recognition, sparse representations and models, unsupervised/semi-supervised learning, geometric structure of speech sounds, computational modeling of speech perception, manifold learning algorithms, novel applications of machine learning techniques.

Robert E. Jenkins
Senior Lecturer: digital systems, spacecraft systems and space technology.

Richard I. Joseph
Jacob Suter Jammer Professor Emeritus.

Moise H. Goldstein Jr.
Professor Emeritus.

C. Harvey Palmer Jr.
Professor Emeritus.

Junghoon Lee
Assistant Research Professor: 3-D reconstruction algorithms from cone-beam projections, limited angle tomography, computer assisted surgery, computational structural biology, nonlinear optimization, statistical signal & image processing/inverse problems.

Xingde Li
Associate Professor (Biomedical Engineering): medical imaging and MRI.

Elliot R. McVeigh
Professor (Biomedical Engineering): cardiovascular MRI, image guided therapy, novel MRI methods.

Michael I. Miller
Hershel L. Seder Professor of Biomedical Engineering (Director, Center for Imaging Science): image understanding, computer vision, medical imaging, computational linguistics, computational neuroscience.

Dzung L. Pham
Associate Professor (Radiology): homeomorphic brain image segmentation, neuroanatomical atlases in MIPAV, robust tissue classification, statistical characterization of brain tissue in MRI.

Theodore O. Poehler
Research Professor: quantum electronics, solid state physics.

Philippe Pouliquen
Assistant Research Scientist: optoelectronic, mixed signal, low power VLSI, CAD tools for VLSI.

Carey Priebe
Professor (Applied Mathematics and Statistics): computational statistics, kernel and mixture estimates, statistical pattern recognition, statistical image analysis, statistical inference for high-dimensional and graph data.

Wilson J. Rugh
Edward J. Schaefer Professor Emeritus.

Nitish Thakor
Professor (Biomedical Engineering): medical instrumentation, medical micro and nanotechnologies, neurological instrumentation, signal processing, and neural prosthesis.

Michael E. Thomas
Research Professor (Principal Professional Staff APL): propagation of light, applied spectroscopy and lasers.

Benjamin M. W. Tsui
Professor (Radiology): quantitative SPECT, PET and CT imaging techniques, image reconstruction methods, computer simulation tools and methods in imaging, image quality assessment, small animal SPECT, PET and CT imaging techniques.

Rene Vidal
Professor (Biomedical Engineering): computer vision (human motion, dynamic scene reconstruction, multiple view geometry, omnidirectional vision), machine learning (generalized component analysis and geometric clustering), robotics (vision-based control), control (identification of hybrid systems).

R. Jacob Vogelstein
Assistant Research Professor (Senior Professional Staff APL) VLSI: systems, neuro-morphic engineering, neural prosthesis systems.

James West
Research Professor: electroacoustics, physical acoustics, and architectural acoustics.

C. Roger Westgate
Professor Emeritus.

Raimond Winslow
Professor (Biomedical Engineering): applied statistical learning, computational cell biology, cardiac electrophysiology, grid-based computing and data sharing for collaborative science.

For current course information and registration go to https://isis.jhu.edu/classes/

**Courses**

**EN.520.137. Introduction To Electrical & Computer Engineering. 3 Credits.**
An introductory course covering the principles of electrical engineering including sinusoidal wave forms, electrical measurements, digital circuits, and applications of electrical and computer engineering. Laboratory exercises, the use of computers, and a design project are included in the course.

Instructor(s): T. Tran
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.520.142. Digital Systems Fundamentals. 3 Credits.**
Number systems and computer codes, switching functions, minimization of switching functions, Quine - McCluskey method, sequential logic, state tables, memory devices, analysis, and synthesis of synchronous sequential devices.

Instructor(s): G. Meyer
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.520.211. ECE Engineering Team Project. 1 Credit.**
This course introduces the student to the basics of engineering team projects. The student will become a member of and participate in the different aspects of an ECE team project over several semesters.

(Freshmen and Sophomores)

Instructor(s): J. Kang
Area: Engineering.

**EN.520.212. ECE Engineering Team Project (Freshmen and Sophomores). 1 Credit.**
This course introduces the student to the basics of engineering team projects. The student will participate in an ECE engineering team project as a member. The student is expected to participate in the different aspects of the project over several semesters. (Freshmen and Sophomores) Permission of instructor required.

Instructor(s): J. Kang
Area: Engineering.
EN.520.213. Circuits. 4 Credits.
An introductory course on electric circuit analysis. Topics include time domain and frequency domain analysis techniques, transient and steady-state response, and operational amplifiers.
**Prerequisites:** AS.110.108 and AS.110.109
**Instructor(s):** H. Weinert
**Area:** Engineering.

EN.520.214. Signals & Systems I. 4 Credits.
An introduction to discrete-time and continuous-time signals and systems covers representation of signals and linear time-invariant systems and Fourier analysis.
**Prerequisites:** Corequisite: AS.110.202
**Instructor(s):** M. Elhilali
**Area:** Engineering, Quantitative and Mathematical Sciences.

EN.520.216. Introduction To VLSI. 3 Credits.
This course teaches the basics of switch-level digital CMOS VLSI design. This includes creating digital gates using MOS transistors as switches, laying out a design using CAD tools, and checking the design for conformance to the Scalable CMOS design rules. Recommended: EN.520.213.
**Prerequisites:** EN.520.142 and recommended: 520.213
**Instructor(s):** A. Andreou
**Area:** Engineering.

EN.520.219. Fields, Matter & Waves. 3 Credits.
Vector analysis, electrostatic fields in vacuum and material media, stationary currents in conducting media, magnetostatic fields in vacuum and material media. Maxwell’s equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications.
**Prerequisites:** Co-req: AS.110.202
**Instructor(s):** M. Foster
**Area:** Engineering, Natural Sciences.

EN.520.220. Fields, Matter & Waves. 3 Credits.
Magnetostatic fields in vacuum and material media. Maxwell’s equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications.
**Prerequisites:** EN.520.219 or equivalent
**Instructor(s):** M. Foster
**Area:** Engineering, Natural Sciences.

EN.520.222. Computer Architecture. 3 Credits.
A study of the structure and organization of classical von Neuman uniprocessor computers. Topics include a brief history of modern machines starting from the Turing computer model, instruction sets, addressing, RISC versus CICS, traps and interrupt handling, two’s complement arithmetic, adders and ALUs, CSA’s Booth’s algorithm, multiplication and division, control unit design, microprogramming, dynamic versus static linking, memory systems and memory hierarchy, paging segmentation, cache hardware, cache organizations, and replacement policies.
**Prerequisites:** EN.520.142
**Instructor(s):** R. Jenkins
**Area:** Engineering.

EN.520.315. Introduction to Information Processing of Sensory Signals. 3 Credits.
An introductory course to basic concepts of information processing of human communication signals (sounds, images) in living organisms and by machine. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
**Instructor(s):** H. Hermansky
**Area:** Engineering.

EN.520.326. Introduction to Optical Instruments. 3 Credits.
**Instructor(s):** J. Khurgin
**Area:** Engineering.

EN.520.345. Electrical & Computer Engineering Laboratory. 3 Credits.
This course consists of 11 one-week laboratory experiments intended to provide an introduction to analog and digital circuits commonly used in engineering. Topics include phase and frequency response, transistors, operational amplifiers, filters, and other analog circuits. The experiments are done using computer controlled digital oscilloscopes, function generators, and power supplies.
**Prerequisites:** 171.101-102 and EN.520.213
**Instructor(s):** A. Foster
**Area:** Engineering.

EN.520.349. Microprocessor Lab I. 3 Credits.
This course introduces the student to the programming of microprocessors at the machine level. 68HC08, 8051, and eZ8 microcontrollers are programmed in assembly language for embedded control purposes. The architecture, instruction set, and simple input/output operations are covered for each family. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.142 or equivalent.
**Instructor(s):** R. Glaser
**Area:** Engineering.

EN.520.353. Control Systems. 3 Credits.
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).
**Instructor(s):** D. Tarraf
**Area:** Engineering, Quantitative and Mathematical Sciences.

EN.520.372. Programmable Device Lab. 3 Credits.
The use of programmable memories (ROMs, EPROMs, and EEPROMs) as circuit elements (as opposed to storage of computer instructions) is covered, along with programmable logic devices (PALS and GALs). These parts permit condensing dozens of standard logic packages (TTL logic) into one or more off-the-shelf components. Students design and build circuits using these devices with the assistance of CAD software. Topics include programming EEPROMs; using PLDs as address decoders; synchronous sequential logic synthesis for PLDs; and PLD-based state machines. Recommended Course Background: EN.520.142 and EN.520.345
**Instructor(s):** R. Glaser
**Area:** Engineering.
EN.520.391. CAD Design of Digital VLSI Systems I (Juniors). 3 Credits.
An introductory course in which students, manually and through computer simulations, design digital CMOS integrated circuits and systems. The design flow covers transistor, physical, and behavioral level descriptions, using SPICE, Layout, and VerilogHD1 VLSI CAD tools. After design computer verification, students can fabricate and test their semester-long class projects. Juniors Only. Recommended Course Background: EN.520.142, EN.520.216 or equivalent; Corequisite: EN600.333, EN.600.334, EN.520.349 or EN.520.372
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.401. Basic Communication. 3 Credits.
This course covers the principles of modern analog and digital communication systems. Topics include: amplitude modulation formats (DSB, SSB VSB), exponential modulation formats (PM, FM), superheterodyne receivers, digital representation of analog signals, sampling theorem, pulse code modulation formats (PCM, DPCM, DM, spread spectrum), signals with additive Gaussian noise, maximum likelihood receiver design, matched filtering, and bit error rate analyses of digital communication systems.
Instructor(s): F. Davidson
Area: Engineering.

EN.520.403. Introduction to Optical Instruments. 3 Credits.
This course is intended to serve as an introduction to optics and optical instruments that are used in engineering, physical, and life sciences. The course covers first basics of ray optics with the laws of refraction and reflection and goes on to description of lenses, microscopes, telescopes, and imaging devices. Following that basics of wave optics are covered, including Maxwell equations, diffraction and interference. Operational principles and performance of various spectrometric and interferometric devices are covered including both basics (monochromatic, Fabry-Perot and Michelson interferometers), and advanced techniques of near field imaging, laser spectroscopy, Fourier domain spectroscopy, laser Radars and others.
Area: Engineering.

EN.520.407. Introduction to the Physics of Electronic Devices. 3 Credits.
This course is designed to develop and enhance the understanding of the basic physical processes taking place in the electronic and optical devices and to prepare students for taking classes in semiconductor devices and circuits, optics, lasers, and microwaves devices, as well as graduate courses. Both classical and quantum approaches are used. Specific topics include theory of molecular bonding; basics of solid state theory; mechanical, transport, magnetic, and optical properties of the metals; semiconductors; and dielectrics.
Prerequisites: AS.171.101 AND AS.171.102 AND EN.520.219
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.410. Fiber Optics & Devices. 3 Credits.
This course covers light propagation in fiber optic light guides, integrated optic wave guides, photodetectors, and the photon nature of light. Topics include light propagation in step-index and graded-index optical fibers, dielectric slab waveguides, photodetectors, photon shot noise, and photodetector signal-to-noise ratios. Recommended Course Background: EN.520.214, EN.520.219-EN.520.220, or equivalent.
Instructor(s): F. Davidson
Area: Engineering.

EN.520.414. Image Processing & Analysis. 3 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.415. Image Process & Analysis II. 3 Credits.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation.
Prerequisites: EN.520.414
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.419. Iterative Algorithms. 3 Credits.
An introduction to the study of the structure, behavior and design of iterative algorithms. Topics include problem formulations, algorithm description and classification, the deterministic iterative (DI) schema, doubling schema, cluster point sets, periodic points, DI schemas without stop rule, the monotonic DI schema, contractive and affine maps, bounded and Cauchy sequences, asymptotically regular sequences, monotonic sequences.
Prerequisites: AS.110.201-202.
Instructor(s): G. Meyer
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.420. Theory & Design of Iterative Algorithms II. 3 Credits.
This course is a continuation of EN.520.419. It covers information on the non-deterministic schema and cyclic iterative schemas, Jacobians, Hessians and Mean Value Theorems, spectral norm, convex sets and positive definite matrices. Prequisite: EN.520.419
Prerequisites: Prequisite: EN.520.419
Instructor(s): G. Meyer
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.424. FPGA Synthesis Lab. 3 Credits.
An advanced laboratory course in the application of FPGA technology to information processing, using VHDL synthesis methods for hardware development. The student will use commercial CAD software for VHDL simulation and synthesis, and implement their systems in programmable Xilinx, 20,000 gate FPGA devices. The lab will consist of a series of digital projects demonstrating VHDL design and synthesis methodology, building up to final projects at least the size of an 8-bit RISC computer. Projects will encompass such things as system clocking, flip-flop registers, state-machine control, and arithmetic. The students will learn VHDL methods as they proceed through the lab projects, and prior experience with VHDL is not a prerequisite.
Area: Engineering, Quantitative and Mathematical Sciences.
EN.520.425. FPGA Senior Projects Laboratory. 3 Credits.
Laboratory course for FPGA based senior projects. Students will work in teams to complete a design project that makes use of embedded FPGAs. The projects will make use of the Spartan2 XSA boards and other resources from the FPGA Synthesis lab course. Possible projects include: A 16 or 32 bit RISC processor with student designed ISA architecture, assembler, and mini operating system; or a Spartan2 emulation of an existing microprocessor such as an 8051, an optical communication system to transmit stereo music using various modulation schemes for comparison (This would include FM or AM and at least one digital scheme such as FSK.); or a digital receiver for commercial AM or FM radio.
Students are expected to complete a demonstration and produce a poster session final report. Senior status, no exceptions.
Prerequisites: Prereq: 520.424 and senior status, Instructor(s): R. Jenkins
Area: Engineering.

EN.520.427. Product Design Lab. 3 Credits.
This project-based course is designed to help students learn how to turn their ideas into commercial products. In the first half of the course, emphasis will be placed on the development process: student teams will gradually build up a complete "contract book" including a mission statement, competitive analysis, patent review, product specifications, system schematics, economic analysis, development schedule, etc. In the second half of the course, each team will be expected to implement its design and demonstrate a prototype of their product's core functionality. At the end of the semester, a final written report will be submitted in the form of a utility patent. Students are encouraged to take this course in conjunction with Electronic Design Lab (EE 520.448) in the Spring semester and leverage the groundwork developed here to enable production of a fully functional and marketable prototype by the end of the academic year.
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.429. Principles of Parallel Programming. 3 Credits.
Programming models and languages for current computing platforms. Computational models include shared and distributed memory multiprocessors. Essential techniques of message-passing parallel programming will be based upon MPI (Message Passing Interface); shared memory programming will use the OpenMP standard. Other parallel language extensions will be studied, including Split-C and UPC (unified parallel C). Programming projects will be given for the IBM SP parallel computer and other available departmental multicomputers. Students should be proficient in programming in the C language.
Instructor(s): L. Podrazik
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.432. Medical Imaging Systems. 3 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Co-listed as EN.580.472
Instructor(s): J. Prince
Area: Engineering.

EN.520.433. Medical Image Analysis. 3 Credits.
This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include, interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: EN.520.432 OR EN.580.472 OR EN.550.310 OR EN.550.311
Instructor(s): J. Prince
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques. 3 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings.
Co-listed with EN.580.473
Prerequisites: EN.520.432 OR EN.580.472
Instructor(s): B. Tsui.

EN.520.435. Digital Signal Processing. 4 Credits.
Methods for processing discrete-time signals. Topics include signal and system representations, z-transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.443. Digital Multimedia Coding and Processing. 3 Credits.
An introduction to the coding and processing of digital multimedia. The course covers current popular techniques for processing, storage, and delivery of media such as speech, audio, images and video. The emphasis will be on the theoretical basis as well as efficient implementations. Topics include transform and subband coding, motion estimation and compensation, international compression standards (AC3, JPEG, MPEG, H.263, HDTV), and emerging techniques. Recommended Course Background: EN.520.435, experience with Matlab and/or C/C++ programming.
Instructor(s): T. Tran
Area: Engineering.

EN.520.445. Audio Signal Processing. 3 Credits.
This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, acoustics, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing.
Instructor(s): M. Elhilali
Area: Engineering.
EN.520.447. Information Theory. 3 Credits.
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g. image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).
Instructor(s): S. Khudanpur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.448. Electronics Design Lab. 3 Credits.
An advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. Recommended: EN.600.333, EN.600.334, EN.520.349, EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: EN.520.345 or equivalent Recommended: 600.333, 600.334, 520.216, 520.349, 520.372, 520.490 or 520.491.
Instructor(s): P. Poulquen.

EN.520.450. Advanced Micro-Processor Lab. 3 Credits.
This course covers the usage of common microcontroller peripherals. Interrupt handling, timer operations, serial communication, digital to analog and analog to digital conversions, and flash ROM programming are done on the 68HC08, 8051, and eZ8 microcontrollers. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.349
Instructor(s): R. Glaser.

EN.520.452. Advanced ECE Engineering Team Project. 3 Credits.
This course introduces the student to running an ECE engineering team project. The student will participate in the team project as a leading member and is expected to manage both the team members and the different aspects of the project over several semesters. Permission of the instructor is required for new team members. (Junior and Seniors) Instructor(s): J. Kang
Area: Engineering.

EN.520.453. Advanced ECE Engineering Team Project. 3 Credits.
The course introduces the student to running an engineering team project. The student will participate in the ECE engineering team project as a leading member. The student is expected to participate in the different aspects of the project over several semesters and manage both team members and the project. (Juniors and Seniors) Permission of instructor is required.
Instructor(s): J. Kang
Area: Engineering.

EN.520.454. Control Systems Design. 3 Credits.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Prerequisites: EN.520.353 AND AS.110.201
Area: Engineering, Natural Sciences.

EN.520.457. Basics of Wave and Quantum Mechanics. 3 Credits.
Basic principles of quantum mechanics for engineers. Topics include the quantum theory of simple systems, in particular atoms and engineered quantum wells, the interaction of radiation and atomic systems, and examples of application of the quantum theory to lasers and solid-state devices. Recommended Course Background: AS.171.101-AS.171.102 and EN.520.219-EN.520.220
Instructor(s): A. Kaplan
Area: Engineering.

EN.520.465. Digital Communications I. 3 Credits.
This course introduces the basic tools and topics of modern digital communication beginning with the mathematical representation and spectral properties of random signals and a basic introduction to the detection of real and complex signals in the presence of noise. Memoryless modulation and demodulation schemes are thoroughly studied for the Gaussian channel, and measures of performance are developed. Topics in wireless communication will be introduced. Recommended Course Background: EN.520.401, EN.550.310 or EN.550.420
Instructor(s): F. Davidson
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.466. Digital Communication II. 3 Credits.
Achieving reliable and efficient digital communications over noisy channels is studied. Shannon’s Noisy Channel Coding Theorem provides the basis and the goal. Bounds on code performance in noisy channels are developed. Important block and convolutional codes and codes on graphs are examined jointly with their respective decoders.
Prerequisites: EN.520.401 AND AS.110.201
Instructor(s): A. Hammons
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.473. Magnetic Resonance in Medicine. 3 Credits.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472). Co-listed with EN.520.481 and EN.580.673.
Instructor(s): D. Herzka; P. Bottomly; W. Edelstein
Area: Engineering, Natural Sciences.

EN.520.481. Microwaves and High Speed Circuits. 3 Credits.
Instructor(s): C. Westgate
Area: Engineering.

EN.520.482. Introduction to Lasers. 3 Credits.
This course covers the basic principles of laser oscillation. Specific topics include propagation of rays and Gaussian beams in lens-like media, optical resonators, spontaneous and stimulated emission, interaction of optical radiation and atomic systems, conditions for laser oscillation, homogeneous and inhomogeneous broadening, gas lasers, solid state lasers, Q-switching and mode locking of lasers.
Prerequisites: EN.520.219 AND EN.520.220
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.
EN.520.483. Bio-Photonics Laboratory. 3 Credits.
This laboratory course involves designing a set of basic optical experiments to characterize and understand the optical properties of biological materials. The course is designed to introduce students to the basic optical techniques used in medicine, biology, chemistry and material sciences.
Instructor(s): J. Kang.

EN.520.485. Advanced Semiconductor Devices. 3 Credits.
This course is designed to develop and enhance the understanding of the operating principles and performance characteristics of the modern semiconductor devices used in high speed optical communications, optical storage and information display. The emphasis is on device physics and fabrication technology. The devices include heterojunction bipolar transistors, high mobility FET’s, semiconductor lasers, laser amplifiers, light-emitting diodes, detectors, solar cells and others.
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.

EN.520.487. Intro To MEMS. 3 Credits.
Area: Engineering, Natural Sciences.

EN.520.491. CAD Design of Digital VLSI Systems I (Seniors/Grads). 3 Credits.
Seniors and Graduate Students Only
Instructor(s): P. Poulken
Area: Engineering.

EN.520.492. Mixed-Mode VLSI Systems. 3 Credits.
Silicon models of information and signal processing functions, with implementation in mixed analog and digital CMOS integrated circuits. Aspects of structured design, scalability, parallelism, low power consumption, and robustness to process variations. Topics include digital-to-analog and analog-to-digital conversion, delta-sigma modulation, bioinstrumentation, and adaptive neural computation. The course includes a VLSI design project. Recommended Course Background: EN.521.491 or equivalent.
Area: Engineering.

EN.520.495. Microfabrication Laboratory. 4 Credits.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Perm. Req’d. Co-listed as EN.580.495 & EN.530.495
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.520.498. Senior Design Project. 3 Credits.
Capstone design project, in which a team of students engineers a system and evaluates its performance in meeting design criteria and specifications. Example application areas are micro-electronic information processing, image processing, speech recognition, control, communications, and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics, and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering, and computer science majors, is strongly encouraged. Instructor permission required.
Instructor(s): Staff
Area: Engineering.

EN.520.499. Senior Design Project. 3 Credits.
Capstone design project, in which a team of students engineer a system and evaluate its performance in meeting design criteria and specifications. Example application areas are microelectronic information processing, image processing, speech recognition, control, communications, and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics, and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering, and computer science majors, is strongly encouraged. Instructor permission required.
Instructor(s): A. Andreou; J. Kang; J. Prince; J. West
Area: Engineering.

EN.520.501. Independent Study-Freshmen-Sophomores. 3 Credits.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by freshmen or sophomores. Instructor permission required.
Instructor(s): A. Andreou; J. Kang; J. Prince.

EN.520.502. Indep Study - Fresh/Soph. 0 - 3 Credit.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.

EN.520.503. Independent Study-Juniors-Seniors. 3 Credits.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors. Instructor permission required.
Instructor(s): Staff.

EN.520.504. Independent Study - Juniors/Seniors. 0 - 3 Credit.
Individual study, including participation in research, under the guidance of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors.
Instructor(s): Staff.

EN.520.515. Processing of Audio and Visual Signals. 3 Credits.
This course consists of two parts. The lecture component of this course is covered by attending EN.520.315. Concurrently, on the more advanced graduate level, there is an additional requirement of critical analysis of the material covered, and the hands-on homework complementing the lectures. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky
Area: Engineering.

EN.520.545. Research. 3 Credits.
Instructor Approval Required. Independent study or research over the summer under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.
Instructor(s): A. Andreou; F. Davidson; J. West; P. Iglesias; T. Tran.

EN.520.548. Independent Research. 0 - 3 Credit.
Instructor(s): Staff.

EN.520.550. Electrical Engineering - Internship. 0 - 3 Credit.
Instructor(s): J. Kang; T. Tran.
EN.520.595. Independent Study. 3 Credits.
Instructor(s): A. Andreou; J. Kang; J. West; R. Etienne Cummings.

EN.520.597. Research-Summer. 3 Credits.
Instructor(s): F. Davidson; J. West; P. Iglesias; R. Etienne Cummings; T. Tran.

EN.520.599. Internship-Summer. 1 Credit.
Instructor(s): F. Davidson; J. Kang; M. Miller.

Seminar for Electrical & Computer Engineering; required of all doctoral students who have not passed the qualifying exam. Repeatable course. Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

EN.520.601. Introduction to Linear Systems Theory.
A beginning graduate course in multi-input multi-output, linear, time-invariant systems. Topics include state-space and input-output representations; solutions and their properties; multivariable poles and zeros; reachability, observability and minimal realizations; stability; system norms and their computation; linearization techniques. Recommended Course Background: Undergraduate courses in control systems and linear algebra.
Instructor(s): D. Tarraf.

EN.520.608. Image Reconstruction & Restoration.
This course covers the principles and methods used to reconstruct images from remotely sensed data and to restore images from blurred and noisy observations. General variational and stochastic regularization methods for ill-posed inverse problems will be covered. Those specific methods used in imaging problems, where the amount of data is typically huge, are presented in detail. Synthetic aperture radar and X-ray computed tomography will serve as motivating examples throughout the course, and specific details for reconstruction and restoration within these applications are covered. Recommended Course Background: EN.520.651.

EN.520.610. Comput Funct Genomics.
This class provides an introduction to mathematical and computational techniques for Functional Genomics, a growing area of research in cell biology and genetics whose objective is to understand the biological function of genes and their interactions. Computational functional genomics focuses on the problems of collecting, processing and analyzing data related to genome-wide patterns of gene expression with the objective to discover mechanisms by which a cell's gene expression is coordinated. This has become feasible with the development of DNA microarray technology, which allows the simultaneous measurement of gene expression levels of thousands of genes. Topics covered: an introduction to cell biology (cells, genome, DNA, transcription, translation, control of gene expression, DNA and RNA manipulation), DNA microarray technology and experimental design, processing and analysis of microarray data (data reduction and filtering, clustering), and computational models for genetic regulatory networks (Boolean networks, Bayesian networks, ODE-based networks). Co-listed with EN.580.610. Students should have working knowledge of elementary probability and statistics.
Instructor(s): J. Goutsias.

EN.520.611. Ultrafast Optical Phenomena.
This course will give an introduction to the field of ultrafast phenomena which studies processes in nature and engineering occurring on the shortest of time scales. Topics will include the complex representation of ultrafast optical signals, nonlinear optics, pulse propagation effects resulting from dispersion and nonlinearities, the fundamentals of ultrafast sources including mode locking and amplification, ultrafast measurement techniques, and the wide range of cutting-edge applications of ultrafast sources.
Area: Engineering, Natural Sciences.

EN.520.612. Advanced Fiber Optics and Devices.
This course covers light propagation in optical fibers, integrated optic wave guides, photodetectors, and the photon nature of light. Topics include light propagation in step-index and graded-index optical fibers, dielectric slab waveguides, photodetectors, photon shot noise, and photodetector signal-to-noise ratios. Recommended Course Background: EN.520.214, EN.520.219-EN.520.220 or equivalent.
Area: Engineering.

EN.520.618. Hybrid Systems.
This graduate level seminar style class focuses on the emerging field of hybrid systems. Topics covered include mathematical models of hybrid systems, analysis and controller synthesis techniques, and model complexity reduction.
Prerequisites: EN.520.601 OR EN.530.616 OR EN.580.616
Instructor(s): D. Tarraf
Area: Engineering.

EN.520.619. Optical Communications.
Fundamentals of direct and coherent (heterodyne) detection optical communication receivers. Topics include Poisson nature of photon detection; estimation and detection for photon counting receivers; marked, filtered and doubly stochastic Poisson processes; and information theory for the photon communication channel.
Instructor(s): F. Davidson.

This course covers information on the non-deterministic schema and cyclic iterative schemas, Jacobians, Hessians and Mean Value Theorems, spectral norm, convex sets and positive definite majs.

EN.520.621. Introduction To Nonlinear Systems.
Nonlinear systems analysis techniques: phase-plane, limit cycles, harmonic balance, expansion methods, describing function, Lyapunov stability. Popov criterion. Recommended Course Background: EN.520.601 or equivalent.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

By employing fundamental concepts from diverse areas of research, such as statistics, signal processing, biophysics, biochemistry, cell biology, and epidemiology, this course introduces a multidisciplinary and rigorous approach to the modeling and computational analysis of complex interaction networks. Topics to be covered include: overview of complex nonlinear interaction networks and their applications, graph-theoretic representations of network topology and stoichiometry, stochastic modeling of dynamic processes on complex networks and master equations, Langevin, Poisson, Fokker-Plank, and moment closure approximations, exact and approximate Monte Carlo simulation techniques, time-scale separation approaches, deterministic and stochastic sensitivity analysis techniques, network thermodynamics, and reverse engineering approaches for inferring network models from data.
Instructor(s): J. Goutsias.
EN.520.624. Integrated Photonics.
This course gives an introduction to integrated photonics. Topics include: material platforms, fabrication approaches, devices and device operation, numerical modeling, nonlinear processes, and applications. Devices discussed include waveguides, resonators, sensors, modulators, detectors, lasers and amplifiers. Recommended Course Background: EN.520.219-EN.520.220, EN.520.495, or equivalent.
Instructor(s): A. Foster
Area: Engineering, Natural Sciences.

EN.520.627. Photovoltaics and Energy Devices.
This course provides an introduction to the science of photovoltaics and related energy devices. Topics covered include basic concepts in semiconductor device operation and carrier statistics; recombination mechanisms; p-n junctions; silicon, thin film, and third generation photovoltaic technologies; light trapping; and detailed balance limits of efficiency. Additionally, thermophotovoltaics and electrical energy storage technologies are introduced. A background in semiconductor device physics (EN.520.485, or similar) is recommended.
Instructor(s): S. Thon
Area: Engineering, Natural Sciences.

EN.520.633. Intro To Robust Control.
The subject of this course is robust analysis and control of multivariable systems. Topics include system analysis (small gain arguments, integral quadratic constraints); parametrization of stabilizing controllers; $H_{\infty}$-infinity optimization based robust control design; and LTI model order reduction (balanced truncation, Hankel reduction). Recommended Course Background: EN.520.601 or EN.530.616 or EN.580.616
Instructor(s): D. Tarraf
Area: Engineering, Natural Sciences.

EN.520.636. Signaling Pathways.
Instructor(s): P. Iglesias.

EN.520.646. Wavelets & Filter Banks.
This course serves as an introduction to wavelets, filter banks, multirate signal processing, and time-frequency analysis. Topics include wavelet signal decompositions, bases and frames, QMF filter banks, design methods, fast implementations, and applications. Recommended Course Background: EN.520.435, AS.110.201, C/C++ and Matlab programming experience.
Instructor(s): T. Tran.

EN.520.648. Compressed Sensing and Sparse Recovery.
Sparsity has become a very important concept in recent years in applied mathematics, especially in mathematical signal and image processing, as in inverse problems. The key idea is that many classes of natural signals can be described by only a small number of significant degrees of freedom. This course offers a complete coverage of the recently emerged field of compressed sensing, which asserts that, if the true signal is sparse to begin with, accurate, robust, and even perfect signal recovery can be achieved from just a few randomized measurements. The focus is on describing the novel ideas that have emerged in sparse recovery with emphasis on theoretical foundations, practical numerical algorithms, and various related signal processing applications. Recommended Course Background: Undergraduate linear algebra and probability.
Instructor(s): T. Tran.

EN.520.651. Random Signal Analysis.
A course covering second-order properties of random processes with applications in estimation and detection. A foundation course for further work in stochastic systems, signal processing, and communications. Recommended Course Background: elementary courses in probability, signals, and linear systems.
Instructor(s): S. Khudanpur.

EN.520.652. Filtering & Smoothing.
Random Signal Analysis, or equivalent, plus some background in linear algebra and matrix theory. This course is intended to give students an opportunity to do directed research in algorithm development that culminates in a MATLAB program. Students will learn about extracting signals from noise using statistical and non-statistical models. Topics include Kalman filtering, smoothing, interpolation (upsampling), spline fitting, and the numerical linear algebra issues that impact these problems. Emphasis is on fast, compact, stable algorithms. The grade is based on the term project and occasional homework. There are no examinations. Class attendance is mandatory.
Prerequisites: Some background in linear algebra, matrix theory, random signals, and MATLAB.
Instructor(s): H. Weinert.

EN.520.666. Information Extraction.
Introduction to statistical methods of speech recognition (automatic transcription of speech) and understanding. The course is a natural continuation of EN.600.465 but is independent of it. Topics include elementary information theory, hidden Markov models, the Baum and Viterbi algorithms, efficient hypothesis search methods, statistical decision trees, the estimation-maximization (EM) algorithm, maximum entropy estimation and estimation of discrete probabilities from sparse data for acoustic and language modeling. Co-listed as EN.600.666.
Recommended Course Background: EN.550.310 and EN.600.120 or equivalent, expertise in C or C++ programming.
Instructor(s): S. Khudanpur.

EN.520.671. Brain Computer Interfaces.
In this course, students will learn state-of-the-art techniques in Brain-Computer Interfaces (BCI) through readings and hands-on work with multi-channel electroencephalographic (EEG) neural recording systems. The class will meet once a week to review a paper or book chapter about BCI technologies, but the bulk of the work will be conducted in the lab, where each student team will be provided with an EEG hardware/software package and design, develop and demonstrate a BCI application. A competition will be held at the end of the semester to judge the best and most innovative projects. There are no formal prerequisites, but students are expected to be proficient in software programming (C and Matlab), signal processing, machine learning and experimental design. Knowledge of neuroscience is not required but may be useful. Grad students only. Graded on a Satisfactory/Unsatisfactory basis.
Instructor(s): F. Tenore; R. Vogelstein
Area: Engineering, Natural Sciences.

EN.520.673. Magnetic Resonance/Medic.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472). Co-listed with EN.580.476 and EN.580.673.
Instructor(s): D. Herzka; P. Bottomley; W. Edelstein.
EN.520.680. Speech and Auditory Processing by Humans and Machines.
This graduate level seminar focuses on works that are relevant to building advanced systems for information extraction from auditory signals. It loosely compliments and expands on the lecture material from the graduate course EN.520.515. Participants will take turns in presenting and critically discussing selected topics, with an aim of using this knowledge in their research projects. When available, guest speakers may at times contribute or substitute for the presentation of the participants. Recommended Course Background: Completion or concurrent participation in EN.520.515 or consent of the instructor. Instructor(s): H. Hermansky.

EN.520.682. Computational & Systems Neuroscience.

EN.520.691. Optoelectronic Microsystems.

EN.520.701. Current Topics in Language and Speech Processing.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U. Instructor(s): S. Khudanpur.

EN.520.702. Current Topics in Language and Speech Processing.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Cross-listed with Computer Science. Grading will be S/U. Instructor(s): S. Khudanpur
Area: Engineering.

EN.520.735. Sensory Information Processing.
Analysis of information processing in biological sensory organs and in engineered microsystems using the mathematical tools of communication theory. Natural or synthetic structures are modeled as microscale communication networks implemented under physical constraints, such as size and available energy resources and are studied at two levels of abstraction. At the information processing level we examine the functional specification, while at the implementation level we examine the physical specification and realization. Both levels are characterized by Shannon's channel capacity, as determined by the channel bandwidth, the signal power, and the noise power. The link between the information processing level and the implementation level of abstraction is established through first principles and phenomenological otherwise, models for transformations on the signal, constraints on the system, and noise that degrades the signals. Instructor(s): A. Andreou.

EN.520.736. Seminar on Control in Systems Biology.
This weekly seminar will focus on research issues in the use of control theory to study biological signal transduction pathways. The purpose of this course is to provide the students with background in research areas in computational, mathematical and systems biology. Each week, the participants will be assigned selected papers in these areas. While one student will lead the discussion, all students will be expected to have read the papers and to contribute to the discussion. Prerequisites: EN.520.636 OR EN.580.636 or permission of instructor Instructor(s): P. Iglesias.

EN.520.738. Advanced Electronic Lab Design.
This course is the graduate expansion of the EN.520.448 Electronic Design Lab, which is an advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. For this graduate expansion, all projects will be based on recently published research from IEEE Transactions. The students will be required to fully research, analyze, implement and demonstrate their chosen topic. The emphasis will be on VLSI microsystems, although other topics will also be considered. Open to graduate students only. Instructor(s): P. Pouliquen.

EN.520.744. Seminar in CISST.
Current research topics in computer integrated surgery, presented primarily by pre-eminent invited speakers in the field.

EN.520.746. Seminar: Medical Image Analysis.
This weekly seminar will focus on research issues in medical image analysis, including image segmentation, registration, statistical modeling, and applications. It will also include selected topics relating to medical image acquisition, especially where they relate to analysis. The purpose of the course is to provide the participants with a background in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University. The format of the course is informal. It will meet weekly for approximately 1.5 hours. Students will read selected papers and will be assigned on a rotating basis to lead the discussion. Co-listed as EN.600.746. Instructor(s): J. Prince.

EN.520.761. Large Scale Analog Compt.
Instructor(s): A. Andreou; R. Etienne Cummings.

EN.520.762. Seminar on Large Scale Analog Computation.
Research seminar devoted to current research in the engineering of large scale integrated analog systems. Topics include models for vision and auditory processing as well as implementation constraints and limitations. Instructor(s): A. Andreou; R. Etienne Cummings Area: Engineering.

EN.520.763. Seminar on Solid State, Quantum Electronics and Nonlinear Optics.
Research Seminar on current research in the area of interaction of light with matter. Instructor(s): A. Kaplan Area: Engineering, Natural Sciences.

Instructor(s): A. Andreou; R. Etienne Cummings.

EN.520.772. Advanced Integrated Circuits.
EN.520.773. Advanced Topics in Microsystem Fabrication.
Graduate-level course on topics that relate to microsystem integration of complex functional units across different physical scales from nano to micro and macro. Topics will include emerging fabrication technologies, micro-electromechanical systems, nanolithography, nanotechnology, soft lithography, self-assembly, and soft materials. Discussion will also include biological systems as models of microsystem integration and functional complexity. Perm. Req’d.
Instructor(s): A. Andreou.

EN.520.800. Independent Study.
Individual, guided study under the direction of a faculty member in the department. May be taken either term by graduate students.
Instructor(s): Staff.

EN.520.801. Dissertation Research.
EN.520.802. Dissertation Research.
Instructor(s): Staff.

EN.520.809. Special Studies.
Individual study in an area of mutual interest to a student and a faculty member in the department. Permission of Instructor required.

EN.520.810. Special Studies.
Individual study in an area of mutual interest to a student and a faculty member in the department.
Instructor(s): M. Thomas; R. Jenkins; R. Joseph.

EN.520.890. Independent Study-Summer.
Instructor(s): Staff.

Cross Listed Courses

General Engineering
EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biomedical robotics and mechatronics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): Staff.

Materials Science Engineering
EN.510.314. Electron Prop-Material. 3 Credits.
Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. Recommended Course Background: EN.510.311 and EN.510.202 or another programming course or permission of instructor.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.418. Electronic and Photonic Processes and Devices. 3 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering.
Instructor(s): T. Poehler.

Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611
Instructor(s): T. Poehler.

EN.510.618. Electronic and Photonic Processes and Devices.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

Mechanical Engineering
EN.530.616. Introduction to Linear Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. ME EN.530.616 can be used to fulfill the requirement of BME EN.580.616 or ECE EN.520.601.
Instructor(s): N. Cowan.
Biomedical Engineering

EN.580.472. Topics in Medical Imaging Systems. 3 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Instructor(s): J. Prince
Area: Engineering.

EN.580.616. Introduction to Linear Dynamical Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. BME EN.530.616 can be used to fulfill the requirement of ME EN.530.616 or ECE EN.520.601.
Instructor(s): S. Sarma.

Computer Science

CLSP seminar series, for any students interested in current topics in language and speech processing. Instructor(s): S. Khudanpur.

Master of Science in Engineering Management

The Master of Science in Engineering Management (MSEM) degree program combines advanced course work in highly-specialized technical fields with a professional education in contemporary business, entrepreneurship, and management practices. Graduates of the program will be provided with the educational background to pursue professional management roles in industry.

Facilities

The MSEM program has a dedicated seminar room housed in Whitehead 105. Students are able to study, conduct research and build prototypes within this space.

Graduate Requirements

Students in the MSEM program will take ten courses to fulfill degree requirements, with the following guidelines:

- Five advanced courses in the engineering/technical concentration
- Five advanced courses in the management concentration, in addition to a 2-semester seminar
- Students must graduate with a 3.0 GPA in the management courses and also in the technical courses
- Courses must be at the 400-level or higher
- Departments sponsoring technical concentrations may impose stricter requirements for course work within the concentration

At the discretion of the student’s advisors, an MSEM student may be permitted to double-count up to two JHU courses (one for the technical concentration and one for the management concentration) or apply undergraduate or graduate courses taken at JHU or elsewhere but not applied to a degree, in accordance with conditions in the WSE Policy on Double-Counting Courses.

Advising

MSEM students will receive advising on the engineering/technical concentration from a designated faculty member affiliated with that concentration. MSEM students will be advised regarding the management concentration by members of the Center for Leadership Education faculty.

Faculty

Faculty members teaching the technical concentration courses are listed in their respective engineering departments elsewhere in this catalog. Faculty members teaching the management concentration courses are listed in the Center for Leadership Education section of this catalog.

Management Concentration

The Center for Leadership Education has constructed a five-course program tailored to the needs of future engineering managers. MSEM students will participate in a cohort program, which begins each fall, where all students in an entering class will take the following five management courses together:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.662.611</td>
<td>Accounting and Finance (fall)</td>
</tr>
<tr>
<td>EN.662.651</td>
<td>Marketing Communication and Strategy (spring)</td>
</tr>
<tr>
<td>EN.662.632</td>
<td>Business Law and Intellectual Property (spring or Intersession)</td>
</tr>
<tr>
<td>EN.662.642</td>
<td>Management and Leadership (spring)</td>
</tr>
<tr>
<td>EN.662.692</td>
<td>Venture Planning to New Venture Creation (fall)</td>
</tr>
</tbody>
</table>

In addition, all MSEM students are required to attend the MSEM Seminar (EN.662.811 M.S. in Engineering Management Seminar/EN.662.812 M.S. in Engineering Management (MSEM) Seminar) course while enrolled in the program. This will meet weekly and addresses three important content areas: Innovation and design thinking; personal skills and development especially in the communication arena; and talks with practicing engineering managers. The Engineering Management program reserves the right to change the list of eligible courses at its discretion.

Technical Concentrations

In addition to fulfilling the management concentration requirements, MSEM students must complete the requirements for one of fourteen technical concentrations. These are:

- Biomedical Engineering
- Civil Engineering
- Communications Science
- Computer Science
- Fluid Mechanics
- Materials Science and Engineering
- Mechanical Engineering
- Mechanics and Materials
- Nanobiotechnology
- Nanomaterials and Nanotechnology
- Operations Research
- Probability and Statistics
- Smart Product and Device Design
- Environmental Systems Analysis, Economics and Public Policy

**Biomaterials**  
(Sponsored by the Department of Materials Science & Engineering (p. 811))

**Prerequisites**
- UG calculus, chemistry, biology, physics and introductory biomaterials course equivalent to EN.510.316 Biomaterials I

**Required Courses (3)**

<table>

Courses not on this list can be used at the advisor’s discretion.

**Civil Engineering**  
(Sponsored by the Department of Civil Engineering (p. 705))

The Civil Engineering concentration for the Master of Science in Engineering Management consists of five courses, with the following guidelines:

**Required Courses**
- EN.560.730 Finite Element Methods

Substitutions for required courses can be made at the advisor’s discretion.

**Elective Courses**
- Any two courses from 560.6xx or above, or 565.6xx or above (excluding seminar)

**Communications Science**  
(Sponsored by the Department of Electrical & Computer Engineering (http://e-catalog.jhu.edu/departments-program-requirements-and-courses/engineering/engineering-management/departments-program-requirements-and-courses/engineering/electrical-computer-science))

Students may select any combination of 5 courses in communications and related fields from the list below.

Substitutions for required courses can be made at the advisor’s discretion.

**Computer Science**  
(Sponsored by the Department of Computer Science (p. 712))

**Curricular Requirements**
- Any five regular graduate courses approved by the advisor, 400-level or higher, from the Department of Computer Science, not including the senior thesis. Three 1-credit graduate courses may be combined to constitute one regular graduate course.

**Fluid Mechanics**  
(Sponsored by the Department of Mechanical Engineering (p. 829))

Any five courses in Fluid Mechanics or closely related discipline, at the 400-level or higher, as approved by the Faculty advisor. At least two of the required technical courses must be at the 600-level or higher.

**Materials Science & Engineering**  
(Sponsored by the Department of Materials Science & Engineering (p. 811))

**Prerequisites**
- UG calculus, chemistry and physics; biology is recommended
Johns Hopkins University - 2013-2014

Required Courses (1)
EN.510.601 Structure of Materials

Substitutions for required courses can be made at the advisor’s discretion.

Electives (4)
• See list of pre-approved elective courses or courses off list by petition

Recommended Structure
• Electives:
List of Pre-approved Electives
EN.510.400 Introduction to Ceramics 3
EN.510.403 Materials Characterization 3
EN.510.405 Materials Science of Energy Technologies 3
EN.510.422 Micro and Nano Structured Materials & Devices 3
EN.510.426 Biomolecular Materials I - Soluble Proteins and Amphiphiles 3
EN.510.428 Material Science Laboratory I 3
EN.510.429 Materials Science Laboratory II 3
EN.510.430 Biomaterials Lab 3
EN.510.431 Biocompatibility of Materials 3
EN.510.456 Introduction to Surface Science 3
EN.510.604 Mechanical Properties of Materials 3
EN.510.605 Electrical, Optical, and Magnetic Properties 3
EN.510.606 Chem Bio Properties/Mat 3
EN.510.607 Biomaterials II 3
EN.510.608 Electrochemistry 3
EN.510.611 Solid State Physics 3
EN.510.612 Solid State Physics 3
EN.510.619 Biopolymers Synthesis 3
EN.510.624 X-Ray Scattering, Diffraction and Imaging 3
EN.510.657 Materials Science of Thin Films 3

Alternative selections can be made at the advisor’s discretion.

Mechanical Engineering
(Sponsored by the Department of Mechanical Engineering (p. 829))

Required Courses
Any five courses in Mechanical Engineering or closely related discipline at the 400-level or higher, as approved by the Faculty advisor. At least two of the required technical courses must be at the 600-level or higher.

Alternative selections can be made at the advisor’s discretion.

Mechanics and Materials
(Sponsored jointly by the Department of Mechanical Engineering (p. 829) and the Department of Materials Science & Engineering (p. 811))

Required Courses
EN.510.601 Structure of Materials
EN.510.604 Mech Props of Materials

Substitutions for required courses can be made at the advisor’s discretion.

Elective Courses
Any two (2) of the following courses, approved by the faculty advisor:

EN.510.403 Materials Characterization 3
EN.510.428 Material Science Laboratory I 3
EN.510.405 Materials Science of Energy Technologies 3
EN.510.422 Micro and Nano Structured Materials & Devices 3
EN.510.426 Biomolecular Materials I - Soluble Proteins and Amphiphiles 3
EN.510.428 Material Science Laboratory I 3
EN.510.429 Materials Science Laboratory II 3
EN.510.430 Biomaterials Lab 3
EN.510.431 Biocompatibility of Materials 3
EN.510.456 Introduction to Surface Science 3
EN.510.604  Mech Props of Materials
EN.510.605  Electrical, Optical, and Magnetic Properties
EN.510.606  Chem Bio Properties/Mat
EN.510.607  Biomaterials II
EN.510.608  Electrochemistry
EN.510.611  Solid State Physics
EN.510.612  Solid State Physics
EN.510.617  Adv Topics Biomaterials
EN.510.619  Biopolymers Synthesis
EN.510.624  X-Ray Scattering, Diffraction and Imaging
EN.510.657  Materials Science of Thin Films
EN.510.665  Adv Tpcs Thermodymanics

Alternative selections can be made at the advisor’s discretion.

Nanomaterials and Nanotechnology
(Sponsored by the Department of Materials Science & Engineering (p. 811))

Prerequisites
• UG calculus, chemistry, and physics

Required Courses (2)
EN.510.422  Micro and Nano Structured Materials & Devices  3 (PR: Permission of the Instructor)
EN.510.619  Electives in Spring: suggest two

Substitutions for required courses can be made at the advisor’s discretion.

Electives (3)
• Electives should be related to Materials Science and Engineering and must be approved by the DMSE graduate committee
• See list of pre-approved elective courses or courses off list by petition

Recommended Structure

Fall  Credits  Spring
EN.510.422  Micro and Nano Structured Materials & Devices  3
EN.500.619  Electives in Spring: suggest two

See list of pre-approved elective courses or courses off list by petition

Total Credits: 3

List of Pre-approved Electives
EN.510.400  Introduction to Ceramics  3
EN.510.403  Materials Characterization  3
EN.510.405  Materials Science of Energy Technologies  3
EN.510.422  Micro and Nano Structured Materials & Devices  3
EN.510.426  Biomolecular Materials I - Soluble Proteins and Amphiphiles  3
EN.510.428  Material Science Laboratory I  3
EN.510.429  Material Science Laboratory II  3
EN.510.430  Biomaterials Lab  3
EN.510.456  Introduction to Surface Science  3
EN.510.604  Mech Props of Materials  3
EN.510.605  Electrical, Optical, and Magnetic Properties  3
EN.510.606  Chem Bio Properties/Mat  3
EN.510.607  Biomaterials II  3
EN.510.608  Electrochemistry  3
EN.510.611  Solid State Physics  3
EN.510.612  Solid State Physics  3

EN.510.657  Materials Science of Thin Films  3
EN.510.665  Adv Tpcs Thermodymanics  3

Operations Research
(Sponsored by the Department of Applied Mathematics & Statistics (p. 650))

Prerequisites
Calculus-based background in Probability and Statistics. Students wishing to strengthen their background in this area may enroll in EN.550.420 Intro To Probability and/or EN.550.430 Introduction to Statistics, but these courses may not be used in fulfillment of this concentration’s requirements.

Required Courses (3)
EN.570.495  Mathematical Foundations For Public Decision Making  3
or EN.550.661  Foundations of Optimization
EN.570.497  Risk and Decision Analysis  3
or EN.570.608  Data Analytics for Engineering, Policy Analysis and Management  0-4
or EN.550.400  Mathematical Modeling and Consulting

Substitutions for required courses can be made at the advisor’s discretion

Elective Courses (2)
Any two courses from the following list, or a substitution as approved by the student’s concentration advisor. As course offerings vary over time, an updated list of acceptable courses will be maintained on the MSEM program website.

EN.570.493  Economic Foundations For Public Decision Making  3
EN.570.496  Urban and Environmental Systems  3
EN.550.662  Optimization Algorithms
EN.550.426  Introduction to Stochastic Processes  4
EN.550.427  Stochastic Processes and Applications to Finance  4
EN.550.433  Monte Carlo Methods  3
EN.550.463  Network Models in Operations Research  4
Alternative selections can be made at the advisor’s discretion.

**Probability and Statistics**

*(Sponsored by the Department of Applied Mathematics & Statistics (p. 650))*

**Admissions Requirements**

- One upper-division undergraduate course in probability (equivalent to EN.550.420 Intro To Probability)
- One upper-division undergraduate course in mathematical statistics (equivalent to EN.550.430 Introduction to Statistics)

**Curricular Requirements**

Any five (5) of the following courses, approved by the faculty advisor:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credit</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Additional Requirements**

- An overall GPA of 3.0 must be maintained in courses used to meet the program’s technical requirements. At most two course grades of C or C+ are allowed to be used, and the rest of the course grades must be B- or better.
- Students must satisfy the department’s graduate student computing requirement.
- With advisor’s approval, one non-departmental course containing appropriate mathematical or statistical content can be counted to satisfy the five course requirement.

**Smart Product and Device Design**

*(Sponsored jointly by the Department of Mechanical Engineering (p. 829) and the Department of Electrical & Computer Engineering (p. 736))*

**Required Courses**

<table>

</tbody>
</table>

Courses not on this list can be used at the advisor’s discretion.

**Environmental Systems Analysis, Economics and Public Policy**

*(Sponsored by the Department of Geography & Environmental Engineering (p. 770))*

**Required Courses (3)**

At least one course from each of the following three groups:

- **Economics** (with calculus)—acceptable courses include EN.570.493 Economic Foundations For Public Decision Making or equivalent. (This requirement may be waived if the student has already had an intermediate microeconomics course accepted by their advisor)
- **Mathematics of Decision Making**—acceptable courses include EN.570.495 Mathematical Foundations For Public Decision Making and EN.570.497 Risk and Decision Analysis
- **Policy**—acceptable courses include EN.570.659 Environmental Policy Analysis, EN.570.427, EN.570.607 Energy Policies & Plan Models, and EN.570.616

Substitutions for required courses can be made at the advisor’s discretion.

**Elective Courses (2)**

Any of the courses listed in the Mandatory list (see Part A above)

<table>
<thead>
<tr>

</tr>
<tr>
<td>EN.570.676</td>
<td>Stochastic Programming</td>
<td></td>
</tr>
</tbody>
</table>

Other courses in environmental economics, systems, or policy, as approved by the advisor.

**Additional Notes**

- All courses must be approved by the student’s advisor.
- All course must be at the 400-level or above.
- Students with a background in quantitatively rigorous economics sufficient for the economics requirement to be waived must still take five (5) courses in this area of concentration.
- No more than one course in environmental engineering may be used to fulfill the area of concentration and only with careful consultation with the student’s advisor. Candidate courses in environmental engineering include:
  - EN.570.446 Biological Process of Wastewater Treatment, EN.570.490 Solid Waste Engineering and Management, EN.570.491 Hazardous Waste Engineering and Management, EN.570.647 Mass Transfer in Environmental Engineering, EN.570.657 Air Pollution, etc.
- No more than one C may be used toward the degree in this concentration.

For current faculty and contact information go to http://eng.jhu.edu/wse/cle/page/our_people

**Faculty**

**Program Directors**

Lawrence Aronhime
Associate Director and Senior Lecturer, Director of Entrepreneurship & Management Program: accounting, finance, entrepreneurship, technology commercialization.

Eric Rice
Associate Director and Senior Lecturer, Director of Masters of Science in Engineering Management Program: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Senior Lecturer
Annette Leps
Senior Lecturer: accounting, finance, management.

Pamela Sheff
Senior Lecturer: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, entrepreneurship.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.662.611. Accounting and Finance.
This course includes a review of financial accounting with an emphasis on the implications of GAAP selections and other managerial decisions on the financial statements. Historic financial performance is assessed using ratio analysis. Relevant cash flows are used in capital budgeting situations; projects are analyzed using discounted cash flow techniques as a measure of valuation. Managerial accounting topics of financial forecasting, cost accumulation, cost allocation, product costing, and variance analysis are used in decision making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): A. Leps.

Business Law and Intellectual Property introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses; contracts; intellectual property; principal-agents relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. For M.S. in Engineering Management only; no audits.
Instructor(s): A. Lebbos.

EN.662.642. Management and Leadership.
Management and Leadership is a case, experiential and research based course intended to introduce participants to issues and solutions related to growing and managing businesses with an emphasis on entrepreneurial enterprises. The course focuses on managerial decision-making and organization building through topics that include planning and managing strategic change; finding competitive advantage; making informed decisions; dealing with uncertainty; negotiating collaborative settlements; managing/leading projects, teams and professionals; networking and forming strategic alliances; valuing differences; creating and maintaining organizational cultures; and devising performance measures. Additionally, participants master aspects of management communication as they address course content. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): E. Rice.

This course is designed to introduce students to key marketing, communications, and strategic issues surrounding the process of bringing new products to the marketplace. Through cases, readings, discussion and hands-on team projects, students develop a flexible approach to thinking about marketing problems, maximizing resources and creating strategic solutions. Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): P. Sheff.

EN.662.692. Venture Planning to New Venture Creation.
Venture Planning requires participants to work in groups to address, design and plan a business solution for an engineering problem with social implications. More specifically, students will work on cross-disciplinary teams to develop a commercially viable new technology. They must select a problem amenable to an engineering solution, investigate the problem, research the issues and potential, develop a design for the technology, investigate the competitive advantage, and create and present a business plan for the idea. Course content will address many of the issues that will be encountered during the process of bringing an idea to fruition. For M.S. in Engineering Management only; graded (not P/F); no audits.

Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): E. Rice; P. Sheff.

Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): E. Rice.

W.P. Carey Minor in Entrepreneurship and Management

The Entrepreneurship & Management (E&M) program offers Johns Hopkins Arts & Sciences, Engineering, and Peabody students a broad array of courses designed to equip them to lead in business, professional, and academic arenas. Some students simply take a course or two. Many choose to fulfill the seven-course E&M minor, pairing it with their engineering, liberal arts, or public health major. The minor’s three core courses, Introduction to Business, Financial Accounting, and Marketing Principles, provide a strong foundation in the fundamentals of entrepreneurial enterprises. Students can then select any three upper-level courses (plus the required work in statistics) to complete the minor or elect to concentrate further in Accounting and Finance, Business Law, Marketing, Leadership and Organizational Behavior, or Professional Communication. Lists of acceptable courses are regularly updated and may be obtained at the Center for Leadership Education office on the center’s website: http://web.jhu.edu/leadership.

The minor in entrepreneurship and management focuses on business and management from a multidisciplinary viewpoint, with a quantitative
emphasis. The program, part of the Center for Leadership Education, offers students a diversified learning experience that emphasizes the concepts, practices, and skills necessary for effective leadership as managers and entrepreneurs in the public and private sectors.

The primary goal of the program is to provide Hopkins students with the knowledge and skills to become effective leaders and entrepreneurs. Individuals with excellent technical training and abilities often move into management positions or start new ventures. As their careers progress, they will be better prepared for success if they have the ability to understand financial reports, interpret statistical data, organize and effectively lead a team, design strategy, analyze and correct problems in the firm’s operations, and understand the dynamics of the marketplace.

The minor is purposely designed to serve different types of students. The program will help prepare students for entrance to law school, an MBA program, or other graduate school. After graduation, other students will start working in engineering or technical positions, then later move into management or start their own businesses. A third group of students is primarily interested in gaining knowledge to follow more generalized careers in finance and business.

Courses that may be used to satisfy requirements for the minor are grouped into four categories: accounting/finance, business law, management/leadership, and marketing/communications. Lists of acceptable courses are regularly updated and may be obtained at the Center for Leadership Education office or on the center’s website: http://web.jhu.edu/leadership.

Facilities

The CLE Faculty offices and Faculty Support Staff offices are located in Whitehead Hall, suites 102, 104 and 105. Faculty and course assistants’ office hours are held in room 104.

Minor in Entrepreneurship and Management

The requirements of the minor in entrepreneurship and management can be downloaded from the Center for Leadership Education’s website under the “W.P. Carey Program in Entrepreneurship and Management” tab (http://eng.jhu.edu/wse/cle/page/em_minor). Students wishing to complete a minor in entrepreneurship and management may also obtain more information from the CLE Faculty Support Staff office located in Whitehead 105.

For current faculty and contact information go to http://eng.jhu.edu/wse/cle/page/our_people

Faculty

Program Directors

Lawrence Aronhime
Associate Director and Senior Lecturer, Director of Entrepreneurship & Management Program: accounting, finance, entrepreneurship, technology commercialization.

Julie Reiser
Senior Lecturer, Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice
Associate Director and Senior Lecturer, Director of Masters of Science in Engineering Management Program: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Full Time Faculty

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing, internships.

Annette Leps
Senior Lecturer: accounting, finance, management.

Keith Quesenberry
Lecturer: integrated marketing communications, advertising, social media marketing, online blogging and copywriting, creative strategy, digital media, communications law and ethics.

Pamela Sheff
Senior Lecturer: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, entrepreneurship.

Part Time Faculty

Michael Agronin
Lecturer: new product development.

Laura Davis
Lecturer: Professional communication for ESL and Oral presentations for ESL.

Kevin Dungey
Senior Lecturer: oral presentations.

Sean Furlong
Lecturer: Financial Accounting

Dorothee Heisenberg
Senior Lecturer: Multinational Firms in the International Economy

Marc DeVries
Lecturer: marketing.

David Fisher
Lecturer: business law.

Mark Franceschini
Senior Lecturer: business law, business ethics, Internet law.

Jason Heiserman
Lecturer: oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Theresa Jones
Lecturer: marketing.

Andrew Kulanko
Senior Lecturer: oral presentations.

Denise Link-Farajali
Lecturer: professional communication: financial math for ESL, research writing for ESL.

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric.

Ben Parris
Lecturer: professional communication.

Bryan Rakes
Lecturer: business law.

Joshua J. Reiter
Senior Lecturer: business process management, total quality management, information technology management, Internet-based business applications, creativity and innovation, entrepreneurship.

Douglas Sandhaus
Senior Lecturer: business law, business ethics, Internet law.

William Smedick
Senior Lecturer: leadership.

Jay Thompson
Lecturer: professional communication.

Caroline Wilkins
Lecturer: professional communication.

For current course information and registration go to https://isis.jhu.edu/courses/

Courses

EN.660.101. Writing a Business Plan. 1 Credit.
This one credit, four session course offered as preparation for the JHU Business Plan Competition, will cover the fundamentals of creating and delivering a business plan for a new venture. Topics to include: organizing the business plan, market analysis, competitive analysis, financial projections, strategies to meet the expectations of varied investors, identification of necessary resources and developing and delivering a persuasive, well-articulated pitch. No audits.

EN.660.102. Personal Finance. 3 Credits.
This interactive course introduces students to the real-world personal financial decisions they will face throughout life. Topics include prioritizing spending, purchasing a car and home, credit, developing and implementing an investment strategy, insurance options, deciphering taxes, and retirement planning.

EN.660.103. The Promise and Peril of Microfinance. 1 Credit.
Microcredit, microlending and microfinance are relatively new tools, potentially useful to help alleviate poverty, contribute to local economies, earn a living and make profit. The promise and publicity it has generated practices, experiments and businesses worldwide; microcredit even generated a Nobel Prize for Muhammad Yunus and the Grameen Bank in 2006. So too, the spread of the concept has produced excesses and controversy and more recently, scholarship in the practices and ideas. In this course we will explore the theory, practice and possibilities of the ideas with emphasis on both the developing world and western economies. The course uses lecture, discussion, case study and community investigation to explore the content. No audits.

EN.660.105. Introduction to Business. 4 Credits.
This course is designed as an introduction to the terms, concepts, and values of business and management. The course comprises three broad categories: the economic, financial, and corporate context of business activities; the organization and management of business enterprises; and, the marketing and production of goods and services. Topic specific readings, short case studies and financial exercises all focus on the bases for managerial decisions as well as the long and short-term implications of those decisions in a global environment. No audits.
Instructor(s): L. Aronhime
Area: Social and Behavioral Sciences
Writing Intensive.

EN.660.203. Financial Accounting. 3 Credits.
The course in Financial Accounting is designed for anyone who could be called upon to analyze and/or communicate financial results and/or make effective financial decisions in a for-profit business setting. No prior accounting knowledge or skill is required for successful completion of this course. Because accounting is described as the language of business, this course emphasizes the vocabulary, methods, and processes by which all business transactions are communicated. The accounting cycle, basic business transactions, internal controls, and preparation and understanding of financial statements including balance sheets, statements of income and cash flows are covered. No audits.
Instructor(s): A. Leps; L. Aronhime; S. Furlong.

EN.660.205. Business Law I. 3 Credits.
This course is designed for the student who is interested in either (a) a broad knowledge of law as it relates to modern business, or (b) a survey of many business related aspects of law with a view to further legal studies. The course will involve reviewing and analyzing statutory and case law covering a variety of substantive subject areas including civil procedure, personal and subject matter jurisdiction, intentional torts, negligence, criminal law, contract law, consumer law and parts of the Uniform Commercial Code. This course, together with Business Law II, will provide a complete, self-contained, well-rounded, study of business law, or will provide a foundation for further legal study. No audits.
Instructor(s): D. Fisher; D. Sandhaus; M. Franceschini
Area: Social and Behavioral Sciences.

EN.660.206. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law.
Prerequisites: EN.660.205
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

EN.660.220. Principles of Management. 3 Credits.
This course introduces the student to the management process. It examines the role of the manager from a traditional and contemporary perspective while applying decision-making and critical thinking skills to the challenges facing managers in today’s globally-diverse environment. Recommended Course Background: EN.660.105
Instructor(s): E. Rice.

EN.660.231. Case Studies-Bus Ethics. 3 Credits.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings - both global and personal in nature.
Instructor(s): D. Sandhaus; J. Smylie
Area: Humanities.
EN.660.235. Leading Change. 3 Credits.
Instructor(s): E. Rice.

EN.660.241. Info Tech Management. 3 Credits.
This course surveys the fundamentals of information technology from a management point of view. Topic areas include systems concepts and value in the global economy, data and technology management, systems analysis and design, telecommunications, and societal and legal issues. Recommended Course Background: EN.660.105

Writing Intensive.

EN.660.250. Principles of Marketing. 3 Credits.
This course explores the role of marketing in society and within the organization. It examines the process of developing, pricing, promoting and distributing products to consumer and business markets and shows how marketing managers use the elements of the marketing mix to gain a competitive advantage. Through interactive, application-oriented exercises, case videotapes, a guest speaker (local marketer), and a group project, students will have ample opportunity to observe key marketing concepts in action. The group project requires each team to research the marketing plan for an existing product of its choice. Teams will analyze what is currently being done by the organization, choose one of the strategic growth alternatives studied, and recommend why this alternative should be adopted. The recommendations will include how the current marketing plan will need to be modified in order to implement this strategy and will be presented to the instructor in written form and presented to the class. No audits.
Instructor(s): K. Quesenberry; L. Kendrick; M. DeVries; Staff; T. Jones.

EN.660.300. Managerial Finance. 3 Credits.
This course is designed to familiarize the student with the basic concepts and techniques of financial management practice. The course begins with a review of accounting, securities markets, and the finance function. The course then moves to discussion of financial planning, financial statement analysis, time value of money, interest rates and bond valuation, stock valuation, and concludes with capital budgeting and project analysis. A combination of classroom discussions, problem sets, and case studies will be used. Note: not open to students who have taken EN.660.302 Corporate Finance. No audits.
Prerequisites: EN.660.203
Instructor(s): Staff.

EN.660.302. Corporate Finance. 3 Credits.
Designed as a practicum for exploring basic concepts and techniques used by today's corporate financial professionals. Financial statement analysis, capital budgeting and the cost of capital are explored. Recommended Course Background: Microeconometrics and Macroeconomics
Prerequisites: EN.660.203
Area: Social and Behavioral Sciences.

EN.660.303. Managerial Accounting. 3 Credits.
This course introduces management accounting concepts and objectives including planning, control, and the analysis of sales, expenses, and profits. Major topics include cost behavior, cost allocation, product costing (including activity based costing), standard costing and variance analysis, relevant costs, operational and capital budgeting, and performance measurement. Note: not open to students who have taken EN.660.204 Managerial Accounting. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.

EN.660.304. Financial Statement Analysis. 3 Credits.
This course is designed to increase a student's ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will access firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. No audits.
Prerequisites: EN.660.203 Financial Accounting
Instructor(s): A. Leps.

EN.660.305. Intellectual Property Law. 3 Credits.
This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations
Prerequisites: PREREQ: EN.660.205 Business Law I
Instructor(s): V. Peros
Area: Social and Behavioral Sciences.

EN.660.306. Law and the Internet. 3 Credits.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. No audits.
Prerequisites: Prerequisite: EN.660.205
Area: Social and Behavioral Sciences.

EN.660.307. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. Not open to students who have taken EN.660.206 Business Law II. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

EN.660.308. Business Law I. 3 Credits.
This course is designed to provide students an introduction to legal reasoning and analysis. Content distinguishes forms of business, civil versus criminal law, and agency principles; intellectual property concepts, contract Law, the UCC (Uniform Commercial Code) and consumer protection are explored and discussed in the context of assigned legal cases which are intended to develop a student’s ability to analyze and apply law. Note: not open to students who have taken EN.660.205 Business Law I. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Fisher; W. Rakes
Area: Social and Behavioral Sciences.
EN.660.310. Case Studies in Business Ethics. 3 Credits.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings—both global and personal in nature. Students will learn the reasoning and analytical skills needed to apply ethical concepts to their own decision-making, to identify moral issues involved in the management of specific problem areas in business and society, and to understand the social and natural environments which give rise to moral issues. The course focus is on performance articulated by clear reasoning and effective verbal and written communication concerning ethical issues in business and society. Not open to students who have taken EN.660.231 Case Studies in Business Ethics. No audits.

Prerequisites: EN.660.105
Instructor(s): D. Sandhaus
Area: Humanities.

EN.660.311. Law and the Internet. 3 Credits.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. Note: not open to students who have taken EN.660.306 Law and the Internet. No audits.

Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): M. Franceschini
Area: Social and Behavioral Sciences.

EN.660.321. Managing & Marketing Social Enterprises. 3 Credits.
This course focuses on preparing students to engage in and lead social enterprises as we explore the options for creating social value. Using a combination of lecture, case study and project work, we investigate both for-profit and non-profit models for creating social value with special emphasis on the non-profit community. Particular emphasis is placed on the management challenges of social enterprises such as creating and conveying their message, options for dealing with finances, relationships within communities, and methods for building constituencies. Additionally, we address critical issues such as measures of success, scale, replication and failure. The class requires contact with organizations in the community as well as one long weekend away from campus. Recommended Course Background: EN.660.105 or EN.660.333 or EN.660.220/EN.660.340. No audits.

Instructor(s): W. Smedick
Area: Social and Behavioral Sciences

Writing Intensive.

EN.660.330. Leadership Dynamics. 3 Credits.
Required: Introduction to Business (660.105) or Principles of Management (660.220) Focuses on the dynamics associated with taking charge in a group or organizational setting. Topics include: visioning, delegation, power, charisma and managing change.

EN.660.331. Leadership in Teams. 3 Credits.
This course will allow students to develop the analytical skills needed to effectively lead and work in teams. Students will learn tools and techniques for problem solving, decision-making, conflict resolution, task management, communications, and goal alignment in team settings. They will also learn how to measure team dynamics and performance, and assess methods for building and sustaining high-performance teams. Students will also explore their own leadership, personality and cognitive styles and learn how these may affect their performance in a team. The course will focus on team-based experiential projects and exercises as well as provide opportunities to individually reflect and write about the concepts explored and skills gained throughout the course. No Audits.

Prerequisites: EN.660.332
Instructor(s): W. Smedick
Area: Social and Behavioral Sciences

Writing Intensive.

EN.660.333. Leading Change. 3 Credits.
In this course, we will use a combination of presentation, discussion, experiential learning, research and self-reflection to investigate issues surrounding leadership and change in communities and the economy. While considering both for-profit and non-profit entities, we will pursue topics including understanding and using theories of change; finding competitive advantage and creating strategic plans; making decisions, even in uncertain times; valuing differences; employing leadership styles; giving and receiving feedback; understanding employee relations; creating performance measures; and developing organizational cultures; and using the dynamics of influence. Not open to students who have taken EN.660.235. No audits. Recommended Course Background: EN.660.105

Instructor(s): W. Smedick

Writing Intensive.

EN.660.335. Negotiation/Conflict. 3 Credits.
The focus of this class is the nature and practice of conflict resolution and negotiation within and between individuals and organizations. The primary format for learning in this class is structured experimental exercises designed to expose students to different aspects of negotiation and to build tangible skills through interpersonal exchange. While some class time is devoted to presentations on theories and approaches, the class method primarily relies on feedback from fellow classmates on their observations of negotiation situations and on personal reflections by students after each structured experience. Topics include conflict style, negotiation, and group conflict. No audits. Recommended Course Background: EN.660.105, an additional course in the Entrepreneurship and Management Program or in the social sciences.

Instructor(s): E. Rice.
EN.660.336. Community Engineering: Interdisciplinary Problem Solving-Community Based Learning. 3 Credits.
So many big and seemingly intractable problems inhibit progress and diminish quality of life especially in and around urban communities. Surely there are ways to begin to tackle some of these problems, if we approach them from a multi-disciplinary perspective. This course provides that opportunity as students, who work primarily in teams, apply theory and ingenuity to investigate problems, propose solutions or invent devices that address some of these problems. Class time is spent in lecture, discussion, and applied community projects to master content. Time will be spent participating on teams and working in community organizations in addition to class.
Area: Social and Behavioral Sciences
Writing Intensive.

EN.660.337. Dead Leaders Society: Historical Perspectives on Leadership. 3 Credits.
Students will analyze how the political, economic, cultural and social contexts of prior centuries shaped the styles and effectiveness of its leadership. Some giants of history like Cleopatra, Eleanor of Aquitaine, King Richard the Lionhearted, Elizabeth I, Winston Churchill and Abraham Lincoln will be analyzed for their contributions to their own era’s as well as modern concepts of leadership. In addition, lesser-known leaders such as Katherine Swynford, Mary Anning and Elizabeth Philpot, Llywelyn ab Gruffydd and Simon de Montfort will be analyzed for their contributions to modern leadership behaviors, styles and effectiveness. No audits.
Recommended Course Background: EN.660.332 or EN.660.331
Prerequisites: EN.660.331 or EN.660.332.

EN.660.340. Principles of Management. 3 Credits.
This course introduces the student to the management process. The course takes an integrated approach to management by examining the role of the manager from a traditional and contemporary perspective while applying decision-making and critical-thinking skills to the challenges facing managers in today’s globally diverse environment. The course examines the techniques for controlling, planning, organizing resources and leading the workforce. Not open to students who have taken EN.660.220 Principles of Management. No audits.
Prerequisites: EN.660.105
Instructor(s): I. Izenberg.

EN.660.341. Business Process and Quality Management. 3 Credits.
This course focuses on both quantitative and qualitative analytical skills and models essential to operations process design, management, and improvement in both service and manufacturing oriented companies. The objective of the course is to prepare the student to play a significant role in the management of a world-class company which serves satisfied customers through empowered employees, leading to increased revenues and decreased costs. The material combines managerial issues with both technical and quantitative aspects. Practical applications to business organizations are emphasized. No audits.
Instructor(s): J. Reiter
Writing Intensive.

EN.660.351. Product and Brand Management. 3 Credits.
Consumers love those little bits of crunchy orange goodness called Cheetos®. But when Frito-Lay decided that consumers might also like Cheetos®-flavored lip balm, they reacted with a hailstorm of derision. This may be proof that our free market economy is just a rudderless, if hilarious, contraption. More likely, Cheetos® Lip Balm was an example of the challenges marketers face in product and brand management. This course is a conceptual and practical exploration of how marketers deliver products and build brands that translate into competitive advantage for their companies. Among the critical concepts typically addressed in the course are developing and positioning a brand, assembling the marketing mix media into a whole, establishing price, creating packaging, and tracking the customer experience. The course uses readings, lecture, exercises, cases and examples to explore these concepts. No audits.
Prerequisites: EN.660.250
Instructor(s): D. Crane.

EN.660.352. New Product Development. 3 Credits.
New product development is the ultimate interdisciplinary entrepreneurial art, combining marketing, technical, and managerial skills. A successful product lies at the intersection of the user’s need, a technical solution, and compelling execution. This class will bootstrap your experience in the art through exercises and team projects. We will examine products and services, consumer and industrial, simple and technologically complex. Case studies will feature primary sources and the instructor’s personal experiences as an inventor for a major consumer products company. Topics will span the product development cycle: identifying user needs, cool-hunting, brainstorming, industrial design, prototyping techniques, market research to validate new ideas, and project management—especially for managing virtual teams and foreign manufacturers. No audits.
Prerequisites: EN.660.250
Instructor(s): M. Agronin.

EN.660.354. Consumer Behavior. 3 Credits.
This course will explore how and why consumers make choices in the marketplace—the “buy-ology” of their behavior. We will learn the psychological, social, anthropological, and economic underpinnings of consumer behavior as well as the brain chemistry that affects choices in the marketplace. Students will learn how consumer behavior can and is influenced and the sometimes-unintended consequences of marketing campaigns designed to produce a particular behavior. Students will analyze how consumers solve problems, assess tradeoffs and make choices; how they integrate and react to retail surroundings, smells, product displays, brand, pricing strategies, social pressures, market structures and a myriad of other influences and motivations to buy. Students will also explore how marketers incorporate what is known about consumer behavior into advertising and promotional campaigns, market segmentation and positioning, pricing strategies and new product introductions. Student experiential projects will include ethnographic observations and analyses of real-world consumer behavior. No audits.
Prerequisites: EN.660.250.

EN.660.355. Sports Marketing. 3 Credits.
This course will allow students to apply marketing principles and concepts to the sports marketing environment while gaining an understanding of how event sponsorships, endorsements, licensing and naming rights are used to achieve business objectives. Through case studies and a group project, students will be exposed to a broad range of sports entities including professional sports teams, governing organizations and sports media.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): L. Kendrick.
EN.660.357. Copywriting and Creative Strategy. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.661.357. No audits.
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry
Writing Intensive.

EN.660.358. International Marketing. 3 Credits.
This course covers product, pricing, promotion, distribution, market research, organization and implementation and control policies relating to international marketing. It also explores the economic, cultural, political and legal aspects of international marketing. Through interactive and application-oriented assignments and cases, students will gain hands-on experience in analyzing and developing marketing strategies for organizations that market both consumer and business products/services internationally. A group project will involve the development of an international marketing plan for a specific product. One or more local international marketers will be invited to speak to the class. No audits.
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.

EN.660.360. Small Business Mgmt. 3 Credits.
Provides tools students will need to successfully launch and manage a small business in a competitive, global environment. Examines the challenges of entrepreneurs, the business plan, marketing and financial issues, hiring, and managing people. Recommended Course Background: EN.660.105, EN.660.220.

EN.660.401. Advanced Corporate Finance. 3 Credits.
The advanced course in corporate finance is designed to provide the upper level business student with a background in the more complex applications of financial management practice. Students will be exposed to advanced financial management concepts through a pedagogy combining classroom instruction, problem solution, business case analysis and work on a group project with coverage of the topics of capital markets, risk and portfolio theory, cost of capital, raising capital, capital structure, corporate dividend policy, real property valuation, merger and acquisition analysis, working capital management, commercial leasing strategies, international finance and derivatives analysis. No audits.
Prerequisites: EN.660.302 Corporate Finance OR EN.660.300 Managerial Finance OR 180.366 Corporate Finance.

EN.660.404. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. No audits.
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

EN.660.405. Intellectual Property Law. 3 Credits.
This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations. The course addresses critical issues such as the various types of intellectual property, the protection and commercialization of intellectual property by business and legal means, and the valuation of intellectual property. In addition, the tension between exclusive rights in intellectual property and free competition will be discussed throughout this course. Through interactive class discussions and a group project, students will have ample opportunity to develop a better understanding pertaining to the different types of intellectual property and to develop an intellectual property strategic plan for protecting an intellectual property portfolio. Specifically, the group project requires each team to research a selected Maryland based company’s intellectual property, its plan for protection and commercialization and its business goals, products and services. Each team will then analyze how well the company’s current business goals relate to its intellectual property portfolio, and recommend changes to better meet these company’s goals. Not open to students who have taken EN.660.305 Intellectual Property Law. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

EN.660.410. Computer Science Innovation and Entrepreneurship. 3 Credits.
This course is designed to give students in CS the requisite skills to generate and screen ideas for new venture creation and then prepare a business plan for an innovative technology of their own design. These skills include the ability to incorporate into a formal business case all necessary requirements, including needs identification and validation; business and financial models; and, market strategies and plans. Student teams will present the business plan to an outside panel made up of practitioners, industry representatives, and venture capitalists. In addition, this course functions as the first half of a two course sequence, the second of which will be directed by CS faculty and focus on the actual construction/programming of the business idea.
Prerequisites: Co-requisite: EN.660.321 OR EN.660.421
Instructor(s): L. Aronhime.

EN.660.411. Corporate Strategy and Business Failure. 3 Credits.
The purpose of this course is to bring together theories of corporate strategy and the tools and techniques of strategy consulting. Students will address these in terms of historical case studies where they will have the opportunity to "fix" famous examples of corporate failure. Students will analyze the political, economic, social, and technological contexts of these cases while applying standard tools to the analysis of competing strategic plans.
Prerequisites: EN.660.105.

EN.660.414. Financial Statement Analysis. 3 Credits.
This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will assess firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. Not open to students who have taken EN.660.304 Financial Statement Analysis. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.
EN.660.420. Marketing Strategy. 3 Credits.
This writing intensive course helps students develop skills in formulating, implementing, and controlling a strategic marketing program for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization and support these decisions with quantitative analyses. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations, including financial projections, and presenting them to the class. No audits.
Prerequisites: Prereq: EN.660.250
Instructor(s): L. Kendrick
Writing Intensive.

EN.660.430. Creativity & Innovation. 3 Credits.
Students will learn techniques for improving the flexibility and originality of their thinking and will explore approaches used by managers and organizations to create and sustain high levels of innovation. The course uses fun and hands-on activities to stimulate innovation. Open to Juniors and Seniors. Recommended Course Background: two courses in the Entrepreneurship and Management program.

EN.660.450. Advertising & Integrated Marketing Communication. 3 Credits.
This course builds on the promotional mix concepts covered in Principles of Marketing (EN.660.250)—advertising, public relations, sales promotion and personal selling. Students will learn how marketers are changing the ways they communicate with consumers and the ways in which promotional budgets are allocated—and how this impacts the development of marketing strategies and tactics. Working with a client (provided by EdVenture Partners) that has chosen this JHU class as its “advertising agency” and an actual budget provided by the firm, the class will form small teams to mirror the functional organization of an actual ad agency (market research, media strategy/planning, copywriting/design, public relations, etc.). Student teams will then develop a promotional plan and corresponding budget to reach the desired target market (JHU undergrads who meet the client’s criteria), implement the plan and then evaluate its effectiveness through pre- and post campaign market research conducted on the target consumer. Note: Not open to students who have taken EN.660.450 as Advertising and Promotion. No audits. (Formerly Advertising and Promotion.)
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.

EN.660.453. Social Media and Marketing. 3 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.661.453.
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry.

EN.660.456. Marketing Communication Law & Ethics. 3 Credits.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.661.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Instructor(s): K. Quesenberry
Writing Intensive.

EN.660.460. Entrepreneurship. 3 Credits.
This course provides students with a solid introduction to the entrepreneurial process of creating new businesses. Students will gain an appreciation for the investors’ perspective in assessing opportunities, evaluating strategies, and valuing the new enterprise. The course will cover the principal components of building a successful venture including market analysis, market analysis, intellectual property protection, legal and regulatory issues, operations, entrepreneurial financing, and the role of the capital markets. Course work will include case studies and creation of investor marketing materials. Open to Juniors and Seniors. No Audits. Recommended Course Background: EN.660.203
Prerequisites: EN.660.105 OR EN.660.250
Instructor(s): E. Rice.

EN.660.461. Engineering Business and Management. 3 Credits.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): I. Izenberg; M. Agronin
Area: Engineering.

EN.660.465. Tech Commercialization. 3 Credits.
In this course, lectures, case analyses, and team projects provide a strategic framework for determining the commercial value of new technologies and the best path for realizing that value. Juniors or Seniors only. Recommended Course Background: EN.660.105, EN.660.203, EN.660.250 or instructor permission.
Writing Intensive.

EN.660.500. Business Internship. 1 Credit.
Students may qualify for an internship with one of the many local employers with whom CLE works or they may arrange a non-local internship on their own. For non-paid internships only, students may apply for sponsorship for academic credit through CLE. Applications must include a resume, transcript and written essay and will be evaluated on the basis of work experience, GPA, writing sample, and course work. Students are expected to complete two reports assigned by the internship coordinator. S/U only.
Instructor(s): L. Kendrick.
EN.660.501. Practicum in Entrepreneurship and Management. 3 Credits.
Students work on an existing business or marketing plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students must apply by submitting a cover letter, resume, unofficial transcript, and essay describing the business concept/marketing plan. Applications must be approved by both the faculty member and director of CLE. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. Permission required. S/U only.
Instructor(s): L. Aronhime; P. Sheff.

EN.660.594. Business Internship-Summer. 1 Credit.
Instructor(s): L. Kendrick.

EN.660.611. Accounting and Finance.
The course includes a review of financial accounting with an emphasis on the managerial implications of financial statements and their application to financial analysis. Course material will also encompass cost accumulation, cost allocation, product costing, and variance analysis, and their impact on financial forecasting and capital budgeting. Students will also explore valuation techniques for new technologies. Permission of instructor required. Co-listed with 662.611.

Cross Listed Courses

Center for Leadership Education

EN.660.100. Hopkins Leadership Challenge Seminar. 1 Credit.
Freshmen only. S/U only.
Instructor(s): W. Smedick
Area: Social and Behavioral Sciences.

EN.660.370. Multinational Firms in the International Economy. 3 Credits.
This course on international business focuses on relationships between multinational firms and national governments throughout the world. We will read historical and contemporary authors’ conceptualizations of these relationships in the US and around the world. Students will apply concepts from the readings to real-world situations. The course is capped at 25 to allow discussion. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Heisenberg.

EN.660.665. Technology Entrepreneurship.
The goal of the course is to provide a strategic framework (technological, market, regulatory, and financial) for determining the commercial value of new technologies and the best path for realizing that value. Through lectures, exercises, and case studies, students will develop and advance their own innovations and inventions, culminating in a business plan. No audits.
Area: Engineering, Natural Sciences.

Professional Communication

EN.661.453. Social Media and Marketing. 3 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits.
Prerequisites: EN.660.250 Writing Intensive.

General Engineering

The General Engineering program offers both a B.A. with a major in general engineering and a number of non-departmental courses.

Bachelor of Arts in General Engineering

The Bachelor of Arts in General Engineering is a liberal arts degree that is designed to provide students with both a concentration in some area of humanities or social sciences and the fundamental engineering principles needed to understand the basics of modern technology, innovations, and engineering practices. It is intended for undergraduate students who desire a background in engineering and technology yet have neither the desire nor the intention to become professional engineers. These students may, for example, plan to pursue graduate or professional study in architecture, business, law (e.g., intellectual property, patent law), or medicine. They may wish to work in areas which relate to engineering and technology or to thrive in the global industrial economy.
The Bachelor of Arts in General Engineering is a true liberal arts degree with a concentration in engineering.

This degree is not an engineering degree, and is not suitable for employment as a professional engineer. This program is not accredited by the Accreditation Board for Engineering and Technology. Students desiring careers as professional engineers should complete a B.S. degree in one of the engineering disciplines offered by the Whiting School.

The distinctive features of the Bachelor of Arts in General Engineering include:

- **Breadth.** Course requirements for the Bachelor of Arts in General Engineering encourage breadth, including mathematics, natural sciences, humanities and/or social sciences, international studies (language or other courses and experience in a foreign country), and in engineering. The curriculum also allows for many free electives. 

- **Flexibility.** This program is designed to allow students, in consultation with their advisor, the flexibility to choose a program of study that matches their interests. The engineering concentration and the humanities and social science requirements may be departmentally based or may follow a theme designed by the student and his/her advisor. Students are encouraged to minor in any area of their choosing.

- **Interdisciplinary Study.** The distribution requirements are ideal for students who seek to understand areas at the inter-face between technical fields (such as robotics, nanotechnology, and biomaterials) or the connections between a technical area and a discipline in the humanities or social sciences (for example environment issues and international trade or ethics and biotechnology).
International Dimensions of Engineering: Students are required to develop knowledge of the international dimensions of engineering. They may do this by studying abroad or by taking a combination of language and other classes that develop an understanding of the culture, technology, or society in a foreign country.

Requirements for the B.A. Degree

All undergraduate students majoring in the Bachelor of Arts in General Engineering must follow a program approved by their advisor. Candidates must fulfill the overall requirements for the B.A. degree as described in this catalog (see page 50). These include the university writing requirement, distribution requirement and 120 credit minimum. Sample curricula and details on concentrations can be found in the Advising Manual for general engineering (www.engineering.jhu.edu/academics).

Mathematics (20 credits)

Mathematics is at the core of modern science and technology and a solid foundation is required to understand how contemporary engineering problems are solved. Students are required to take five courses including:

- AS.110.108 Calculus I 4
- AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
- One course in statistics 4
- One course at the 200-level or above in either statistics or mathematics 4
- One mathematics or statistics elective 4

Total Credits 20

Natural Sciences (15 credits)

Students are required to take four courses and two laboratory courses including:

- AS.171.101 General Physical Science Major I 4
- or AS.171.107 General Physics for Physical Sciences Majors (AL) 4
- At least one course chosen from the following: 3
  - AS.030.101 Introductory Chemistry I
  - EN.510.101 Introduction to Materials Chemistry
  - AS.020.151 General Biology I
- Two terms of laboratory course 2
- Two elective courses (area code N) 6

Total Credits 15

Humanities and Social Sciences (24 credits)

Writing Requirement. Students must complete at least four (minimum of 12 credits) writing intensive courses (catalog code W) and one of these courses must specifically develop writing skills, such as Technical Communication or Basic Expository Writing.

Humanities or Social Science Concentration. A minimum of four courses (12 credits) must be taken as a coherent group in either the humanities or social sciences, of which two are at the advanced (300+) level.

Humanities or Social Science Elective. Three additional courses (9 credits) in either the humanities or social sciences. These electives are typically used to take courses in economics and the history of science and technology, depending on the courses chosen to fulfill the concentration requirements detailed above.

International Dimensions of Engineering

Because of the importance of the globalization of technology, all students completing the B.A. in general engineering are required to demonstrate competence in being able to address technical issues within the context of another society. This can be done in one of three different ways.

First, students are encouraged to study abroad for a minimum of one fall or one spring semester in any foreign country (except Canada). In that country, they must take the equivalent of a minimum of 12 credits which are transferred to their Hopkins transcript. In this case, these credits can satisfy any degree requirements (Humanities or Social Sciences, Engineering Concentration, Mathematics, Free Electives, etc.).

Second, students may complete the equivalent of two semesters of the same foreign language (students may not use language courses in their native language to satisfy this requirement) and one additional course which relates to the culture, economy, social structure, or politics of a country which uses this foreign language (9 credits).

Third, students may demonstrate proficiency in a foreign language by taking an intermediate course in a foreign language (this can include their native tongue) and two additional courses which relate to the culture, economy, social structure, or politics of a country which uses this foreign language (9 credits).

Engineering Core (15 credits)

One course (3 credits) that is an introduction to an engineering discipline. Examples include:

- EN.500.101 What Is Engineering? 3
- EN.520.137 Introduction To Electrical & Computer Engineering 3
- EN.530.101 Freshman Experiences in Mechanical Engineering 2
- EN.560.141 Perspectives on the Evolution of Structures 3
- EN.570.108 Introduction Environmental Engineering 3

One course (3 credits) in a computer language. Examples include:

- EN.500.200 Computing for Engineers and Scientists 3
- EN.600.107 Introductory Programming in Java 3

Three courses in the fundamentals of engineering science (at least one course from three of the following four areas).

- EN.520.213 Circuits 4
- EN.530.201 Statics and Mechanics of Materials 4
- or EN.560.201 Statics & Mechanics of Materials 4
- EN.510.201 Introductory Materials Science for Engineers 3
- or EN.510.311 Structure of Materials
**Engineering Focus Area (20 credits)**

The concentration in engineering must consist of at least six courses (minimum of 20 credits) that are related thematically or departmentally; at least three (3) of which must be at the advanced level (300 or above). While examples of concentrations are provided in the Advising Manual, students are encouraged to develop their own concentrations in consultation with their faculty advisor.

**Free Electives**

Between five and nine full courses (at least 3 credits each) to ensure a minimum of 120 credits in total. The number of courses required will depend on how the International Dimensions requirement is satisfied and on the courses chosen in other areas. Students must select these courses in consultation with their advisor. These free electives are designed to allow students to develop a curriculum of study uniquely suited to their interests.

Students are required to have a minimum cumulative GPA of 2.0 to graduate. Further, a maximum of 12 “D” credits may be counted toward degree requirements. There is a maximum limit of six “D” credits in any combination of courses used to satisfy the Humanities or Social Sciences concentration, the Engineering Core and the Engineering Concentration (47 total credits). No more than 12 credits completed prior to matriculation or in summer sessions at other accredited colleges or universities may be accepted.

Transfer students are not subject to the 12-credit limit on transfer credit. They must obtain credit for courses they wish to transfer during their first year at Hopkins. University regulations require a minimum of four consecutive full-time semesters and 60 credits earned at JHU for a Hopkins degree.

**Courses**

EN.500.100. Archimedes’ Lever: How Engineers Move the World. 1 Credit.
S/U Grading Only. Freshmen only. This course is an introduction to the world of engineering as a creative endeavor that reshapes the world. This course will give students multiple perspectives on engineering, including historical, ethical, societal, commercial, legal, environmental, and interpersonal. The soul of engineering is invention and students will enjoy opportunities to express their creativity. Weekly meetings will feature presentations and hands-on activities led by the Dean and Vice Deans of engineering as well as other faculty from our campus.
Instructor(s): E. Scheinerman
Area: Engineering.

EN.500.101. What Is Engineering?. 3 Credits.
This is a course of lectures, laboratories, and special projects. Its objective is to introduce students not only to different fields of engineering but also to the analytic tools and techniques that the profession uses. Assignments include hands-on and virtual experiments, oral presentations of product design, and design/construction/testing of structures. Freshmen only or Permission Required.
Instructor(s): M. Karweit
Area: Engineering.

EN.500.103. Hopkins Engineering Sampler Seminar. 1 Credit.
This course provides students with an overview of the undergraduate programs in the Whiting School of Engineering. Faculty from various departments will introduce students to their discipline including aspects of their personal research. Freshmen only.
Instructor(s): E. Scheinerman
Area: Engineering.

EN.500.110. What is Engineering?-Summer. 3 Credits.
To introduce engineering ideas, thoughts, and problem-solving to potential engineering students. The course is intended to establish the framework within which engineers typically operate. Registration Requirement: Algebra II with Trig. Open only to high school students admitted to the Engineering Innovation Summer Program. Undergraduates should refer to EN.500.101.
Instructor(s): K. Borgsmiller; M. Karweit.
EN.500.125. Spatial Reasoning and Visualization for Engineers. 1 Credit.
This course will enhance students ability to imagine and mentally manipulate objects in three-dimensional space—a talent that is important in engineering. Through guided practice and hands-on activities, students will hone their spatial skills. This course is only for engineering freshmen. Registration is by invitation only, based on the results of the summer spatial reasoning diagnostic assessment. S/U only.
Instructor(s): K. Ferrara
Area: Engineering

EN.500.200. Computing for Engineers and Scientists. 3 Credits.
This course introduces a variety of techniques for solving problems in engineering and science on a computer using MATLAB. Topics include structure and operation of a computer, the programming language MATLAB, computational mathematics, and elementary numerical analysis. Co-listed with EN.550.200.
Prerequisites: Prereqs: AS.110.107 OR AS.110.109
Instructor(s): K. Hedrick
Area: Engineering, Quantitative and Mathematical Sciences

EN.500.401. Research Laboratory Safety. 1 Credit.
An introduction to laboratory safety including chemical, biological, radiation, and physical hazards. Includes information on hazard assessment techniques, laboratory emergencies, and general lab standards for Whiting School of Engineering. The class will feature hands-on exercises with real-life experiments. Intended for students who have not yet begun working in a research laboratory.
Instructor(s): D. Kuespert

EN.500.403. Introduction to Research Laboratory Safety.
This course covers laboratory hazards including chemical, biological, radiation (non-ionizing and ionizing), and physical hazards, as well as JHU-specific procedures. This course is intended for undergraduates beginning work in a research laboratory for the first time, as well as other students with no laboratory safety background. Credit may be received for only one of these courses, EN.500.703 Research Lab Safety Review, and EN.540.490 Chemical and Laboratory Safety. Co-listed with EN.500.703, AS.360.403, and AS.360.703. ***NOTE: Most coursework is on Blackboard and must be completed before the live class meeting. A brief introduction to safety in Johns Hopkins University experimental research laboratories.
Instructor(s): D. Kuespert

EN.500.405. Energy Engineering: Fundamentals and Future. 3 Credits.
Area: Engineering, Natural Sciences.

EN.500.410. Surgery For Engineers. 3 Credits.
Perm Req’d. Students must apply for this course - contact Cynthia Ramey at cramcy@jhu.edu
Instructor(s): M. Marohn; R. Kumar
Area: Engineering, Natural Sciences

Instructor(s): J. Selinski

Instructor(s): Staff

EN.500.603. Academic Ethics.
Instructor(s): C. Smith; Staff

EN.500.703. Research Laboratory Safety Review.
This course briefly reviews hazards in the laboratory and provides information regarding JHU-specific procedures such as chemical and biological waste handling. This course is intended for incoming postdoctoral fellows with some experience in laboratory safety; those with no background should take EN.500.403 instead. Credit may be received for only one of these courses, EN.500.403 Intro to Research Lab Safety, and EN.540.490 Chemical and Laboratory Safety. Co-listed with EN.500.403, EN.360.403, and EN.360.703. ***NOTE: Most coursework is on Blackboard and must be completed before the live class meeting. A review of hazards and safety procedures specific to Johns Hopkins University laboratories.
Instructor(s): D. Kuespert

EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): Staff

EN.500.781. Preparation for University Teaching.
This course will prepare graduate students to teach at the university level. Topics covered include large and small class teaching, characteristics of student learning, syllabus construction, grading students, and developing a teaching portfolio. Full-time EN Graduate Students only. Co-listed as EN.360.781.
Instructor(s): R. Shingles

Cross-listed with Mechanical Engineering.
Instructor(s): J. Guest

Instructor(s): Staff

Cross Listed Courses

Civil Engineering

EN.560.141. Perspectives on the Evolution of Structures. 3 Credits.
Why do buildings and bridges look the way they do today? Students will be provided the tools to answer this question for themselves through a study of the history of the design of buildings and bridges throughout the world from both engineering and architectural/aesthetic perspectives. Only simple mathematics is required (no calculus). Students will participate in individual and group critique of structures from engineering, architectural, and social points of view.
Instructor(s): B. Schafer
Area: Engineering, Quantitative and Mathematical Sciences Writing Intensive.

Institute for NanoBio Technology

EN.670.495. Animation in Nanotechnology & Medicine. 3 Credits.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.
EN.670.616. Introduction to NanoBio Tutorials II.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): D. Wirtz.

EN.670.620. Fundamental Laboratory Principles of Nanobiotechnology.
This laboratory course introduces students to fundamental concepts of materials science and cell engineering required for research in biological nanoscience. Topics covered include cell culture, quantitative light microscopy, and synthesis of nanoparticles. This laboratory course is a prerequisite for EN.500.621.

EN.670.629. Cancer Nanotechnology Training Center (CNTC) Tutorial.
This course is to allow CNTC fellows the opportunity each week to review and present on cancer research topics. The papers and discussions covered will be on areas of human cancers and nanotechnology and include the latest developments from studies of model organisms.
Instructor(s): D. Wirtz.

EN.670.695. Animation in Nanotechnology & Medicine.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

Geography and Environmental Engineering

The Department of Geography and Environmental Engineering is concerned with the improved understanding and description of environmental problems including questions of pollutant fate and transport, water resources engineering, environmental chemistry, geomorphology, drinking water and wastewater treatment, ecosystem dynamics, and technology, society, and environmental change. Drawing from a number of disciplines and approaches, elements within these systems are examined, and interconnections among elements are explored. The department represents a unique opportunity for undergraduate education through our environmental engineering major, a geography major, three minors, and for advanced graduate education, research, and interdisciplinary collaboration. Some broadly defined examples of subjects collaboratively studied by our faculty and students are listed below.

• Engineering processes to alleviate environmental problems. This requires knowledge of both natural processes and engineering design. The former addresses phenomena that are basic to understanding how engineering can help solve environmental problems. The latter involves the application of such understanding to problem solutions.
• Surficial, atmospheric and subsurface processes involving interactions of chemical, biological, and hydrological processes in the environment.
• Application of engineering solutions in the context of the public decision making process including economic, social, and administrative factors.
• Analysis of interrelationships between engineering and administrative decisions and cultural, institutional, and governmental sectors of society, especially in the urban environment.

Engineering designs and public decisions must rest upon a sound knowledge of fundamental scientific processes as well as economic policy and social science. Research and study are focused on both basic, and the applied aspects of environmental problems. Interdisciplinary work is necessary, combining, for example, the basic sciences, engineering, and environmental economics. Because of its diversity of interests and association with other departments of the university, the department can offer a broad range of graduate programs based on the natural, social, and engineering sciences.

Department Areas of Interest, Study, and Research

The following areas of interest help illustrate the depth and breadth of academic and research opportunities available through the Department of Geography and Environmental Engineering. This list is far from complete. The interests and expertise of students and faculty within the department are continually expanding and changing. Students are encouraged to work with their advisors to build upon these areas of interest to construct a program that best suits their interests and professional goals and includes sufficient depth and rigor. Unique combinations of course work and research experience make it possible for students to identify and address issues in new, imaginative ways.

The Environmental Engineering area of interest is concerned with issues that involve water and wastewater treatment, transport and fate of contaminants in natural and engineered environments, hazardous and solid waste management, hydrology, and environmental fluid dynamics. Current research efforts are directed to:

1. applying biological, chemical, and physical processes to treatment of contaminants in drinking water or wastewater;
2. evaluating colloidal stability in natural and engineered systems;
3. exploring contaminant transport and interphase transfer, and the influence of these processes on chemical or biological transformations; and
4. examining heat and mass transport and scaling mechanics at the land-atmosphere interface.

The Water and Air Resources Engineering area of interest is concerned with the occurrence, movement, and management of water and air through and above the surface of the Earth. This area involves many faculty in the department and has close interactions with faculty and students throughout Hopkins including those in the Center for Environmental and Applied Fluid Mechanics. Research in this area currently deals with:

1. surface hydrology and groundwater;
2. the dispersion of pollutants in the atmosphere and surface and subsurface waters;
3. water supply, distribution, and risk analysis;
4. measurement and modeling of turbulent environmental flows;
5. mathematical modeling of subsurface and atmospheric transport phenomena;
6. movement of water and chemicals in the vadose zone and in water supply aquifers;
7. the impact of climate change on water resources; and
8. river system dynamics.

The Environmental Chemistry area of interest is devoted to understanding the chemical and biological reactions and mobility of contaminants in natural environments and engineered aquatic systems. Research is focused on

1. identifying chemical and biological constituents of aquatic environments that catalyze, inhibit, or react with organic and inorganic contaminants;
2. exploring how protonation, complex formation, sorption, and partitioning affect rates of contaminant transformation;
3. examining interconnections between physical, chemical, and biological phenomena affecting contaminants; and
4. developing structure-property and structure-reactivity relationships that provide a basis for predicting transformation and fate.

The goal of the area of interest in Systems Analysis and Economics for Public Decision Making is to develop competence in the modeling and analysis of public policy alternatives and private sector responses to those policies. To achieve this goal, students typically emphasize economics or systems analysis or a blend of these two disciplines. Those emphasizing economics undertake specialized training in resource economics, microeconomic theory, cost-benefit analysis, public finance, and econometrics. Example applications include the economics of public works, water and energy pricing and regulation, demand forecasting, natural resource valuation, and public utility financing. Students focusing on systems analysis take courses in the mathematics of optimization and decision analysis, including linear and non-linear programming, integer programming, stochastic programming, simulation, Bayesian analysis, and multiobjective decision making. Example applications include water resources management, siting of urban and regional facilities for services and/or distribution, pollution management, simulation of market responses to environmental policies, and integrated assessment of climate policy and impacts.

The Geomorphology, Hydrology, and Ecology area of interest promotes the fundamental understanding of processes at the Earth’s surface. Research is presently focused on:
1. physical dynamics of tidal freshwater wetland evolution;
2. land use impacts on forest dynamics;
3. sediment transport, channel dynamics, and benthic ecology in rivers;
4. acquisition of metals by plants, fungi, and bacteria;
5. estuarine paleoecology; and
6. maintenance and flushing flows in mountainous rivers.

The Technology, Society, and Environmental Change area of interest focuses primarily on the relationships among social organization, technological and industrial change, the production of space and place, government policy and environmental outcomes. Substantive domains of inquiry include:
1. globalization and regional/local processes of economic, political, and cultural change. In particular, this entails grappling in particular with the behavior of multinational corporations and governments and the regional/local consequences of technological changes and institutional activities and decision making. Comparative studies of industrial transformations and their social and environmental consequences are emphasized.
2. urbanization and regional growth and decay. This involves the study of spatial differentiation in population distributions and their well-being arising out of the spatial mobilities of capital and labor, shifts in industrial structure, and processes of technological and cultural change. Comparative studies of urbanization processes—particularly Baltimore’s—are encouraged; and
3. the dynamics of environmental and social change. This requires consideration of philosophic, economic, and broad-based cultural backgrounds to environmental problems. Issues such as environmental justice, environmental ethics, and a critical application of appropriate knowledge (scientific, economic, cultural) for environmental decision making are strongly emphasized.

Financial Aid
The department maintains a large and continuing program of financial aid for graduate students, including tuition scholarships, fellowship awards, research assistantships, and teaching assistantships. Financial aid is granted on the basis of merit, and criteria for consideration for these awards include academic excellence, professional or research experience, and career commitment to the field. Continued support is subject to the student’s performance, availability of research or TA funds, and requisite staffing of current projects. Ph.D. students receive priority for full financial support. Pending available funding, partial tuition fellowships are offered to qualified master’s students. Ph.D. applicants are nominated by the department for consideration for fellowships. The department often can offer one or more departmental fellowships to help support the most qualified Ph.D. applicants for their first year of study.

Furthermore, many students within the department have been awarded graduate research fellowships available to Ph.D. and M.S. students through programs administered by the National Science Foundation and the Environmental Protection Agency. Graduate fellowships are also available for underrepresented minority students in the engineering and natural science fields through the GEM Consortium. Additionally, the Johns Hopkins Environment, Energy, Sustainability & Health Institute (E²SHI) invites applications for one-year fellowships of up to $25,000 to support Johns Hopkins University doctoral students pursuing interdisciplinary research in environment, energy, sustainability, or health topics. Qualified students are strongly recommended to apply for these fellowships during the fall of the final year prior to beginning graduate studies, as many programs have November or December deadlines.

The Department of Geography and Environmental Engineering offers:
• an undergraduate Bachelor of Science (B.S.) degree in Environmental Engineering
• four focus areas within the environmental engineering major:
  • Environmental Management and Economics
  • Environmental Engineering Science
  • Environmental Transport
  • Environmental Health Engineering
• an undergraduate Bachelor of Arts (B.A.) in Geography
Departments, Program Requirements, and Courses

- two focus areas within the Geography major:
  - Human Geography
  - Physical Geography

- three minors:
  - a minor in environmental engineering
  - a minor in environmental sciences
  - a minor in engineering for sustainable development

- a five-year concurrent (B.S./M.S. or B.S./M.S.E.) program.

As part of these minor programs, or as part of other programs of the student's own design, the department offers electives in such areas as ecology, geomorphology, water and wastewater pollution treatment processes, environmental systems analysis, and environmental policy studies.

Major in Environmental Engineering

The mission of our undergraduate program is to provide students with a broadly based yet rigorous education in the fundamental subjects central to the field, in a milieu that fosters development of a spirit of intellectual inquiry and the problem-solving skills required to address the open-ended issues characteristic of the real world.

Our B.S. program provides a strong foundation in the physical, chemical, and biological sciences, as well as in mathematics, engineering science, and engineering design. It is broad and flexible enough to accommodate students with a variety of interests in environmental engineering. This training should provide an ideal preparation for future employment in business or industry or for subsequent training at the graduate level, either in environmental engineering or in a field such as environmental law, public health, or medicine.

Program Objectives

The B.S. in Environmental Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The Program in Environmental Engineering educates students to think critically, communicate clearly, and collaborate effectively as they apply the fundamental scientific principles of engineering to environmental problems. We emphasize the importance of intellectual growth, professional ethics, and service to society. Our graduates are prepared to be successful:

1. engineering professionals in private and governmental organizations, and
2. students in the best graduate programs.

Our department is noted for our students' exceptionally high pass rate of the "Fundamentals of Engineering" (FE) exam offered by the National Council of Examiners for Engineering and Surveying (NCEES).

Focus Areas within the Environmental Engineering (EE) Major

Students must select between four different focus areas:

- Environmental Management and Economics
- Environmental Engineering Science
- Environmental Transport
- Environmental Health Engineering

With the assistance of a faculty advisor, each student will plan a curriculum suited to his or her ultimate career goals. The program also encourages and supports individual career goals. Program requirements total 125 credits.

Mathematics with a focus on applications (19 credits)

Required Courses:

<table>

<td>Introductory Organic Chemistry Lab</td>
<td></td>
</tr>
</tbody>
</table>

Total Credits 24

Humanities and Social Sciences (HS) (18 credits)

A minimum of six courses totaling 18 credits in Humanities or Social Sciences. The six courses must include:

1. one advisor approved course that specifically develops writing skills (e.g., a how to write class),
2. EN.570.334 Engineering Microeconomics, and
3. four additional Humanities and Social Sciences courses with at least two at the 300-level or higher. EN.570.404 Political Ecology and/or EN.570.406 Environmental History can be taken as part of these requirements. Please note that the writing course will fulfill one of the two writing intensive courses required by the university.

**Note:** most medical schools require a year of English literature and/or composition.

**Required course:**

**Total Credits** 9

The Design and Synthesis sequence is a five-credit project course (2 credits fall semester, 3 credits spring semester) and involves a comprehensive study of the engineering design process from problem definition to final design. The course involves team projects that include written and oral presentations. Students will form small teams that will work with local companies or government agencies in executing the project. Prerequisite: senior standing in Environmental Engineering.

**Note:** 600-level courses require permission of instructor

* These courses are offered on the Bloomberg School of Public Health campus.

---

**Technical Electives (TE) (minimum of 12 credits)**

(selected in consultation with an advisor)
Departments, Program Requirements, and Courses

At least three Engineering, Quantitative Studies, or Natural Sciences at or above the 300-level, subject to approval by the department totalling at least 12 credits.

Technical electives must fulfill the following requirements:

1. TEs must total 12 credits of advanced 300-level Engineering, Quantitative Studies, or Natural Sciences courses, and
2. must be approved by the department. (For ABET requirements at least one from: Solid Waste; Hazardous Waste; Air Pollution; Environmental Health Engineering, if not satisfied as part of the Environmental Engineering electives.) Up to six credits of independent study or research may be applied toward engineering requirements (e.g., EN.570.501 Research/EN.570.502 Undergraduate Research, EN.570.505 Undergraduate Independent Study, or EN.570.499 Senior Thesis). Note earlier comments for premedical majors.

It is strongly recommended that students take additional advanced classes in computing and numerical methods. EE students are strongly encouraged to take at least one course in organic chemistry (e.g., AS.030.205 Organic Chemistry I). The organic chemistry course will meet the TE requirement.

Guidance for Technical Electives for the EE Major

Technical electives are intended to provide students with courses with technical content and extend mastery in appropriate subject matter.

- TEs require use of fundamental science or mathematics, have appropriate prerequisites (e.g., university-level calculus, physics, chemistry, or other N or Q courses) and generally at a 300-level or higher.
- TEs must have the appropriate level of rigor which is defined as encompassing both of the following requirements:
  - 5-10 homework assignments; and
  - a culminating project (final project, group project, paper) or final examination. Lecture-only classes (no homework or exams) will not qualify as a TE for the EE major.
- TEs require accumulation and depth of analytical skill or knowledge. In general, this precludes survey courses or courses that have no technical prerequisites that are taught by multiple professors or a series of guest lecturers, or cover a broad spectrum of a topic instead of building mastery in one area.

Exceptions are possible only with the approval of either the Departmental Chair or Director of Undergraduate Studies.

Sample EE Program (Focus Area: Environmental Engineering Science)

Note: This program is based on the assumption that students have not previously completed A.P. courses in calculus, physics, chemistry, etc.

Environmental engineers play particularly pivotal roles as professionals who bridge the gap between understanding complex scientific concepts and helping to formulate public policies that affect the environment. Environmental engineering has become an important aspect of engineering practice in most engineering fields, and the discipline spans the professional spectrum from the private sector through governmental agencies to academia. An undergraduate minor in environmental engineering allows engineering students to pursue an interest in this field and to incorporate aspects of environmental engineering into careers in other engineering disciplines.

Students in any undergraduate major in the Whiting School of Engineering are eligible for admission to the environmental engineering minor program. Students will work with an advisor in the Department of Geography and Environmental Engineering to develop a program that meets the requirements for the minor and is consistent with the educational requirements of their major field of engineering study.

Requirements of the EE minor program consist of:

- a set of required core science and mathematics courses, already common to civil and chemical engineering majors;
- four required courses in environmental engineering (total of 12 credits, listed below); and
- two elective courses, one taken at the freshman or sophomore level, and the other taken at the junior or senior level.

### Core Courses (EE Minor)

Advanced placement credits and/or equivalent courses in other schools or departments are acceptable, subject to advisor approval.

**Note:** EN.500.200 is not strictly required for students who are willing to undertake additional effort toward obtaining basic skills in these areas; see the instructor if you have specific concerns.

### Elective Courses

(Total of 6 credits) one course from each of two groups is required.

Double counting of these courses with specified required courses in the student’s major is not allowed. Substitution for one required course may be possible under special circumstances, with explicit approval of the environmental engineering minor advisor. Additional course electives are...
possible but require approval of the environmental engineering minor advisor.

**Group A**

Introductory courses at the freshman and sophomore level. One course required.*

- EN.570.107
- EN.570.108
- EN.570.205
- EN.570.239
- EN.570.317
- EN.570.328
- AS.020.151
- AS.270.220

**Group B**

- EN.570.303
- EN.570.353
- EN.570.411
- EN.570.420
- EN.570.423
- EN.570.431
- EN.570.442
- EN.570.443
- EN.570.445
- EN.570.460
- EN.570.490
- EN.570.491
- EN.570.600
- AS.030.204
- AS.030.205
- AS.030.301
- AS.270.220
- AS.270.221
- AS.270.369
- AS.270.375
- AS.540.303
- AS.540.303
- AS.550.310
- EN.560.435

**Core Sciences (ES Minor)**

Because of the interdisciplinary nature of environmental science, it is important that professionals from various areas of expertise acquire a common language and set of core concepts to make discussion and cooperation possible. The following courses represent the minimum set of requirements:

**Mathematics (12 credits)**

- AS.110.108 Calculus I 4
- AS.110.109 Calculus II (For Physical Sciences and Engineering) 4

At least one of the four courses:

- AS.110.201 Linear Algebra 4
- AS.110.202 Calculus III 4
- AS.110.302 Diff Equations/Applic 4
- EN.550.291 Lin Alg & Diff Equations 4

**Biology (3 credits)**

- AS.020.151 General Biology I 3

**Physics (10 credits)**

- AS.171.101 General Physics: Physical Science Major I 4
- AS.171.102 General Physics: Physical Science Majors II 4
- AS.173.111 General Physics Laboratory I 1
- AS.173.112 General Physics Laboratory II 1

**Chemistry (13 credits)**

- AS.030.101 Introductory Chemistry I 3
- AS.030.104
- AS.030.105 Introductory Chemistry Lab I 1
- AS.030.106 Introductory Chemistry Laboratory II 1

**Environmental Sciences**

Students must take two introductory courses dealing with the environment and three or more of the upper-level environmental science courses on the following lists:

**Introductory Courses (6 credits)**

- EN.570.110 Introduction to Engineering for Sustainable Development
- EN.570.205 Ecology
- EN.570.239 Emerging Environmental Issues
- AS.270.110 Freshman Seminar: Sustainable + Non-Sustainable Resources
- AS.270.220 The Dynamic Earth: An Introduction to Geology
- AS.270.221 Lab Dynamic Earth

**Upper-Level Courses (9 credits)**

- EN.570.239 Emerging Environmental Issues
- EN.570.301 Environmental Engineering Fundamentals I
- EN.570.302 Water & Wastewater Treatment
- EN.570.317

For further information, contact Dr. William P. Ball, EE Minor Coordinator, 410-516-5434, bball@jhu.edu, or Adena Rojas, Senior Academic Program Coordinator, 410-516-5533, arojas@jhu.edu.

**Minor in Environmental Sciences**

The environmental sciences minor has been developed to encourage and facilitate studies in environmental sciences by students completing degrees in the other science and engineering disciplines. The environmental sciences (ES) minor requires:

- completion of a set of courses in the core sciences,
- two introductory courses dealing with the environment, and
- three or more upper-level environmental sciences courses, as described.
Environmental Systems

Environmental modeling, risk assessment, environmental systems design, pollution control strategies. Illustrative majors: Civil Engineering, Applied Mathematics and Statistics.

Faculty Advising

A faculty advisor is assigned to each student in the environmental sciences minor program to assist in planning his/her academic program and to approve the choice of courses to satisfy the minor. Faculty advisors are available in the following areas:

Biological Processes: Edward J. Bouwer
Physical Processes: Peter R. Wilcock
Environmental Chemistry: Alan T. Stone
Environmental Systems: Ben Hobbs
Human Geography: Erica J. Schoenberger

For further information, contact Professor Peter Wilcock, EES Coordinator 410-516-5421, wilcock@jhu.edu.

Minor in Engineering for Sustainable Development

Engineers will be increasingly called upon to help devise solutions to the tremendous problems of poverty, inequality, and social and environmental dislocation that afflict major parts of the globe in the 21st century. Working as an engineer in this context involves negotiating highly complex social, economic, and political realities and dealing with a wide range of institutions and actors, including national and local governments, multilateral lenders such as the World Bank, diverse non-governmental organizations (NGOs), and local communities. It also increasingly involves working in interdisciplinary teams with social scientists, public health and medical workers, humanitarian aid workers, bankers, politicians, and the like. “Sustainable” development implies a development path that is socially equitable, culturally sensitive, and environmentally appropriate over a multi-generational time frame. The minor in Engineering for Sustainable Development exposes engineering students to some of the key issues related to development, methods of information-gathering in diverse and difficult settings, and working effectively with non-engineers on complex problems.

The minor encompasses seven courses. The core course is EN.570.110 Introduction to Engineering for Sustainable Development. Five additional courses will be selected in a program devised in consultation with the minor advisor.

Of the Five Additional Courses

• Three must be grouped around a specific theme, region or within a specific discipline. Themes might include, for example, public health, environment, or economic development. Regions include Africa, Latin America, or Asia. Disciplinary concentrations might be in Anthropology, Economics, Geography, History, Political Science, Public Health, or Sociology.
• Three of the courses must be at the 300-level or above.
• One of the courses must cover methods for gathering and evaluating information in a development context.

Examples include:

<table>

Pairing a Major with the ES Minor

Many of the most creative and productive advances in environmental sciences in recent years have come from scientists trained in traditional disciplines (biology, chemistry, geology, physics, and engineering) who have devoted themselves to the study of environmental problems. Completion of the degree requirements of a traditional discipline provides depth and rigor that, when supplemented with additional academic training in environmental science, can be applied to professional work in a variety of environmental subjects, as the following examples show:

Biological Processes

Response of ecosystems to change, microbial degradation of pollutants, biogeochemical cycling of greenhouse gases. Illustrative majors: Biology, Biomedical Engineering, Biophysics, Biochemical Engineering.

Physical Processes

Erosion of hillslopes, rivers, and coastlines; sediment production, transport, and fate; groundwater, movement of contaminant plumes; oceanography; atmospheric physics; aerosol formation; global warming. Illustrative majors: Civil Engineering, Chemical and Biomolecular Engineering, Mechanical Engineering, Physics, Earth and Planetary Sciences.

Environmental Chemistry

Focus Areas within the Geography Major

Students may select between two different focus areas within the geography major:

**Human Geography Requirements**

- And knowledge of one foreign language at the intermediate level.
- at least four appropriate introductory courses (12 or more credits) are also required in such fields as anthropology, economics, humanities, political science, and sociology.
- a minimum of nine courses (about 27 credits) at or above the intermediate level in their field of major interest (in consultation with the geography advisor).

The aim here is to enable students to build their own combination of departmental courses and courses from relevant cognate disciplines. Someone specializing in economic geography, for example, might include courses on natural resources, society and environment, environmental economics, and political ecology combined with courses in anthropology, political science, sociology, or economics. A student interested in urban geography might combine course work in the department with courses in the humanities, in political science, or in urban economics, while taking advantage of the seminar-internship on urban policy in a government department or with a community organization. A student interested in environmental issues could work across the physical-human divide and combine course work in ecology and geology with seminars on environmental policy, ethics, and philosophy. Someone specializing in cultural geography could combine work on the social and geographical landscape with courses in social and cultural anthropology.

**Physical Geography**

The major with a focus area in physical geography consists of four parts:

1. mathematics,
2. the basic natural sciences,
3. those sciences directly related to the student’s area of specialization, such as environmental chemistry, physical geography, or biogeography, and
4. courses which focus on the environment itself: the atmosphere, earth, and hydrosphere.

**Requirements**

- AS.110.202 Calculus III/EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering (or the equivalent).
- at least four appropriate introductory courses (12 or more credits) are also required in such fields as chemistry, biology, geology, or physics.
- a minimum of eight courses (about 24 credits) at the intermediate level in their field of major interest (in consultation with their geography minor advisor).

Undergraduates with an interest in environmental chemistry, for example, would take fundamental courses such as organic chemistry, biochemistry, and thermodynamics, while those oriented toward the earth sciences would take courses in petrology, thermodynamics, fluid mechanics, and other aspects of geology. For a student interested in biogeography—dealing with the spatial pattern of plants, the role of environmental factors...
in influencing those distributions, and the effect of changes in vegetation on the landscape—the department offers courses in plant geography, ecology, and paleoecology.

Program in Public Decision Making

Undergraduates majoring in geography may satisfy departmental requirements through the program in Systems Analysis and Economics for Public Decision Making. In addition to prerequisites from other departments (e.g., EN.550.361 Introduction to Optimization-EN.550.362 Introduction to Optimization II and AS.180.101 Elements of Macroeconomics-AS.180.102 Elements of Microeconomics), students in this program take at least four courses from the public decision making curriculum, including EN.570.495 Mathematical Foundations For Public Decision Making and EN.570.493 Economic Foundations For Public Decision Making.

Requirements for Advanced Degrees

Course work requirements for the master’s degree and doctorate are generally flexible. Former training and experience and the special field of interest influence the development of each student’s program of advanced study.

No 100-level or 200-level courses can be counted toward the credit requirements for master’s degrees.

Proficiency in one foreign language is required for all degree candidates in Human Geography. Based on the nature and need of students’ educational and research programs, faculty advisors may require proficiency in one foreign language for an M.A. or a Ph.D. degree. There is no language requirement for the M.S.E. degree.

Ph.D. Degree

The goals for students in the Ph.D. program are

• to develop reasoning skills that can be applied to new and unanticipated issues;
• learn how to pose questions and answer them in a logical manner;
• acquire a depth of understanding and technical knowledge in a particular study area, on par with others worldwide; and
• make a significant contribution to our understanding in this particular study area. The emphasis in the Ph.D. degree is upon a sound foundation in the fundamentals required in a given area with considerable flexibility in course selection determined by the interests and background of each graduate student. The doctoral student must take the equivalent of about two full academic years of formal course work. Roughly half of this is done in the principal subject, and the rest is chosen from allied fields. The minimum residence requirement is two consecutive semesters registered as a full-time student.

All students must pass departmental and Graduate Board oral examinations for the doctorate. Usually these examinations are taken after two years of academic work. Research leading to the dissertation should make an original contribution to the chosen field of specialization, and the result must be worthy of publication. A final dissertation defense that involves an open seminar and a closed oral examination is required of all DoGEI doctoral students.

Master of Science (M.S.) Degree

The M.S. degree is open to students with undergraduate degrees in engineering, mathematics, biology, chemistry, physics, geology, and other scientific disciplines. The M.S. degree program includes the following requirements:

• a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
• at least 50% of the required 30 credits must come from courses within the department.
• students are permitted to apply up to two classes with a grade of “C” toward their degree.
• up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

M.S. students have the option to complete an independent research project, submitted as a formal essay. A minimum of two semesters is required to complete the M.S. degree without the research project option. Three to four semesters are typically required to complete the degree with a research project.

M.S. students are strongly recommended to take as prerequisites for the M.S. program mathematics through differential equations and computing skills. Additionally, M.S. students who choose to follow Contaminate Fate and Transport, Environmental Process Engineering, and Water Resources Engineering concentrations are encouraged to take an introductory fluid mechanics course. Whether introductory fluid mechanics will count towards an M.S. student’s graduation credits is decided on a case-by-case basis by the department. Each individual’s program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

Concentrations for the M.S. Degree

Environmental Science

This concentration provides a broad yet rigorous background for environmental professionals. Using the department’s areas of interest, study, and research as guides and in consultation with their advisors, M.S. students can construct their own concentration that complements and
expands their interests and professional goals. Additionally, M.S. students can choose to follow or pull from the M.S.E. concentration tracks: Fate & Transport, Environmental Management and Economics, Environmental Process Engineering, and Water Resources Engineering.

**Environmental Science and Policy**

This concentration is similar to Environmental Science but includes economics and systems courses. Four courses are recommended in environmental science, including the following:

- EN.570.445 Physical and Chemical Processes 3
- EN.570.446 Biological Process of Wastewater Treatment 3
- EN.570.448 Physical and Chemical Processes II 3

M.A. and M.S. students pursuing this program who do not have prior background in environmental engineering can substitute EN.570.301 Environmental Engineering Fundamentals I and EN.570.302 Water & Wastewater Treatment in lieu of the courses suggested above.

The other environmental science courses should be chosen from the following:

- EN.270.375
- EN.570.306
- EN.570.319
- EN.570.411 Engineering Microbiology 4
- EN.570.442 Environmental Organic Chemistry 3
- EN.570.443 Aquatic Chemistry 3
- EN.570.491 Hazardous Waste Engineering and Management 3

Four courses are required in environmental policy, including:

- EN.570.493 Economic Foundations For Public Decision Making 3
- EN.570.495 Mathematical Foundations For Public Decision Making 3

Choose one of the following:

- AS.195.477 Intro To Urban Policy
- AS.195.478 Urban Policy Internship
- AS.195.607 The Policy Process
- EN.570.497 Risk and Decision Analysis
- EN.570.659 Environmental Policy Analysis

The final two courses would be a project or electives in environmental science, engineering, policy, or systems that are appropriate to the student’s goals.

**Master of Science in Engineering (M.S.E.) Degree**

The M.S.E. degree is open to students with an ABET-accredited undergraduate engineering degree or demonstrated equivalent. The M.S.E. degree program includes the following requirements:

- a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
- at least 50% of the required 30 credits must come from courses within the department.
- students are permitted to apply up to two classes with a grade of “C” toward their degree.

- 5-6 required courses and 4-5 recommended elective courses depending on concentration (Note: In order to substitute an alternate course for a recommended elective, students must receive written approval from their advisor).
- prerequisites (required) for the M.S.E. program includes mathematics through differential equations and computing skills.
- up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

The M.S.E. program is typically a nine month program based on course work alone. However, M.S.E. students have the option to complete an independent research project, submitted as a formal essay or group project report. An M.S.E. degree with significant research components will usually require three to four semesters for completion and is generally intended for those students planning to work in engineering practice. Each individual’s program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor. M.S.E. students select from the concentrations below.

**Recommended Electives Note:** It is strongly advised to select elective courses from the list of recommended electives appropriate for each concentration. In order to substitute an alternate course for a recommended elective, students must receive written approval from their advisor.

**Concentrations for the M.S.E. Degree**

**Contaminant Fate and Transport**

This concentration emphasizes understanding of physical, chemical, and biological phenomena that affect the movement and transformation of pollutants in the environment.

**Required courses:**

- EN.570.411 Engineering Microbiology 4
- EN.570.441 Environmental Inorganic Chemistry 3
- EN.570.442 Environmental Organic Chemistry 3
- EN.570.443 Aquatic Chemistry 3
- EN.570.452 Exper Meth Env Eng Chem 4

One course in applied mathematics, numerical analysis, or engineering mathematics, such as:

- EN.570.495 Mathematical Foundations For Public Decision Making
- EN.570.496 Urban and Environmental Systems
- EN.570.487 Financial Market Research
- EN.570.661 Applied Math For Enginee

**Recommended electives include:**

- EN.570.375 Groundwater 3
- EN.570.521 Landscape Hydrology and Watershed Analysis
- EN.570.446 Biological Process of Wastewater Treatment 3
- EN.570.459
- EN.570.460 Environmental Colloidal Phenomena 3
- EN.570.656
- EN.570.657 Air Pollution
- EN.570.686 Multiscale Flow & Transport
Environmental Process Engineering
This concentration involves the analysis and design of processes of water treatment, waste treatment, and environmental remediation, and includes a solid grounding in the chemical, biological, and physical principles underlying treatment and remediation technologies.

Required courses:
EN.570.411 Engineering Microbiology 4
EN.570.443 Aquatic Chemistry 3
EN.570.445 Physical and Chemical Processes 3
EN.570.446 Biological Process of Wastewater Treatment 3
EN.570.448 Physical and Chemical Processes II 3
EN.570.452 Exper Meth Env Eng Chem 4

One course in applied mathematics, numerical analysis, or engineering mathematics, such as:
EN.570.487 Financial Market Research
EN.570.495 Mathematical Foundations For Public Decision Making
EN.570.496 Urban and Environmental Systems
EN.570.661 Applied Math For Enginee

Additional requirements: an introductory fluid mechanics course. If this prerequisite is lacking, it can be taken as part of the course of study, but the credits will not be counted toward the 30-credit requirement.

Recommended electives include:
At least one course in Systems Analysis or Economics
EN.570.493 Economic Foundations For Public Decision Making
EN.570.497 Risk and Decision Analysis
EN.570.423 Principles of Geomorphology 4
EN.570.431 Sediment Transport & River Mechanics 3
EN.570.443 Aquatic Chemistry 3
EN.570.445 Physical and Chemical Processes 3
EN.570.686 Multiscale Flow & Transport

Environmental Management and Economics
This concentration focuses on using models of physical and economic systems to analyze and improve the design of public policies and environmental control systems.

Required courses:
EN.570.493 Economic Foundations For Public Decision Making 3
EN.570.495 Mathematical Foundations For Public Decision Making 3
EN.570.496 Urban and Environmental Systems 3
EN.570.497 Risk and Decision Analysis 3
EN.570.608 Data Analytics for Engineering, Policy Analysis and Management 3
EN.570.659 Environmental Policy Analysis

Recommended electives include:
At least one course in physical, chemical, or biological processes
EN.570.607 Energy Policies & Plan Models
EN.570.611 *
EN.570.618 Multiobject Programming and Planning
EN.570.676 Stochastic Programming

* Or other environmental economics course.

M.A. Degree
The M.A. degree is open to students with undergraduate degrees in social sciences or the humanities. It requires:

• a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
• at least 50% of the required 30 credits must come from courses within the department.
• students are permitted to apply up to two classes with a grade of “C” toward their degree.
• up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.
In addition to these course credits, M.A. students have the option to complete an independent research project, submitted as a formal essay. Students can focus on one of the department’s areas of interest, study, or research or construct their own program that complements and expands their undergraduate experience; three semesters are typically required to complete the degree. Each program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

For current faculty and contact information go to http://engineering.jhu.edu/dogee/people/faculty.html

Faculty
Chair
Edward J. Bouwer
Abel Wolman Professor of Environmental Engineering: environmental engineering, environmental microbiology, waste treatment.

Professors
William P. Ball
Professor: environmental engineering, contaminant fate and transport.

Grace S. Brush
Professor: ecology, plant geography.

J. Hugh Ellis
Professor: environmental systems.

Steve H. Hanke
Professor: applied micro- and macroeconomics and finance.

Benjamin F. Hobbs
Theodore K. and Kay W. Schad Professor of Environmental Management: energy and environmental systems, engineering and economics.

A. Lynn Roberts
Professor: environmental chemistry.

Erica J. Schoenberger
Professor: economic geography, environment, society and technology, environmental history.

Alan T. Stone
Professor: environmental and aquatic chemistry.

Peter R. Wilcock
Professor: mechanics of earth surface processes, applied geomorphology.

Associate Teaching Professor
Hedy V. Alavi
Associate Teaching Professor, Program Chair, EP Environmental Engineering, Science, and Management: environmental engineering, hazardous and solid waste engineering and management.

Professor Emeritus
John J. Boland
Professor Emeritus: environmental economics and policy.

Research Professor Emeritus
Eugene D. Shchukin

Assistant Professors
Kai Loon Chen
Assistant Professor: physiochemical processes, particle interaction.

Seth Guikema
Assistant Professor: Probabilistic systems modeling techniques, risk analysis, uncertainty modeling, infrastructure modeling, and decision making under uncertainty.

Claran Harman
Assistant Professor: watershed hydrology, geomorphology.

Associate Research Professor
Justin C. Williams
Associate Research Professor: environmental and urban systems.

Joint, Part-Time, and Visiting Appointments
Joseph Katz
Professor (Mechanical Engineering): experimental fluid mechanics, development of advanced diagnostics techniques.

Charles Meneveau
Professor (Mechanical Engineering): environmental fluid mechanics, engineering, turbulence.

Marc B. Parlange
Adjunct Professor: hydrology, environmental fluid mechanics, atmospheric interactions.

Andrea Prosperetti
Professor (Mechanical Engineering): fluid mechanics, bubble mechanics, numerical simulations.

Kellogg Schwab
Associate Professor (Environmental Health Engineering, Bloomberg School of Public Health): environmental public health, pathogen microbiology.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses
EN.570.108. Introduction Environmental Engineering. 3 Credits.
Overview of environmental engineering including water/air quality issues, water supply/ wastewater treatment, hazardous/solid waste management, pollution prevention, global environmental issues, public health considerations/environmental laws, regulations and ethics.Cross listed with Public Health Studies.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.109. Environment & Society: Towards Sustainability. 3 Credits.
An introduction to understanding sustainability, with a focus on identifying and implementing solutions for a world of increasing needs and limited resources.
Instructor(s): C. Norman
Area: Humanities, Social and Behavioral Sciences.
EN.570.110. Introduction to Engineering for Sustainable Development. 3 Credits.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

EN.570.205. Ecology. 3 Credits.
Introduction to processes governing the organization of individual organisms into populations, communities, and ecosystems. Interactions between individual organisms, groups of organisms, and the environment, including adaptation, natural selection, competition.
Instructor(s): G. Brush
Area: Natural Sciences.

EN.570.210. Computation/Math Modeling. 3 Credits.
An introduction to the use of computers in developing mathematical models. A structured approach to problem definition, solution, and presentation using spreadsheets and mathematical software. Modeling topics include elementary data analysis and model fitting, numerical modeling, dimensional analysis, optimization, simulation, temporal and spatial models. Recommended Course Background: AS.110.108 or equivalent.
Instructor(s): P. Wilcock
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.239. Emerging Environmental Issues. 3 Credits.
Scientific principles underpinning environmental issues, with an emphasis on potential impacts of anthropogenic perturbation on human and ecosystem health. Recommended Course Background: two semesters of Chemistry.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.285. Understanding Aid: Anthropological Perspectives for Technology-Based Interventions. 3 Credits.
This course combines anthropological perspectives with the discussion and examination of technology-based interventions in the field of development and aid policies, with particular focus on activities related to water resources, sanitation, and hygiene. Readings and discussions analyze some of the theoretical, historically rooted, and practical issues that challenge those who hope to provide effective aid. A key aim of this course is to provide students with better understanding of cultural, social, environmental and economic issues relevant to technical intervention in developing countries.
Area: Humanities, Social and Behavioral Sciences.

EN.570.301. Environmental Engineering Fundamentals I. 3 Credits.
Fundamentals and applications of physical and chemical processes in the natural environment and engineered systems. This class will cover material balances, chemical equilibrium, chemical kinetics, vapor pressure, dissolution, sorption, acid-base reactions, transport phenomena, reactor design, water quality, and environmental implications of nanotechnology.
Instructor(s): K. Chen
Area: Engineering, Natural Sciences.

EN.570.302. Water & Wastewater Treatment. 3 Credits.
Theory and design of water and wastewater treatment processes including coagulation, sedimentation, filtration, adsorption, gas transfer, aerobic and anaerobic biological treatment processes, disinfection, and hydraulic profiles through treatment units.
Prerequisites: EN.570.301 or permission required.
Instructor(s): W. Ball
Area: Engineering, Natural Sciences.

EN.570.304. Environmental Engineering Laboratory. 3 Credits.
Introduction to laboratory measurements relevant to water supply and wastewater discharge, including pH and alkalinity, inorganic and organic contaminants in water, reactor analysis, bench testing for water treatment, and measurement and control of disinfection by-products. Recommended Course Background: EN.570.210 or Instructor Permission; Corequisite: EN.570.302.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.305. Environmental Engineering Systems Design. 4 Credits.
Techniques from systems analysis applied to environmental engineering design and management problems: reservoir management, power plant siting, nuclear waste management, air pollution control, and transportation planning. Design projects are required.
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.310. Unraveling Error: Moral Explorations of Technology. 3 Credits.
In this course we will explore the concept of error as a way of thinking through the fundamental moral problems posed by technology. We will unpack how technologies have created new ways of living that pose both new possibilities and new challenges to established value systems. We will critically think through the notion of technological progress in relation to error, through specific cases such as disasters, climate change and global inequalities. And we will examine moral decision making in engineering ethics and how it is rooted in different ways of understanding and considering (or ignoring) error and its consequences.
Instructor(s): M. Ottens
Area: Humanities, Engineering Writing Intensive.

EN.570.312. Projects in Appropriate and Sustainable Technology. 1 Credit.
Corequisite: EN.570.311
Corequisites: EN.570.311
Instructor(s): E. Schoenberger; W. Ball.

EN.570.320. Topics on Appropriate and Sustainable Technology for Developing Communities. 1 Credit.
Lectures, readings and discussions on general and location-specific issues related to collaborative student projects about appropriate technology-based interventions. Focus is on improving student understanding about some of the environmental, social, health, and economic issues relevant to the development of sustainable technical interventions for under-developed communities and about the role of engineers in designing, planning, implementing, and evaluating such interventions.
Instructor(s): W. Ball
Area: Engineering, Social and Behavioral Sciences.

EN.570.321. Practicum on Appropriate and Sustainable Technology for Developing Communities. 2 Credits.
Permission required Academic and practical support for students working on engineering projects in developing countries. Readings and discussions on general and location-specific issues related to collaborative student projects about appropriate technology-based interventions.
Instructor(s): W. Ball
Area: Engineering, Social and Behavioral Sciences.
EN.570.322. Projects in Appropriate and Sustainable Technology. 1 Credit.
Corequisite: EN.570.311
Instructor(s): W. Ball.

EN.570.328. Geography & Ecology of Plants. 3 Credits.
Patterns of aquatic and terrestrial plant species; historical changes in patterns using paleobotanical techniques; emphasis on biological and physical mechanisms controlling the patterns; the role of climate and man on plant distributions; several field trips; project required.
Instructor(s): G. Brush
Area: Natural Sciences.

EN.570.334. Engineering Microeconomics. 3 Credits.
This course uses a calculus-based approach to introduce principles of engineering economics and microeconomics (demand and production theory) and their uses in engineering decision making. Recommended Course Background: AS.110.202
Instructor(s): C. Norman
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.351. Introduction to Fluid Mechanics. 3 Credits.
Introduction to the use of the principles of continuity, momentum, and energy to fluid motion. Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow. Recommended Course Background: Statics, Dynamics, and AS.110.302
Instructor(s): P. Wilcock
Area: Engineering.

EN.570.353. Hydrology. 3 Credits.
The occurrence, distribution, movement, and properties of the waters of the Earth. Topics include precipitation, infiltration, evaporation, transpiration, groundwater, and streamflow. Analyzes include the frequency of floods and droughts, time-series analyzes, flood routing, and hydrologic synthesis and simulation. Recommended Course Background: AS.110.302, EN.570.351
Instructor(s): C. Harman
Area: Social and Behavioral Sciences.

EN.570.375. Groundwater. 3 Credits.
This introductory course emphasizes the fundamental principles governing the movement of water and contaminants in groundwater systems. Topics include groundwater hydraulics, well hydraulics, groundwater recharge, and solute transport. Prerequisites: EN.550.291/AS.110.302; Corequisites: EN.570.351
Instructor(s): M. Hilpert.
Area: Environmental Studies.

EN.570.395. Principles of Estuarine Environment: Chesapeake Bay. 3 Credits.
Topics include the physical, chemical, and biological components of the Chesapeake Bay ecosystem from the time it started to form some 10,000 to 12,000 years ago, when sea level began to rise as the continental glaciers receded; the geology, geomorphology, and biology of the watershed drained by the estuary; relationships between the watershed and the estuary through the millennia and the effect of climate, geomorphology, and humans on the ecology of the ecosystem and its economic productivity.
Instructor(s): G. Brush
Area: Engineering, Natural Sciences.

EN.570.401. Ecosystems Ecology. 3 Credits.
This course compares the geography, biological structure, economics, history and dynamics of a number of terrestrial and marine ecosystems. The effect of human and natural disturbance, including climate on the evolution of the ecosystem will be considered. Designs for restoration and maintenance of ecosystems within the context of climate change and societal organizations will be studied. Sources will include historical and paleoecological records as well as results from the National Science Foundation Long Term Ecological Studies of Ecosystems (the LTER program).
Area: Natural Sciences
Writing Intensive.

EN.570.402. Practicum on Appropriate and Sustainable Technology for Developing Communities. 2 Credits.
Suggested: Microeconomics, Introductory Statistics and Optimization.
Instructor(s): W. Ball
Area: Engineering.

EN.570.403. Ecology. 3 Credits.
This is a graduate level of EN.570.205; Additional Writing Requirements.
Instructor(s): G. Brush
Area: Natural Sciences
Writing Intensive.

EN.570.404. Political Ecology. 3 Credits.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

EN.570.405. History of Environmental Thought. 3 Credits.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

EN.570.406. Environmental History. 3 Credits.
Environmental history explores the interactions between social change and environmental transformation, or the ways in which societies modify landscapes and are themselves affected by geological, climatological and changing ecological conditions. Topics include the relationship between climate change and human evolution, the environmental impacts of market-based commodity production and regional economic specialization; the relationship between urbanization and environmental change; how warfare affects and is affected by environmental conditions. Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.
EN.570.407. Comparison of Environmental Challenges and Governance in China and the US. 3 Credits.
In cooperation with the School of the Environment at Nanjing University, Nanjing, China, this course will study China's environmental challenges and governance in the context of America's own environmental challenges and governance system. Case studies will involve greenhouse gas emissions and a comparison of water quality issues in Tai Lake and the Chesapeake Bay. We will consider how developments may shape business, government, and culture, and the ways in which China and America may learn from one another. The class sessions will be conducted in part “live,” in part by teleconference with Nanjing University, and in part by web (including communications with Nanjing University students and faculty). The objectives for the course are to 1) Provide students with basic information and concepts of law, business, and governance needed to understand 21st century environmental governance challenges; 2) Provide students exposure to important environmental problems facing both China and America; 3) Provide students with alternative frameworks needed to sift through and understand the wealth of information about environmental challenges and opportunities faced by China in the globalized world; and 4) Encourage students to learn to observe and think independently about how to frame and address questions of China environmental challenges and governance which may be key to the 21st century.
Instructor(s): E. Bouwer; H. Alavi
Area: Social and Behavioral Sciences.

EN.570.410. Ethics for Engineering. 3 Credits.
This two day intersession class will explore in detail the demand for energy in the built environment. Co-taught by the Johns Hopkins Energy Manager students will look at how buildings use energy and what steps they can take to reduce energy. The class will emphasize understanding behavior, economics and technologies and explore the meaning of sustainability. Case studies from the University will be presented. Day three will be focused on how energy (conservation, efficiency and renewable) projects can be financed.
Area: Social and Behavioral Sciences.

EN.570.411. Engineering Microbiology. 4 Credits.
Fundamental aspects of microbiology and biochemistry as related to environmental pollution and water quality control processes, biogeochemical cycles, microbiological ecology, energetics and kinetics of microbial growth, and biological fate of pollutants.
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.412. Landscape Hydrology and Watershed Analysis. 3 Credits.
The purpose of this class is to understand the landscape-scale controls on the fluxes of water and waterborne materials through watersheds. This class differs from the Hydrology and Hydrologic Modeling classes in its focus on data analysis, and its embrace of the complexity of real landscapes. There will be significant quantitative components to the material taught, but emphasis will be on developing a greater sense of the way that landscapes “function”, and how this function is related to real-world issues of water resources and pollution. Students will gain an understanding of how climate, geologic and ecologic setting, and human impacts control the partitioning of water between different fates, the flowpaths through the landscape and the storage and residence time of water. They will also learn conceptual and practical tools for analyzing hydrologic and other landscape data, and integrating this data in a holistic approach to watershed analysis. The class will be of interest for students intending to go into watershed or landscape management, and anyone wishing to pursue research in hydrology, geomorphology or ecology at landscape and watershed scales. The class will include at least one field trip to an instrumented watershed. GIS skills will be an advantage but are not required. Recommended Course Background: AS.270.405 or EN.570.353 or equivalent.
Instructor(s): C. Harman
Writing Intensive.

EN.570.418. Multiobjective Programming and Planning. 3 Credits.
Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Undergraduate level of EN.570.618. Recommended Course Background: EN.570.495 or Permission Required.
Instructor(s): J. Williams
Area: Engineering.

EN.570.419. Environmental Engineering Design I. 2 Credits.
Through general lectures and case study examples, this course will expose students to some of the non-technical professional issues that they will face as professional engineers in their second-semester senior design project.
Instructor(s): B. Hobbs
Area: Engineering.

EN.570.421. Environmental Engineering Design II. 3 Credits.
Engineering design process from problem definition to final design. Team projects include written/oral presentations. Students will form small teams that work with local companies or government agencies in executing the project. Recommended Course Background: EN.570.302, EN.570.352, and EN.570.419
Instructor(s): E. Bouwer; P. Wilcock
Area: Engineering.

EN.570.423. Principles of Geomorphology. 4 Credits.
Analysis of the factors responsible for the form of the landscape. The concept of the cycle of erosion is discussed primarily in terms of the principles that govern the processes of erosion. Climate, conditions of soil formation, and the distribution of vegetation are considered as they relate to the development of landforms. Recommended Course Background: AS.270.220 or permission required.
Instructor(s): P. Wilcock
Area: Natural Sciences.
EN.570.442. Geomorphic and Ecologic Foundations of Stream Restoration. 3 Credits.
Principles from hydrology, sedimentation engineering, geomorphology, and ecology applied to design and assessment of stream restoration. Watershed context, design alternatives, uncertainty, ecological response. Field trips, design exercises, and project assessment.
Instructor(s): P. Wilcock
Area: Engineering, Natural Sciences.

EN.570.428. Problems in Applied Economics. 3 Credits.
This course brings the principles of economic theory to bear upon particular problems in the fields of economics, finance and public policy. Micro, macro and international problems, from both the private and public sectors, are addressed. A heavy emphasis is placed on research and writing. Students learn how to properly conduct substantive economic research, utilizing statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Permission Required.
Instructor(s): S. Hanke
Area: Social and Behavioral Sciences
Writing Intensive.

EN.570.432. Sediment Transport & River Mechanics. 3 Credits.
Sediment entrainment, transport, and deposition; the interaction of flow and transport in shaping river channels. Review of boundary layer flow; physical properties of sediment; incipient, bed-load, and suspended-load motion; bed forms; hydraulic roughness; velocity and stress fields in open channels; scour and deposition of bed material; bank erosion; size, shape, planform, and migration of river channels. Techniques of laboratory, theoretical, and numerical modeling are developed and applied to problems of channel design, restoration, and maintenance. Recommended Course Background: EN.570.351
Instructor(s): P. Wilcock
Area: Engineering, Natural Sciences.

EN.570.441. Environmental Inorganic Chemistry. 3 Credits.
Advanced undergraduate/graduate course that explores the chemical transformations of elements of the periodic table. Thermodynamic, kinetic, and mechanistic tools needed to address the multiple chemical species and interfaces that are present in natural waters and water-based technological processes are emphasized. Ligand exchange, metal ion exchange, adsorption/desorption, precipitation/dissolution, electron and group transfer reactions, and other concepts from coordination chemistry will be covered. Applications include elemental sources and sinks in ocean waters, reactive transport in porous media, weathering and soil genesis, nutrient and toxic element uptake by organisms, water treatment chemistry, and rational design of synthetic chemicals.
Prerequisites: Prereq: EN.570.443
Instructor(s): A. Stone
Area: Natural Sciences.

EN.570.442. Environmental Organic Chemistry. 3 Credits.
Advanced undergraduate/graduate course focusing on examination of processes that affect the behavior and fate of anthropogenic organic contaminants in aquatic environments. Students learn to predict chemical properties influencing transfers between hydrophobic organic chemicals, air, water, sediments, and biota, based on a fundamental understanding of intermolecular interactions and thermodynamic principles. Recommended Course Background: AS.030.104 or permission required.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.443. Aquatic Chemistry. 3 Credits.
Equilibrium speciation of natural waters, biofluids, and engineered systems. Electrolyte solutions, acids and bases, complex formation, precipitation and dissolution, oxidation and reduction. Recommended Course Background: One year of both Chemistry and Calculus.
Instructor(s): A. Stone
Area: Engineering, Natural Sciences.

EN.570.445. Physical and Chemical Processes. 3 Credits.
The application of basic physical and chemical concepts to the analysis of environmental engineering problems. Principles of chemical equilibrium and reaction, reaction engineering, interphase mass transfer, and adsorption are presented in the context of process design for unit operations in common use for water and wastewater treatment. Topics addressed include mass balances, hydraulic characteristics of reactors, reaction kinetics and reactor design, gas transfer processes (including both fundamentals of mass transfer and design analysis), and adsorption processes (including both fundamentals of adsorption and design analysis).
Prerequisites: EN.570.301 AND EN.570.302 or permission of instructor
Instructor(s): W. Ball
Area: Engineering.

EN.570.446. Biological Process of Wastewater Treatment. 3 Credits.
Fundamentals and application of aerobic and anaerobic biological unit processes for the treatment of municipal and industrial wastewater. Recommended Course Background: EN.570.411
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.448. Physical and Chemical Processes II. 3 Credits.
Fundamentals and applications of physical and chemical processes used in water and wastewater treatment. This class will cover particle interactions, coagulation, flocculation, granular media filtration, membrane processes, and emerging water treatment processes. Recommended Course Background: EN.570.445 or Permission Required.
Instructor(s): K. Chen
Area: Engineering.

EN.570.449. Social Theory for Engineers. 3 Credits.
Engineers work in a social context. This course addresses a number of questions about that social context. How should we understand how societies come about, how they evolve, and why the rules of the game are what they are? What is the relationship between the individual and society, what does it mean to be ‘modern,’ are there different forms of rationality? How might all this impinge on what it means to be an engineer?
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

EN.570.452. Exper Meth Env Eng Chem. 4 Credits.
An advanced laboratory covering principles of modern analytical techniques and their applications to problems in environmental sciences. Topics include electrochemistry, spectrometry, gas and liquid chromatography. The course is directed to graduate students and advanced undergraduates in engineering and natural sciences. Recommended Course Background: EN.570.443
Instructor(s): A. Stone
Area: Engineering, Natural Sciences
Writing Intensive.
EN.570.460. Environmental Colloidal Phenomena. 3 Credits.
This class will introduce fundamental concepts of colloidal and interfacial phenomena and apply them to natural and engineered aquatic systems. This course will also include topics related to the environmental applications and implications of nanotechnology. Modern measurement techniques employed in the laboratory to study colloidal behavior and interfacial interactions will be discussed. Lab demonstrations will be conducted and students will be given opportunities to review research papers related to topics covered in class. Topics include: Brownian motion and diffusion, size and surface characterization, electric double layer, electrokinetic phenomena, DLVO theory, Non-DLVO forces, aggregation, deposition, modern measurement techniques in the laboratory, fate and transport of engineered nanoparticles in the environment, and environmental applications of nanotechnology (e.g., sensors, remediation, antimicrobial agents).
Instructor(s): K. Chen.
Area: Humanities, Social and Behavioral Sciences.

EN.570.470. Applied Econ & Finance. 3 Credits.
This course focuses on company valuations, using the proprietary Hanke-Guttridge Discounted Free Cash Flow Model. Students use the model and data from financial statements filed with the Securities and Exchange Commission to calculate the value of publicly-traded companies. Using Monte Carlo simulations, students also generate forecast scenarios, project likely share-price ranges and assess potential gains/losses. Stress is placed on using these simulations to diagnose the subjective market expectations contained in current objective market prices, and the robustness of these expectations. During the weekly seminar, students' company valuations are reviewed and critiqued. Permission Required.
Prerequisites: EN.660.203
Instructor(s): S. Hanke
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences
Writing Intensive.

EN.570.487. Financial Market Research. 3 Credits.
This course investigates the workings of financial, foreign exchange, and commodity futures markets. Research is focused on price behavior, speculation, and hedging in these markets. Extensive research and writing is required. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Permission Required.
Instructor(s): S. Hanke
Area: Social and Behavioral Sciences
Writing Intensive.

EN.570.490. Solid Waste Engineering and Management. 3 Credits.
This course covers advanced engineering and scientific concepts and principles applied to the management of municipal solid waste (MSW) to protect human health and the environment and the conservation of limited resources through resource recovery and recycling of waste material.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.491. Hazardous Waste Engineering and Management. 3 Credits.
This course addresses traditional and innovative technologies, concepts, and principles applied to the management of hazardous waste and site remediation to protect human health and the environment.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.492. M. Gordon Wolman Seminar. 1 Credit.
Undergraduates only with permission of instructor.
Instructor(s): K. Chen.

EN.570.493. Economic Foundations For Public Decision Making. 3 Credits.
This course includes an exposition of intermediate level price theory, combined with a survey of applications to the analysis of public sector decisions. Theoretical topics include demand, supply, the function and behavior of the market, and introductory welfare economics. Recommended Course Background: AS.180.101-AS.180.102, AS.110.202 or equivalent.
Instructor(s): C. Norman
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.495. Mathematical Foundations For Public Decision Making. 3 Credits.
A collection of systems analytic techniques which are frequently used in the study of public decision making is presented. Emphasis is on mathematical programming techniques. Primarily linear programming, integer and mixed-integer programming, and multiobjective programming. Recommended Course Background: AS.110.106-AS.110.107/AS.110.109
Instructor(s): J. Williams
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.496. Urban and Environmental Systems. 3 Credits.
The mathematical techniques learned in EN.570.305 and EN.570.495 are applied to realistic problems in urban and environmental planning and management. Examples of such problems include the siting of public-sector and emergency facilities; natural areas management, protection and restoration; solid waste collection, disposal, and recycling; public health; the planning and design of energy and transportation systems; and cost allocation in environmental infrastructure development.
Instructor(s): J. Williams
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.497. Risk and Decision Analysis. 3 Credits.
This course introduces the methods of probabilistic risk and decision analysis. Topics will include risks in daily life, public attitudes towards risk, fault trees, event trees, decision trees, utility functions, risk attitude, and value of information calculations. Recommended Course Background: Introductory Statistics.
Instructor(s): S. Guikema
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.501. Research. 3 Credits.
Instructor(s): Staff.

EN.570.502. Undergraduate Research.
Instructor(s): Staff.

EN.570.505. Undergraduate Independent Study. 0 - 3 Credit.
Instructor(s): Staff.
EN.570.506. Maryland Department of the Environment Independent Study. 0 - 3 Credit.
This independent study within the MDE’s Water Management Administration (WMA) will engage the student in scientific/policy literature and data research and management, field investigations, or evaluation of emerging issues and innovative approaches to surface and ground water protection and drinking water management, wastewater management, wetlands and non-point source pollution control. Each independent course will focus on a scientific, regulatory or policy topic designed to further the mission of the administration, which is to protect the public health and the aquatic environment. The student will be assigned to a WMA engineer, scientist or project manager to develop a course of study. Hours can be tailored to accommodate student’s schedule.
Instructor(s): E. Bouwer.

EN.570.507. Independent Study: Baltimore City Energy Office. 3 Credits.
This Independent Study within Baltimore City’s Energy Office will engage students in local energy policies, energy initiatives, data and City operations. Interns will have the chance to apply optimization and modeling skills to one of many projects. These projects can include: • Measurement and verification of performance contracts with energy service contractors • Collection of data from City operated co-generation and solar plants and developing operation models • Analyzing energy usage data from City buildings and making recommendations As part of an independent student project, students will be required to submit a final report and present their findings to the City. Hours can be tailored to accommodate student’s schedule but a minimum of 10 hours per week during the semester is required. Permission required.
Instructor(s): E. Bouwer.

EN.570.521. Landscape Hydrology and Watershed Analysis. 3 Credits.
The purpose of this class is to understand the landscape-scale controls on the fluxes of water and waterborne materials through watersheds. This class differs from the Hydrology and Hydrologic Modeling classes in its focus on data analysis, and its embrace of the complexity of real landscapes. There will be significant quantitative components to the material taught, but emphasis will be on developing a greater sense of the way that landscapes “function”, and how this function is related to real-world issues of water resources and pollution. Students will gain an understanding of how climate, geologic and ecologic setting, and human impacts control the partitioning of water between different fates, the flowpaths through the landscape and the storage and residence time of water. They will also learn conceptual and practical tools for analyzing hydrologic and other landscape data, and integrating this data in a holistic approach to watershed analysis. The class will be of interest for students intending to go into watershed or landscape management, and anyone wishing to pursue research in hydrology, geomorphology or ecology at landscape and watershed scales. The class will include at least one field trip to an instrumented watershed. GIS skills will be an advantage but are not required. Recommended Course Background: AS.270.405 or EN.570.353 or equivalent.
Instructor(s): C. Harman
Writing Intensive.

EN.570.590. Internship-Summer. 1 Credit.
Instructor(s): G. Brush.

EN.570.597. Research-Summer. 3 Credits.
Instructor(s): E. Bouwer; K. Chen; M. Hilpert; M. Ward; W. Ball.

EN.570.599. Independent Study. 0 - 3 Credit.
Instructor(s): C. Norman.

EN.570.601. IGERT Water, Climate and Health Colloquium.
Recommended Course Background: Microeconomics, Introductory Statistics, and Optimization.
Instructor(s): G. Brush.

EN.570.602. IGERT-Water, Climate & Health-Capstone.
Instructor(s): G. Brush.

Methods for optimizing operation and design of energy systems and for analyzing market impacts of energy and environmental policies are reviewed, emphasizing both theory and solution of actual models. Review of linear and nonlinear programming and complementarity methods for market simulation. Recommended Course Background: EN.570.493 and EN.570.495 or equivalent.
Instructor(s): B. Hobbs.

EN.570.608. Data Analytics for Engineering, Policy Analysis and Management.
Data analytics is the use of computational statistics and data mining to draw insights and build predictive models based on large data sets. As data becomes more prevalent in across many different areas of importance in engineering, policy analysis, and management, analytics is becoming an increasingly important topic. This course assumes a working knowledge of regression and statistics and builds from this to introduce modern data analytics. This course covers major classes of methods beyond linear regression, including additive models, tree-based models, Bayesian networks, boosting, bagging, and model averaging. The course focuses on the application and interpretation of the methods while also providing an understanding of the underlying basis and theory behind them. Assignments, exams, and the term project are primarily data-driven analytic exercises. Recommended Course Background: EN.550.420 and EN.550.430 or equivalent (by approval of instructor).
Instructor(s): S. Guikema
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.612. Infrastructure Modeling, Simulation, and Analysis.
This course will be a mix of seminar-style guided discussions and student presentations and lectures on specific topics based on the current research literature in the field. It will give an overview of the infrastructure systems that form the basis for health, security, and economic prosperity in the developed world and give an overview of some of the most pressing infrastructure challenges in the developing world. The focus will be on quantitative modeling of infrastructure performance, sustainability, and resilience for supporting infrastructure management and policy decision-making. Suggested: Microeconomics, Introductory Statistics, and Optimization.
Instructor(s): S. Guikema
Area: Engineering, Natural Sciences.

EN.570.613. Sem:Geomorphology.

EN.570.618. Multiobject Programming and Planning.
Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Graduate level of EN.570.418. Recommended Course Background: EN.570.495 or Permission Required.
Instructor(s): J. Williams
Area: Engineering.

EN.570.622. Topics in Human Geography.
We will analyze examples of excellent proposals in different disciplinary idioms and write multiple drafts of dissertation proposals and thesis or dissertation chapters.
Instructor(s): E. Schoenberger
Writing Intensive.

EN.570.633. Stochastic Simulation and Game Theory.
This course provides an introduction to stochastic simulation and game theory. It covers a mix of the theoretical background and the practical use of these two methods. The stochastic simulation portion of the course covers both discrete event and time step methods. It also covers random number generators, analysis of output, comparison of systems, variance reduction techniques, and linkages between simulation and optimization. The game theory portion of the course provides an introduction to the basic types of games: static games of complete information, dynamic games of complete information, static games of incomplete information, and dynamic games of incomplete information. Several case studies are covered.
Instructor(s): S. Guikema.

EN.570.634. Foundational Literature of Risk and Decision Analysis.
This course will be a guided reading, discussion, and assessment of the foundational literature from the fields of risk and decision analysis. We will read work by authors such as Ramsey, Savage, Raiffa, Laplace, and others that have established the foundations on which the fields are built. The goal is to provide Ph.D. students with a strong foundation in the field and an understanding of the literature underlying the development of the field.
Prerequisites: EN.570.497
Instructor(s): S. Guikema.

EN.570.641. Department Seminar.

Detailed investigation of mechanisms of abiotic and biochemical transformations of organic pollutants in natural and engineered environments.
Prerequisites: EN.570.442 or permission of instructor
Area: Engineering, Natural Sciences.

EN.570.646. Water Quality and Treatment: Global Issues and Solutions.
The goal of this course is to introduce students to the theory and concepts necessary to understand the factors that affect water quality and to design unit operations and processes for water and wastewater treatment, including sedimentation, coagulation, filtration, adsorption, disinfection, biological treatment, sludge handling and disposal. Students will be introduced to the organic, inorganic and biological contaminants that affect water quality, the relevant water quality regulations that ensure water safety, and appropriate treatment techniques for remediating contaminants. Students will apply this understanding toward the quantitative design and sizing of engineered facilities for water and wastewater treatment. Using a team-based semester project, students will learn to collaborate within interdisciplinary teams and share technical information and ideas with others. Background information will first be delivered via lectures and presentations, followed by open-ended problems, and culminating in the team design project. To the extent possible, the design portion of the course will include green, sustainable design options. This course will appeal to engineers and non-engineers, as the design of sustainable solutions for remediating the world’s deteriorating water sources is of interest to the IGERT students in engineering, science, and public health. The course structure is appropriate for students of any science-related background, and the interdisciplinary team format for the semester design project will take advantage of the diverse science backgrounds of the students in the IGERT cohorts. Undergraduates with department permission.
Instructor(s): W. Ball.

EN.570.647. Mass Transfer in Environmental Engineering.
Instructor(s): W. Ball.

EN.570.657. Air Pollution.
The course consists of an introduction to the fundamental concepts of air pollution. Major topics of concern are aspects of atmospheric motion near the earth’s surface; basic thermodynamics of the atmosphere; atmospheric stability and turbulence; equations of mean motion in turbulent flow, mean flow in the surface boundary layer; mean flow, turbulence in the friction layer; diffusion in the atmosphere; statistical theory of turbulence; plume rise. Emphasis is placed upon the role and utility of such topics in a systems analysis context, e.g., development of large and mesoscale air pollution abatement strategies. Comparisons of the fundamental concepts common to both air and water pollution are discussed.
Instructor(s): J. Ellis.

EN.570.659. Environmental Policy Analysis.
Instructor(s): C. Norman
Writing Intensive.

EN.570.661. Applied Math For Engineer.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

EN.570.673. Public Systems Seminar.

EN.570.676. Stochastic Programming.
Instructor(s): J. Ellis.
EN.570.680. Environment and Society.
This class addresses a range of questions, including: Why do we not act in our own best interests in the environment? How are environmental discourses developed and how do they relate to environmental policies? How do environmental politics and policy in the US compare with other countries?
Instructor(s): E. Schoenberger
Area: Social and Behavioral Sciences.

EN.570.681. Environ Engineering Sem.
The scope of this course is to quantitatively describe flow and transport processes in porous media on a variety of length scales ranging from the molecular to the field scale. Phenomena investigated include single-phase and multiphase flow, solute transport, and chemotaxis. We will derive and/or motivate the governing dynamic equations and discuss mathematical and computational methods to solve these equations. This course addresses audiences from environmental and chemical engineering as well as the hydrological sciences. The course will give an introduction to the necessary mathematical and computational methods.
Instructor(s): M. Hilpert.

EN.570.701. Professional Presentation and per review Skills in Systems Analysis and Modeling.
Instructor(s): C. Norman
Area: Engineering.

EN.570.800. Masters Independent Study.
Instructor(s): Staff.

EN.570.801. Doctoral Research.
Sec. 01 – Staff Sec. 02 – Stone Sec. 03 – Boland Sec. 04 – Wilcock Sec. 05 – Roberts Sec. 06 – Alavi Sec. 07 – Bouwer Sec. 08 – Ellis Sec. 11 – Hilpert Sec. 12 - Hanke Sec. 13 - Staff Sec. 14 - Ball Sec. 16 - Hobbs Sec. 17 - Guikema 18 – Schoenberger.
Instructor(s): Staff.

EN.570.803. Master’s Research.
Investigation of an environmental engineering and chemistry problem and preparation of project report.
Instructor(s): Staff.

EN.570.805. Masters Internship.
Instructor(s): W. Ball.

EN.570.813. Seminar: Geomorphology.
Instructor(s): P. Wilcock.

EN.570.841. M. Gordon Wolman Seminar.
Instructor(s): K. Chen.

EN.570.850. Graduate Independent Study.
Instructor(s): C. Norman; M. Hilpert; S. Guikema.

Instructor(s): B. Hobbs; C. Norman; J. Ellis; J. Williams; S. Guikema.

Instructor(s): E. Bouwer.

Cross Listed Courses

Anthropology
AS.070.285. Understanding Aid: Anthropological Perspectives for Technology-Based Interventions. 3 Credits.
This course combines anthropological perspectives with the discussion and examination of technology–based interventions in the field of development and aid policies, with particular focus on activities related to water resources, sanitation, and hygiene. Readings and discussions analyze some of the theoretical, historically rooted, and practical issues that challenge those who hope to provide effective aid. A key aim of this course is to provide students with better understanding of cultural, social, environmental and economic issues relevant to technical intervention in developing countries.
Instructor(s): E. Cervone; W. Ball
Area: Humanities, Social and Behavioral Sciences.

Public Policy
AS.195.477. Intro To Urban Policy. 3 Credits.
195.477 & 195.478 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Area: Social and Behavioral Sciences
Writing Intensive.

AS.195.478. Urban Policy Internship. 3 Credits.
195.478 & 195.477 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Writing Intensive.

Earth Planetary Sciences
AS.270.205. Introduction to Geographic Information Systems and Geospatial Analysis. 3 Credits.
The course provides a broad introduction to the principles and practice of Geographic Information Systems (GIS) and related tools of Geospatial Analysis. Topics will include history of GIS, GIS data structures, data acquisition and merging, database management, spatial analysis, and GIS applications. In addition, students will get hands-on experience working with GIS software.
Instructor(s): X. Chen
Area: Engineering, Natural Sciences.

AS.270.320. The Environment and Your Health. 3 Credits.
This course surveys the basic environmental health sciences (toxicology, risk assessment), current public health issues (hazardous waste, radon, water-borne diseases) and emerging global health threats (global warming, ozone depletion, sustainability).
Instructor(s): M. Trush
Area: Natural Sciences.
Public Health Studies

AS.280.335. The Environment and Your Health. 3 Credits.
This course surveys the basic concepts underlying environmental health sciences (toxicology, exposure assessment, risk assessment), current public health issues (hazardous waste, water- and food-borne diseases), and emerging global health threats (global warming, built environment, ozone depletion, sustainability). Public Health Studies, Global Environmental Change and Stability, and Earth and Planetary Science majors have 1st priority for enrollment. Your enrollment may be withdrawn at the discretion of the instructor if you are not a GECS, PHS, or EPS major.
Prerequisites: (Students may not have taken AS.270.320)
Instructor(s): M. Trush
Area: Natural Sciences.

Interdepartmental

AS.360.147. Adam Smith and Karl Marx. 3 Credits.
Freshmen Seminar. This freshmen seminar examines the ideas of Smith, the greatest proponent of the free market, and Marx, his most radical critic. Freshmen only.
Instructor(s): E. Schoenberger; P. Jelavich
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

AS.360.528. Problems in Applied Economics. 3 Credits.
Permission Required. This course brings the principles of economic theory to bear upon particular problems in the fields of economics, finance and public policy. Micro, macro and international problems, from both the private and public sectors, are addressed. A heavy emphasis is placed on research and writing. Students learn how to properly conduct substantive economic research, utilizing statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise.
Instructor(s): S. Hanke
Area: Social and Behavioral Sciences
Writing Intensive.

Information Security Institute

The Johns Hopkins University Information Security Institute (JHUISI) (isi.jhu.edu) is the University’s focal point for research and education in information security, assurance and privacy. Securing cyberspace and our national information infrastructure is more critical now than ever before, and it can be achieved only when the core technology, legal and policy issues are adequately addressed. JHUISI is committed to a comprehensive approach that includes input from academia, industry and government. The University, through JHUISI’s leadership, has thus been designated as a Center of Academic Excellence in Information Assurance Education and Research by the National Security Agency and leading experts in the field. Through our broad range of educational opportunities including a ground-breaking graduate program and leading edge research in foundational science and applied technologies, JHUISI is having a significant impact in the region and nationwide.

Our research in networking, wireless, systems evaluation, medical privacy and electronic voting, among other areas is widely circulated among academics and policymakers. Moreover, JHUISI is instrumental in homeland security efforts across Hopkins, including emergency health preparedness, bio-terrorism and national defense.

The Johns Hopkins University Information Security Institute based in the Whiting School of Engineering provides a broad and holistic perspective to the information security and assurance field relative to both research and education. In addition to a comprehensive collection of programs related to information technology, a range of management, governance, and policy issues are integrated into the Information Security Institute agenda. The breadth of focus provided represents a strength and distinction of the Johns Hopkins University Information Security Institute. Through the involvement of the faculty and resources from the Whiting School of Engineering, the Krieger School of Arts and Sciences, the Bloomberg School of Public Health, the Carey Business School, and the Applied Physics Lab, a variety of innovative as well as international research and educational initiatives in information security and assurance are supported within the Information Security Institute.

Facilities

The computing facilities include a laboratory of shared PC workstations running Windows, several customizable machines for student projects, and multiple high-speed laser printers. Various focused research laboratories have additional resources that provide greater specialization than the general lab. The facilities are connected to a secure high-speed network which allows access to specialized hardware in other departments and institutions. The Information Security Institute and Department of Computer Science cooperate in the use of some of these facilities.

M.S.S.I. Graduate Program

The flagship educational experience offered by Johns Hopkins University in the area of information security and assurance is represented by the Master of Science in Security Informatics (M.S.S.I.) degree. A wide range of courses is available in support of this unique and innovative graduate program. Its full-time, part-time, or adjunct faculty deliver these courses at multiple sites spanning the Homewood campus in northern Baltimore, the medical and health facilities in eastern Baltimore, the part-time graduate program operations at APL and the Montgomery County Campus, and the SAIS and KSAS facilities in Washington, D.C.

The M.S.S.I. is a full-time day program offered on the Homewood Campus in North Baltimore. Most students complete the program in three full-time semesters though some graduate students may finish their degree part-time after completing two consecutive semesters of residency as a full-time student.

Application Requirements for the M.S.S.I. Degree

- Application to the M.S.S.I. degree is open to outstanding candidates who hold a bachelor’s degree with sufficient technical exposure to computer science that serves as preparation for the core technology courses, including intermediate programming, data structure, discrete mathematics, and computer system fundamentals.
- All U.S. citizens and U.S. permanent residents are obligated to take and submit the results of the Aptitude Test of the Graduate Record Examination as one of the requirements for admission.
- International students are obligated to take either the TOEFL test or the IELTS test.
In general, the M.S.S.I. Capstone Project will include both technology and non-technology components, and will be conducted within a team-structured environment comprised of students and faculty mentors (plus external mentors if appropriate). These projects will generally be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and contracts. They should relate to real-world problems and exhibit both theoretical and practical significance. The project must be documented by a report and presentation, as well as other applicable deliverables including but not limited to system prototypes, utility libraries, experimental demonstrations, conference or journal submissions, and so on. It should follow the best practice of software engineering.

Students should actively initiate the project while communicating with the potential faculty mentor for technical issues and the faculty advisor for project management. They are expected to develop a project plan at the end of the second semester. The project is expected to have a proposal approved at the start of the third semester and be finished by the end of the third semester. A presentation will be scheduled when the project concludes. The faculty mentor should approve each milestone of the project with the faculty advisor being informed. When the project is completed with all the deliverables, the faculty advisor assigns a score upon the recommendation of the faculty mentor.

**Course Requirement Details**

- All courses toward the degree requirement must be 400-level or above.
- The overall grade point average of the courses counted toward the coursework requirements must be 3.00 or higher.
- At most two independent study courses can be counted toward the course requirements.
- No courses with grades of P may be counted with the exception of EN.650.736/ and independent study courses.
- At most two courses with grade less than B- may be counted toward the course work requirements. No courses with grade less than C- may be counted.
- At most two courses may be transferred from other institutions. The student’s faculty advisor and the director of Information Security Institute must approve such transfer courses.
- Courses not found on the area-specific lists can be used to meet area requirements with written approval from the student’s advisor and one additional faculty member.
- A grade of D or F results in probation. A second D or F is cause for being dropped from the program.

Concurrent Bachelor’s/Master’s Degree Program in Conjunction with the M.S.S.I.

A concurrent bachelor’s/master’s degree program including the M.S.S.I. is also available to Johns Hopkins University students. In this program, by the conclusion of the undergraduate sophomore/junior academic year, a student can apply for concurrent admission into the M.S.S.I. program. If accepted, the student during each subsequent semester partitions her/his course load into courses that will count for the undergraduate degree and courses that will count for the M.S.S.I. degree. Usually with one additional year of study, the student can simultaneously satisfy both sets of degree requirements.

Dual Master’s Program with the Department of Computer Science

Students interested in pursuing the above Dual Master’s Program (DMP) will have initially entered either the M.S.S.I. program or the M.S.E. program in Computer Science, and then apply for the DMP at a later point. A maximum of two courses (approved by the advisors) can be double counted toward each set of course requirements, thereby facilitating the feasibility of completing the DMP in two academic years plus the in-between summer. In such cases, the designation of the double counted courses would be done in conjunction with one advisor from each department and the Academic Program Administrator.

Dual Master’s Program with the Department of Applied Math and Statistics in the WSE

A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the master’s program in the Department of Applied Math and Statistics in the WSE. The details of this DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant differences. Each program should be contacted if a student is interested.

Dual Master’s Program with the School of Public Health

A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the Master of Health Sciences (M.H.S.) program in the Bloomberg School of Public Health (BSPH). The details of this M.S.S.I./M.H.S. DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant differences. Each program should be contacted if a student is interested.

Joint Program with the Certificate in National Security Studies of the School of Arts and Sciences

A joint M.S.S.I. Degree and the Certificate in National Security Studies (C.N.S.S.) in the Krieger School of Arts and Sciences is now being offered. The C.N.S.S. requires completion of five core courses. Two designated courses can be double counted for the M.S.S.I. and the C.N.S.S. Each program should be contacted if a student is interested in completing this course of study.

For current faculty and contact information go to http://isi.jhu.edu/institute/people
Faculty

Intern Executive Director
Anton Dahbura
Information Security Institute.

Program Director
Xiangyang Li
Master of Science in Security Informatics.

Professors

Gerald Masson
Professor (Computer Science); reliable computing, computer networking, real-time monitoring of software operations, computer architecture, computer networking, security informatics relative to networks and software operations.

Aviel Rubin
Professor (Computer Science), Technical Director of Information Security Institute: network and systems security, applied cryptography, cryptographic key distribution, anonymity and computer privacy, electronic commerce, fire-walls and network perimeter defenses, security issues in e-voting, applying security to applications such as medical information systems, intellectual property protection.

Associate Professor

Giuseppe Atieniese
Computer Science: applied cryptology, cryptology and network security, security and privacy in computing, applied cryptography and network security, DNSSEC and medical information privacy protection.

Associate Research Professor

Susan Hohenberger
Computer Science: theory, cryptography, computer security, algorithms, complexity theory, balancing privacy and accountability in information systems.

Assistant Research Professor

Stephen Checkoway
Computer Science: systems security, voting security, post-election auditing.

Matthew Green
Computer Science: applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Lecturers

William Agresti
Professor and Associate Dean for Professional Programs (Carey Business School): system design and development, information systems architecture, and IT integration for business, software engineering, IT measurement and knowledge management.

Kevin Fairbanks
Assistant Professor (U.S. Naval Academy): digital forensics.

Michael Jacobs, J.D.
Computer ethics, digital rights management, intellectual property protection.

George Kalb
Information Security Institute; Adjunct Professor, Lecturer, Part-time Programs in Engineering and Applied Science: embedded computer systems-vulnerabilities, intrusions and protection mechanisms, embedded systems security, software engineering.

Michael Kociemba
Instructor (Carey Business School): information security, management, and infrastructure protection.

Darren Lacey, J.D.
Chief Information Security Officer for Johns Hopkins University.

Williams Sauer, J.D.
Digital rights management, intellectual property protection.

Lanier Watkins

Courses

EN.650.412. Java Security. 3 Credits.
This course provides a comprehensive coverage of the security aspects of the Java platform. Java’s security model and the VM and language features that support security are covered. Java APIs relevant to development of secure software are discussed. The course concentrates on the practical aspects of using these APIs. Use of the Java Cryptography APIs is addressed and material on security in J2EE (Java 2 Enterprise Edition) is presented. Topics covered include the java.security.* packages, the Java Cryptography Architecture and Java Cryptography Extension (JCA and JCE), Java Secure Sockets Extension (JSSE), Java Authentication and Authorization Service (JAAS), Java Generic Security Services (Java GSS-API), and the Java Certification Path API.
Instructor(s): E. Ceesay
Area: Engineering.

EN.650.414. Rights in Digital Age. 3 Credits.
This course will examine various legal and policy issues presented by the tremendous growth in computer technology, especially the Internet. The rights that various parties have with respect to creating, modifying, using, distributing, storing, and copying digital data will be explored. The concurrent responsibilities, and potential liabilities, of those parties will also be addressed. The course will focus on intellectual property issues, especially copyright law, and other legal and economic considerations related to the use and management of digital data. Copyright law and its role within the framework of intellectual property law will be presented in a historical context with an emphasis on its applicability to emerging-technological issues. Specifically, the treatment of various works, such as music, film, and photography that were traditionally, analog in nature will be analyzed with respect to their treatment in the digital domain; works that are by their nature digital, such as computer software, will also be analyzed. The current state of U.S. copyright law will be presented, as will relevant international treaties and foreign laws. The goal of the course is to provide those involved or interested in digital rights management with a general awareness of the rights and obligations associated with maintaining and distributing digital data. (This course will be taught in Washington, DC and video-cast into Hodson Hall Room 213.)
Instructor(s): M. Jacobs
Area: Social and Behavioral Sciences.
EN.650.424. Network Security. 3 Credits.
This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] Co-listed with EN.600.424.
Prerequisites: 600.226 and (600.344 or 600.444) or permission; 600.120 (or equivalent) recommended.
Instructor(s): A. Mishra
Area: Engineering, Quantitative and Mathematical Sciences.

EN.650.432. Law & Policy Informations Assurance. 3 Credits.
Instructor(s): G. Masson; M. Lavine
Area: Engineering.

EN.650.433. Embedded Computer Systems. 3 Credits.
This course provides an understanding of differences in network-based computers, program mobility, current intrusion protection technologies and exploitation methods along with material relating to computer hacking and vulnerability assessment. Department Majors Only. Course taught Online.
Instructor(s): G. Kalb
Area: Engineering.

EN.650.445. Practical Cryptographic Systems. 3 Credits.
This semester long course will teach skill of how cryptographic systems work and fail - as part of a complete hardware and software system. The skills will be taught by examples i.e., by studying and identifying flows in widely deployed crypto systems. We will place a particular emphasis on the failure of "security by obscurity" and the feasibility of reverse-engineering undocumented crypto systems. Co-listed with EN.600.454.
Instructor(s): M. Green.

EN.650.457. Computer Forensics. 3 Credits.
This course introduces students to the field of computer forensics and it will focus on the various contemporary policy issues and applied technologies. Topics to be covered include: legal and regulatory issues, investigation techniques, data analysis approaches, and incident response procedures for Windows and UNIX systems. Homework in this course will relate to laboratory assignments and research exercises. Students should also expect that a group project will be integrated into this course.
Instructor(s): K. Fairbanks
Area: Engineering.

EN.650.458. Introduction to Cryptography. 3 Credits.
Cryptography has a rich history as one of the foundations of information security. This course serves as the introduction to the working primitives, development and various techniques in this field. It emphasizes reasoning about the constraint and construction of cryptographic protocols that use shared secret key or public key. Students will also be exposed to some current open problems. Permission of instructor only.
Instructor(s): X. Li
Area: Engineering.

EN.650.460. Software Vulnerability Analysis. 3 Credits.
This course will examine vulnerabilities in C source, stack overflows, writing shell code, etc. Also, vulnerabilities in web applications: SQL Injection, cookies, as well as vulnerabilities in C binary fuzzing, and exploit development without source among other topics. Students should have experience in C++ Programming.
Instructor(s): S. Checkoway
Area: Engineering.

EN.650.470. Basics of Applied Cryptography and Network Security. 3 Credits.
This course will cover some key aspects of applied cryptography. Topics include algorithms for encryption and decryption using symmetric key and public key techniques, design and analysis of block and stream ciphers, pseudo-random number generation, hash functions and their uses, message authentication codes, authentication protocols, key establishment, key management, digital signatures and secret sharing.

EN.650.471. Cryptography & Coding. 4 Credits.
A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication: How can we ensure the privacy of messages? Coding theory studies how to make communication reliable: How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow. Students should have computing experience. Recommended Course Background: AS.110.201
Prerequisites: EN.550.171 or permission
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

EN.650.621. Critical Infrastructure Protection.
This course focuses on understanding the history, the vulnerability, and the need to protect our Critical Infrastructure and Key Resources (CIKR). We will start by briefly surveying the policies which define the issues surrounding CIKR and the strategies that have been identified to protect them. Most importantly, we will take a comprehensive approach to evaluating the technical vulnerabilities of the 18 identified sectors, and we will discuss the tactics that are necessary to mitigate the risks associated with each sector. These vulnerabilities will be discussed from the perspective of ACM, IEEE or other technical journals/articles which detail recent and relevant network-level CIKR exploits. We will cover well known vulnerable systems such the Internet, SCADA or PLC and lesser known systems such as E911 and industrial robot. Also, a class project is required. Recommended Course Background: EN.650.424 or equivalent or permission by instructor.
Instructor(s): L. Watkins
Area: Engineering, Natural Sciences.

EN.650.630. Moral and Legal Foundations of Privacy.
This course explores the ethical and legal underpinnings of privacy. Inquiries into the values that underline the right: constitutional and common law foundations; balancing privacy against other rights and interests. Core Policy course for MSSI degree
Instructor(s): A. Siegel.
EN.650.632. Law & Policy of Info Assurance.
This course introduces information assurance as a response to changes in technology, asymmetric threats and computer crime. It traces the concepts through civilian applications as OMB and NIST standards as well as private sector issues related to privacy, contingency response, and reliable infrastructures. It examines these concepts from a risk assessment and standards based approach central to government planning and the private sector.

This course will study information security and assurance methodologies from the perspective of implementation and performance on reduced instruction set architectures. All 1st year MSSI students entering after Fall '08 will be required to take this course.
Instructor(s): G. Masson.

EN.650.640. Moral & Legal Foundations of Privacy.
This course explores the ethical and legal underpinnings of the concept of privacy. It examines the nature and scope of the right to privacy by addressing fundamental questions such as: What is privacy? Why is privacy morally important? How is the right to privacy been articulated in constitutional law?
Instructor(s): M. Jacobs; W. Sauers.

EN.650.650. Special Topics in Security and Privacy of Medical Information.
This course will cover topics in security and privacy of medical information. Topics will include security and access control with respect to medical records (EPR,PHR), securing communication standards (HL7,DICOM), recent attacks on patient monitoring systems, security architectures for portable patient records, break the glass systems, privacy, anonymity and medical identity theft. Students are expected to enter this class with basic knowledge in computers and networking and should be comfortable programming.
Instructor(s): S. Garera
Area: Quantitative and Mathematical Sciences.

EN.650.651. Health Info Privacy Law.
Core health course for MSSI Course meets Oct. 23-December 22 This course pertains to issues relating to protecting health information privacy in the modern era. Theoretical and ethical discussions underlying health information privacy are covered. The primary focus of the course is to provide a modern context through which privacy protections are debated, constructed, implemented, and enforced. The course attempts to instruct students on the legal, policy, and practical issues surrounding the protection of health information privacy. The major federal and state privacy laws and policies and how these laws and policies are implemented in the public and private sectors is considered.

The course will address information security in the public health and medical fields, with special emphasis on clinical care, research and the role of the academic medical center. In many respects, the course builds on EN.650.651 Health Information, Privacy, Law and Policy’s treatment of privacy and how such privacy is protected in the health and medical arena, including but not limited to HIPAA. Open to MSSI students or Permission required.
Instructor(s): D. Lacey.

This course addresses the risks (financial, reputation, business, and third party), costs, ROI, and other business issues concerned in planning and managing a secure operation. Topics include disaster recovery, outsourcing issues; service level agreements; evaluating external security service providers; assessing security total cost of ownership; audit procedures; financial integrity; cost/benefit analyses; back-up and recovery provisions; insurance protection; contingency and business continuity plans; qualitative and quantitative risk analysis; monitoring the security of the enterprise; information economics; performance reporting; automated metrics reporting; responses to threats; effects of security policies and practices on business and customers; preparing a business case for information security investments; and developing cost-effective solutions given constraints in money, assets, and personnel. Case studies and exercises will be used to illustrate financial planning and evaluation of security operations.
Instructor(s): W. Agresti.

Intrusion detection supports the on-line monitoring of computer system activities and the detection of attempts to compromise normal services. This course starts with an overview of intrusion detection tasks and activities. Detailed discussion introduces a traditional classification of intrusion detection models, applications in host-centered and distributed environments, and various intrusion detection techniques ranging from statistical analysis to biological computing. This course serves as a comprehensive introduction of recent research efforts in intrusion detection and the challenges facing modern intrusion detection systems. Students will also be able to pursue in-depth study of special topics of interest in course projects.
Instructor(s): X. Li
Area: Engineering, Natural Sciences.

This course focuses on the personnel, legal, regulatory and privacy issues that comprise the basic security management areas that must be considered when developing and implementing an effective information security program. Specific topics include security-related legislation, government and industry security frameworks, the identification and management of risk, security controls, defense in depth, critical infrastructure protection, development and implementation of an enterprise wide security strategy, and organizational roles and responsibilities.
Instructor(s): M. Kociemba.

This course will analyze advanced topics and state of the art issues in the field of digital forensics. The course will be run in a research seminar format and students will be given both basic and applied research projects in such areas as: intrusion analysis, network forensics, memory forensics, mobile devices, and other emerging issues.
Prerequisites: EN.650.457 or instructors permission required
Instructor(s): K. Fairbanks.
The human factor is critical to any successful computer security solution since users are very often the weakest link in such systems. This course will examine a variety of human behaviors ranging from micro to macro cybernetic levels that are relevant to making the best case for information security. It is delivered through lectures on relevant findings in different disciplines of human computer interaction, human factors engineering, cognitive science, and product design; studies of useful user and security modeling frameworks and tools; and term research projects to explore security oriented topics in human machine systems. Its goal is to improve security informatics through informed decisions by the knowledge of the good and bad human characters in computer and cyber security.
Instructor(s): X. Li
Area: Engineering.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor
Instructor(s): S. Checkoway.

All MSSI programs must include a project involving a research and development oriented investigation focused on an approved topic addressing the field of information security and assurance from the perspective of relevant applications and/or theory. There must be project supervision and approval involving a JHUISI affiliated faculty member. A project can be conducted individually or within a team-structured environment comprised of MSSI students and an advisor. A successful project must result in an associated report suitable for on-line distribution. When appropriate, a project can also lead to the development of a so-called "deliverable" such as software or a prototype system. Projects can be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and Contracts. A project can count for as much as 3 course credits towards the MSSI requirements by means of enrolling in EN.650.736/EN.650.746. Satisfactory/Unsatisfactory only
Elective Technology course for MSSI degree.
Instructor(s): A. Dahbura; X. Li.

Open to MSSI students Permission Required for non-MSSI students

Instructor(s): A. Dahbura; X. Li.

Instructor(s): G. Masson.

Instructor(s): Staff.

Individual study in an area of mutual interest to a graduate student and a faculty member in the Institute.
Instructor(s): G. Masson.

Instructor(s): G. Masson.

Cross Listed Courses
Computer Science

EN.600.412. Security and Privacy in Cloud Computing. 1 Credit.
This course focuses on the security and privacy issues in Cloud Computing systems. While the cloud computing paradigm gains more popularity, there are many issues related to confidentiality, integrity, and availability of data and computations involving a cloud. In this course, we examine cloud computing models, look into the threat model and security issues related to data and computation outsourcing, and explore practical applications of secure cloud computing. Students should have some background in network and/or data security.
Instructor(s): R. Hasan
Area: Engineering.

EN.600.415. Databases. 3 Credits.
Graduate level version of EN.600.315. Students may receive credit for EN.600.315 or EN.600.415, but not both. Recommended Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.421. Object Oriented Software Engineering. 3 Credits.
Graduate level version of EN.600.321. Students may receive credit for EN.600.321 or EN.600.421, but not both. Recommended Course Background: EN.600.226 and EN.600.120
Instructor(s): S. Smith
Area: Engineering.
EN.600.424. Network Security. 3 Credits.
This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] EN.600.120 (or equivalent) recommended.
Prerequisites: 600.226 and (600.344 or 600.444) or permission; 600.120 (or equivalent) recommended.
Instructor(s): Staff
Area: Engineering.

EN.600.433. Computer Systems. 3 Credits.
Graduate version of 600.333. Students may receive credit for 600.333 or 600.433, but not both. [Systems]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.442. Modern Cryptography. 3 Credits.
This course focuses on cryptographic algorithms, formal definitions, hardness assumptions, and proofs of security. Topics include number-theoretic problems, pseudo-randomness, block and stream ciphers, public-key cryptography, message authentication codes, and digital signatures. Recommended Course Background: EN.600.226 and a 300-level or above systems course; EN.600.271/EN.600.471 and EN.550.171 or equivalent.
Instructor(s): C. Pappacena
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.443. Security & Privacy in Computing. 3 Credits.
Lecture topics will include computer security, network security, basic cryptography, system design methodology, and privacy. There will be a heavy work load, including written homework, programming assignments, exams and a comprehensive final. The class will also include a semester-long project that will be done in teams and will include a presentation by each group to the class. [Applications] Prerequisite: A basic course in operating systems and networking, or permission of instructor.
Instructor(s): A. Rubin
Area: Engineering.

EN.600.444. Computer Networks. 3 Credits.
This course considers intersystem communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, modems, multiplexing, error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. Recommended Course Background: EN.600.333 or EN.600.433 or permission. Students can only receive credit for EN.600.344 or EN.600.444, not both.
Instructor(s): A. Terzis
Area: Engineering.

EN.600.450. Network Embedded Systems & Sensor Networks. 3 Credits.
This course is an introduction to fundamental concepts of networked embedded systems and wireless sensor networks. It is intended for juniors, seniors and first year graduate students in Computer Science and other engineering majors with the prerequisite background. Covered topics include: embedded systems programming concepts, low power and power aware design, radio technologies, communication protocols for ubiquitous computing systems, and some of the mathematical foundation of sensor behavior. Laboratory work consists of a set of programming assignments that consider a set of the issues described in class. Recommended Course Background: EN.600.226, EN.600.120, and EN.600.344/EN.600.444
Instructor(s): M. Chang
Area: Engineering.

EN.600.463. Algorithms I. 3 Credits.
Graduate version of EN.600.363. Students may receive credit for EN.600.363 or EN.600.463, but not both. Recommended Course Background: EN.600.226 and EN.550.171 or instructor permission required.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.471. Theory of Computation. 3 Credits.
This is a graduate-level course studying the theoretical foundations of computer science. Topics covered will be models of computation from automata to Turing machines, computability, complexity theory, randomized algorithms, inapproximability, interactive proof systems and probabilistically checkable proofs. Students may not take both EN.600.271 and EN.600.471, unless one is for an undergrad degree and the other for grad. Recommended Course Background: EN.550.171 or instructor permission.
Prerequisites: Students may not take both 600.271 and 600.471, unless one is for an undergrad degree and the other for grad.
Instructor(s): V. Variyam
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.642. Advanced Topics in Cryptography.
This course will focus on advanced cryptographic topics with an emphasis on open research problems and student presentations.
Instructor(s): G. Ateniese.

Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class. There will be homework assignments and a course project.
Prerequisites: EN.600.443 OR EN.600.424 or permission of instructor.
Instructor(s): A. Rubin.

Center for Leadership Education

Center for Leadership Education

The Center for Leadership Education (CLE) at Johns Hopkins is comprised of three academic programs as well as experiential activities, programs, and events. The academic programs, the W. P.
Carey Program in Entrepreneurship and Management (E & M), the Professional Communication Program (PCP), and the Master of Science in Engineering Management (MSEM) program offer challenging business-related courses with practical applications. Students may take classes in management, marketing, law, finance, accounting, leadership, social enterprises, creativity and innovation, technical communication, oral communication, research writing, and other contemporary topics in professional communication.

The W. P. Carey Program was established in 1996 as an opportunity for undergraduate students to learn management and leadership skills. Students may complete a minor in Entrepreneurship and Management, or they may choose instead to take a few courses of interest. The E & M minor is the largest and most popular minor at Hopkins, as students from both Engineering and Arts and Sciences greatly benefit from practical and interesting business courses. (See our website for more information at web.jhu.edu/leadership.)

In addition to the academic programs, the Center for Leadership Education sponsors experiential programs designed to give students real-world business and leadership experience. These learning experiences help students make career choices or select among fields for graduate and professional studies.

CLE Experiential Programs Include

- **The Annual JHU Business Plan Competition:** Students compete for cash prizes for best business plans in several different categories.
- **The Marshal L. Salant Student Investment Program:** Students manage an investment portfolio of $100K donated by JHU alumnus Marshal L. Salant. Profits exceeding 5 percent are donated to student scholarships.
- **Internships:** Students can apply for sponsorship of business-related internships during the spring, summer, or fall semesters.
- **CLE Speaker Series:** Prominent and successful business professionals and entrepreneurs speak on campus.
- **Hopkins Student Enterprises:** Students start and manage businesses that provide services to the campus and community.
- **Alpha Kappa Psi:** Students run a chapter of this national co-ed business fraternity.
- **American Marketing Association Student Chapter:** Students run a chapter of this national marketing organization.
- **Intersession Courses:** Including P.R. and Media in the Big Apple, featuring a two-day trip to visit P.R. firms in NYC.
- **Save the Future:** STF leverages the brainpower of business-savvy, socially-minded college undergraduates from Hopkins to teach personal money management skills to high school students.
- **Building Bright Ideas:** This intensive 10-week entrepreneurship course designed for Baltimore City high school students is taught by hand-selected and trained JHU students.
- **Social Investment Outreach:** SIO provides people of underprivileged communities and developing countries with a means of helping themselves escape poverty through microcredit and sustainable community development.

For current faculty and contact information go to [http://eng.jhu.edu/wse/cle/page/our_people](http://eng.jhu.edu/wse/cle/page/our_people)

**Faculty**

**Program Directors**

Lawrence Aronhime

**Associate Director and Senior Lecturer:** accounting, finance, entrepreneurship, technology commercialization.

Julie Reiser
Senior Lecturer, Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice
Associate Director and Senior Lecturer, Director of Masters of Science in Engineering Management Program: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

**Full Time Faculty**

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing.

Annette Leps
Senior Lecturer: accounting, finance, management.

Keith Quesenberry
Lecturer: integrated marketing communications, advertising, social media marketing, online blogging and copywriting, creative strategy, digital media, communications law and ethics.

Pamela Sheff
Senior Lecturer: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, higher education in prisons, community-based learning, entrepreneurship.

**Part Time Faculty**

Michael Agronin
Lecturer: product development.

Laura Davis
Lecturer: professional communication for ESL.

Marci DeVries
Lecturer: marketing.

Kevin Dungey
Senior Lecturer: oral presentations.

David Fisher
Lecturer: business law.

Mark Franceschini
Senior Lecturer: business ethics, Internet law.

Sean Furlong
Lecturer: financial accounting.

Dorothee Heisenberg
Senior Lecturer: multinational firms in the international economy.

Jason Heiserman
Lecturer: oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Theresa Jones
Lecturer: marketing.
EN.660.665. Technology Entrepreneurship.
The goal of the course is to provide a strategic framework (technological, market, regulatory, and financial) for determining the commercial value of new technologies and the best path for realizing that value. Through lectures, exercises, and case studies, students will develop and advance their own innovations and inventions, culminating in a business plan. No audits.
Area: Engineering, Natural Sciences.

EN.663.640. Writing Proposals that Win.
Graduate students only.
Instructor(s): E. Rice.

EN.663.645. Improving Presentation Skills for Scientists and Engineers.
This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course and is not open to undergraduates.
Instructor(s): J. Reiser; K. Dungey.

EN.663.646. Improving Presentation and Interview Skills for Humanities Students.
This course is designed to give Humanities students an opportunity to refine their lecturing and interviewing skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both expert and non-expert audiences, and create clear, compelling PowerPoint presentations (if appropriate). All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course that begins halfway through the semester and is not open to undergraduates. Second 7 Weeks, Wednesday 4 – 6:30 pm.
Instructor(s): J. Reiser.

EN.663.647. Academic Writers’ Workshop.
Do you struggle with writer's block? Do you have trouble setting writing goals and sticking to them once the hustle and bustle of the semester begins? This module is for academic writers of all stripes and persuasions—dissertation students, creative writers, post-docs, and new faculty—who would like to work with other academic writers on setting writing goals, strategizing how to overcome individual obstacles that are impeding the writing process, and getting feedback on work in a positive, supportive atmosphere of non-specialists/non-experts. The module emphasizes productivity rather than critique. Suggested readings: How to Write a Lot by Daniel Silvia, The Now Habit by Neil Fiore.
Instructor(s): J. Reiser.

EN.663.650. Finding a Job and Building Your Career.
Finding a job often is hard work—a task that takes time, energy and skills. Moreover, advancing in your career requires planning and attention to issues and opportunities at work. This module is designed to assist you in sharpening skills required for your efforts in these regards. Among topics of concern are building a resume, writing letters of application, interviewing effectively, engaging a mentor, managing initial personal finance issues and adjusting to current trends in the workplace. Expect to produce a polished resume, an effective letter of application and a set of practiced interviewing skills and a personalized career development plan through the time period of the class. Graduate students only. This is a 7-week course and is not open to undergraduates.
First 7 Weeks, Wednesday 3pm – 5:30 pm
Instructor(s): E. Rice.

So you have an idea for a business—now what? How do you convert your idea to a plan? What factors must you consider and how should you do that? How do you think about customers and competition? How much money do you need and where can you find it? How do you pitch your idea for maximum impact? Answers to these questions and more are the topics of concern for this module. Expect to build at least several sections of a business plan for your idea with the time period of the class.
Graduate students only.
Instructor(s): E. Rice.
EN.660.105. Introduction to Business. 4 Credits.
This course is designed as an introduction to the terms, concepts, and values of business and management. The course comprises three broad categories: the economic, financial, and corporate context of business activities; the organization and management of business enterprises; and, the marketing and production of goods and services. Topic specific readings, short case studies and financial exercises all focus on the bases for managerial decisions as well as the long and short-term implications of those decisions in a global environment. No audits.
Instructor(s): L. Aronhime
Area: Social and Behavioral Sciences
Writing Intensive.

EN.660.203. Financial Accounting. 3 Credits.
The course in Financial Accounting is designed for anyone who could be called upon to analyze and/or communicate financial results and/or make effective financial decisions in a for-profit business setting. No prior accounting knowledge or skill is required for successful completion of this course. Because accounting is described as the language of business, this course emphasizes the vocabulary, methods, and processes by which all business transactions are communicated. The accounting cycle, basic business transactions, internal controls, and preparation and understanding of financial statements including balance sheets, statements of income and cash flows are covered. No audits.
Instructor(s): A. Leps; L. Aronhime; S. Furlong.

EN.660.205. Business Law I. 3 Credits.
This course is designed for the student who is interested in either (a) a broad knowledge of law as it relates to modern business, or (b) a survey of many business related aspects of law with a view to further legal studies. The course will involve reviewing and analyzing statutory and case law covering a variety of substantive subject areas including civil procedure, personal and subject matter jurisdiction, intentional torts, negligence, criminal law, contract law, consumer law and parts of the Uniform Commercial Code. This course, together with Business Law II, will provide a complete, self-contained, well-rounded, study of business law, or will provide a foundation for further legal study. No audits.
Instructor(s): D. Fisher; D. Sandhaus; M. Franceschini
Area: Social and Behavioral Sciences.

EN.660.206. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law.
Prerequisites: EN.660.205
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

EN.660.220. Principles of Management. 3 Credits.
This course introduces the student to the management process. It examines the role of the manager from a traditional and contemporary perspective while applying decision-making and critical thinking skills to the challenges facing managers in today’s globally-diverse environment. Recommended Course Background: EN.660.105
Instructor(s): E. Rice.

EN.660.231. Case Studies-Bus Ethics. 3 Credits.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings - both global and personal in nature.
Instructor(s): D. Sandhaus; J. Smylie
Area: Humanities.
EN.660.235. Leading Change. 3 Credits.
Instructor(s): E. Rice.

EN.660.241. Info Tech Management. 3 Credits.
This course surveys the fundamentals of information technology from a management point of view. Topic areas include systems concepts and value in the global economy, data and technology management, systems analysis and design, telecommunications, and societal and legal issues. Recommended Course Background: EN.660.105 Writing Intensive.

EN.660.250. Principles of Marketing. 3 Credits.
This course explores the role of marketing in society and within the organization. It examines the process of developing, pricing, promoting and distributing products to consumer and business markets and shows how marketing managers use the elements of the marketing mix to gain a competitive advantage. Through interactive, application-oriented exercises, case videotapes, a guest speaker (local marketer), and a group project, students will have ample opportunity to observe key marketing concepts in action. The group project requires each team to research the marketing plan for an existing product of its choice. Teams will analyze what is currently being done by the organization, choose one of the strategic growth alternatives studied, and recommend why this alternative should be adopted. The recommendations will include how the current marketing plan will need to be modified in order to implement this strategy and will be presented to the instructor in written form and presented to the class. No audits.
Instructor(s): K. Quesenberry; L. Kendrick; M. DeVries; Staff; T. Jones.

EN.660.300. Managerial Finance. 3 Credits.
This course is designed to familiarize the student with the basic concepts and techniques of financial management practice. The course begins with a review of accounting, securities markets, and the finance function. The course then moves to discussion of financial planning, financial statement analysis, time value of money, interest rates and bond valuation, stock valuation, and concludes with capital budgeting and project analysis. A combination of classroom discussions, problem sets, and case studies will be used. Note: not open to students who have taken EN.660.302 Corporate Finance. No audits.
Prerequisites: EN.660.203
Instructor(s): Staff.

EN.660.302. Corporate Finance. 3 Credits.
Designed as a practicum for exploring basic concepts and techniques used by today's corporate financial professionals. Financial statement analysis, capital budgeting and the cost of capital are explored. Recommended Course Background: Microeconometrics and Macroeconomics
Prerequisites: EN.660.203
Area: Social and Behavioral Sciences.

EN.660.303. Managerial Accounting. 3 Credits.
This course introduces management accounting concepts and objectives including planning, control, and the analysis of sales, expenses, and profits. Major topics include cost behavior, cost allocation, product costing (including activity based costing), standard costing and variance analysis, relevant costs, operational and capital budgeting, and performance measurement. Note: not open to students who have taken EN.660.204 Managerial Accounting. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.

EN.660.304. Financial Statement Analysis. 3 Credits.
This course is designed to increase a student's ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will access firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. No audits.
Prerequisites: EN.660.203 Financial Accounting
Instructor(s): A. Leps.

EN.660.305. Intellectual Property Law. 3 Credits.
This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations
Prerequisites: PREREQ: EN.660.205 Business Law I
Instructor(s): V. Peros
Area: Social and Behavioral Sciences.

EN.660.306. Law and the Internet. 3 Credits.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. No audits.
Prerequisites: Prerequisite: EN.660.205
Area: Social and Behavioral Sciences.

EN.660.307. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. Not open to students who have taken EN.660.206 Business Law II. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

EN.660.308. Business Law I. 3 Credits.
This course is designed to provide students an introduction to legal reasoning and analysis. Content distinguishes forms of business, civil versus criminal law, and agency principles; intellectual property concepts, contract Law, the UCC (Uniform Commercial Code) and consumer protection are explored and discussed in the context of assigned legal cases which are intended to develop a student’s ability to analyze and apply law. Note: not open to students who have taken 660.205 Business Law I. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Fisher; W. Rakes
Area: Social and Behavioral Sciences.
EN.660.310. Case Studies in Business Ethics. 3 Credits.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings—both global and personal in nature. Students will learn the reasoning and analytical skills needed to apply ethical concepts to their own decision-making, to identify moral issues involved in the management of specific problem areas in business and society, and to understand the social and natural environments which give rise to moral issues. The course focus is on performance articulated by clear reasoning and effective verbal and written communication concerning ethical issues in business and society. Not open to students who have taken EN.660.231 Case Studies in Business Ethics. No audits. **Prerequisites: EN.660.105**
Instructor(s): D. Sandhaus
Area: Humanities.

EN.660.311. Law and the Internet. 3 Credits.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. Note: not open to students who have taken EN.660.306 Law and the Internet. No audits. **Prerequisites: EN.660.205** OR **EN.660.308**
Instructor(s): M. Franceschini
Area: Social and Behavioral Sciences.

EN.660.321. Managing & Marketing Social Enterprises. 3 Credits.
This course focuses on preparing students to engage in and lead social enterprises as we explore the options for creating social value. Using a combination of lecture, case study and project work, we investigate both for-profit and non-profit models for creating social value with special emphasis on the non-profit community. Particular emphasis is placed on the management challenges of social enterprises such as creating and conveying their message, options for dealing with finances, relationships within communities, and methods for building constituencies. Additionally, we address critical issues such as measures of success, scale, replication and failure. The class requires contact with organizations in the community as well as one long weekend away from campus. Recommended Course Background: EN.660.105 or EN.660.333 or EN.660.220/EN.660.340. No audits. **Writing Intensive.**

EN.660.330. Leadership Dynamics. 3 Credits.
Required: Introduction to Business (660.105) or Principles of Management (660.220) Focuses on the dynamics associated with taking charge in a group or organizational setting. Topics include: visioning, delegation, power, charisma and managing change.

EN.660.331. Leadership in Teams. 3 Credits.
This course will allow students to develop the analytical skills needed to effectively lead and work in teams. Students will learn tools and techniques for problem solving, decision-making, conflict resolution, task management, communications, and goal alignment in team settings. They will also learn how to measure team dynamics and performance, and assess methods for building and sustaining high-performance teams. Students will also explore their own leadership, personality and cognitive styles and learn how these may affect their performance in a team. The course will focus on team-based experiential projects and exercises as well as provide opportunities to individually reflect and write about the concepts explored and skills gained throughout the course. No Audits. **Prerequisites: EN.660.332**
Instructor(s): W. Smedick.

EN.660.332. Leadership Theory. 3 Credits.
Students will be introduced to the history of Leadership Theory from the “Great Man” theory of born leaders to Transformational Leadership theory of non-positional learned leadership. Transformational Leadership theory postulates that leadership can be learned and enhanced. The course will explore the knowledge base and skills necessary to be an effective leader in a variety of settings. Students will assess their personal leadership qualities and develop a plan to enhance their leadership potential. Recommended Course Background: EN.660.105 or EN.660.220/EN.660.340. No audits. **Instructor(s): W. Smedick**
Area: Social and Behavioral Sciences **Writing Intensive.**

EN.660.333. Leading Change. 3 Credits.
In this course, we will use a combination of presentation, discussion, experiential learning, research and self-reflection to investigate issues surrounding leadership and change in communities and the economy. While considering both for-profit and non-profit entities, we will pursue topics including understanding and using theories of change; finding competitive advantage and creating strategic plans; making decisions, even in uncertain times; valuing differences; employing leadership styles; giving and receiving feedback; understanding employee relations; creating performance measures; and developing organizational cultures; and using the dynamics of influence. Not open to students who have taken EN.660.235. No audits. **Recommended Course Background: EN.660.105**
**Instructor(s): W. Smedick**
**Writing Intensive.**

EN.660.335. Negotiation/Conflict. 3 Credits.
The focus of this class is the nature and practice of conflict resolution and negotiation within and between individuals and organizations. The primary format for learning in this class is structured experimental exercises designed to expose students to different aspects of negotiation and to build tangible skills through interpersonal exchange. While some class time is devoted to presentations on theories and approaches, the class method primarily relies on feedback from fellow classmates on their observations of negotiation situations and on personal reflections by students after each structured experience. Topics include conflict style, negotiation, and group conflict. No audits. Recommended Course Background: EN.660.105, an additional course in the Entrepreneurship and Management Program or in the social sciences. **Instructor(s): E. Rice.**
EN.660.336. Community Engineering: Interdisciplinary Problem Solving-Community Based Learning. 3 Credits.
So many big and seemingly intractable problems inhibit progress and diminish quality of life especially in and around urban communities. Surely there are ways to begin to tackle some of these problems, if we approach them from a multi-disciplinary perspective. This course provides that opportunity as students, who work primarily in teams, apply theory and ingenuity to investigate problems, propose solutions or invent devices that address some of these problems. Class time is spent in lecture, discussion, and applied community projects to master content. Time will be spent participating on teams and working in community organizations in addition to class. 
Area: Social and Behavioral Sciences Writing Intensive.

EN.660.337. Dead Leaders Society: Historical Perspectives on Leadership. 3 Credits.
Students will analyze how the political, economic, cultural and social contexts of prior centuries shaped the styles and effectiveness of its leadership. Some giants of history like Cleopatra, Eleanor of Aquitaine, King Richard the Lionhearted, Elizabeth I, Winston Churchill and Abraham Lincoln will be analyzed for their contributions to their own era’s as well as modern concepts of leadership. In addition, lesser-known leaders such as Katherine Swynford, Mary Anning and Elizabeth Philpot, Llywelyn ab Gruffydd and Simon de Montfort will be analyzed for their contributions to modern leadership behaviors, styles and effectiveness. No audits. Recommended Course Background: EN.660.332 or EN.660.331 Prerequisites: EN.660.331 or EN.660.332.

EN.660.340. Principles of Management. 3 Credits.
This course introduces the student to the management process. The course takes an integrated approach to management by examining the role of the manager from a traditional and contemporary perspective while applying decision-making and critical-thinking skills to the challenges facing managers in today’s globally diverse environment. The course examines the techniques for controlling, planning, organizing resources and leading the workforce. Not open to students who have taken EN.660.220 Principles of Management. No audits. Prerequisites: EN.660.105 Instructor(s): I. Izenberg.

EN.660.341. Business Process and Quality Management. 3 Credits.
This course focuses on both quantitative and qualitative analytical skills and models essential to operations process design, management, and improvement in both service and manufacturing oriented companies. The objective of the course is to prepare the student to play a significant role in the management of a world-class company which serves satisfied customers through empowered employees, leading to increased revenues and decreased costs. The material combines managerial issues with both technical and quantitative aspects. Practical applications to business organizations are emphasized. No audits. Instructor(s): J. Reiter Writing Intensive.

EN.660.351. Product and Brand Management. 3 Credits.
Consumers love those little bits of crunchy orange goodness called Cheetos®. But when Frito-Lay decided that consumers might also like Cheetos®-flavored lip balm, they reacted with a hailstorm of derision. This may be proof that our free market economy is just a rudderless, if hilarious, contraption. More likely, Cheetos® Lip Balm was an example of the challenges marketers face in product and brand management. This course is a conceptual and practical exploration of how marketers deliver products and build brands that translate into competitive advantage for their companies. Among the critical concepts typically addressed in the course are developing and positioning a brand, assembling the marketing mix media into a whole, establishing price, creating packaging, and tracking the customer experience. The course uses readings, lecture, exercises, cases and examples to explore these concepts. No audits. Prerequisites: EN.660.250 Instructor(s): D. Crane.

EN.660.352. New Product Development. 3 Credits.
New product development is the ultimate interdisciplinary entrepreneurial art, combining marketing, technical, and managerial skills. A successful product lies at the intersection of the user’s need, a technical solution, and compelling execution. This class will bootstrap your experience in the art through exercises and team projects. We will examine products and services, consumer and industrial, simple and technologically complex. Case studies will feature primary sources and the instructor’s personal experiences as an inventor for a major consumer products company. Topics will span the product development cycle: identifying user needs, cool-hunting, brainstorming, industrial design, prototyping techniques, market research to validate new ideas, and project management -- especially for managing virtual teams and foreign manufacturers. No audits. Prerequisites: EN.660.250 Instructor(s): M. Agronin.

EN.660.354. Consumer Behavior. 3 Credits.
This course will explore how and why consumers make choices in the marketplace—the “buy-ology” of their behavior. We will learn the psychological, social, anthropological, and economic underpinnings of consumer behavior as well as the brain chemistry that affects choices in the marketplace. Students will learn how consumer behavior can and is influenced and the sometimes-unintended consequences of marketing campaigns designed to produce a particular behavior. Students will analyze how consumers solve problems, assess tradeoffs and make choices; how they integrate and react to retail surroundings, smells, product displays, brand, pricing strategies, social pressures, market structures and a myriad of other influences and motivations to buy. Students will also explore how marketers incorporate what is known about consumer behavior into advertising and promotional campaigns, market segmentation and positioning, pricing strategies and new product introductions. Student experiential projects will include ethnographic observations and analyses of real-world consumer behavior. No audits. Prerequisites: EN.660.250.

EN.660.355. Sports Marketing. 3 Credits.
This course will allow students to apply marketing principles and concepts to the sports marketing environment while gaining an understanding of how event sponsorships, endorsements, licensing and naming rights are used to achieve business objectives. Through case studies and a group project, students will be exposed to a broad range of sports entities including professional sports teams, governing organizations and sports media. Prerequisites: EN.660.250 Principles of Marketing Instructor(s): L. Kendrick.
EN.660.357. Copywriting and Creative Strategy. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.661.357. No audits.
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry
Writing Intensive.

EN.660.358. International Marketing. 3 Credits.
This course covers product, pricing, promotion, distribution, market research, organization and implementation and control policies relating to international marketing. It also explores the economic, cultural, political and legal aspects of international marketing. Through interactive and application-oriented assignments and cases, students will gain hands-on experience in analyzing and developing marketing strategies for organizations that market both consumer and business products/services internationally. A group project will involve the development of an international marketing plan for a specific product. One or more local international marketers will be invited to speak to the class. No audits.
Prerequisites: EN.660.250

EN.660.360. Small Business Mgmt. 3 Credits.
Provides tools students will need to successfully launch and manage a small business in a competitive, global environment. Examines the challenges of entrepreneurs, the business plan, marketing and financial issues, hiring, and managing people. Recommended Course Background: EN.660.105, EN.660.220.

EN.660.401. Advanced Corporate Finance. 3 Credits.
The advanced course in corporate finance is designed to provide the upper level business student with a background in the more complex applications of financial management practice. Students will be exposed to advanced financial management concepts through a pedagogy combining classroom instruction, problem solution, business case analysis and work on a group project with coverage of the topics of capital markets, risk and portfolio theory, cost of capital, raising capital, capital structure, corporate dividend policy, real property valuation, merger and acquisition analysis, working capital management, commercial leasing strategies, international finance and derivatives analysis. No audits.
Prerequisites: EN.660.302 Corporate Finance OR EN.660.300 Managerial Finance OR 180.366 Corporate Finance.

EN.660.404. Business Law II. 3 Credits.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. No audits.
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

EN.660.405. Intellectual Property Law. 3 Credits.
This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations. The course addresses critical issues such as the various types of intellectual property, the protection and commercialization of intellectual property by business and legal means, and the valuation of intellectual property. In addition, the tension between exclusive rights in intellectual property and free competition will be discussed throughout this course. Through interactive class discussions and a group project, students will have ample opportunity to develop a better understanding pertaining to the different types of intellectual property and to develop an intellectual property strategic plan for protecting an intellectual property portfolio. Specifically, the group project requires each team to research a selected Maryland based company’s intellectual property, its plan for protection and commercialization and its business goals, products and services. Each team will then analyze how well the company’s current business goals relate to its intellectual property portfolio, and recommend changes to better meet these company’s goals. Not open to students who have taken EN.660.305 Intellectual Property Law. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

EN.660.410. Computer Science Innovation and Entrepreneurship. 3 Credits.
This course is designed to give students in CS the requisite skills to generate and screen ideas for new venture creation and then prepare a business plan for an innovative technology of their own design. These skills include the ability to incorporate into a formal business case all necessary requirements, including needs identification and validation; business and financial models; and, market strategies and plans. Student teams will present the business plan to an outside panel made up of practitioners, industry representatives, and venture capitalists. In addition, this course functions as the first half of a two course sequence, the second of which will be directed by CS faculty and focus on the actual construction/programming of the business idea.
Prerequisites: Co-requisite: EN.600.321 OR EN.600.421
Instructor(s): L. Aronhime.

EN.660.411. Corporate Strategy and Business Failure. 3 Credits.
The purpose of this course is to bring together theories of corporate strategy and the tools and techniques of strategy consulting. Students will address these in terms of historical case studies where they will have the opportunity to “fix” famous examples of corporate failure. Students will analyze the political, economic, social, and technological contexts of these cases while applying standard tools to the analysis of competing strategic plans.
Prerequisites: EN.660.105.

EN.660.414. Financial Statement Analysis. 3 Credits.
This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will assess firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. Not open to students who have taken EN.660.304 Financial Statement Analysis. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.
EN.660.420. Marketing Strategy. 3 Credits.
This writing intensive course helps students develop skills in formulating, implementing, and controlling a strategic marketing program for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization and support these decisions with quantitative analyses. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations, including financial projections, and presenting them to the class. No audits.
Prerequisites: Prereq: EN.660.250
Instructor(s): L. Kendrick
Writing Intensive.

EN.660.430. Creativity & Innovation. 3 Credits.
Students will learn techniques for improving the flexibility and originality of their thinking and will explore approaches used by managers and organizations to create and sustain high levels of innovation. The course uses fun and hands-on activities to stimulate innovation. Open to Juniors and Seniors. Recommended Course Background: two courses in the Entrepreneurship and Management program.

EN.660.450. Advertising & Integrated Marketing Communication. 3 Credits.
This course builds on the promotional mix concepts covered in Principles of Marketing (EN.660.250)—advertising, public relations, sales promotion and personal selling. Students will learn how marketers are changing the ways they communicate with consumers and the ways in which promotional budgets are allocated—and how this impacts the development of marketing strategies and tactics. Working with a client (provided by EdVenture Partners) that has chosen this JHU class as its “advertising agency” and an actual budget provided by the firm, the class will form small teams to mirror the functional organization of an actual ad agency (market research, media strategy/planning, copywriting/design, public relations, etc.). Student teams will then develop a promotional plan and corresponding budget to reach the desired target market (JHU undergrads who meet the client’s criteria), implement the plan and then evaluate its effectiveness through pre- and post campaign market research conducted on the target consumer. Note: Not open to students who have taken EN.660.450 as Advertising and Promotion. No audits.
(Formerly Advertising and Promotion.)
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.

EN.660.453. Social Media and Marketing. 3 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.661.453.
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry.

EN.660.456. Marketing Communication Law & Ethics. 3 Credits.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.661.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Instructor(s): K. Quesenberry
Writing Intensive.

EN.660.460. Entrepreneurship. 3 Credits.
This course provides students with a solid introduction to the entrepreneurial process of creating new businesses. Students will gain an appreciation for the investors’ perspective in assessing opportunities, evaluating strategies, and valuing the new enterprise. The course will cover the principal components of building a successful venture including management, market analysis, intellectual property protection, legal and regulatory issues, operations, entrepreneurial financing, and the role of the capital markets. Course work will include case studies and creation of investor marketing materials. Open to Juniors and Seniors. No Audits. Recommended Course Background: EN.660.203
Prerequisites: EN.660.105 OR EN.660.250
Instructor(s): E. Rice.

EN.660.461. Engineering Business and Management. 3 Credits.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): I. Izenberg; M. Agronin
Area: Engineering.

EN.660.465. Tech Commercialization. 3 Credits.
In this course, lectures, case analyses, and team projects provide a strategic framework for determining the commercial value of new technologies and the best path for realizing that value. Juniors or Seniors only. Recommended Course Background: EN.660.105, EN.660.203, EN.660.250 or instructor permission.
Writing Intensive.

EN.660.500. Business Internship. 1 Credit.
Students may qualify for an internship with one of the many local employers with whom CLE works or they may arrange a non-local internship on their own. For non-paid internships only, students may apply for sponsorship for academic credit through CLE. Applications must be reviewed by the internship coordinator. S/U only.
Instructor(s): L. Kendrick.
EN.660.501. Practicum in Entrepreneurship and Management. 3 Credits.
Students work on an existing business or marketing plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students must apply by submitting a cover letter, resume, unofficial transcript, and essay describing the business concept/marketing plan. Applications must be approved by both the faculty member and director of CLE. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. Permission required. S/U only.
Instructor(s): L. Aronhime; P. Sheff.

EN.660.611. Accounting and Finance.
The course includes a review of financial accounting with an emphasis on the managerial implications of financial statements and their application to financial analysis. Course material will also encompass cost accumulation, cost allocation, product costing, and variance analysis, and their impact on financial forecasting and capital budgeting. Students will also explore valuation techniques for new technologies. Permission of instructor required. Co-listed with 662.611.

Professional Communication
EN.661.110. Professional Communication for Science, Business and Industry. 3 Credits.
This course teaches students to communicate effectively with a wide variety of specialized and non-specialized audiences. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. No audits.
Instructor(s): B. Parris; C. O'Donnell; C. Wilkins; J. Thompson
Writing Intensive.

EN.661.111. Professional Communication for ESL Students. 3 Credits.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Note: not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.611. No audits.
Instructor(s): L. Davis
Writing Intensive.

EN.661.120. Business Communication. 3 Credits.
Sec. 01: Sheff Sec. 02: Sheff Sec. 03: Porosky Students focus on writing business memos, resumes and cover letters, business proposals, and formal reports. They present work orally using business and professional formats, and enhance their presentations with technology-based media. Writing Intensive.

EN.661.150. Oral Presentations. 3 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. No audits.
Instructor(s): A. Kulanko; C. O'Donnell; J. Heiserman; J. Reiser; K. Dungey
Writing Intensive.

EN.661.151. Oral Presentations for ESL. 3 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. Co-listed with EN.661.651. No audits.
Instructor(s): L. Davis
Writing Intensive.

EN.661.160. Media & Society. 3 Credits.
This online course takes a comprehensive and critical view of the history, roles and responsibilities of media in society. It explores the organization, creation, economics, control and effects of mass communications in the United States and the world. Students will learn how both traditional and new digital media has come to play such an integral role in our society while exploring the exciting career opportunities in journalism, public relations, advertising, radio, film, TV and the Internet. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through writing assignments. No audits.
Recommended Course Background: One writing course in any discipline.
Instructor(s): K. Quesenberry.

EN.661.170. Visual Rhetoric. 3 Credits.
A course that aims to help students design clearer, more visually engaging graphics for a wide variety of business and technical documents. Students will learn to manage essential principles of graphic design through a variety of graphic programs (Adobe Creative Suite) and MS Office software. Topics will include logos, letterhead, event posters, brochures, data graphics and some basic web design. No audits.
Instructor(s): C. O'Donnell.

EN.661.270. Working with Writer’s Block. 3 Credits.
This course is designed to help anyone currently struggling with writer’s block--anything from extreme procrastination, avoidance behavior, poor writing process, or outright blockage (among others). It utilizes experimental, non-traditional, and un-orthodox methods--including mindfulness meditation and freewriting--to help students and professionals learn how to embrace their own writing process in a more open, flexible, and creative fashion. We will use the work of Jon Kabat-Zinn, Natalie Goldberg, Anne Lamott, and others. This course will only be taught pass/fail.
Instructor(s): J. Reiser
Writing Intensive.
EN.661.315. The Culture of the Engineering Profession. 3 Credits.
This course focuses on building understanding of the culture of engineering while preparing students to communicate effectively with the various audiences with whom engineers interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students will engage in discussion, argument, case study and project work to investigate: the engineering culture and challenges to that culture, the impacts of engineering solutions on society, the ethical guidelines for the profession, and the ways engineering information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. No audits. For Engineering sophomores, juniors and seniors or by permission of instructor.
Instructor(s): E. Rice; P. Sheff
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.317. The Culture of the Medical Profession. 3 Credits.
This course builds understanding of the culture of medicine as well as the ways in which different strata within society have access to and tend to make decisions about health and health related services while preparing students to communicate effectively with the various audiences with whom medical professionals interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students engage in discussion, argument, case study and project work to investigate topics such as the medical culture, the ways medicine is viewed by different segments of society, issues associated with access to health care, ethical dilemmas and guidelines for medical decisions, the impacts of medical and engineering solutions on society, decision making within client/patient groups, social and cultural differences that affect behavioral change, and the ways medical information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication through a series of short papers and presentations associated with analysis of the writings and cases. For sophomores, juniors, and seniors or by permission of instructor. No audits.
Instructor(s): P. Sheff
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.357. Copywriting & Creative Strategy. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.660.250. No audits.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): K. Quesenberry
Writing Intensive.

EN.661.361. Corporate Communications & P.R.. 3 Credits.
This course focuses on the ways that organizations, both for-profit and non-profit, manage their communications to deliver strategic, coherent and compelling messages to their varied stakeholders. Using case studies and team-based, real world projects, we will explore topics including public and media relations, corporate image, branding, advertising, internal and external communications, crisis management, investor relations, ethics and social responsibility. In the process, we will consider issues ranging from organizational culture and leadership styles to defining strategy, managing conflict, defending positions and disagreeing agreeably. No audits. Recommended Course Background: AS.220.105, EN.661.110, AS.060.113 or AS.060.114, AS.060.215, EN.660.250, EN.660.105, and EN.661.150
Instructor(s): P. Sheff
Writing Intensive.

EN.661.390. Online Journalism: JayStreet: A Journal of Entrepreneurship & Technology at JHU. 3 Credits.
Online journalism, especially at the intersection of science, medicine, and technology, is a rapidly growing field. This interactive course, open to students in all academic disciplines, produces Jay Street, an online journal, focusing on science, medicine, and technology with a JHU connection. Using a combination of guest speakers, interviews, investigative reporting, and selected readings, we will explore and write about some of the exciting and innovative research in science, medicine, and technology conducted at the Johns Hopkins Institutions. Serving as writers, editors and designers, students will choose a theme and design the journal, develop articles and interviews, blogs and videos, providing themselves a key credential for the future. No audits. Recommended Course Background: At least one writing intensive course and/or permission of the instructor.
Writing Intensive.

EN.661.410. Research Writing for ESL. 3 Credits.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provides intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. Undergraduates must be conducting research with a faculty member or must obtain special permission of instructor to register for the course. S/U grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.610. No audits.
Writing Intensive.
EN.661.425. Ethics of Biomedical Innovation. 3 Credits.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Co-listed with EN.580.425.
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.453. Social Media and Marketing. 3 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits. Prerequisites: EN.660.250
Writing Intensive.

EN.661.454. Blogging and Online Copywriting. 3 Credits.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Co-listed with EN.661.654. No audits. Recommended Course Background: one writing course in (professional communication, expository writing, or writing seminars).
Prerequisites: Prereq. EN.660.250-Principles of Marketing.
Instructor(s): K. Quesenberry
Writing Intensive.

EN.661.455. Copywriting & Creative Thinking. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. No audits. Prerequisites: EN.660.250
Writing Intensive.

EN.661.456. Marketing Communication Law & Ethics. 3 Credits.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.660.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry
Writing Intensive.

EN.661.487. Advanced Communication Skills for Science and Engineering. 3 Credits.
This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Undergraduates are required to be conducting research with a faculty member or by special permission of instructor. Co-listed with EN.661.687. No audits. Writing Intensive.

EN.661.488. Communicating Decisions in a Crisis. 3 Credits.
Open to sophomores, juniors and seniors only or permission of instructor. This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.688. No audits. Writing Intensive.

EN.661.610. Research Writing for ESL.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.410. No audits. Instructor(s): D. Link-Farajali
Writing Intensive.

EN.661.687. Communicating Decisions in a Crisis. 3 Credits.
Open to sophomores, juniors and seniors only or permission of instructor. This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.688. No audits. Writing Intensive.

EN.661.688. Communicating Decisions in a Crisis. 3 Credits.
Open to sophomores, juniors and seniors only or permission of instructor. This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.688. No audits. Writing Intensive.

EN.661.488. Communicating Decisions in a Crisis. 3 Credits.
Open to sophomores, juniors and seniors only or permission of instructor. This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.688. No audits. Writing Intensive.

EN.661.610. Research Writing for ESL.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.410. No audits. Instructor(s): D. Link-Farajali
Writing Intensive.
EN.661.611. Professional Communication for ESL.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.411.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that “edge” you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester. Financial Math students only. P/F only. No audits.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Instructor(s): D. Link-Farajali.

EN.661.651. Oral Presentations for ESL.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. Co-listed with EN.661.151.

EN.661.653. Social Media and Marketing.
Students will design and manage their own “guerrilla” marketing and communications firm that will work with a local, non-profit client. The student-run firm will develop the client’s online presence and marketing campaign using a variety of social media resources including website development, blogging, Google Analytics, FB, Tumblr, Twitter, or other tool they determine to be critical to the project. The course is welcome to all students who have had either one writing course—in professional communications, oral presentations, expository writing, or writing seminars—or one marketing course. The course also welcomes students with graphic design, start-up, or other relevant business or management experience. Co-listed with 661.453. No audits.
Instructor(s): J. Reiser.

EN.661.654. Blogging, Editing, and Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars). Co-listed with EN.661.454. No audits.
Prerequisites: Prereq. EN.660.250-Principles of Marketing. Recommended prerequisite: one writing course in any discipline (professional communication, expository writing or writing seminars). Co-listed with 661.454. No audits.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Co-listed with EN.661.487. No audits.

This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.488. No audits.
EN.661.710. Dissertation Writing Workshop.
This course is designed to introduce students to the dissertation writing process, explain JHU-specific rules and regulations regarding dissertation work, and facilitate the completion of new work or work already in progress. Open to students in any discipline and in any stage of the dissertation process, this course will begin with a selection of speakers from relevant JHU departments, The Graduate Board, the MSE Library and the Commercial Binding Office, the Counseling Center’s Dissertation Support Group, professors, and recently graduated students (among others). During the second half of the course, students will designate one component of the dissertation and work to bring it to completion in a supportive workshop environment. This “component” could include a prospectus, a literature review, a chapter, an introduction, an overall plan for completion, or preparation for the defense. Topics will be geared toward the individual needs of the students registered in the course but will, in general, emphasize goal setting, project planning, developing strategies for working with readers/advisors/committees, learning how to emphasize “the big picture,” working with research tools such as Refworks or Zotero, building a daily writing practice, exploring strategies to deal with the isolation/depression common to dissertation writers, navigating the submission process, and, in general, supporting the overall dissertation writing process through its various stages. Course is taught pass/fail only. Non-native speakers are encouraged to take EN.661.610 Research Writing for ESL before taking this course. No audits.
Instructor(s): J. Reiser.

This workshop is for dissertation writers who have already completed the Dissertation Writing Workshop, EN.661.710. This class provides a venue for students to hold themselves accountable, to set weekly goals, to workshop drafts, and to present work-in-progress to the whole group. Course is taught pass/fail only. Course may be repeated. No audits.
Prerequisites: Prereq: EN.661.710.

Engineering Management

EN.662.611. Accounting and Finance.
This course includes a review of financial accounting with an emphasis on the implications of GAAP selections and other managerial decisions on the financial statements. Historic financial performance is assessed using ratio analysis. Relevant cash flows are used in capital budgeting situations; projects are analyzed using discounted cash flow techniques as a measure of valuation. Managerial accounting topics of financial forecasting, cost accumulation, cost allocation, product costing, and variance analysis are used in decision making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): A. Leps.

Business Law and Intellectual Property introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses; contracts; intellectual property; principal-agent relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. For M.S. in Engineering Management only; no audits.
Instructor(s): A. Lebbos.

EN.662.642. Management and Leadership.
Management and Leadership is a case, experiential and research based course intended to introduce participants to issues and solutions related to growing and managing businesses with an emphasis on entrepreneurial enterprises. The course focuses on managerial decision-making and organization building through topics that include planning and managing strategic change; finding competitive advantage; making informed decisions; dealing with uncertainty; negotiating collaborative settlements; managing/leading projects, teams and professionals; networking and forming strategic alliances; valuing differences; creating and maintaining organizational cultures; and devising performance measures. Additionally, participants master aspects of management communication as they address course content. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): E. Rice.

This course is designed to introduce students to key marketing, communications, and strategic issues surrounding the process of bringing new products to the marketplace. Through cases, readings, discussion and hands-on team projects, students develop a flexible approach to thinking about marketing problems, maximizing resources and creating strategic solutions. Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): P. Sheff.

EN.662.692. Venture Planning to New Venture Creation.
Venture Planning requires participants to work in groups to address, design and plan a business solution for an engineering problem with social implications. More specifically, students will work on cross-disciplinary teams to develop a commercially viable new technology. They must select a problem amenable to an engineering solution, investigate the problem, research the issues and potential, develop a design for the technology, investigate the competitive advantage, and create and present a business plan for the idea. Course content will address many of the issues that will be encountered during the process of bringing an idea to fruition. For M.S. in Engineering Management only; graded (not P/F); no audits.

EN.662.801. MSEM Seminar.

Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): E. Rice; P. Sheff.

Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): E. Rice.

Materials Science and Engineering

Materials are essential to the construction of any engineering structure, from the smallest integrated circuit to the largest bridge. In almost every technology, the performance, reliability, or cost is determined by the materials used. As a result, the drive to develop new materials
and processes (or to improve existing ones) makes materials science and engineering one of the most important and dynamic engineering disciplines.

The central theme of materials science and engineering is that the relationships among the structures, properties, processing, and performance of materials are crucial to their function in engineering structures. Materials scientists seek to understand these fundamental relationships and use this understanding to synthesize new materials or develop new processes for producing existing ones. Materials engineers design or select materials for particular applications and develop improved processing techniques. Since materials scientists and engineers must understand the properties of materials as well as their applications, the field is inherently interdisciplinary and draws on aspects of almost every other engineering discipline as well as physics, chemistry, and, most recently, biology. Because the field encompasses so many different areas, it is often categorized according to types of materials (metals, ceramics, polymers, and semiconductors) or to their applications (biomaterials, electronic materials, magnetic materials, or structural materials).

The department prepares students for successful careers in materials science and engineering, for advanced study in science or engineering, and for professional education in other fields. The goal of the undergraduate program is to provide a rigorous and comprehensive curriculum in materials science and engineering as well as in mathematics, basic sciences, humanities, and social sciences. Our low student-to-faculty ratio allows students close contact with faculty in both classroom and research environments, as well as with other students and researchers in the department. The student is encouraged to proceed at his or her own rate and to participate in interdisciplinary, interdepartmental, and interschool programs. In the tradition of Johns Hopkins, all of our undergraduate students participate in research, often beginning in their sophomore year, working closely with faculty and graduate students.

In recognition that biomaterials and nanotechnology represent two of the most rapidly developing areas of materials science and engineering, the Department of Materials Science and Engineering offers challenging specializations in biomaterials or nanotechnology within its undergraduate program.

The field of biomaterials is concerned with the science and engineering of materials in biology and medicine. Engineering materials are increasingly used in applications such as drug delivery and gene therapy, scaffolds for tissue engineering, replacement body parts, and biomedical and surgical devices. Biomaterials is an inherently interdisciplinary field that requires deep understanding of the properties of materials in general, and the interactions of materials with the biological environment. The Biomaterials Track is designed to provide a firm grounding in the physics, chemistry, and biology of materials, as well as breadth in general engineering, mathematics, humanities, and social science. In addition, students are encouraged to gain hands-on experience in biomaterials research laboratories. The program seeks to educate students to reach the forefront of leadership in the field of biomaterials engineering. While the fundamental principles of materials science still apply, a complete understanding of biomaterials and their interactions with biological environments requires a greater degree of specialization than the standard undergraduate curriculum provides. In recognition of completion of the Biomaterials Track, a student may elect to have his or her academic transcript annotated to indicate a specialty in biomaterials.

Nanotechnology advances the utilization of materials and devices with extremely small dimensions. Nanotechnology is a visionary field, as micro and nanostructured devices impact all fields of engineering, from microelectronics (smaller, faster computer chips) to mechanical engineering (micromotors and actuators) to civil engineering (“smart,” self-healing nanocomposite materials for buildings and bridges) to biomedical engineering (biosensors and tissue engineering). Materials science is central to nanotechnology because the properties of materials can change dramatically when things are made extremely small. This observation is not simply that we need to measure such properties or develop new processing tools to fabricate nanodevices. Rather, our vision is that the wide (and sometimes unexpected) variety of phenomena associated with nanostructured materials allow us to envision radically new devices and applications that can only be made with nanostructured materials. The Nanotechnology Track encompasses a curriculum designed to train students in the fundamental interdisciplinary principles of materials science including physics and chemistry, and also to expose students to the forefront of nanomaterials research through elective classes as well as research laboratories. Students in the Nanotechnology Track will be well-prepared for successful careers in materials engineering across a wide range of disciplines. In recognition of completion of the Nanotechnology Track, a student may elect to have his or her academic transcript annotated to indicate a specialty in nanotechnology.

The graduate curriculum provides students with a broad yet thorough grounding in the fundamentals of materials science and engineering. After completing the core curriculum, students pursuing master and Ph.D. degrees take advanced courses that will allow them to work at the forefront of knowledge in their chosen specialty. Those desiring to conduct original research and advance the frontiers of knowledge pursue a master’s essay and/or Ph.D. thesis. To this end, the department has an outstanding and wide-ranging research program, with particular emphasis on nanomaterials, thin films, metastable materials, biomaterials, computational materials science, and materials characterization.

Facilities

The teaching and research facilities of the Department of Materials Science and Engineering are located in Maryland and Krieger halls on the Homewood campus. Our central facilities include the Surface Analytical Laboratory, with advanced tools for the chemical characterization of solid surfaces; the Scanning Electron Microscopy Laboratory; the X-Ray Diffraction Laboratory; the Laboratory for Thin Film Deposition; and facilities for sample preparation, optical microscopy, and mechanical testing. Individual research groups have established laboratories with advanced facilities for materials processing, nanotechnology, and materials characterization. Through collaboration with other departments and national laboratories, students and faculty also have access to a variety of other facilities necessary for world-class research.

Mission Statement and Program Objectives

The Materials Science and Engineering faculty strives to maintain the Johns Hopkins University tradition: to train a small number of students of highest quality who can make great impact on the scientific and engineering community that is large compared with the size of the department and the university. This institutional aspiration can only be realized with the success of our students as they pursue career directions beyond their time at Hopkins. Our degree program is designed to provide an optimum starting point for students with a diversity of career
aspirations providing a solid foundation for future career development. Graduates of the Materials Science and Engineering Program:

• Pursue careers that include advanced graduate studies in materials science and engineering or begin careers in related areas of science and engineering or professional disciplines that benefit from an understanding of materials science such as medicine, business or law.
• Employ elements of the research process in their careers including:
  a. the use of critical reasoning to identify fundamental issues and establish directions for investigation
  b. the ability to define specific plans for problem solution
  c. the use of analytical thought to interpret results and place them within a broader context

Requirements for the B.S. Degree

The Department of Materials Science and Engineering offers a program leading to the Bachelor of Science Degree. The B.S. for the Materials Science and Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org). The student must meet the general university requirements for the chosen degree as well as the departmental requirements, and must complete the program approved by the student’s advisor.

An anticipated individual program of study designed to meet the university and department requirements for the B.S. degree, as well as to reflect the student’s interest, should be filed as early as possible during the student’s residence. The faculty advisor’s signature is required on all course registration and course change forms. As changes are made in the program, it shall be the student’s responsibility to see that a revised program is filed with the advisor. Each student must have an approved program on file no later than the semester before he/she expects to graduate.

General university requirements include (see also General Requirements for Departmental Majors for more information):

• Complete program of study outlined by concentration (standard, biomaterials, or nanotechnology).
• Fulfill the university writing requirement two writing intensive courses, at least 3 credits each.
• Fulfill 75 credits earned in courses coded Engineering, Quantitative Studies, or Natural Science.
• At least 30 credits of this must be counted Natural Science or Quantitative Studies with no course counted twice.
• At least 30 additional credits must be taken outside of Engineering area, excluding prerequisites for the major.
• Fulfill a minimum of six courses coded Humanities or Social and Behavioral Sciences, at least 3 credits each, for a minimum of 18 credits.
• Take a minimum of 128 credits.

To meet the course requirements for the B.S. degree in Materials Science and Engineering, the student must complete a minimum of 128 credits, distributed as follows:

<table>
<thead>
<tr>

</table>

** The 42 credits of materials science courses must be passed with a letter grade of C or higher.
*** All courses must be passed with a letter grade of C- or higher
** Of these electives, 6 credits must be in natural sciences, mathematics, or engineering, and 9 credits are open electives to be chosen by the student. All courses must be passed with a letter grade of D or higher.

In addition to the degree program in Materials Science and Engineering, students may elect to complete specialized tracks in biomaterials or nanotechnology. Whether a student chooses to pursue studies following the standard program, the Biomaterials Track or the Nanotechnology Track, the course work specified for the degree will provide a firm grounding in the principles of materials science and engineering.

Students Majoring in Materials Science and Engineering:

• are well prepared for professional scientific and engineering practice, as well as for advanced study in materials science and engineering or other scientific, engineering, or professional areas;
• acquire a solid grounding in the mathematics, chemistry, biology, and the physics that are required for the solution of materials problems related to the structure, properties, processing, and performance of materials;
• can utilize modern scientific, engineering, and computer tools to analyze problems in materials science and engineering;
• can identify important scientific and engineering problems related to materials and design systems and processes as well as perform and complete relevant experiments to aid the solution of these problems within the constraints provided by social, economic, environmental, and cultural factors;
• learn to work both independently and in teams;
• obtain extensive experience in oral and written communication including science and engineering—specific forms of communication such as technical reports, scientific notebooks, and technical presentations of research;
• are instilled with an appropriate appreciation of the broad need for lifelong learning, the scope and meaning of professional responsibility, and the relevance of engineering practice to contemporary economic, environmental, and societal issues on local and global levels.

Three B.S. Degree Tracks are Offered by the Department of Materials Science and Engineering

Standard Track

The Standard Track is intended for those students with general materials science interests. It permits the student to tailor the degree program to specific interests by allowing a broad range of choices for upper-level science and engineering electives.

Biomaterials Track

Our biomaterials curriculum covers a variety of topics including biomimetic materials and natural materials, host responses to biomaterials and
biocompatibility, and applications of biomaterials, particularly to tissue engineering, drug delivery, and medical devices and implants. The goal of the Biomaterials Track in the Department of Materials Science and Engineering is to train students in the basic principles of materials science and engineering as these principles are applied to developing novel materials that benefit human health.

Students of the Biomaterials Track will be well-prepared for successful careers in biomaterials engineering or any biomedical-related field.

To receive commendation for completion of the Biomaterials Track, the student must complete two electives whose subject matter is some aspect of biomaterials and complete a biomaterials-related senior design project. Approval of electives must be made by a student's academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.

Intent to follow the Biomaterials Track in Materials Science and Engineering must be declared by the student’s fifth semester (first semester junior year). Students should express their intent in writing or by email to their department advisors and copy the academic coordinator. Students intending to follow the Biomaterials Track must complete a biomaterials-related senior design project.

**Nanotechnology Track**

It is with the goal of developing a broad vision for the application of nanostructured materials that the Department of Materials Science offers a Nanotechnology Track.

The nanotechnology curriculum covers the preparation, imaging, capabilities, and detailed physical understanding of materials as nanoscale objects. Successful completion of the Nanotechnology Track will be noted on the student’s transcript.

The Nanotechnology Track is intended for those students with a focused interest in nanomaterials. To satisfy the requirements of the Nanotechnology Track, students must complete two electives whose subject matter is some aspect of nanotechnology and complete a nanotechnology-related senior design project. Approval of electives must be made by a student's academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.

Students must declare their intent to satisfy the requirements of the Nanotechnology Track in Materials Science and Engineering by their fifth semester (first semester junior year). Students should declare their intent in writing or by email to their department advisors and copy the academic coordinator.

Students who wish to pursue both the biomaterials and nanotechnology track are permitted to do so, as long as they complete all requirements, and the subject matter of their senior design project falls within the scope of both programs (as approved by the instructor of senior design).

Detailed description of the B.S. program (course credits in parenthesis):

**Detailed Description of the B.S. Program**

**Materials Science (42 credits)**

Must be passed with a letter grade of C or higher.

</tbody>
</table>

**Humanities (18 credits)**

18 credits of Humanities or Social Sciences electives. Letter grade of C- or higher.

**Science and Engineering Electives (6 credits)**

Two courses of 200-level or above in engineering, natural sciences, or mathematics. Letter grade of D or higher required.

**Unrestricted Electives (9 credits)**

9 credits of unrestricted electives. Letter grade of D or higher is required.

Total Credits: 128
* Courses in other departments with an emphasis on the structure, properties, or processing of materials may be counted as materials science electives. A list of approved electives appears in the department’s Undergraduate Advising Manual (available from a student’s academic advisor). All 400-level or higher classes required in the Biomaterials and Nanotechnology Tracks will be counted toward satisfying the upper-level materials science electives requirement.

** Students may take EN.510.101 Introduction to Materials Chemistry to fulfill the Intro. Chem (AS.030.101/AS.030.102) requirement. In this case, the student needs to make up the balance of the credits with 3 credits of free electives.

*** For the Biomaterials Track, EN.580.221 Molecules and Cells must be passed with a grade of C or higher.

**Financial Aid**

Scholarships and other sources of financial assistance for undergraduates are described under Admissions and Finances (p. 22). In addition, the faculty employs a number of undergraduates as laboratory assistants to help with various aspects of their individual research programs.

Hopkins undergraduate students are encouraged to consider completing both the B.S. degree and the M.S.E. degree in a total of five years. This five-year, dual degree option offers additional preparation for the pursuit of Ph.D. programs and careers in materials science and engineering. Students are encouraged to consult their undergraduate advisors to gain information on M.S.E. programs at Hopkins, as well as third- and fourth-year course selections best suited to the pursuit of the M.S.E. degree.

Students may take EN.510.101 Introduction to Materials Chemistry or both AS.030.101 Introductory Chemistry I/AS.030.102 Introductory Chemistry II to fulfill the introductory chemistry lecture requirement.

**Advising and Review of Student Performance**

Each graduate student will normally have one or more faculty advisors. Students who are entering the M.S.E. program and plan to pursue a degree without an essay will be assigned an academic advisor. Students who are entering the M.S.E. program and plan to pursue a degree with an essay will be advised by their research advisor. Students who are entering the Ph.D. program will be advised by their research advisor. Students with a research advisor in another department will be assigned
Requirements for the M.S.E. Degree with Essay

(8 courses)

The degree of Master of Science in Engineering (M.S.E.) with Essay is awarded subject to the recommendation of the student's advisor and departmental approval, based on satisfactory completion of the following requirements:

Three core courses in Materials Science and Engineering

<table>

Four advanced (400 level or higher) elective courses in materials science and engineering or related fields *

A master's essay or journal publication is required

Total Credits 27

* Elective courses in materials science and engineering or related fields, subject to the following rules:
  - Up to two of the elective courses may be taken from within the Engineering for Professionals (EP) program.
  - Up to two of the elective courses can be business courses.
  - Any elective taken from outside the department (including EP courses) requires prior approval of the Graduate Program Committee.
  - With approval of the Graduate Program Committee, the student can transfer up to two graduate courses from another institution. Students desiring such credit must make the request in writing to the Graduate Program Committee by the end of the first semester after matriculation. This request must include a description of the course, a course syllabus, and documentation of the grade received.
  - With approval of the Graduate Program Committee, current or former Hopkins undergraduates can count two courses (400 level or higher) to both their B.S. and M.S.E. requirements.
  - A grade of C or better must be achieved in each course to obtain credit.
  - A overall grade point average of 3.0 must be maintained, and a grade point average of a 3.0 is required to earn the degree at the end of the program.
  - Attendance is required at the weekly Graduate Student Seminar and the Department of Materials Science and Engineering Seminar.

** A master’s essay or journal publication is required. A Master’s essay must be approved by one faculty reader and confirm to the requirements of the Graduate Board. For a journal publication a student must submit to the Graduate Program Committee an article describing his or her original research that has been published (or accepted for publication) in an archival, peer-reviewed technical journal. The student must be the primary author of the article.

Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 21 months. The student’s transcript will reflect a “Master of Science in Engineering with Essay.”

Requirements for the M.S.E. Degree without Thesis

(10 courses)

The degree of Master of Science in Engineering (M.S.E.) is awarded subject to the recommendation of the student’s advisor and departmental approval, based on satisfactory completion of the following requirements:

Three core courses in Materials Science and Engineering

<table>
<thead>
<tr>

</tbody>
</table>

Six advanced (400-level or higher elective courses in materials science and engineering or related fields *

Total Credits 18

* A master’s essay or journal publication is required.
Six advanced (400-level or higher) elective courses in materials science and engineering or related fields, subject to the following rules:

- Up to two of the elective courses may be taken from within the Engineering for Professionals (EP) program.
- Up to two of the elective courses can be business courses.
- Any elective taken from outside the department (including EP courses) requires prior approval of the Graduate Program Committee.
- With approval of the Graduate Program Committee, the student can transfer up to two 556 / Materials Science and Engineering graduate courses from another institution. Students desiring such credit must make the request in writing to the Graduate Program Committee by the end of the first semester after matriculation. This request must include a description of the course, a course syllabus, and documentation of the grade received.
- All electives will need prior approval from the Graduate Program Committee.
- A grade of C or better must be achieved in each course to obtain credit.
- A overall GPA of 3.0 must be maintained, and a GPA of 3.0 is required to earn the degree at the end of the program.
- Attendance is required at the weekly Graduate Student Seminar and the Department of Materials Science and Engineering Seminar.
- Up to two of the elective courses may be Graduate Research in Materials Science (EN.510.807), which may be taken in any session (Fall, January, Spring, or Summer). Note that 117 hours or research per course are required for credit.

Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 12 months. The student’s transcript will reflect a “Master of Science in Engineering.”

Requirements for the Ph.D. degree

To receive the degree of Ph.D., the candidate must fulfill the requirements below. The department must be satisfied that all academic requirements have been satisfied by the candidate before a recommendation will be made to the University Graduate Board to confer the Ph.D. degree.

1. Successful completion of four required courses in materials science and engineering.

   EN.510.601 Structure of Materials
   EN.510.602 Thermodynamics of Materials
   EN.510.603 Phase Transformations
   EN.510.615 Physical Prop-Material

   Each of the four required courses must be passed with a letter grade of B- or higher. If a student receives a grade of C+ or lower in a required course, the student may re-take the course once to achieve a grade of B- or higher. Receipt of grades of C+ or lower in two or more required courses will ordinarily be cause for dismissal from the program without the opportunity to re-take those courses.

   In addition, the student must maintain an overall GPA of 3.0 or better in the four required courses. If the student’s GPA falls below 3.0, the student must re-take one or more of the required courses and earn higher grade(s). Upon doing so the prior grade(s) in those course(s) are replaced and not counted toward the GPA.

   The four required courses must be successfully completed (meeting the grade and GPA requirements above) no later than the start of the student’s third year after matriculation; failure to do so will result in dismissal from the program. Exception: A student who fails to meet the requirements above due to a low grade in a single required course, and who has not had an opportunity to re-take that course during the first two years, will be permitted to re-take that one course in the third year.

   Students who have completed prior graduate-level coursework similar to EN.510.601 Structure of Materials, EN.510.602 Thermodynamics of Materials or EN.510.603 Phase Transformations may petition the Graduate Program Committee to waive one of these required courses. Alternatively, students with undergraduate degrees in Materials Science may petition the Graduate Program Committee to waive the Physical Properties course. However, only one of the four required courses can be waived. If approved, the course that has been waived will not be counted toward calculation of the GPA as described above. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation.

2. Successful completion of three advanced (600-level or higher) elective courses in materials science and engineering or a related field.

   Elective courses must be completed with a grade of C or higher, but there is no cumulative GPA requirement. A list of approved electives is available from the Academic Program Coordinator. Students wishing to use a course not on this list must submit a request to the Graduate Program Committee no later than the end of the first week of the semester in which the course is taken. Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses.

   Graduate research (EN.510.807-EN.510.808), part-time graduate courses (from Engineering for Professionals in WSE or Advanced Academic Programs in KSAS), and seminars (courses with less than three contact hours per week) will not be counted toward completion of PhD course requirements. Undergraduate courses (400-level or lower) will not be counted unless they are cross-listed as graduate level, 600 or higher. Independent study courses (EN.510.805-EN.510.806) may be used with prior approval of the Graduate Program Committee.

   Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation.

   In some cases an advisor may require a student to complete additional coursework, beyond the four required courses and three electives described above.

3. Teaching Assistant Requirement.

   Students in their second year in the department will be required to act as teaching assistant for two courses.

4. Successful completion of a comprehensive oral examination covering fundamentals of materials science and engineering. The comprehensive examination tests knowledge in each of the subjects listed below:

   - Structure of materials
   - Thermodynamics of materials
   - Phase transformations in materials
In each of the three subject areas, students may be asked questions related to the properties of materials. The depth of required knowledge regarding properties of materials will match the level of knowledge presented in the Physical Properties of Materials class.

Successful completion of the comprehensive exam requires satisfactory performance on all areas tested; there are no partial or conditional passes.

The comprehensive exam is offered semiannually, usually immediately prior to the fall and spring semesters. A student who fails the exam on the first try may make a second attempt, but the exam must be successfully completed no later than the start of the third year following matriculation. Failure to do so will result in dismissal from the program.

5. An oral presentation of a proposal for a research project to form the basis of the candidate’s dissertation.

The dissertation proposal must be presented at a department seminar no later than the end of the third year following matriculation. A written version of the dissertation proposal must be submitted to a faculty committee consisting of the student’s faculty advisor and two other faculty members (to be selected in consultation with the advisor) no later than two weeks prior to the oral presentation. A brief closed session between the student and the committee shall follow the presentation, at which the committee members will ask questions about and provide comments on the proposed plan of research. Additional private discussions may be required by one or more committee members. The thesis proposal is also an examination, with the committee testing the candidate’s depth of knowledge in his or her area of specialization (and not simply on the specific proposed research).

6. Completion of an original research project, documented in a dissertation that is defended by the candidate in a public presentation.

Candidates must write a dissertation conforming to university requirements that describes their work and results in detail. A public defense of the dissertation is required, and will be followed by a closed examination session. The committee for the closed examination shall consist of five faculty members, approved by the Graduate Program Committee, with at least two members being from outside the department. The outcome of the closed examination will be decided by majority vote of the committee. Because the closed examination session fulfills the university Graduate Board Oral (GBO) examination requirement, all procedures pertaining to GBOs as established by the University Graduate Board must be followed.

The committee may impose certain conditions (e.g. changes to the dissertation) for the candidate to meet prior to final certification that he or she has passed the exam. For this reason, the thesis defense must be scheduled for a date at least two months prior to any personal or university deadline for graduation. A complete draft of the dissertation must be submitted to all committee members no later than two weeks prior to the defense.

The dissertation in its final form must be read and approved in writing by two members of the committee (the advisor and one other member to be chosen by the committee as a whole).

Financial Aid

Fellowships of various forms are available for full-time graduate students, including tuition remission fellowships, teaching fellowships, and additional stipend fellowships.

Research assistantships are available to support full-time graduate students who work with individual professors on their research contracts and grants.

For current faculty and contact information go to http://materials.jhu.edu/index.php/people/

Faculty

Chair
Howard E. Katz
Professor: organic, hybrid, nanostructured, and interfacial materials in electronic and photonic devices; organic materials synthesis, thin film fabrication and patterning; novel architectures for devices, sensors, and circuits; host-guest chemistry, material responses to high electric fields; organic nonlinear optics; nanoparticles in biosystems; materials for physical science education.

Professors
Robert C. Cammarata
Structure, properties, and processing of thin films and nanostructured materials, thermodynamics and mechanics of surfaces, mechanical behavior of materials, nanoindentation testing, stresses in thin films, novel electrochemical deposition methods, computer simulations, transport and assembly of nanowires in solution.

Jonah Erlebacher
Nanostructured materials, self-organization and pattern formation, computational materials science, kinetics of shape change, ultra-high vacuum processing, nanoporous metals, fuel cells and energy.

Kalina Hristova
Biomolecular materials, structure and function of cellular membranes, membrane proteins, self-assembly of biological amphiphiles, protein-lipid interactions, protein synthesis, X-ray diffraction, fluorescence.

Todd C. Hufnagel
Structure and properties of amorphous alloys; mechanical behavior of metals, polymers, and biomaterials; use of synchrotron radiation for in situ studies of deformation and phase transformations in materials; electron microscopy.

Evan Ma
Nonequilibrium processing and metastable materials, thermodynamics and kinetics of phase transformations, atomic level structures and polymorphs in metallic glasses and chalcogenide glasses, mechanical properties of amorphous and nanocrystalline metals, mechanics of small-volume materials, in situ TEM, phase-change alloys for data storage and memory applications.

Peter C. Seawson
Biomaterials, nanomedicine.

James B. Spicer
Ultrafast phenomena, laser interactions with materials, nanostructured composite materials, sensor physics, laser-based materials processing.
elastic and anelastic materials properties, intelligent materials processing, near-field optical and microwave techniques.

Timothy P. Weihs
The study of exothermic reactions in layered materials and their applications, processing and characterization of thin films, mechanical testing of metals and biological materials, nanoindentation studies.

Associate Professors
Michael Falk
Theoretical and computational research investigating materials processes far from equilibrium: deformation, failure and fracture in non-crystalline materials such as metallic glasses; reactive materials, interactions of stress and diffusion in energy storage materials; mixing processes that accompany frictional sliding and wear.

Hai-Quan Mao
Nanomaterials, electrospinning, nanofibers, biomimetic matrix, stem cell expansion and differentiation, nerve regeneration, micellar nanoparticles, therapeutic delivery, biodegradable polymers.

Assistant Professors
Margarita Herrera-Alonso
Structure-property relationships of biodegradable polymers, polymer synthesis, graft copolymers, nanoparticles and nanomaterials, kinetics of self-assembly, delivery of drugs and imaging agents.

Tim Mueller
Computational materials discovery and design.

Professors Emeriti
Robert E. Green Jr.
Materials science, nondestructive characterization, ultrasonics, acoustic emission, X-ray diffraction, radiography, topography and tomography, synchrotron radiation, electro-optical systems, light-sound interactions, mechanical properties, thermography, sensors, process control.

Jerome Kruger
Corrosion science and engineering, oxidation and passivation, ellipsometry, economics of corrosion.

Research Professor
Theodore O. Poehler
Electronically conducting polymers, organic charge transfer compounds, materials for optical information processing, and semiconductors.

Associate Research Professor
Patricia M. McGuigan
Adhesion, tribology, tribocharging, atomic force microscopy, interfacial phenomena, wetting, interferometry, polymer and ceramic materials.

William L. Wilson
Optical and electronic materials, Photonics, Bio-inspired nanomaterials, Nonlinear Microscopy, Time and spatially resolved Spectroscopies, Optical Data Storage materials and devices.

Assistant Research Professor
John Baty
Paper conservation, heritage science.

Lecturer
Orla Wilson

Synthesis of nanostructured materials, specifically metallic and bimetallic nanoparticles in the 2-20 nm size range; electron, confocal and scanning-probe microscopies as characterization tools; applications of nanostructured materials as homogeneous and heterogeneous catalysts, novel optical security devices, and nanovectors for targeted drug delivery.

Joint, Part-Time, and Visiting Appointments
Kit Bowen
E. Emmet Reid Professor (Chemistry): experimental chemical physics-photoelectron spectroscopy of negative ions, structure and dynamics of gas phase, weakly bound molecular clusters.

Chia-Ling Chien,
Jacob L. Hain Professor of Physics (Physics): Fabrication of experimental studies of structural, electronic, magnetic, and super-conducting properties of nanostructured solids; magneto-electronics, manipulation of small entities in low Reynolds number regime, biosensing.

Michael Edidin
Professor (Biology): membrane organization and dynamics, immunology studied with nanoparticles and advanced microscopy.

Jennifer H. Elisseeff
Professor (Biomedical Engineering): tissue engineering, biomaterials, cartilage regeneration.

D. Howard Fairbrothe
Professor (Chemistry): surface chemistry, electron induced deposition of nanostructured materials, environmental health and safety of nanomaterials.

Sharon Gerecht
Assistant Professor (Chemical and Biomolecular Engineering): biomaterials, stem cells, biomimetic hydrogels, vascular differentiation, angiogenesis, regenerative medicine, hypoxia, microfluidics.

Somnath Ghosh
Professor (Civil Engineering): computational mechanics with focus on materials analysis, characterization and processing, including simulation and design.

David Gracias
Associate Professor: micro and nanotechnology, surface science, metamaterials, complex systems, nanoelectrics, nanomedicine, regenerative medicine, drug delivery and microfluidics.

Kevin J. Hemker
Professor (Mechanical Engineering): mechanical behavior of materials, transmission on electron microscopy, high temperature alloys, thermal barrier coatings, nanocrystalline materials and materials for MEMS.

Lynne Jones
Associate Professor (Orthopaedic Surgery, School of Medicine): biomaterials, osteonecrosis pathogenesis and treatment, total joint arthroplasty, bone graft materials.

Joseph L. Katz
Professor (Chemical and Biomolecular Engineering): nucleation processes, formation of ceramic powders in flames, inhibiting scale formation.

Gerald Meyer
Professor (Chemistry): inorganic chemistry-photochemistry and electrochemistry of metal complexes and inorganic solids, light-induced
electron and energy transfer, environmental science, biomaterials, artificial photosynthesis.

John D. Tovar
Assistant Professor (Chemistry): materials-oriented synthetic organic chemistry, electrochemistry, pi-conjugated and conducting polymers, supramolecular chemistry, organic electronics, biomimetic electronic materials.

David R. Veblen
Professor (Earth and Planetary Sciences): crystallography, transmission electron microscopy, X-ray diffraction, mineralogy.

Denis Wirtz
Theophilus Halley Smoot Professor (Chemical and Biomolecular Engineering): cell adhesion and migration, cell mechanics, cysto-skeleton physics, receptor-ligand interactions, cancer bioengineering, progeria, particle tracking methods.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.510.101. Introduction to Materials Chemistry. 3 Credits.
Basic principles of chemistry and how they apply to the behavior of materials in the solid state. The relationship between electronic structure, chemical bonding, and crystal structure is developed. Attention is given to characterization of atomic and molecular arrangements in crystalline and amorphous solids; metals, ceramics, semiconductors, and polymers (including proteins). Examples are drawn from industrial practice (including the environmental impact of chemical processes), from energy generation and storage (such as batteries and fuel cells), and from emerging technologies (such as biomaterials).
Instructor(s): P. McGuiggan
Area: Natural Sciences.

EN.510.103. Foundations of Nanotechnology. 3 Credits.
This course will be a survey of the rapidly developing field of nanotechnology from an interdisciplinary point of view. Topics covered will include a general introduction to the nanoworld, fabrication, characterization and applications of hard and soft nanomaterials, as well as examining nanotechnology in terms of its societal, ethical, economic and environmental impact.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.107. Modern Alchemy. 3 Credits.
Can you really turn lead into gold? Converting common substances into useful materials that play important roles in today’s technologies is the goal of many modern scientists and engineers. In this course, we will survey selected topics related to modern materials, the processes that are used to make them as well as the inspiration that led to their development. Topics will include the saga of electronic paper, the sticky stuff of gecko feet and the stretchy truth of metal rubber.
Instructor(s): J. Spicer
Area: Natural Sciences.

Through this course, students are introduced to the basic tenants of the field of materials science and engineering and important aspects of career development. Discussions will cover the range of career options in the field, the opportunities to engage with cutting edge research and technology at JHU, the skills that practitioners require and the ethical conundrums that engineering professionals navigate. Only available to Materials Science & Engineering freshmen and engineering undecided freshmen.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.201. Introductory Materials Science for Engineers. 3 Credits.
An introduction to the structure, properties, and processing of materials used in engineering applications. After beginning with the structure of materials on the atomic and microscopic scales, this course explores defects and their role in determining materials properties, the thermodynamics and kinetics of phase transformations, and ways in which structure and properties can be controlled through processing. Previously: Introduction to Engineering Materials.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

EN.510.202. Computation and Programming for Materials Scientists and Engineers. 3 Credits.
This course will introduce students to the basics of programming in the MATLAB environment. Students will build skills in algorithmic problem solving by programming assignments regarding a range of biological and non-biological materials systems. Students will learn to write function definitions and deploy basic operations of selection and iteration as well as MATLAB specific vectorization methods and the construction of graphical user interfaces. Applications may include materials structure, phase equilibrium, propagating reactions, and other relevant scientific and engineering applications.
Instructor(s): M. Ulmschneider
Area: Engineering, Natural Sciences.

EN.510.311. Structure of Materials. 3 Credits.
First of the Introduction to Materials Science series, this course seeks to develop an understanding of the structure of materials starting at the atomic scale and building up to macroscopic structures. Topics include bonding, crystal structures, crystalline defects, symmetry and crystallography, microstructure, liquids and amorphous solids, diffraction, molecular solids and polymers, liquid crystals, amphiphilic materials, and colloids. Recommended Course Background: AS.110.106-AS.110.107 or AS.110.108-AS.110.109, EN.510.101 or AS.030.101-AS.030.102, AS.171.101-AS.171.102 or AS.171.103-AS.171.104, EN.510.202 or another programming course, or permission of instructor.
Instructor(s): T. Hufnagel
Area: Engineering, Natural Sciences.
EN.510.312. Thermodynamics/Materials. 3 Credits.
Second of the Introduction to Materials Science series, this course examines the principles of thermodynamics as they apply to materials. Topics include fundamental principles of thermodynamics, equilibrium in homogeneous and heterogeneous systems, thermodynamics of multicomponent systems, phase diagrams, thermodynamics of defects, and elementary statistical thermodynamics.
Prerequisites: ( AS.110.106 AND AS.110.107 OR AS.110.108 AND AS.110.108 ) AND ( EN.510.101 OR AS.030.101 AND AS.030.102 ) AND ( AS.171.101 AND AS.171.102 OR AS.171.103 AND AS.171.104 ) AND EN.510.202 or another programming course; or permission of instructor.
Instructor(s): M. Herrera-Alonso
Area: Engineering, Natural Sciences.

EN.510.313. Mech Property-Materials. 3 Credits.
Third of the Introduction to Materials Science series, this course is devoted to a study of the mechanical properties of materials. Lecture topics include elasticity, anelasticity, plasticity, and fracture. The concept of dislocations and their interaction with other lattice defects is introduced. Recommended Course Background: EN.510.311 and EN.510.202 or another programming course, or permission of instructor.
Instructor(s): T. Weihs
Area: Engineering, Natural Sciences.

EN.510.314. Electron Prop-Material. 3 Credits.
Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelasticity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. Recommended Course Background: EN.510.311 and EN.510.202 or another programming course or permission of instructor.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.315. Physical Chem of Mat II. 3 Credits.
Fifth of the Introduction to Materials Science series, this course covers diffusion and phase transformations in materials. Topics include Fick's laws of diffusion, atomic theory of diffusion, diffusion in multi-component systems, solidification, diffusional and diffusionless transformations, and interfacial phenomena. Recommended Course Background: EN.510.311, EN.510.312, and EN.510.202 or another programming course or permission of instructor.
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.316. Biomaterials I. 3 Credits.
Sixth of the Introduction to Materials Science series, this course offers an overview of principles and properties of biomedical materials. Topics include properties of materials used in medicine, synthesis and properties of polymeric materials, polymeric biomaterials, natural and recombinant biomaterials, biodegradable materials, hydrogels, stimulii-sensitive materials, and characterizations of biomaterials. Recommended Course Background: AS.030.205 and EN.510.202 or another programming course, or permission of instructor.
Instructor(s): H. Mao
Area: Engineering, Natural Sciences.

EN.510.400. Introduction to Ceramics. 3 Credits.
This course will examine the fundamental structure and property relationships in ceramic materials. Areas to be studied include the chemistry and structure of ceramics and glasses, microstructure and property relationships, ceramic phase relationships, and ceramic properties. Particular emphasis will be placed on the physical chemistry of particulate systems, characterization, and the surface of colloid chemistry of ceramics. Recommended Course Background: EN.510.311, EN.510.312, or permission of instructor.
Instructor(s): P. Mcguigagan
Area: Engineering, Natural Sciences.

EN.510.403. Materials Characterization. 3 Credits.
This course will describe a variety of techniques used to characterize the structure and composition of engineering materials, including metals, ceramics, polymers, composites and semiconductors. The emphasis will be on microstructural characterization techniques, including optical and electron microscopy, X-ray diffraction, and acoustic microscopy. Surface analytical techniques, including Auger electron spectroscopy, secondary ion mass spectroscopy, X-ray photoelectron spectroscopy, and Rutherford backscattering spectroscopy. Real-world examples of materials characterization will be presented throughout the course, including characterization of thin films, surfaces, interfaces, and single crystals.
Instructor(s): P. Mcguigagan
Area: Natural Sciences.

EN.510.405. Materials Science of Energy Technologies. 3 Credits.
This course examines the science and engineering of contemporary and cutting-edge energy technologies. Materials Science and Mechanical Engineering fundamentals in this area will be complemented by case studies that include fuel cells, solar cells, lighting, thermoelectrics, wind turbines, engines, nuclear power, biofuels, and catalysis. Students will consider various alternative energy systems, and also to research and engineering of traditional energy technologies aimed at increased efficiency, conservation, and sustainability. Recommended Course Background: undergraduate course in thermodynamics.
Instructor(s): J. Erlebacher
Area: Engineering, Natural Sciences.

EN.510.407. Biomaterials II: Host response and biomaterials applications. 3 Credits.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Also listed as EN.510.607.
Prerequisites: EN.510.316
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.

EN.510.409. Melting, Smelting, Refining and Casting. 3 Credits.
This is a laboratory class on metal formation, an area that underlies almost all other technologies. We will examine extraction of metals from ore, refining of metals. The kinetics of melting and solidification will be explored in the context of casting and forming.
Instructor(s): J. Erlebacher, T. Hufnagel
Area: Engineering, Natural Sciences.
EN.510.410. Simulation of Materials and Biological Systems. 3 Credits.
This course will review basics of programming in MATLAB environment. Students will build their MATLAB skills by programming assignments regarding a range of biological and materials systems. Integration of time-dependent ODEs and PDEs, solution of eigenvalue problems, Monte Carlo calculations and molecular dynamics simulations will be explored in the context of problems that may include chemical reactions, band structure, phase equilibrium, disease progression, waves in heart tissue, glycolysis, and other relevant scientific and engineering applications.
Instructor(s): M. Falk
Area: Engineering, Natural Sciences.

EN.510.419. Physical Metallurgy. 3 Credits.
This course examines the relationship between microstructure and mechanical properties of metals and alloys. Starting from fundamentals (phase diagrams and phase transformation kinetics), we will explore how the structure of metals and alloys can be manipulated by thermomechanical processing to achieve desired properties. Detailed examples will be drawn from several alloy systems, including steels, aluminum, and titanium. A theme of the course will be the impact of materials processing and materials selection on the environment, including considerations of lightweight materials and processing techniques for minimizing energy consumption.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

EN.510.420. Stealth Science & Engineering. 3 Credits.
The goal of stealth engineering is the creation of objects that are not easily detected using remote sensing techniques. To achieve this end, engineered systems of materials are arrayed to alter the signature of objects by reducing energy returned to remote observers. This course will provide an introduction to the general principles behind signature reduction by examining the mathematics and science behind basic electromagnetic and acoustic transport processes. Specific topics will include energy absorbing materials, anti-reflection coatings, wave guiding and scattering, metamaterials and adaptive screens.
Area: Engineering, Natural Sciences.

EN.510.421. Nanoparticles. 3 Credits.
Nanoparticles - one-dimensional materials with diameters of nearly atomic dimension - are one of the most important classes of nanostructured materials because their unusual properties that often differ significantly from bulk materials. This course will explore the synthesis, structure and properties of nanoparticles. Applications of nanoparticles in medicine, optics, sensing, and catalysis will be discussed, with an emphasis will be on metal nanoparticles and semiconductor quantum dots.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.422. Micro and Nano Structured Materials & Devices. 3 Credits.
Almost every material's property changes with scale. We will examine ways to make micro- and nano-structured materials and discuss their mechanical, electrical, and chemical properties. Topics include the physics and chemistry of physical vapor deposition, thin film patterning, and microstructural characterization. Particular attention will be paid to current technologies including computer chips and memory, thin film sensors, diffusion barriers, protective coatings, and microelectromechanical (MEMS) devices.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.413. Statistical Mechanics of Materials. 3 Credits.
This course will present the basic principles of statistical mechanics and apply them to problems concerning the behavior of materials. Topics include: basic principles of statistical mechanics; time averages and ensembles; connection to macroscopic thermodynamics; fluctuations; classical and quantum particle statistics; lattice statistics; statistical thermodynamic models of gases, liquids, crystals, crystalline defects, linear chain polymers, and surfaces; phase transitions and critical phenomena; kinetic and transport phenomena; thermodynamics of irreversible processes. Also listed as EN.510.613/EN.510.413.
Recommended Course Background: EN.510.312 or undergraduate course in thermodynamics.
Instructor(s): R. Cammarata
Area: Engineering, Natural Sciences.

EN.510.415. The Chemistry of Materials Synthesis. 3 Credits.
Many of the latest breakthroughs in materials science and engineering have been driven by new approaches to their synthesis, which has allowed the preparation of materials with fanciful structures and fascinating properties. This advanced course will explore synthetic approaches to multifunctional and nanostructured materials, ranging from opals to complex polymers to nanowires and quantum dots. Applications include electronics, energetics, and drug delivery. Participants will gain sufficient familiarity with synthesis options to be able to design research programs that rely on them. Emphasis will be placed on broad strategies that lead to material functionality, rather than detailed step-by-step sequences. Some topics will be selected “on the fly” from the most exciting current literature.
Prerequisites: Prereq: AS.030.205 AND (EN.510.312 or EN.560.321 or equivalent Thermodynamics course.)
Area: Engineering, Natural Sciences.

EN.510.416. Applications of X-Ray Diffraction. 3 Credits.
Area: Engineering, Natural Sciences.

EN.510.418. Electronic and Photonic Processes and Devices. 3 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.
EN.510.424. Physical Science of Paper. 3 Credits.
An exploration of paper’s past, present, and possible future from the physical science and engineering perspectives. Includes an in-depth analysis of the defining physical, chemical, and electronic properties of paper since its origins in China as early as 202 BCE and the periodic technological innovations that improved quality, lowered price, and expanded use. Applications include paper as a medium for historic and artistic works, packaging, transformer insulation, architectural elements, medical diagnostics, and printed sensors. Topics include technologies such as email and e-books which may disrupt traditional paper formats, environmental concerns of industrial manufacture, transferrable knowledge from pulping such as the manufacture of feeds and fuels from cellulose biomass, and paper’s legacy as found in cultural heritage artifacts and their conservation. Recommended: AS.030.205 Organic Chemistry I
Prerequisites: EN.510.101 OR (AS.030.101 AND AS.030.102)
Instructor(s): J. Baty
Area: Engineering, Natural Sciences.
EN.510.425. Spectroscopy and Spectral Microscopy of Materials Systems. 3 Credits.
This class will explore the nature of the fundamental spectral behavior of materials and materials systems. The course will pay particular attention to linear and nonlinear spectroscopies in microscopes. We will discuss the quantum mechanical basis for the spectral response in condensed media and the fundamentals of the interaction of radiation with matter. We will survey the array of linear and nonlinear spectral techniques available to the materials scientist and will include some “hands-on” experimental training in a number of techniques.
Area: Engineering, Natural Sciences.
EN.510.426. Biomolecular Materials I - Soluble Proteins and Amphiphiles. 3 Credits.
This course will examine the fundamental structure, interactions, and function relationship for biological macromolecules. The course will emphasize experimental methods and experimental design, and the physics behind human disease. Topics will include micellization, protein folding and misfolding, and macromolecular interactions. Recommended Course Background: EN.580.221
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.
EN.510.428. Material Science Laboratory I. 3 Credits.
This course focuses on characterizing the microstructure and mechanical properties of structural materials that are commonly used in modern technology. A group of Al alloys, Ti alloys, carbon and alloy steels, and composite materials that are found, for example, in actual bicycles will be selected for examination. Their microstructures will be studied using optical metallography, scanning electron microscopy, X-ray diffraction, and transmission electron microscopy. The mechanical properties of these same materials will be characterized using tension, compression, impact, and hardness tests. The critical ability to vary microstructure and therefore properties through mechanical and heat treatments will also be demonstrated and investigated in the above materials.
Prerequisites: EN.510.311 and EN.510.313
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.
EN.510.429. Materials Science Laboratory II. 3 Credits.
This laboratory concentrates on the experimental investigation of electronic properties of materials using basic measurement techniques. Topics include thermal conductivity of metal alloys, electrical conductivity of metals/metal alloys and semiconductors, electronic behavior at infrared wavelengths, magnetic behavior of materials, carrier mobility in semiconductors and the Hall effect in metals and semiconductors. Lab Assignment is by Professor. Recommended Course Background: EN.510.311 or Permission Required.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.
EN.510.430. Biomaterials Lab. 3 Credits.
This laboratory course concentrates on synthesis, processing and characterization of materials for biomedical applications, and characterization of cell-materials interaction. Topics include synthesis of biodegradable polymers and degradation, electrospinning of polymer nanofibers, preparation of polymeric microspheres and drug release, preparation of plasmid DNA, polymer-mediated gene delivery, recombinant protein synthesis and purification, self-assembly of collagen fibril, surface functionalization of biomaterials, cell culture techniques, polymer substrates for cell culture, and mechanical properties of biological materials. Recommended Course Background: EN.510.407
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences
Writing Intensive.
EN.510.431. Biocompatibility of Materials. 3 Credits.
This course provides a detailed examination of the interaction of surgical implant materials (i.e., metals, polymers, ceramics, and composites) with the body. The effect of the physiological environment on the properties of implant materials is described as well as the cellular, tissue response to the implant. Concepts dealing with the design of materials with improved biocompatibility are explored. Department Majors only or permission of instructor. Recommended Course Background: EN.510.104 or EN.510.316
Instructor(s): M. Yu
Area: Engineering, Natural Sciences.
EN.510.432. Electrochemical Energy Conversion and Power Sources. 3 Credits.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.
EN.510.433. Senior Design Research. 3 Credits.
This course is the first half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of the weekly departmental research seminar. Co-listed with EN.510.438 and EN.510.440
Prerequisites: Prereq: EN.510.311 and 510.312 and EN.510.428 and 510.429
Instructor(s): O. Wilson
Area: Engineering
Writing Intensive.
EN.510.433. Senior Design/Research II. 3 Credits.
This course is the second half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 Co-listed with EN.510.439 and EN.510.441
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.435. Mechanical Properties of Biomaterials. 3 Credits.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic materials will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.635.
Instructor(s): T. Wehns
Area: Engineering, Natural Sciences.

EN.510.436. The Foundations of Information Technology. 3 Credits.
The revolutionary technologies of the Information age have been driven by an array of physics and materials science advances which have served as the foundation for their development. In this course we will explore the developments in solid-state devices, photonics, optical communications, and storage that serve as the underpinnings of the revolution with a focus on the enabling materials innovations. The fundamental physical principles, i.e., the basic science of the devices and concepts will be reviewed. In addition, next generation concepts and devices, (such as holographic storage, quantum computing, etc.), will be discussed. Also listed as 510.636.
Instructor(s): W. Wilson
Area: Engineering, Natural Sciences.

EN.510.437. Biosensor Materials and Mechanisms. 3 Credits.
Recent advances in biosensor technology are poised to revolutionize health care, enabling faster and more personalized diagnoses and recommendations. Biosensors are also increasingly important to public health, security, industry, and environmental science. This course will cover the materials, processes, and signaling mechanisms in use and anticipated for future developments in biosensors. Techniques such as electrochemistry, fluorescence, plasmonics, and enzymatic amplification will be discussed, and materials including nanowires, nanoparticles, organic semiconductors, and templated materials will be covered. Detection of nucleic acid sequences, proteins, carbohydrates, pharmaceuticals, and microorganisms will be emphasized. Same course as 510.637.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.438. Biomaterials Senior Design I. 3 Credits.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.440 and EN.510.433
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.439. Biomaterials Senior Design II. 3 Credits.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, verbal reporting of project activities and status is emphasized, culminating in student talks presented to a special session of students and faculty. Students also prepare a poster and a written final report summarizing their design and research results. Co-listed with EN.510.434 and EN.510.441
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.440. Nanomaterials Senior Design I. 3 Credits.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.433 and EN.510.438
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.441. Nanomaterials Senior Design II. 3 Credits.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. During this semester, verbal reporting of project activities and status is emphasized, culminating in student talks presented to a special session of students and faculty. Students also prepare a poster and a written final report summarizing their design and research results. Co-listed with EN.510.434 and EN.510.439
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.443. Chemistry and Physics of Polymers. 3 Credits.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.643. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.456. Introduction to Surface Science. 3 Credits.
Instructor(s): R. Cammarata
Area: Engineering, Natural Sciences.
EN.510.457. Materials Sci Thin Films. 3 Credits.
The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Also listed as 510.657
Instructor(s): T. Wehns
Area: Engineering, Natural Sciences.

EN.510.465. Advanced Topics in Thermodynamics and Kinetics of Materials. 3 Credits.
Selected areas of thermodynamics and kinetics will be examined in depth with the aim of understanding the ideas and assumptions underlying results central to materials science. Attempts will be made to be as rigorous as possible without losing sight of the physical meanings. The theories and models obtained will be evaluated critically to determine their validity and limitations. Topics to be covered include classical formulations of the laws of thermodynamics, Carathédory’s formulation, relation of thermodynamics to statistical mechanics, Gibbs’ thermodynamics of heterogeneous systems and of surfaces, thermodynamics of phase transitions, glass transition, theory of absolute reactions rates and thermodynamics of irreversible processes developed generally and applied to the chemical kinetics and diffusion, theory of nucleation (Volmer-Weber, Becker-Dürring, Fisher-Turnbull), theory of growth (including instabilities during growth), Johnson-Mehl-Avrami kinetics of phase transformations, Lifshitz-Slyozov-Wagner kinetics of coarsening, spinodal decomposition. Co-listed with EN.510.665. Recommended Course Background: EN.510.312 or EN.510.602 (or similar course covering thermodynamics).
Area: Engineering, Natural Sciences.

EN.510.501. Research/Materials Science. 3 Credits.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Instructor(s): Staff.

EN.510.502. Research in Materials Science. 0 - 3 Credit.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Instructor(s): Staff.

EN.510.503. Independent Study/Materials Science. 3 Credits.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): R. Cammarata; Staff.

EN.510.504. Independent Study. NULL Credits.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): P. Searson; T. Hufnagel.

EN.510.597. Research-Summer. 3 Credits.
Instructor(s): Staff.

An introduction to the structure of inorganic and polymeric materials. Topics include the atomic scale structure of metals, alloys, ceramics, semiconductors; structure of polymers; crystal defects; elementary crystallography; tensor properties of crystals; and an introduction to the uses of diffraction techniques (including X-ray diffraction and electron microscopy) in studying the structure of materials. Recommended Course Background: undergraduate chemistry, physics, and calculus or permission of instructor.
Instructor(s): R. Cammarata.

An introduction to the classical and statistical thermodynamics of materials. Topics include the zeroth law of thermodynamics; the first law (work, internal energy, heat, enthalpy, heat capacity); the second law (heat engines, Carnot cycle, Clausius inequality, entropy, absolute temperature); equilibrium of single component systems (free energy, thermodynamic potentials, virtual variations, chemical potential, phase changes); equilibrium of multicomponent systems and chemical thermodynamics; basics of statistical physics (single and multiple particle partition functions, configurational entropy, third law; statistical thermodynamics of solid solutions); and equilibrium composition-temperature phase diagrams. Recommended Course Background: undergraduate calculus, chemistry, and physics or permission of instructor.
Instructor(s): M. Falk.

EN.510.603. Phase Transformations.
This course presents a unified treatment of the thermodynamics and kinetics of phase transformations from phenomenological and atomistic viewpoints. Phase transformations in condensed metal and nonmetal systems are discussed. Recommended Course Background: EN.510.601 and EN.510.602
Instructor(s): J. Erlebacher.

An introduction to the properties and mechanisms that control the mechanical performance of materials. Topics include mechanical testing, tensor description of stress and strain, isotropic and anisotropic elasticity, plastic behavior of crystals, dislocation theory, mechanisms of microscopic plasticity, creep, fracture, and deformation and fracture of polymers. Recommended Course Background: EN.510.601
Instructor(s): T. Hufnagel.

EN.510.605. Electrical,Optical, and Magnetic Properties.
An overview of electrical, optical and magnetic properties arising from the fundamental electronic and atomic structure of materials. Continuum materials properties are developed through examination of microscopic processes. Emphasis will be placed on both fundamental principles and applications in contemporary materials technologies. Recommended Course Background: EN.510.601
Instructor(s): J. Spicer.

An introduction to the chemical and biological properties of organic and inorganic materials. Topics include an introduction to polymer science, polymer synthesis, chemical synthesis, and modification of inorganic materials, biomineralization, biosynthesis, and properties of natural materials (proteins, DNA, and polysaccharides), structure-property relationships in polymeric materials (synthetic polymers and structural proteins), and materials for biomedical applications. Recommended Course Background: undergraduate chemistry and biology or permission of instructor.
Instructor(s): M. Herrera-Alonso.
EN.510.607. Biomaterials II.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Recommended Course Background: EN.510.606
Instructor(s): K. Hristova.

EN.510.608. Electrochemistry.
Thermodynamics of electrochemical interfaces, including electrochemical potential, the Nernst equation, ion-solvent interactions, and double layer theory. Charge transfer kinetics for activation and diffusion controlled processes. Analysis of kinetics at various electrodes, including redox reactions, metal-ion electrodes, and semiconductor electrodes. Electroanalytical techniques are discussed, including those related to bioelectrochemistry and semiconductor electrochemistry. Selected reactions of technological importance are evaluated, including the hydrogen evolution reaction, oxygen reduction, electrodeposition, and energy generation and storage. Recommended Course Background: EN.510.607.
Instructor(s): P. Searson.

An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering.
Instructor(s): T. Poehler.

Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611
Instructor(s): T. Poehler.

This course will present the basic principles of statistical mechanics and apply them to problems concerning the behavior of materials. Topics include: basic principles of statistical mechanics; time averages and ensembles; connection to macroscopic thermodynamics; fluctuations; classical and quantum particles statistics; lattice statistics; statistical thermodynamic models of gases, liquids, crystals, crystalline defects, linear chain polymers, and surfaces; phase transitions and critical phenomena; kinetic and transport phenomena; thermodynamics of irreversible processes. Also listed as EN.510.413/EN.510.613.
Recommended Course Background: EN.510.312 or undergraduate course in thermodynamics.
Instructor(s): R. Cammarata.

A detailed survey of the relationship between materials properties and underlying microstructure. Structure/property/processing relationships will be examined across a wide spectrum of materials including metals, ceramics, polymers and biomaterials, and properties including electrical, magnetic, optical, thermal, mechanical, chemical and biocompatibility.
Instructor(s): P. McGuigan
Area: Engineering, Natural Sciences.

EN.510.617. Adv Topics Biomaterials.
EN.510.618. Electronic and Photonic Processes and Devices.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

In this course, we will review the current synthetic methods for preparing biopolymers of both synthetic and natural origin. The class will focus mainly on polypeptides and polysaccharides, but natural polyesters and polynucleotides (DNA and RNA) will be covered as well. Some of the main topics are; solid phase peptide synthesis, ring-opening polymerization for polypeptide synthesis, recombinant DNA and bacterial protein synthesis, bacterial production of biodegradable polyester, and chemical and biological engineering of polysaccharides.
Instructor(s): M. Yu
Area: Engineering, Natural Sciences.

Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.

EN.510.624. X-Ray Scattering, Diffraction and Imaging.
An introduction to the uses of X-rays for structural characterization of materials. Topics include: X-ray scattering by atoms; kinematic and dynamical theories of diffraction; Fourier series and transform methods; scattering by liquids and amorphous solids; coherent X-ray diffraction, scattering, and imaging; and modern X-ray sources (synchrotron radiation and X-ray free-electron lasers). Recommended Course Background: EN.510.601 or permission of the instructor.
Instructor(s): T. Hufnagel.

EN.510.628. Organics, Polymers and Hybrids for New Electronics.
This will be an advanced course on material alternatives to those used in conventional silicon electronics. We will begin with a review of the materials associated with silicon, then introduce alternative materials such as organic semiconductors, composite dielectrics, and carbon nanotubes being contemplated for high performance displays and high-throughput printed circuits. We conclude with a discussion of nanomaterials in circuits and solar cells.
Instructor(s): H. Katz.
This course develops parallel treatments of photon, electron, phonon, and atomic/molecular transport in condensed matter. With emphasis on fundamental descriptions as well as the mathematical tools used to model energy transfer processes, systems ranging from the nanoscale up to macroscopic length scales where continuum approaches apply are considered. Topics include energy states of material systems, energy transport in the forms of waves and particles, particle and wave scattering using weak and strong scattering descriptions, thermal conversion processes, the Boltzmann transport equation and derivation of classical laws, deviation from continuum/classical behavior for nanoscale systems and energy transport applications in nano- and microtechnology.
Prerequisites: EN.510.605 or instructor permission
Area: Engineering, Natural Sciences.

Instructor(s): M. Falk
Area: Engineering, Natural Sciences.

This course examines the relationship between microstructure and mechanical properties of metals and alloys. Starting from fundamentals (phase diagrams and phase transformation kinetics), we will explore how the structure of metals and alloys can be manipulated by thermomechanical processing to achieve desired properties. Detailed examples will be drawn from several alloy systems, including steels, aluminum, and titanium. A theme of the course will be the impact of materials processing and materials selection on the environment, including considerations of lightweight materials and processing techniques for minimizing energy consumption. Prerequisite: EN.510.311-312 Same course as EN.510.419.
Instructor(s): E. Ma.

EN.510.632. Introduction to and Applications of Scanning Probe Microscopy.
Scanning Probe Microscopy has emerged as one of the premier techniques to characterize surfaces. This course will give an overview of the family of SPM techniques including scanning tunneling microscopy (STM), atomic force microscopy (AFM), scanning near field optical microscopy (SNOM) and Kelvin probe microscopy. In each of these applications, the theory of operation, measurement and imaging techniques, and experimental limitations will be discussed.
Instructor(s): P. Mcguigian
Area: Engineering, Natural Sciences.

This course will cover the use of computational methods to discover and design materials for new technologies. Topics addressed will include structure prediction, materials informatics, and the calculation of material properties from first principles using methods such as density functional theory. Participants will gain hands-on experience with modern computational techniques.
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.635. Mechanical Properties of Biomaterials.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic systems will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.435
Instructor(s): T. Weihs
Area: Engineering, Natural Sciences.

The revolutionary technologies of the Information age have been driven by an array of physics and materials science advances which have served as the foundation for their development. In this course we will explore the developments in solid-state devices, photonics, optical communications, and storage that serve as the underpinnings of the revolution with focus on the enabling materials innovations. The fundamental physical principles, i.e., the basic science of the devices and concepts will be reviewed. In addition, next generation concepts and devices, (such as holographic storage, quantum computing, etc.), will be discussed. Also listed as 510.436.
Instructor(s): W. Wilson.

Recent advances in biosensor technology are poised to revolutionize health care, enabling faster and more personalized diagnoses and recommendations. Biosensors are also increasingly important to public health, security, industry, and environmental science. This course will cover the materials, processes, and signaling mechanisms in use and anticipated for future developments in biosensors. Techniques such as electrochemistry, fluorescence, plasmonics, and enzymatic amplification will be discussed, and materials including nanowires, nanoparticles, organic semiconductors, and templated materials will be covered. Detection of nucleic acid sequences, proteins, carbohydrates, pharmaceuticals, and microorganisms will be emphasized. Same course as EN.510.437.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.643. Chemistry and Physics of Polymers.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.443. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.656. Introduction to Surface Science.
Introduction to the structure and properties of solid surfaces. Topics include Gibbsonian and gradient thermodynamics of surfaces; crystallography and structure of free solid surfaces; characterization methods; surface mobility and phase transitions; gas-solid interactions; crystal growth; electronic structure; solid-solid surfaces; thin film epitaxy. Recommended course background: EN.510.311, EN.510.312, EN.510.313, EN.510.314, EN.510.315 or instructor permission.
Instructor(s): R. Cammarata.

The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Also listed as EN.510.457.
Instructor(s): T. Weihs.

Selected areas of thermodynamics and kinetics will be examined in depth with the aim of understanding the ideas and assumptions underlying results central to materials science. Attempts will be made to be as rigorous as possible without losing sight of the physical meanings. The theories and models obtained will be evaluated critically to determine their validity and limitations. Topics to be covered include classical formulations of the laws of thermodynamics, Carathéodory’s formulation, relation of thermodynamics to statistical mechanics, Gibbs’ thermodynamics of heterogeneous systems and of surfaces, thermodynamics of phase transitions, glass transition, theory of absolute reactions rates and thermodynamics of irreversible processes developed generally and applied to the chemical kinetics and diffusion, theory of nucleation (Volmer-Weber, Becker-Düoring, Fisher-Turnbull), theory of growth (including instabilities during growth), Johnson-Mehl-Avrami kinetics of phase transformations, Lifshitz-Slyozov-Wagner kinetics of coarsening, spinodal decomposition. Co-listed as EN.510.465. Recommended Course Background: EN.510.312 or EN.510.602 or similar course covering thermodynamics.

The Graduate Research Seminar in the Department of Materials Science and Engineering provides a forum for students to present their latest research results in a formal seminar setting. The course encourages discussion between students in varying disciplines in order to establish new collaborations and develop the shared vocabulary required for interdisciplinary materials science research. Permission Required. Instructor(s): H. Katz.

Instructor(s): H. Katz.

The Materials Science Seminar exposes students to a wide array of internationally recognized speakers who discuss topics of cutting-edge Materials Science research. Speakers are selected both to overlap research interests within the department and to expose students to broader trends in contemporary Materials Science. Instructor(s): H. Katz.

Instructor(s): H. Katz.

EN.510.807. Graduate Research In Materials Science.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component. Instructor(s): H. Katz.

EN.510.808. Graduate Research.
Instructor(s): H. Katz.

Cross Listed Courses

Physics Astronomy

AS.171.321. Introduction to Space, Science, and Technology. 3 Credits.

Topics include space astronomy, remote observing of the earth, space physics, planetary exploration, human space flight, space environment, orbits, propulsion, spacecraft design, attitude control and communication. Crosslisted by Departments of Earth and Planetary Sciences, Materials Science and Engineering and Mechanical Engineering. Recommended Course Background: AS.171.101-AS.171.102 or similar; AS.110.108-AS.110.109.

Instructor(s): H. Moos; S. Murray

Area: Engineering, Natural Sciences.

Institute for NanoBio Technology

This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.

Instructor(s): Staff.

Mechanical Engineering

The Department of Mechanical Engineering offers undergraduate and graduate programs of instruction and research. Undergraduate programs are offered in Mechanical Engineering and in Engineering Mechanics. The B.S. in the Mechanical Engineering and Engineering Mechanics degree programs are accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org. Graduate programs are offered leading to the M.S.E. and the Ph.D. degrees. A five-year accelerated B.S./M.S.E. program is also available.

Mechanical Engineering is of great importance in most contemporary technologies. Examples include aerospace, power generation and conversion, fluid machinery, design and construction of mechanical systems, transportation, manufacturing, production, biomechanics, and others. This wide range of applications is reflected in the four main stems of the undergraduate curriculum-thermal and fluid systems, mechanics and materials, robotics and control systems, and biomechanics. Engineering Mechanics is a more flexible program that enables students to pursue particular interests while centering on a smaller core of courses. Students may use this flexibility to follow specific interests in physics, mathematics, economics, biology, and other disciplines while receiving an engineering degree.

Design is a major component of both undergraduate programs. In the two-semester Engineering Design Project course taken by undergraduates during their senior year, students work in teams of three or four to design, construct, and test a mechanical device or system for an industrial sponsor.

A major effort of the department is directed toward the creation of a stimulating intellectual environment in which both undergraduate and
graduate students can develop to their maximum potential. Faculty members encourage undergraduate students to participate in both fundamental and applied research along with the graduate students. In most junior and senior undergraduate classes, and in graduate classes, small enrollments permit close contact with faculty members. Students have excellent opportunities to participate actively in the classroom and laboratories and to follow special interests within a subject area.

Facilities

Most teaching and research facilities of the department, as well as the departmental office, are located in Latrobe, Krieger, Wyman, Maryland, and Hackerman Halls. The undergraduate laboratories are equipped with sophisticated data acquisition and analysis systems. A V-6 automobile engine with dynamometer and a computer-controlled milling machine are examples of facilities used for undergraduate instruction. The Mechatronics laboratory allows students to design and build their own robots for a class competition. The Senior Design laboratories are used by seniors to construct and test their prototypes in the yearlong design project course. Computer facilities are readily available throughout the department and the Whiting School.

Research facilities include laboratories in several disciplines. The Laboratory for Impact Dynamics and Rheology includes facilities for the study of failure, instabilities, impact and dynamic phenomena. The Hopkins Extreme Materials Institute addresses fundamental science issues associated with materials under extreme conditions, such as dynamic environments, human tissues, and impacts on planets and asteroids. The Laboratory for Active Materials and Biomimetics contains facilities for the characterization of tissues, active materials and biomaterials. These, coupled with electron microscopy facilities, enable innovative research on the mechanical properties of materials.

The Microspecimen Testing Laboratory has special tensile test machines for specimens as thin as 60 nanometers. The Computational Solid Mechanics Laboratory uses state-of-the-art finite-element techniques to study the physics of impact, wear, and more generally, the behavior of materials under high deformation and high-deformation rates. The calculations are conducted at length scales ranging from the nanoscale up to the macroscale.

A large hydrodynamics laboratory is the home of laser-based flow simulation and analysis research, and the Corrsin wind tunnel is equipped with modern instrumentation for turbulence research. The heat transfer laboratory is equipped for research using holographic interferometry to study heat transfer in complex geometries with single- and two-phase flows.

The Laboratory for Computational Sensing and Robotics consists of numerous laboratories and collaborating research centers covering multiple domains. The robotics and mechatronics laboratory is fully equipped for the construction and testing of prototypes of novel robotic systems. The Dynamical Systems and Control laboratory is equipped for design, fabrication, and testing of advanced robotic arms and underwater robots. Experimental equipment includes a test-bed remotely operated underwater vehicle. The Locomotion in Mechanical and Biological Systems (LIMBS) laboratory is equipped with an industrial six-axis manipulator, and as well as the facilities for the development of mobile and medical robots.

Financial Aid

Scholarships and other forms of financial assistance for undergraduates are described under Admissions and Finances (p. 22). In addition, selected undergraduates may be employed as laboratory assistants on research projects. Assistance in various forms is available for graduate students, including tuition fellowships, fellowships with stipend, research assistantships, and competitively-awarded hourly teaching assistant positions. Applications for graduate study must be received by January 5th for consideration.

Research assistantships support graduate students who work with professors on their research contracts and grants.

The Department of Mechanical Engineering offers two undergraduate programs: the Bachelor of Science in Mechanical Engineering and the Bachelor of Science in Engineering Mechanics. Both programs are accredited by ABET, the Accreditation Board for Engineering and Technology. The department offers concentrations in biomechanical engineering and aerospace engineering. For additional information regarding both the mechanical engineering and engineering mechanics academic programs, please consult the undergraduate advising manuals which are available on the departmental website at http://www.me.jhu.edu/advising.html. For details and an explanation of ABET requirements, visit www.abet.org.

Requirements for the Bachelor’s Degree

See also General Requirements for Departmental Majors (p. 33); Writing Requirement, and the department’s undergraduate advising manuals.

The Mechanical Engineering Program

The mission of the B.S. in mechanical engineering degree program is to provide a rigorous educational experience that prepares a select group of students for leadership positions in the profession and a lifetime of learning. The faculty is committed to maintaining a modern and flexible curriculum which, building on a foundation of basic sciences and mathematics, develops a solid education in the mechanical engineering sciences. The aim of the Mechanical Engineering program is to build competence in the design and development of thermal, fluid, and mechanical systems, to promote a broad knowledge of the contemporary social and economic context, and to develop the communication skills necessary to excel.

The program provides a basic background in thermal and mechanical systems. Laboratory instruction, as well as the senior design project, gives the student hands-on experience. Each student’s program of study is planned in consultation with his or her faculty advisor. Students are encouraged to develop depth in one or two areas of concentration within mechanical engineering chosen from fluid mechanics, mechanics of solids and design, heat transfer and energy, robotics, and biomechanics. The choice of concentration is decided in the junior year after consultation with the student’s faculty advisor.

The objectives for the B.S. in mechanical engineering degree program are designed to provide a high-quality educational experience that is tailored to the needs and interests of the student. The program will educate an exceptional group of engineers who, after graduation, will be:

1. successful and on track to become leaders among their peers in industry, government laboratories and other organizations, and
2. advanced students in the best graduate programs.

Students graduating from the B.S. in mechanical engineering will have demonstrated the ability to:
• understand and apply the fundamentals of mathematics (through linear algebra and multivariate calculus), numerical methods, statistical analysis, and physical sciences (physics and chemistry) necessary to attain competence in the mechanical engineering disciplines.
• design, conduct, evaluate, and report experiments including analysis and statistical interpretation of data.
• identify, formulate, and solve engineering problems in the areas of thermo-fluid and mechanical systems.
• use basic concepts from the mechanical engineering sciences, modern engineering tools (machine-tools, laboratory instrumentation, and computer hardware and software), and related subjects to design mechanical engineering components and processes, taking into account constraints such as manufacturability, cost, safety, environmental, and socio-political impacts.
• enter professional practice and/or graduate school, with the recognition of the need for life-long learning and the ability to pursue it.
• use effective communication, multidisciplinary teamwork, and possess awareness of professional and ethical responsibilities, and an appreciation of the societal, economic, and environmental impacts of engineering.

The Mechanical Engineering Curriculum is Structured as Follows

Mathematics (19 credits)
(grades below C- not accepted)
AS.110.108 Calculus I 4
AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
AS.110.202 Calculus III 4
or AS.110.211 Honors Multivariable Calculus 4
EN.550.291 Lin Alg & Diff Equations 4
or AS.110.211 Honors Multivariable Calculus 4
or AS.110.201 Linear Algebra 4
& AS.110.302 and Diff Equations/Applic 4
Statistics Elective at 300-level or above: 3-4
EN.560.348 Probability & Statistics in Civil Engineering 4
or EN.550.349 Probability & Statistics for the Physical and Information Sciences & Engineering 4

Science (12 credits)
(grades of D, D+, D- or F not accepted)
EN.530.101 Freshman Experiences in Mechanical Engineering 4
& EN.530.102 and Freshman Experiences in Mechanical Engineering 4
EN.530.105 Mechanical Engineering Freshman Laboratory I 2
& EN.530.106 and Mechanical Engineering Freshman Laboratory II 2
EN.530.201 Statics and Mechanics of Materials 4
EN.530.202 Dynamics 4
EN.530.215 Mechanics-Based Design 3
EN.530.216 Mechanics Based Design Laboratory 1
EN.530.231 Mechanical Engineering Thermodynamics 3
EN.530.232 Mechanical Engineering Thermodynamics Laboratory 1
EN.530.241 Electronics & Instrumentation 4
or EN.520.213 Circuits 4
& EN.520.345 and Electrical & Computer Engineering Laboratory 4
EN.530.327 Introduction to Fluid Mechanics 3
EN.530.329 Introduction to Fluid Mechanics Laboratory 1
EN.530.334 Heat Transfer 3
EN.530.335 Heat Transfer Laboratory 1
EN.530.343 Design and Analysis of Dynamical Systems 4
EN.530.352 Materials Selection 4
EN.530.414 Computer-Aided Design 3
EN.530.454 Manufacturing Engineering 3
EN.660.461 Engineering Business and Management 3

Capstone Design (8 credits)
(grades below C- not accepted)
EN.530.403 Engineering Design Project 8
& EN.530.404 and Engineering Design Project II 8

Mechanical Engineering Electives (9 credits)
Three courses (300-level or higher) in mechanical engineering 9

Technical Electives (9 credits)
(grades below C- not accepted)
Three engineering, quantitative studies, or natural sciences courses at or above the 300-level, chosen from any combination of courses in engineering, basic sciences, or mathematics selected in consultation with the student’s advisor. **

Total Credits 126-127

* To obtain coherence and depth in these humanities and social science electives, at least six credits must be at the 300-level or higher. While a course grade of C- or higher is preferred, up to 10 credits with a D or D+ grade will be accepted. For examples of areas of concentration and more details, see the undergraduate academic advising manual at http://www.me.jhu.edu/advising.html.
** These courses are intended to complement the mechanical engineering electives. One of the three technical electives may be a computer language course taken at any level.

A program of not less than 126 credits must be completed to be eligible for the bachelor’s degree. All undergraduate students must follow a program approved by a faculty member in the department who is selected as the student’s advisor.

Johns Hopkins University - 2013-2014
Aerospace Engineering Concentration

A student may specialize in aerospace engineering once a solid background in the fundamentals of mechanical engineering has been developed through the basic Mechanical Engineering courses. This concentration requires knowledge and background in several fields including advanced dynamics, flight mechanics, propulsion, aerospace materials and structures, signal processing, control systems, astrophysics and space systems. Students pursuing the Aerospace Engineering Concentration are required to take at least five of the following courses (which can be counted toward the Mechanical Engineering elective and Technical Elective requirements in the general Mechanical Engineering program):

Any five of the courses listed below are required. A sixth course amongst this list, though not required is highly recommended.

Biomechanics Concentration

A student may specialize in Biomechanics once a solid background in the fundamentals of mechanical engineering has been developed through the core Mechanical Engineering or Engineering Mechanics courses.

The essence of mechanics is the interplay between forces and motion. In biology, mechanics is important at the macroscopic, cellular, and subcellular levels.

At the macroscopic length scale biomechanics of both soft and hard tissues plays an important role in computer-integrated surgical systems and technologies, e.g., medical robotics. At the cellular level, issues such as cell motility and chemotaxis can be modeled as mechanical phenomena. At the subcellular level, conformational transitions in biological macromolecules can be modeled using molecular dynamics simulation, which is nothing more than computational Newtonian mechanics; statistical mechanics, or using coarse-grained techniques that rely on principles from the mechanics of materials.

In addition, much of structural biology can be viewed from the perspective of Kinematics, e.g., finding spatial relationships in data from the Protein Data Bank.

Each student who pursues the Biomechanics concentration will, in consultation with his or her academic advisor, choose the set of technical and mechanical engineering course electives that best matches the student’s interests. Upon completion of the concentration, notification of this achievement is placed on the student’s academic record and transcript.

A student may specialize in biomechanics once a solid background in the fundamentals of mechanical engineering has been developed through the basic courses. Students pursuing the biomechanics concentration within mechanical engineering are required to take at least four of the following courses. Two among the four should be chosen from the biomechanics-oriented courses, indicated by an asterisk (*).

Total Credits 58

x Prerequisite: AS.030.101 Introductory Chemistry I

xx Prerequisite: EN.580.221 Molecules and Cells, EN.580.222 Systems and Controls, and AS.110.302 Diff Equations/Applic

Note: Some courses that from time to time may be counted toward the biomechanics concentration may require AS.030.205 Organic Chemistry I as a prerequisite. This course will count as a technical elective when taken to allow enrollment in the appropriate biomechanics concentration courses. Note that AS.030.205 has several prerequisites: AS.030.101 Introductory Chemistry I-AS.030.102 Introductory Chemistry II and AS.030.105 Introductory Chemistry Lab I-AS.030.106 Introductory Chemistry Laboratory II.

Students may not use the satisfactory/unsatisfactory option for required courses, including Humanities and Social Studies. Exceptions can be considered and approved by their faculty advisors. Further, the Department of Mechanical Engineering requires that grades of C- or better be obtained in all required engineering, mathematics, and science courses (i.e. grades of D, D+ or D-, or F will not be accepted).
department will accept D, D+ or D- grades only up to a maximum of 10 credits for Humanities and Social Sciences courses.

### The Engineering Mechanics Program

The mission of the B.S. in engineering mechanics degree program is to provide a rigorous educational experience that prepares a select group of students for leadership positions in the profession and a lifetime of learning. The faculty is committed to maintaining a modern and flexible curriculum which, building on a foundation of basic sciences and mathematics, develops a solid education in the mechanical engineering sciences. The aim of the Engineering Mechanics program is to build competence in the analysis, design, and modeling of fluid and solid systems, to promote a broad knowledge of the contemporary social and economic context, and to develop the communication skills necessary to excel.

The educational objectives for the B.S. in engineering mechanics degree are designed to educate a select group of science-oriented engineers who, after graduation, will be successful and on track to become leaders among their peers:

1. in the best graduate programs in engineering, science, medical schools, or law schools, and

2. in industry, government laboratories, and other organizations.
Students graduating from the B.S. in Engineering Mechanics programs will have demonstrated the ability to

- understand and apply the fundamentals of mathematics (through linear algebra and multivariate calculus), numerical methods, statistical analysis, and physical sciences (physics and chemistry) necessary to attain competence in the mechanics or related disciplines such as applied physics, bioengineering, or other scientific/engineering disciplines.
- understand the interplay between engineering science and the design, evaluation, and reporting of experiments including analysis and statistical interpretation of data.
- identify, formulate, and solve engineering problems in the mechanical sciences.
- use basic concepts from the mechanical sciences, mathematics, the basic sciences, and related subjects, as well as modern engineering tools, to design mechanical engineering components and processes, taking into account constraints such as manufacturability, cost, safety, environmental, and socio-political impacts.
- enter graduate school and/or professional practice with the tools needed for life-long learning and the recognition of its importance.
- use effective communication, multidisciplinary teamwork, and possess awareness of professional and ethical responsibilities, and an appreciation of the societal, economic, and environmental impacts of engineering.

The curriculum is intended to enable graduates to explore fundamental questions in many fields of engineering. Emphasis is placed on the basic sciences (mathematics, physics, and chemistry) and on the analysis, modeling, and design aspects of solid and fluid engineering systems. Although specific core courses are required, the student is encouraged and guided by his or her advisor to select an individual program of study, within ABET guidelines, according to the student’s particular goals. This program of study may range from a general study of mechanics or engineering science to more specialized programs in a variety of areas, such as robotics, fluid dynamics, environmental engineering, mechanics of solids, experimental mechanics, dynamical systems, mechanics of materials, or biomechanics.

This flexibility makes the program ideal for double-majors and for those wishing to tailor a strong foundation for graduate work in a wide range of disciplines. All mathematics elective and technical elective courses must be at the 300-level or higher, unless approved by their faculty advisor.

### Mathematics (23 credits)

(grades below C- not accepted)

- AS.110.108 Calculus I 4
- AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
- AS.110.202 Calculus III 4
- or AS.110.211 Honors Multivariable Calculus 4
- or AS.110.212 Honors Linear Algebra 4

Mathematics elective 4

- Statistics Elective at 300-level or above 3-4
  - EN.560.348 Probability & Statistics in Civil Engineering
  - EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering

Other qualified statistics courses can be taken upon advisor’s approval.

### Basic Science (16-17 credits)

(grades below C- not accepted)

- EN.530.103 Introduction to Mechanics I & EN.530.104 and Introduction to Mechanics II 4-5
- or AS.171.101 General Physics:Physical Science Major I & AS.173.111 and General Physics Laboratory I 5
- or AS.171.102 General Physics: Physical Science Majors II & AS.173.112 and General Physics Laboratory II 5
- EN.510.101 Introduction to Materials Chemistry 3
- or AS.030.101 Introductory Chemistry I 4

### Humanities (18 credits) 18

Six humanities and/or social science electives *

### Introductory Engineering and Computing

- EN.530.101 Freshman Experiences in Mechanical Engineering & EN.530.102 and Freshman Experiences in Mechanical Engineering 4
- EN.530.105 Mechanical Engineering Freshman Laboratory I & EN.530.106 Mechanical Engineering Freshman Laboratory II (provide the necessary engineering and computing instruction for freshmen and are strongly recommended) 2

Alternate introductory courses are available. If EN.530.101-EN.530.102 and EN.530.105-EN.530.106 are not taken, students must take one course from each of the engineering and computing course lists below:

#### Introductory Engineering:
- EN.500.101 What Is Engineering?
- EN.510.101 Introduction to Materials Chemistry
- EN.520.137 Introduction To Electrical & Computer Engineering
- EN.570.108 Introduction Environmental Engineering
- EN.580.202 BME in the Real World

#### Computing:
- EN.500.200 Computing for Engineers and Scientists (recommended)
- EN.510.202 Computation and Programming for Materials Scientists and Engineers
- EN.580.200 Introduction to Scientific Computing in BME using Python, Matlab, and R
- EN.600.112 Introductory Programming for Scientists and Engineers
- EN.600.107 Introductory Programming in Java

Any other computing course approved by the faculty advisor. EN.600.107 should be taken as a last resort if none of the other computing options fits the student’s schedule.

### Other Required Engineering Courses

- EN.530.201 Statics and Mechanics of Materials 4
- EN.530.231 Mechanical Engineering Thermodynamics 3
- EN.530.327 Introduction to Fluid Mechanics 3
- EN.530.405 Mechanics of Solids and Structures 3
- or EN.530.215 Mechanics-Based Design
- EN.560.202 Dynamics 4
The Engineering Program at Johns Hopkins University offers a variety of courses to fulfill the requirements for different concentrations within the Department of Mechanical Engineering. This description includes details about the concentrations, electives, and specific courses that students can choose from to satisfy their degree requirements.

### Engineering Science Electives (12 credits)
Courses from engineering, basic sciences, or mathematics (grades below C- not accepted)
- EN.530.405 Mechanics of Solids and Structures
- EN.530.404 Foundations of Power and Fluids
- EN.530.425 Fluid Mechanics I
- EN.530.730 Advanced Fluid Mechanics

### Technical Electives (minimum of 18 credits)
Courses from engineering, quantitative studies, or natural sciences at or above the 300-level, chosen in consultation with the student's advisor. Running credits below 126 are required.

### Engineering Mechanics Electives (6 credits)
Courses below C- not accepted
- EN.530.416 Advanced Mechanical Design
- EN.530.426 Mechanics-Based Design
- EN.530.343 Dynamics of Robots and Spacecraft
- EN.530.448 Biosolid Mechanics

### Biomechanics Concentration
Engineering Mechanics (EM) is a flexible program offered by the Department of Mechanical Engineering. Students who want to specialize in any area of mechanics, including biomechanics, must choose from a set of required courses, engineering science electives, and technical electives.

In biology, mechanics is important at the macroscopic, cellular, and subcellular levels. At the macroscopic length scale, biomechanics of both soft and hard tissues plays an important role in computer-integrated surgical systems and technologies (e.g., medical robotics). At the cellular level, issues such as cell motility and chemotaxis can be modeled as mechanical phenomena. At the subcellular level, conformational transitions in biological macromolecules can be modeled using molecular dynamics simulation (which is nothing more than computational Newtonian mechanics), statistical mechanics, or coarse-grained techniques that rely on principles from the mechanics of materials. In addition, much of structural biology can be viewed from the perspective of Kinematics (e.g., finding spatial relationships in data from the Protein Data Bank).

Each student who pursues the biomechanics concentration within the EM major will, in consultation with his or her EM advisor, choose the set of technical and EM electives that best matches the student's interests. Many electives from other departments are acceptable. The electives for the EM major are structured as follows:

### Engineering Science Electives (12 credits)
- One course in solid mechanics
- One course in fluid mechanics
- One additional course in mechanics of either solids or fluids
- One course in either materials or dynamics

### Engineering Mechanics Electives (6 credits)
- Two additional courses in the same area of mechanics (i.e., fluids, solids, or dynamics)

### Technical Electives (18 credits)
Courses from 300-level courses in engineering and the sciences in consultation with the student's faculty advisor.

- AS.020.363 Developmental Biology
- AS.020.380 Eukaryotic Molecular Biology
- AS.250.353 Computational Biology
- AS.250.353 Computational Biology
- AS.020.363 Developmental Biology
- AS.020.380 Eukaryotic Molecular Biology
- AS.250.353 Computational Biology
- AS.020.363 Developmental Biology
- AS.020.380 Eukaryotic Molecular Biology
- AS.250.353 Computational Biology
- AS.020.363 Developmental Biology
- AS.020.380 Eukaryotic Molecular Biology
- AS.250.353 Computational Biology

---

*One must specifically teach writing (either AS.060.113 Expository Writing or AS.060.114 Expository Writing, AS.220.105 Fiction Poetry Writing I, or another course as approved by the student's advisor). To obtain coherence and depth in these humanities and social science electives, at least six credits must be at the 300-level or higher. Required Engineering Courses (minimum of 26 credits; grades below C- not accepted)

++ Appropriate choices from the social sciences and philosophy may be also used to fulfill this requirement. Because of the importance of computer languages in modern technical society, students may take computer language courses at any level.

---

Fluid mechanics courses may be chosen from courses such as:
- EN.530.328 Fluid Mechanics I
- EN.530.405 Mechanics of Solids and Structures
- EN.530.414 Computer-Aided Design
- EN.530.416 Advanced Mechanical Design

Dynamics courses may be chosen from courses such as:
- EN.530.343 Design and Analysis of Dynamical Systems
- EN.530.424 Dynamics of Robots and Spacecraft

Solid mechanics courses may be chosen from courses such as:
- EN.530.215 Mechanics-Based Design
- EN.530.405 Mechanics of Solids and Structures
- EN.530.414 Computer-Aided Design
- EN.530.416 Advanced Mechanical Design

---

Students must use the satisfactory/unsatisfactory option for required courses, including Humanities and Social Sciences, unless approved by their faculty advisor. The department will accept D or D+ grades only up to a maximum of 10 credits except where indicated. All undergraduate students must follow a program approved by a faculty member in the department who is selected as the student's advisor.

</table>

This is not a complete list of possible courses that can be taken, and not all of these courses must be taken. Rather, students who wish to pursue the biomechanics concentration will take at least five courses such as those listed above. These five should be concentrated either at the cellular/subcellular length scale or in macroscopic biomechanics. Note that given the flexibility of the EM program, it would be possible for students to satisfy both of these kinds of concentrations simultaneously if they apply all 12 of their elective courses toward this end.

### The Concurrent Five-Year Bachelor’s / Master’s Program

The Mechanical Engineering Department offers a concurrent five-year bachelor’s/master’s program for mechanical engineering and engineering mechanics majors. Applications to the B.S./M.S.E. program should be...
submitted by January 5 for consideration of spring admission and June 15 for possible Fall admission, during applicant’s junior (3rd) year.

To apply for admission, students must submit an application, plus a statement of purpose, college transcript, and three letters of recommendation —two of which should be from Mechanical Engineering faculty.

Upon acceptance into the program, students will be asked to develop an outline of their proposed academic program with their advisor.

Admission and Advising

To be admitted to graduate study in the Department of Mechanical Engineering, applicants must submit credentials sufficient to convince the faculty that they will thrive in a program of advanced course work and/or research. No academic degree is required, but the applicant should have at least two years of relevant undergraduate training, or the equivalent, and should have achieved very high marks or have given other evidence of outstanding ability. Graduate Record Examination scores must be submitted.

Upon arrival, each graduate student is assigned to a faculty advisor to help map a tentative program for the first year and enter the intellectual life of the department. The student will remain in regular communication with the advisor. The advisor may use a variety of methods to assess the student’s progress, sometimes including special oral or written examinations. It is not necessary that a student have the same advisor in successive years. After serious research for a dissertation has begun, the research supervisor will automatically function as advisor. All Ph.D. students are required, and master’s students are strongly encouraged to attend the weekly Mechanical Engineering Graduate Seminars.

Requirements for the M.S.E. Degree

**Essay Option:** For the Master of Science in Engineering degree at least eight one-semester courses are required. At least half of them must be selected among those listed as graduate courses in this catalog. The remaining courses can be chosen from 300- and 400-level courses in this catalog, with the advisor’s approval. A completed piece of research conducted under the guidance of a full-time faculty member of the department and reported as a master’s essay is required. All students must follow a course of study approved by their individual advisor.

**Non-Essay Option:** The student must successfully complete a coordinated sequence of ten courses, which requires one year of full-time resident graduate study. At least six of the ten courses must be selected among the graduate courses of this catalog. The intent of this program is to provide the student with an intensive exposure to fundamental and advanced topics within mechanical engineering and engineering mechanics. Students must follow a course of study approved by their individual advisor.

Requirements for the Ph.D. Degree

As soon as the student is prepared to do so, he/she should fulfill the requirements for candidacy. In addition to general university requirements, the student must pass two exams. The first is an oral Departmental Qualifying Exam based on core courses. This exam is usually taken after the third semester. The second is a preliminary oral examination satisfying the Graduate Board requirements. This is a comprehensive examination in which students must demonstrate proficiency at the graduate level in their field of specialization.

Although there are no formal course requirements, students are presumed to be prepared by studies equal to six 600-level courses in their field of specialization and six courses in related fields. All candidates for the doctorate must complete two semesters as a teaching assistant as part of their training. All students are required to follow a course of study approved by their individual advisor.

The final and principal requirement for the doctorate is a piece of original research worthy of publication. Candidates must write a dissertation describing their work in detail and successfully defend it in a final oral presentation and examination.

For current faculty and contact information go to http://www.me.jhu.edu/ faculty.html

**Faculty Chair**

Louis L. Whitcomb
Professor: Control Systems: adaptive and model-based control of linear and nonlinear systems, observers, nonlinear systems analysis, with focus on problems arising in mechanical systems, robots, and robotic vehicles. Underwater Robotics: dynamics, control, instrumentation, and navigation of underwater vehicles and inhabited submersibles—with focus on deep submergence oceanographic vehicles. Industrial and Medical Robotics: dynamics, control, instrumentation, and operation of precision robotics for novel medical and industrial applications.

**Full Time Professors**

Ishan Barman
Assistant Professor, joining January 2014: elucidation of morphological and chemical information of different patho-physiological states through an interdisciplinary approach featuring novel optical, spectroscopic and microfluidic measurements, mechanism modeling and advanced numerical methods for analysis and interpretation of the acquired data.

Gregory S. Chirikjian
Professor: computational structural biology (in particular, computational mechanics of large proteins), conformational statistics of biological macromolecules, developed theory for ‘hyper-redundant’ (snakelike) robot motion planning, designs and builds hyper-redundant robotic manipulator arms, applied mathematics (applications of group theory in engineering), self-replicating robotic systems.

Noah J. Cowan
Associate Professor: robot dynamics, animal biomechanics, and sensorimotor control; theory and application of control systems and system identification techniques for closed-loop systems (especially biological systems); biological motor control and systems neuromechanics; medical robotics.

Andrew S. Douglas
Professor (Vice Dean for Academic Affairs, Whiting School of Engineering): nonlinear mechanics of solids, mechanical response of compliant biological tissues, finite deformation elasticity, Static and dynamic fracture of ductile materials.

Jaafar El-Awady
Assistant Professor: multiscale materials modeling, damage and fracture mechanisms of materials in mechanical design, material degradation in
extreme environments, nano-materials and structures, impact dynamics and wave propagation.

Dennice Gayme
Assistant Professor: Dynamics and control of nonlinear, networked and spatially distributed systems such as the electric power grid, and wind farms. Modeling of turbulence and transition to turbulence in wall bounded shear flows and wind farms. Grid integration of renewable energy sources.

Kevin J. Hemker
Professor, Alonzo G. Decker, Jr. Chair in Mechanical Engineering: Professor Hemker and his students seek to identify the underlying atomic-scale processes that govern the mechanical behavior of advanced material systems. They are making key observations and discoveries that define the way the mechanics and materials community thinks about and understands the properties of: nanocrystalline materials, MEMS and micro-lattice materials, thermal barrier coatings, armor ceramics, and high temperature structural materials.

Cila Herman
Professor: experimental heat transfer and fluid mechanics, optical measurement techniques, image processing. Thermoacoustic refrigeration, influence of electric fields on boiling in terrestrial conditions and microgravity, heat exchangers, heat transfer in boiling, optical tomography, holographic interferometry, cooling of electronic equipment, digital image processing, heat transfer augmentation.

Joseph M. Katz
Professor, Whiting School Mechanical Engineering Chaired Professor, Gilman Scholar: cavitation phenomena, attached partial cavitation, cavitation in turbulent shear flows, jets and wakes. Multiphase flows: interaction between bubbles and flow structure, mixing mechanisms and droplet formation in water-fuel stratified shear flows, transport of microscopic particles and droplets in turbulent flows. Development of optical flow diagnostics techniques, including Particle Image Velocimetry (PIV) and Holographic Particle Image Velocimetry (HPIV). Applications of PIV and HPIV for measuring the characteristics of turbulence and addressing turbulence modeling issues. Complex flow structure and turbulence within turbo-machines: Wake-wake and blade-wake interactions in multistage axial turbomachines, flow and rotating stall in centrifugal pumps, development of optical diagnostics techniques for measurements in turbomachines. Oceanography: flow structure and turbulence in the bottom boundary layer of the coastal ocean; measurement of spatial distributions of plankton, particles and bubbles in the ocean; development of optical instrumen-tation, including subsensible holography and PIV systems. Prevention of nozzle wear in abrasive water suspension jets (AWSJ) using porous lubricated nozzles. Flow-induced vibrations and noise, mechanisms of noise generation in turbulent separated flows and in turbomachines.

Marin Kobliarov
Assistant Professor: developing intelligent robotic vehicles that can perceive, navigate, and accomplish challenging tasks in uncertain, dynamic, and highly constrained environments. Performing research in analytical and computational methods for mechanics, control, motion planning, and reasoning under uncertainty, and in the design and integration of novel mechanisms and embedded systems. Application areas include mobile robots, aerial vehicles, and nanosatelitites.

Charles Meneveau
Professor, Louis M. Sardella Chair in Mechanical Engineering, Director of the Center for Environmental and Applied Fluid Mechanics: theoretical, experimental, and numerical studies in turbulence, large-eddy-simulation, turbulence modeling, fractals and scaling in complex systems, small-scale structure of turbulence and velocity gradient dynamics, applications of LES to environmental flows, wind energy, development of data-intensive science tools to study turbulence.

Rajat Mittal
Professor: computational fluid dynamics, low Reynolds number aerodynamics, biomedical flows, active flow control, LES/DNS, immersed boundary methods, fluid dynamics of locomotion (swimming and flying), biomimetics and bioinspired engineering, turbomachinery flows.

Andrea Prosperetti
Professor, Charles A. Miller Jr. Chair in Mechanical Engineering: multiphase flow; theoretical and computational fluid mechanics and acoustics; gas and vapor bubbles.

K. T. Ramesh
Professor, Alonzo G. Decker, Jr. Professor of Science and Engineering, Director of the Center for Advanced Metallic and Ceramic Systems (CAMCS) and the Hopkins Extreme Materials Institute (HEMI): Nanomaterials, planetary impact, dynamic failure mechanisms, shock, impact, and wave propagation, high-strain-rate behavior of materials, injury biomechanics, constitutive and failure modeling.

Sean Sun
Vice Chair, Associate Professor: mechanobiology of the cell, molecular biomechanics and biophysics, molecular motors and muscle, statistical mechanics and nonlinear phenomena.

Jeff Tza-Huei Wang
Associate Professor: bioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Tamer Zaki
Associate Professor: Transitional and turbulent shear flows: receptivity, linear and non-linear instability waves, secondary instability, breakdown to turbulence, direct numerical simulations, transition modelling. Two-fluid shear flows: linear and non-linear instability methods, interface tracking, the interaction of vortical disturbances with interfaces, direct numerical simulations, laminar-to-turbulence transition. Turbulence: boundary layer turbulence, separation, stratification, drag reduction, turbulence structures, direct numerical simulations, large-scale high-performance computing.

Secondary Faculty Appointments

Stephen Belkoff
Joint, Part-Time, and Research Appointments: Associate Professor (Orthopedic Surgery): biomechanics, orthopaedic implants, fracture fixation in osteoporotic bone, mechanism of injury, vertebroplasty.

Robert C. Cammarata
Joint, Part-Time, and Research Appointments: Professor (Materials Science and Engineering): structure, properties, and processing of thin films and nanostructured materials, thermodynamics and mechanics of surfaces, mechanical behavior of materials, nonindentation testing, stresses in thin films, novel electrochemical deposition methods, computer simulations.

Gregory L. Eyink
Joint, Part-Time, and Research Appointments: Professor (Department of Applied Mathematics and Statistics): mathematical physics, fluid
mechanics, turbulence, dynamical systems, partial differential equations, nonequilibrium statistical physics, geophysics and climate.

Lori Graham-Brady
Professor, Civil Engineering: stochastic finite element methods, probabilistic mechanics, stochastic simulation of material properties, micromechanics.

Daniel Naiman

Mark Robbins
Joint, Part-Time, and Research Appointments: Professor (Physics and Astronomy): Connecting and contrasting atomistic and macroscopic descriptions of non-equilibrium processes including friction, adhesion, large-strain mechanical deformation, fracture, heat flow, fluid flow, and boundary conditions at interfaces between different materials. Techniques include molecular simulations, continuum calculations and multiscale modeling approaches that bridge the two.

Dan Stoianovici
Joint, Part-Time, and Research Appointments: Professor (Brady Urological Institute): urology, medical robotics.

Russell H. Taylor
Joint, Part-Time, and Research Appointments: Professor (Computer Science): medical robotics, computer-assisted surgery.

Nitatish V. Thakor
Joint, Part-Time, and Research Appointments: Professor (Biomedical Engineering): medical instrumentation and medical micro and nanotechnologies, neurological instrumentation, signal processing, computer applications.

Rene Vidal
Joint, Part-Time, and Research Appointments: Associate Professor (Biomedical Engineering): biomedical image analysis, computer vision, machine learning, dynamical systems, signal processing.

Timothy Weihs
Joint, Part-Time, and Research Appointments: Professor (Materials Science and Engineering), Director of the Center for Leadership Education: self-propagating exothermic reaction and joining with reactive multilayer foils, processing and characterization of thin films, layered materials, and thin film reactions, mechanical testing of metals and biological materials.

Senior Lecturer
David Kraemer
Senior Lecturer

Steven Marra
Senior Lecturer: Soft and hard tissue biomechanics, nonlinear mechanics of solids, mechanics of tissue damage.

Nathan Scott
Senior Lecturer: Principles and practice of engineering design education.

Professor Emeritus
William N. Sharpe Jr.

Professor Emeritus: experimental solid mechanics; microelectromechanical systems (MEMS), microsample testing.

Associate Research Professor
Mehran Armand
Associate Research Professor (Applied Physics Laboratory).

Juan I. Arvelo Jr.
Assistant Research Professor (Applied Physics Laboratory).

Lester Su
Associate Research Professor: (Stanford University).

Liming Voo
Associate Research Professor (Applied Physics Laboratory).

Research Scientist
Alan Brandt

Research Professor
Ilene Busch-Vishniac
Research Professor (University of Saskatchewan).

Shiyi Chen
Research Professor (Peking University).

Allison Okamura
Research Professor (Stanford University).

Alexander Spector
Research Professor, Biomedical Engineering: biosolid mechanics, cell mechanics and biophysics, molecular motors, mathematical and computational modeling.

Pazhayannur Swaminathan
Research Professor (Applied Physics Laboratory).

David Van Wie
Research Professor (Applied Physics Laboratory).

Assistant Research Professor
Nitin Daphalapurkar
Assistant Research Professor.

Iulian Iordachita
Assistant Research Professor: robotics, medical robotics and instrumentation, mechanisms and mechanical transmissions for robots, advance electro-mechanical design, biologically-inspired mechanisms.

John Thomas
Assistant Research Professor (Applied Physics Laboratory).

Adjunct Associate Professor
Thomas Dragone
Adjunct Associate Professor: aerospace structures and materials, airframe structure design and development, materials science.

Adjunct Assistant Professors
Ryan Eustice
Adjunct Assistant Professor (Department of Naval Architecture and Marine Engineering, University of Michigan).

Jian Sheng
Adjunct Assistant Professor (University of Minnesota).

**Adjunct Professor**
Gabor Fichtinger
Adjunct Professor, Computer Science and Radiology: Director of Computer Integrated Surgical Systems and Technology (CISST).

**Associate Research Scientist**
Tihomir Hristov
Associate Research Scientist.

Xiaofeng Liu
Assistant Research Scientist.

**Adjunct Associate Research Scientist**
Edwin Malkiel
Adjunct Associate Research Scientist.

**Adjunct Research Professor**
Thomas Wright
Adjunct Research Professor: theoretical solid mechanics, wave propagation, dynamic failure, adiabatic shear localization, instabilities.

**Lecturer**
Yury Ronzhes
Joint, Part-Time, and Research Appointments: Lecturer.

For current course information and registration go to https://isis.jhu.edu/classes/

**Courses**

**EN.530.101. Freshman Experiences in Mechanical Engineering. 2 Credits.**
An overview of the field of mechanical engineering along with topics that will be important throughout the mechanical engineering program. This one-year course includes applications of mechanics, elementary numerical analysis, programming in Matlab, use of computer in data acquisition, analysis, design, and visualization, technical drawing, the design process and creativity, report preparation, teamwork, and engineering ethics. Corequisites: EN.530.103 and EN.530.105.
Instructor(s): S. Marra
Area: Engineering.

**EN.530.102. Freshman Experiences in Mechanical Engineering. 2 Credits.**
An overview of the field of mechanical engineering along with topics that will be important throughout the mechanical engineering program. This is the second half of a one-year course that includes applications of mechanics, elementary numerical analysis, programming in Matlab, use of computer data acquisition, analysis, design, and visualization; technical drawing, the design process and creativity, report preparation, teamwork, and engineering ethics.
**Prerequisites: EN.530.101**
Instructor(s): S. Belkoff
Area: Engineering.

**EN.530.103. Introduction to Mechanics I. 2 Credits.**
This is the first half of a one-year course offering in-depth study of elements of mechanics, including linear statics and dynamics, rotational statics and dynamics, thermodynamics, fluids, continuum mechanics, transport, oscillations, and waves. This is an alternate to AS.171.101, designed specifically for Mechanical Engineering and Engineering Mechanics students taking EN.530.101 concurrently. Restricted to Mechanical Engineering, Engineering Mechanics, Civil Engineering, Undecided Engineering Majors, or permission of instructor.
Instructor(s): J. Thomas
Area: Engineering, Natural Sciences.

**EN.530.104. Introduction to Mechanics II. 2 Credits.**
This is the second half of a one-year course offering in-depth study of elements of mechanics, including linear statics and dynamics, rotational statics and dynamics, thermodynamics, fluids, continuum mechanics, transport, oscillations, and waves. This is an alternate to AS.171.101, designed specifically for Mechanical Engineering and Engineering Mechanics students taking EN.530.102 concurrently.
**Prerequisites: EN.530.103**
Instructor(s): J. Thomas
Area: Engineering, Natural Sciences.

**EN.530.105. Mechanical Engineering Freshman Laboratory I. 1 Credit.**
Hands on laboratory complementing EN.530.101 and EN.530.103, including experiments, mechanical dissections, and design experiences distributed throughout the year. Experiments are designed to give students background in experimental techniques as well as to reinforce physical principles. Mechanical dissections connect physical principles to practical engineering applications. Design projects allow students to synthesize working systems by combining mechanics knowledge and practical engineering skills. Corequisites: EN.530.101 and EN.530.103.
Instructor(s): S. Marra
Area: Engineering.

**EN.530.106. Mechanical Engineering Freshman Laboratory II. 1 Credit.**
Hands on laboratory complementing EN.530.102 and EN.530.104, including experiments, mechanical dissections, and design experiences distributed throughout the year. Experiments are designed to give student background in experimental techniques as well as to reinforce physical principles. Mechanical dissections connect physical principles to practical engineering applications. Design projects allow students to synthesize working systems by combining mechanics knowledge and practical engineering skills.
**Prerequisites: EN.530.105**
Instructor(s): S. Belkoff
Area: Engineering.

**EN.530.110. Chair’s Dialogue on Grand Engineering Challenges. 1 Credit.**
The purpose of this course is to allow the ME Chair and students to engage in a meaningful dialog about grand engineering challenges facing the world today. Based on the premise that these challenges constitute the opportunity of a lifetime disguised as a series of unsolvable problems, the course will explore the technical, scientific, political, and societal facets of these challenges and the opportunities for engineers to engage in topics such as: energy, the environment, medical health and national security.
EN.530.201. Statics and Mechanics of Materials. 4 Credits.
Equilibrium of rigid bodies, free-body diagrams, design of trusses. One- dimensional stress and strain. Hooke's law. Properties of areas. Stress, strain, and deflection of components subjected to uniaxial tension, simple torsion, and bending. Co-listed with EN.560.201. Recommended Course Background: AS.171.101 or EN.530.103 and EN.530.104 or Permission Only.
Instructor(s): T. Igusa
Area: Engineering.

EN.530.202. Dynamics. 4 Credits.
Basic principles of classical mechanics applied to the motion of particles, system of particles and rigid bodies. Kinematics, analytical description of motion; rectilinear and curvilinear motions of particles; rigid body motion. Kinetics: force, mass, and acceleration; energy and momentum principles. Introduction to vibration. Includes laboratory experience.
Prerequisites: (EN.530.201 or EN.560.201) AND (AS.171.101 or (EN.530.103 AND EN.530.104)) AND AS.110.109
Instructor(s): N. Nakata
Area: Engineering.

EN.530.215. Mechanics-Based Design. 3 Credits.
Prerequisites: EN.530.201 OR EN.560.201
Instructor(s): T. Nguyen
Area: Engineering.

EN.530.216. Mechanics Based Design Laboratory. 1 Credit.
This is the laboratory that supports EN.530.215 Mechanics Based Design.
Corequisites: EN.530.215
Instructor(s): S. Marra
Area: Engineering.

EN.530.231. Mechanical Engineering Thermodynamics. 3 Credits.
Prerequisites: AS.110.109
Instructor(s): J. Katz
Area: Engineering.

EN.530.232. Mechanical Engineering Thermodynamics Laboratory. 1 Credit.
This course is the complementary laboratory course and a required corequisite for EN.530.231. Corequisite: EN.530.231
Instructor(s): S. Marra
Area: Engineering, Natural Sciences.

EN.530.241. Electronics & Instrumentation. 4 Credits.
Introduction to basic analog electronics and instrumentation with emphasis on basic electronic devices and techniques relevant to mechanical engineering. Topics include basic circuit analysis, laboratory instruments, discrete components, transistors, filters, op-amps, amplifiers, differential amplifiers, power amplification, power regulators, AC and DC power conversion, system design considerations (noise, precision, accuracy, power, efficiency), and applications to engineering instrumentation.
Prerequisites: AS.171.102
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.319. Molecular Modeling and Simulation for Engineers. 3 Credits.
Nano-sized engineering materials and devices behave in ways that are profoundly different from their traditional macroscopic counterparts. This course will provide students with an introduction to this exciting and rapidly evolving field. Through a combination of lectures, case-studies, and hands-on applications, students will (i) develop an understanding of the principles that govern the performance of nanoscale engineering systems, and (ii) learn how molecular modeling tools can assist in the design and analysis of such systems. Recommended Course Background: AS.110.107/AS.110.109, General Physics II
Area: Engineering.

EN.530.327. Introduction to Fluid Mechanics. 3 Credits.
Prerequisites: Co-requisite: EN.530.329
Instructor(s): D. Gayme
Area: Engineering.

EN.530.328. Fluid Mechanics II. 3 Credits.
Instructor(s): C. Meneveau
Area: Engineering.

EN.530.329. Introduction to Fluid Mechanics Laboratory. 1 Credit.
This course is the complementary laboratory course and a required co-requirement for EN.530.327. Corequisite: EN.530.327
Instructor(s): S. Marra
Area: Engineering.

EN.530.334. Heat Transfer Laboratory. 1 Credit.
This is the laboratory that supports EN.530.334 Heat Transfer.
Corequisites: EN.530.334
Instructor(s): S. Marra
Area: Engineering.

EN.530.335. Heat Transfer Laboratory. 1 Credit.
This is the laboratory that supports EN.530.334 Heat Transfer.
Corequisites: EN.530.334
Instructor(s): S. Marra
Area: Engineering.

EN.530.343. Design and Analysis of Dynamical Systems. 4 Credits.
Modeling and analysis of damped and undamped, forced and free vibrations in single and multiple degree-of-freedom linear dynamical systems. Introduction to stability and control of linear dynamical systems.
Prerequisites: Prereq: (110.108 and 110.109 and (110.202 or 110.211) and ((550.291) or (110.201 and 110.302) or (110.201 and 110.306)), and C- or better or concurrent enrollment in 530.202 or 560.202.
MechE Majors must also have taken 530.241
Instructor(s): S. Marra
Area: Engineering.
EN.530.352. Materials Selection. 4 Credits.
An introduction to the properties and applications of a wide variety of materials: metals, polymers, ceramics, and composites. Considerations include availability and cost, formability, rigidity, strength, and toughness. This course is designed to facilitate sensible materials choices so as to avoid catastrophic failures leading to the loss of life and property.
Prerequisites: Prereq: EN.530.215 or permission of instructor
Instructor(s): S. Marra
Area: Engineering.

EN.530.354. Manufacturing Engineering. 3 Credits.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming, shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Special Notes: Labs and field trips will be scheduled with class separately. Mechanical Engineering and Engineering Mechanics Sophomores and Juniors only.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.381. Engineering Design Process. 3 Credits.
Goal of the course is to teach students the iterative process of design from requirement establishment, to generation of (many) concepts, to decision making and criteria based concept selection. The four C's of design: Creativity, Complexity, Choice, and Compromise will be explored. The processes of functional decomposition, modeling and simulation and assessment of Risk, Reliability and Safety will be covered. Modern tools of design and their interfaces with manufacturing and Product Lifecycle Management (PLM) tools will be presented. Throughout the course teams of students will maintain a record of design process as it relates to a specific term project. The progress of the design will be reported according the principles of project management. This course will equip students with tools needed for success in Senior Design.
Instructor(s): N. Scott
Area: Engineering.

EN.530.403. Engineering Design Project. 4 Credits.
This senior year "capstone design" course is intended to give some practice and experience in the art of engineering design. Students working in teams of two to four will select a small-scale, industry-suggested design problem in the area of small production equipment, light machinery products, or manufacturing systems and methods. A solution to the problem is devised and constructed by the student group within limited time and cost boundaries. Preliminary oral reports of the proposed solution are presented at the end of the first semester. A final device, product, system, or method is presented orally and in writing at the end of the second semester. Facilities of the Engineering Design Laboratory (including machine shop time) and a specified amount of money are allocated to each student design team for purchases of parts, supplies, and machine shop time where needed. Recommended Course Background: ME Majors: EN.530.215, EN.530.327; EM & BME Majors: EN.530.215 or EN.530.405, and EN.530.327.
Instructor(s): N. Scott
Area: Engineering.

EN.530.404. Engineering Design Project II. 4 Credits.
The Senior Design Project, a unique two-semester course, is the capstone of Johns Hopkins's Mechanical Engineering Program. In the class, students working in small teams tackle specific design challenges presented by industry, government, and nonprofit organizations. The sponsors provide each team with a budget, access to world-class resources, and technical contacts. Ultimately, each team conceptualizes a novel solution to the sponsor’s problem and then designs, constructs, and tests a real-world prototype before presenting the finished product and specifications to the sponsor. The course requires students to draw upon the four years of knowledge and experience they’ve gained in their engineering studies and put it to practical use. Throughout the year, they produce progress reports as they design, build, and test the device they are developing. Combining engineering theory, budget and time management, and interactions with real clients, the senior design project is critical to students’ preparation for the transition from school to the workplace.
Prerequisites: EN.530.403
Instructor(s): N. Scott
Area: Engineering
Writing Intensive.

EN.530.405. Mechanics of Solids and Structures. 3 Credits.
This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and structures. We will begin with the mathematical preliminaries used in continuum mechanics: vector and tensor calculus, then introduce kinematics and strain measures, descriptions of stress in a body, frame indifference, conservation laws: mass, momentum, energy balance, and entropy. These concepts will be applied to develop the constitutive equations for solids and fluids, methods for solving boundary values problems that occur in engineering structures, energy methods and foundations of the finite element method.
Instructor(s): J. El-Awady
Area: Engineering, Natural Sciences.

EN.530.410. Biomechanics of the Cell. 3 Credits.
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. Discussion of the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models.
Instructor(s): A. Spector; S. Sun
Area: Engineering, Natural Sciences.

EN.530.414. Computer-Aided Design. 3 Credits.
The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the "Pro/E" package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stoianovici
Area: Engineering.

EN.530.415. Energy Engineering: Fundamentals and Future. 3 Credits.
Area: Engineering, Natural Sciences.
EN.530.416. Advanced Mechanical Design. 3 Credits.
A continuation of EN.530.215 expanding on topics such as fatigue, fracture, and various mechanical components and including linkage systems and cams. Student teams will be assigned different experimental and/or computational projects. Recommended Course Background: EN.530.215
Prerequisites: EN.530.215
Instructor(s): M. Dehghani
Area: Engineering.

EN.530.418. Aerospace Structures & Materials. 3 Credits.
An introduction to the design of aircraft and spacecraft structures and components. This course will build on skills learned in EN.530.215 and EN.530.352. Recommended Course Background: EN.530.352 or instructor permission.
Instructor(s): T. Dragone
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors. Mechanical Engineering and Engineering Mechanics majors only.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and 110.108 and 110.109, and (110.202 or 110.211), and (EN.550.291 or AS.110.302) and (EN.530.241 or EN.520.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.421. Mechatronics. 3 Credits.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or permission of instructor
Instructor(s): G. Chirikjian
Area: Engineering.

EN.530.424. Dynamics of Robots and Spacecraft. 3 Credits.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton’s principle.
Area: Engineering.

EN.530.425. Mechanics of Flight. 3 Credits.
Instructor(s): K. Phillips
Area: Engineering.

EN.530.426. Biofluid Mechanics. 3 Credits.
Course will cover selected topics from physiological fluid dynamics, including respiratory flow patterns, blood flow and pulse propagation, aerodynamics of phonation and speech, rheology of blood flow in the microcirculation, aquatic animal propulsion, and animal flight.
Instructor(s): R. Mittal
Area: Engineering.
EN.530.441. Introduction to Biophotonics. 3 Credits.
The primary aim for this course is to explore the unique and diverse properties of light that makes it suited for diagnosis, imaging, manipulation and control of biological structure and function from the nanoscale to the tissue level. The course will focus on different optical spectroscopic and microscopic modalities that provide biochemical and morphological information, while introducing new ideas on analysis and interpretation of the acquired data. We will also discuss manipulation methods, including optical tweezers and laser scissors, and low-level light therapy. In all of these areas, the idea is to develop a basic understanding of the subject and to use it for finding solutions to real-world problems in healthcare. Discussions and open exchanges of ideas will be strongly emphasized.
Instructor(s): I. Barman
Area: Engineering.

EN.530.444. Computer-Aided Fluid Mechanics and Heat Transfer. 3 Credits.
Computer simulation has become an essential part of science and engineering and this course introduces the student to the use of computer simulation in the disciplines of heat transfer and fluid mechanics. The commercial software COMSOL is used a wide variety of problems, ranging from simple models for which analytical solutions are available, to complex, unsteady, multiphysics real-life problems. Problems will be solved by identifying proper governing equations and boundary conditions first, and then implementing these in the COMSOL environment. Applications will include heat conduction, convection and radiation, internal and external flows, with applications ranging from mechanical to biomedical and aerospace engineering.
Instructor(s): C. Herman
Area: Engineering.

EN.530.445. Introduction to Biomechanics. 3 Credits.
An introduction to the mechanics of biological materials and systems. Both soft tissue such as muscle and hard tissue such as bone will be studied as well as the way they interact in physiological functions. Special emphasis will be given to orthopedic biomechanics. Recommended Course Background: EN.530.215/EN.530.216 and Lab or equivalent. If you have not taken this course or an equivalent, please contact the instructor before registering to ensure you have the appropriate background knowledge to succeed in this course.
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.446. Experimental Methods in Biomechanics. 3 Credits.
An introduction to experimental methods used in biomedical research. Standard experimental techniques will be applied to biological tissues, where applicable and novel techniques will be introduced. Topics include strain gauges, extensometers, load transducers, optical kinematic tracking, digital image correlation, proper experimental design, calibration and error analysis. Of particular emphasis will be maintaining native tissue temperature and hydration. Laboratory will include "hands-on" testing.
Area: Engineering, Natural Sciences.

EN.530.448. Biosolid Mechanics. 3 Credits.
This class will introduce fundamental concepts of statics and solid mechanics and apply them to study the mechanical behavior of bones, blood vessels, and connective tissues such as tendon and skin. Topics to be covered include concepts of small and large deformation, stress, constitutive relationships that relate the two, including elasticity, anisotropy, and viscoelasticity, and experimental methods. Recommended Course Background: AS.110.201 and AS.110.302, as well as a class in statics and mechanics
Area: Engineering.

EN.530.451. Cell & Tissue Engineering Laboratory. 2 Credits.
Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn basic cell culture procedures and specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Co-listed with EN.580.451. Senior and Graduate students only; others Permission Required. Lab Fee: $100
Instructor(s): E. Haase; J. Wang
Area: Engineering.

EN.530.452. Cell & Tissue Engineering Laboratory. 2 Credits.
This laboratory course will consist of three experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. $100 lab fee will be charged. Co-listed with EN.580.452
Instructor(s): E. Haase; J. Wang
Area: Engineering.

EN.530.454. Manufacturing Engineering. 3 Credits.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Open only to seniors in Mechanical Engineering and Engineering Mechanics and other majors at all levels.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.457. Intro To Acoustics. 3 Credits.
This course is an introduction to the science of sound and its applications to music, speech communication, science, and engineering. Topics will include hearing, speech, wave propagation, microphones and loudspeakers, noise control, underwater sound, and room acoustics. Recommended Course Background: EN.530.327
Area: Engineering, Natural Sciences.

EN.530.464. Energy Systems Analysis. 3 Credits.
This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required.
Instructor(s): D. Gayme
Area: Engineering.
EN.530.467. Thermal Design Issues for Aerospace Systems. 3 Credits.
This course deals with processes, systems, instruments, and equipment for aerospace systems. Issue of energy conversion and thermal design are emphasized. Topics include thermodynamic concepts and heat transfer processes for aerospace systems (with emphasis on radiation), the space environment, influence of gravity on heat transfer, power generation for space systems (energy sources, solar cell arrays, energy storage), thermal control (analysis techniques, design procedures, active versus passive design, heating and refrigeration), environmental effects. Area: Engineering.

EN.530.470. Space Vehicle Dynamics & Control. 3 Credits.
In this course we study applied spacecraft orbital and attitude dynamics and their impact on other subsystems. In the orbital dynamics part of the course, we discuss some the issues associated with orbital insertion, control and station keeping. Focus is on the two-body problem regime where conic solutions are valid. Orbit perturbations are also considered. For attitude dynamics, different attitude representations such as of direction cosines, quaternions, and angles are introduced. Then we look at the forces and moments acting on space vehicles. Attitude stability and control considerations are introduced. Instructor(s): M. Ozimek; T. McGee Area: Engineering.

EN.530.485. Physics and Feedback in Living Systems. 3 Credits.
The complex mechanisms of living systems cannot be reduced to a set of base pairs: genes are only one part of mystery of life. Rather, organisms must develop, move, interact, and function in their natural environment, and thus are constrained by the laws of physics. For example, during locomotion an animal must accelerate according to Newton’s laws by applying forces between itself and the environment. Beyond physical principles alone, biological systems extensively use feedback to enhance stability and facilitate adaptation in the presence of a changing world. This course examines the critical roles that physical principles and feedback mechanisms play in life, with special emphasis on animal locomotion and its control. Juniors and Seniors only. Prerequisites: AS.110.109
Instructor(s): N. Cowan Area: Engineering.

EN.530.491. Special Topics. 1 Credit.
Selected topics for third- and fourth-year students in mechanical engineering and other engineering departments. Offered by arrangement with faculty adviser and instructor in charge. Instructor(s): Staff.

EN.530.495. Microfabrication Laboratory. 4 Credits.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprised of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photore sist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Permission Required. Instructor(s): A. Andreadi; J. Wang Area: Engineering, Natural Sciences.

EN.530.525. Independent Research. 3 Credits.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible. Instructor(s): Staff.

EN.530.526. Independent Study. 1 - 3 Credit.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible. Instructor(s): Staff.

EN.530.527. Independent Study. 1 - 3 Credit.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible. Instructor(s): Staff.

EN.530.597. Research-Summer. 1 - 3 Credit.
Instructor(s): Staff.

EN.530.599. Independent Study. 1 - 3 Credit.
Instructor(s): Staff.

EN.530.600. MSE Graduate Research.
Instructor(s): Staff.

The course focuses on the optimal control of dynamical systems subject to constraints and uncertainty by studying analytical and computational methods leading to practical algorithms. Topics include calculus of variations, nonlinear local optimization, global stochastic search, dynamic programming, linear quadratic (gaussian) control, numerical trajectory optimization, model-predictive control. Advanced topics include approximate dynamic programming and optimal control on manifolds. The methods and algorithms will be illustrated through implementation of various simulated examples. Recommended Course Background: AS.110.201 and AS.110.302; experience with control systems; programming in MATLAB. Instructor(s): M. Kobilarov.

This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and materials. We will begin with the mathematical preliminaries of continuum mechanics: vectors and tensors calculus, then introduce the kinematics of deformation and descriptions of stress in a continuum: Eulerian and Lagrangian descriptions, followed by conservation laws: mass, momentum, and energy balance, and entropy. These concepts will be applied to develop the concepts of constitutive relations: frame invariance, material symmetry, and dissipation. The second half of the class will be devoted to elasticity, both classical and finite elasticity, and solution methods for boundary value problems. Instructor(s): T. Nguyen.

EN.530.606. Mechanics of Solids and Materials II.
An overview of the area of the mechanics of solids and materials, with the intent of providing the foundation for graduate students interested in research that involves these disciplines. The course is based on the principles of continuum mechanics, and covers the fundamental concepts of elasticity, plasticity, and fracture as applied to materials. One objective is to get graduate students to the point that they can understand significant fractions of research seminars and papers in this area. This mathematically rigorous course emphasizes the setup and solution of boundary value problems in mechanics, and attempts to integrate the primary behaviors with deformation and failure mechanisms in materials. Special topics covered may include (depending on the interests of the student body) wave propagation, viscoelasticity, geomechanics or biomechanics. Instructor(s): J. El-Awady Area: Engineering.
EN.530.610. Statistical Mechanics in Biological Systems.
Application of equilibrium and nonequilibrium concepts in statistical mechanics to biology is presented in some detail. Topics include many-body dynamics and equilibrium ensembles, thermodynamics and phase transitions, free energy functionals, computer simulations of biological systems, nonequilibrium model such as the Langevin equation and the Fokker-Planck equation, kinetic models of biochemical networks, Markov models of stochastic systems and pattern formation in nonequilibrium systems. Emphasis will be on quantitative understanding of biological problems.

This course teaches in-depth and hands-on understanding of numerical methods for solid mechanics problems. The course begins with a review of the fundamental concepts of the finite element method for linear boundary value problems (BVP) and initial boundary value problems (IBVP) in solid mechanics. Then more advance methods for nonlinear BVPs are presented and applied to problems of material inelasticity and finite elasticity. Topics covered include the strong and weak statements of the BVP, weighted residual methods, time integration, Newton-type methods for nonlinear problems, and error estimation and convergence. Instructor(s): T. Nguyen.

EN.530.616. Introduction to Linear Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. ME EN.530.616 can be used to fulfill the requirement of BME EN.580.616 or ECE EN.520.601.
Instructor(s): N. Cowan.

EN.530.620. Robot Sensors and Actuators (Graduate).
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Instructor(s): L. Whitcomb.

EN.530.621. Fluid Dynamics I.
Instructor(s): A. Prosperetti.

EN.530.622. Fluid Dynamics II.
Instructor(s): J. Katz.

EN.530.624. Dynamics of Robots and Spacecraft (Graduate).
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton’s principle.
Instructor(s): G. Chirikjian.

EN.530.625. Turbulence.
Instructor(s): C. Meneveau.

Nonlinear dynamical systems theory are discussed in the context of mechanics, engineering and biological problems. Concepts such as stability, bifurcations, limit cycles and chaos are illustrated using simple analytic theories as well as practical examples. Emphasis are placed on developing intuition using analytic approaches and simple numerical calculations. The course is appropriate for graduate students with foundational knowledge of solid and fluid mechanics, and some notions of statistical mechanics and biological concepts.
Instructor(s): D. Gayme; S. Sun.

In the first part of the course, the focus is on steady and transient two- and three-dimensional heat conduction. Energy balances and the energy equation are reviewed, and mathematical methods for solving partial differential equations are discussed. Heat transfer with a phase change, and contemporary conduction problems are discussed. In the second part of the course radiative properties and thermal radiation exchange are reviewed. The equation of transfer for participating media is developed, and simplification is discussed.
Instructor(s): C. Herman.

EN.530.632. Convection.
This course begins with a review of the phenomenological basis of the constitutive models for energy and mass flux. Then, using the transport theorem, general conservation and balance laws are developed for mass, species, energy, and entropy. Scaling analysis is used to determine when simplifications are justified, and simplified cases are solved analytically. Experimental results and correlations are given for more complex situations. Free, mixed, and forced internal and external convection are studied, and convection with a phase change is also explored.
Instructor(s): C. Meneveau.

EN.530.635. Mixing & Combustion.
Mixing of fluids, covering ideas from dynamical systems and mixing in turbulent flows. Combustion of gaseous and liquid fuels; chemistry, kinetics, deflagrations and detonations, premixed and non-premixed flames, effect of turbulence, spray and droplet combustion, combustion systems.

This course focuses on advanced topics related to energy and thermodynamics. The objective of this course is to provide a thorough understanding of the environmental impacts related to energy conversion systems. The use of the second law of thermodynamics is introduced to quantify the performance of energy conversion systems. Topics such as global warming, alternative energy sources (solar, wind power, geothermal, tides, etc.) and new technology (fuel cells and hydrogen economy) and resources and sustainable development are addressed. A section of the course is devoted to current trends in nuclear energy generation and environmental issues associated with it.
Instructor(s): C. Herman.
EN.530.642. Plasticity.
Instructor(s): J. El-Awady.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations, Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.
Instructor(s): L. Whitcomb.

Graduate-level introduction to adaptive identification and control. Emphasis on applications to mechanical systems possessing unknown parameters (e.g., mass, inertia, friction). Topics include stability of linear and nonlinear dynamical systems, Lyapunov stability, input-output stability, adaptive identification, and direct and indirect adaptive control. Recommended Course Background: AS.110.106, AS.110.107/AS.110.109, AS.110.202; Physics I, II; AS.110.201, AS.110.302, Equations, linear control theory, and Matlab.
Instructor(s): L. Whitcomb.

This course is a survey of group theory with an emphasis on applications in mechanical design research. In particular, the representation theory of finite groups, compact Lie groups, and certain noncompact unimodular groups is reviewed, and Fourier analysis on these groups is applied as a tool in design problems. The concentration is on applications in CAD, discrete and computational geometry, and robotics. Specific applications include modern interpolation, deformation of solid models, and pattern matching.
Instructor(s): G. Chirikjian.

EN.530.649. System Identification.
This course will cover several fundamental approaches system identification, including spectral, prediction error, subspace, and "online" (adaptive) identification methods. The emphasis will be on LTI systems, but some time will be devoted to system identification for classes of nonlinear dynamical systems, such as those that are linear in parameters.
Instructor(s): N. Cowan.

EN.530.653. Advanced Systems Modeling.
This course covers the following topics at an advanced level: Newton’s laws and kinematics of systems of particles and rigid bodies; Lagrange’s equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion; structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Lagrange, Kane’s formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research.
Instructor(s): G. Chirikjian.

EN.530.654. Advanced Systems Modeling II.
A continuation of EN.530.653, this course covers the following topics at an advanced level: Newton’s laws of kinematics of systems of particles and rigid bodies; Lagrange’s equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion; structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Lagrange, Kane’s formulation of dynamics, computing torques with O(n) recursive manipulator dynamics; Luh-Walker-Paul, Hollerbach, O(n) dynamics simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which relates the topics of this course to his or her research.
Instructor(s): G. Chirikjian.

An advanced course on the microscopic mechanisms that control the mechanical behavior of materials. Methods and techniques for measuring, understanding, and modeling: plasticity, creep, shear banding, and fracture will be addressed. Subjects to be covered include dislocation theory and strengthening mechanisms, high temperature diffusion and grain boundary sliding, shear localization, void formation, ductile rupture, and brittle fracture.
Instructor(s): A. Prosperetti.

EN.530.657. Physical Acoustics.
This course provides a foundation for modern acoustics including derivation of wave equation and its solution in various media, sound radiation, sound propagation, instrumentation and sound/structure interaction. Specific applications of focus will be determined by the research interests of the students in the class.
Instructor(s): A. Prosperetti.

An advanced course on the theoretical treatment and modeling of the mechanisms of deformation in solids at intermediate and high temperatures. Topics include diffusion of point defects; vacancy migration; diffusion of solutes; cooperative and diffusion-less transformations; dislocation obstacle interactions; dislocation climb and cross-slip; friction forces in metals, alloys and covalent crystals.
Instructor(s): J. El-Awady.
EN.530.660. Computational Analysis of Stochastic Processes.
This class will cover stochastic processes (including both discrete and continuous time, and including both discrete and continuous state), leading to a rigorous treatment of stochastic differential equations and filtering, emphasizing computation. The class will draw from examples relevant to engineering, such as the Kalman filter. The course will comprehensively, but rapidly review all needed material in probability and statistics.
Prerequisites: 580.616 or 530.616 Linear Dynamical Systems.

EN.530.661. Applied Mathematics for Engineering.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required.
Instructor(s): D. Gayme.

EN.530.671. Statistical Mechanics in Biological Systems.
Principles of statistical physics are discussed in the context of biological problems. After an introduction, topics covered will include equilibrium theory of liquids and polymers, theory of chemical reactions in complex environments, stochastic models, dynamics of membranes and channels, theory of biological motors, computer simulations of liquids and proteins.
Instructor(s): S. Sun.

EN.530.672. Biosensing & BioMEMS.
The course discusses the principles of biosensing and introduces micro- and nano-scale devices for fluidic control and molecular/cellular manipulation, measurements of biological phenomena, and clinical applications.
Instructor(s): J. Wang.

EN.530.676. Locomotion in Mechanical and Biological Systems.
Advanced graduate course on the mechanics of locomotion in animals and machines, and neural control of locomotion. Terrestrial, aquatic, and aerial locomotion modes are considered. Topics include dynamical systems theory, linear and nonlinear differential equations, Poincaré and Floquet theory, and system identification techniques. Recommended Course Background: graduate course in robotics, controls, or dynamical systems theory, and a basic understanding of probability theory; or permission of instructor.
Instructor(s): N. Cowan.

EN.530.678. Nonlinear Control and Planning in Robotics.
The course starts with a brief introduction to nonlinear systems and covers selected topics related to model-based trajectory planning and feedback control. Focus is on applications to autonomous robotic vehicles modeled as underactuated mechanical systems subject to constraints such as obstacles in the environment. Topics include: nonlinear stability, stabilization and tracking, systems with symmetries, differential flatness, backstepping, probabilistic roadmaps, stochastic optimization.
Recommended Course Background: multi-variable/differential calculus, AS.110.302, AS.110.201, undergraduate linear control, basic probability theory.
Instructor(s): M. Kobilarov.

EN.530.701. Uncertainty Analysis and Downscaling.
This course will describe several approaches used to infer small- scale information from large-scale observations (downscaling). Downscaling is especially useful for multi-scale phenomena characterized with power-law spectra or fractal geometry. Topics: Self- consistency conditions across length-scales to determine model parameters in coarse-grained simulations. Tools for characterizing scale-invariant (fractal) processes. Sample applications of downscaling as practiced today: (i) multi-scale transport phenomena in fluids, (ii) rainfall modeling in hydrology. The process of inferring small-scale information from large-scale observations is most often inherently uncertain. The second part of this course will explore uncertainty models in the analytical context of downscaling. Topics: assimilation of data and models (Kalman filtering and related methods for nonlinear models and very large data sets), statistical analysis of spatial-temporal data (independent components analysis, kernel methods). Applications to downscaling in atmospheric data.

EN.530.707. Robot System Programming.
This course seeks to introduce students to open-source software tools that are available today for building complex experimental and fieldable robotic systems. The course is grouped into four sections, each of which building on the previous in increasing complexity and specificity: tools and frameworks supporting robotics research, robotics-specific software frameworks, integrating complete robotic systems, and culminates with an independent project of the student's own design using small mobile robots or other robots in the lab. Students will need to provide a computer or a virtual-box (with at least a few GB of memory and a few tens of GB of disc space) running Ubuntu 12.04 (or one of its variants). Students should have an understanding of intermediate programming in C/C++ (including data structures and dynamic memory allocation) Familiarity with Linux programming. Familiarity with software revision control systems (e.g. subversion, mercurial, git), linear algebra. Recommended Course Background: EN.530.646 and EN.600.436.
Instructor(s): L. Whitcomb.

This course will introduce students to advanced concepts in computational fluid dynamics (CFD) including fast linear sparse solvers, and curvilinear, unstructured and Cartesian grid based methods for complex flows. Students will also learn how to develop fast flow solvers on large-scale shared and distributed memory computers.
Area: Engineering.

EN.530.730. Finite Element Methods.
Variational methods and mathematical foundations, Direct and Iterative solvers, 1-D Problems formulation and boundary conditions, Trusses, 2-D/3D Problems, Triangular elements, QUAD4 elements, Higher Order Elements, Element Pathology, Improving Element Convergence, Dynamic Problems.
Instructor(s): S. Ghosh.
An advanced examination of fracture mechanisms in ductile and brittle materials. Both the mechanics and the materials aspects are covered with importance placed on the synthesis of the two approaches. Topics include linear elastic fracture mechanics, ductile fracture, the J-integral, atomistic aspects of fracture in polycrystalline materials, fracture in ceramics and polymers, influence of the material microstructure on fracture toughness and ductility in FCC and BCC materials.

EN.530.748. Stress Waves/Impact/Shockwaves.

The course provides a basic understanding of nanomaterials and nanomechanics. Develops the necessary background in mechanics, mechanical properties and modeling to understand the mechanics of nanomaterials and related problems in nanomechanics and nanotechnology. We will also examine the mechanics of nanoscale assemblies and microscale structures used for investigating nanoscale phenomena. Each student will be expected to complete a paper on a research topic chosen together with the instructor. A mechanics background is NOT required to take this course.

EN.530.759. Research Seminar in Plasticity and Failure.
A weekly research seminar featuring ongoing research as well as reviews of new papers of interest in the general areas of plasticity and failure. The course will have an emphasis on dynamic phenomena, but will consider both engineering materials and biological systems. Students will be expected to make two presentations during the semester. Permission of instructor and advisor required. Instructor(s): K. Ramesh.

EN.530.762. Advanced Math Methods for Engineers.

EN.530.767. Computational Fluid Dynamics.
Advanced introduction to finite-difference and finite-volume approaches to modeling incompressible flows. Computer project requiring programming. Instructor(s): R. Mittal.

EN.530.772. Non-Linear Finite Elements.
This course will discuss state of the art theoretical developments and modeling techniques in nonlinear computational mechanics, for problems with geometric and material nonlinearities. Large deformation of elastic-plastic and visco-plastic materials, contact-friction and other heterogeneous materials like composites and porous materials will be considered. A wide variety of applications in different disciplines, e.g. metal forming, composite materials, polycrystalline materials will be considered. Co-listed with EN.560.772. Instructor(s): S. Ghosh.

EN.530.773. Topics in Applied Mathematics Engineering.
Instructor(s): A. Prosperetti.

EN.530.780. Advanced Finite Element Methods and Multi-Scale Methods.

EN.530.800. Independent Study.
Instructor(s): Staff.

EN.530.801. Graduate Research.
Instructor(s): Staff.

EN.530.802. Graduate Research.
Instructor(s): Staff.

EN.530.803. Mechanical Engineering Seminar.
Instructor(s): Staff.

EN.530.804. Mechanical Engineering Seminar.
Instructor(s): Staff.

Instructor(s): J. Katz.

EN.530.808. Graduate Seminar in Fluid Mechanics.
Instructor(s): Staff.

Instructor(s): Staff.

EN.530.897. Research-Summer.
Instructor(s): Staff.

EN.530.899. Independent Study-Summer.
Instructor(s): Staff.

Cross Listed Courses

Physics Astronomy
AS.171.321. Introduction to Space, Science, and Technology. 3 Credits.
Topics include space astronomy, remote observing of the earth, space physics, planetary exploration, human space flight, space environment, orbits, propulsion, spacecraft design, attitude control and communication. Crosslisted by Departments of Earth and Planetary Sciences, Materials Science and Engineering and Mechanical Engineering. Recommended Course Background: AS.171.101-AS.171.102 or similar; AS.110.108-AS.110.109.
Instructor(s): H. Moos; S. Murray
Area: Engineering, Natural Sciences.

General Engineering
Instructor(s): Staff.
EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): Staff.

Cross-listed with Mechanical Engineering.
Instructor(s): J. Guest.

Electrical Computer Engineering
EN.520.353. Control Systems. 3 Credits.
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).
Instructor(s): D. Tarraf
Area: Engineering, Quantitative and Mathematical Sciences.

Civil Engineering
EN.560.201. Statics & Mechanics of Materials. 4 Credits.
Basic principles of classical mechanics applied to the equilibrium of particles and rigid bodies at rest, under the influence of various force systems. In addition, the following topics are studied: free body concept, analysis of simple structures, friction, centroids and centers of gravity, and moments of inertia. Includes laboratory experience. Co-listed with EN.530.201. Recommended Course Background: AS.171.101, or EN.530.103/EN.530.104 or instructor permission.
Instructor(s): T. Igusa
Area: Engineering.

Geography Environmental Engineering
EN.570.661. Applied Math For Engineer.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

Biomedical Engineering
Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn basic cell culture procedures and specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Co-listed with EN.530.451. Senior and Graduate students only; others, instructor permission required. Fall semester only. Lab Fee: $100
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

EN.580.616. Introduction to Linear Dynamical Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. BME EN.580.616 can be used to fulfill the requirement of ME EN.530.616 or ECE EN.520.601.
Instructor(s): S. Sarma.

Entrepreneurship and Management
EN.660.461. Engineering Business and Management. 3 Credits.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): I. Izenberg; M. Agronin
Area: Engineering.

NanoBio Technology
The Institute for NanoBioTechnology (INBT) is a Johns Hopkins University center for integrated nanobiotechnology research, education, and outreach. Launched in May 2006 with funding from NASA, the National Science Foundation, and the Howard Hughes Medical Institute, INBT aims to revolutionize healthcare and medicine by bringing together internationally renowned faculty expertise, students, and world-class research facilities in engineering, the physical sciences, medicine, and public health to create groundbreaking technologies. Supporting funding also has been provided by the Johns Hopkins School of Medicine, Whiting School of Engineering, Krieger School of Arts and Sciences, and Bloomberg School of Public Health. INBT collaborates with industry through its Corporate Partnership Program, which is open to companies involved in all aspects of nanobiotechnology. INBT headquarters are located in 100 Croft Hall on the Homewood campus. Laboratory facilities and faculty are located at several Johns Hopkins locations. Examples of INBT research include the development of new tools and techniques to probe biological systems at the molecular, cellular, and tissue levels, that will provide new insight into the mechanisms of disease, and the

Courses

EN.670.495. Animation in Nanotechnology & Medicine. 3 Credits.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.497. Animation in Nanotechnology & Medicine. 3 Credits.
This course involves the use of animation to visualize scientific processes in nanotechnology and medicine. Animation is becoming an increasingly important tool in both research and education, especially in fields such as nanobiotechnology that involve complex processes and occur at multiple length scales. Understanding of the subject matter is gained through interaction with faculty and graduate students in research groups in the Institute for NanoBioTechnology at Hopkins. The course follows the basic animation pipeline from concept to post production.
Instructor(s): M. Rietveld.

Using digital video and recording equipment, students learn to communicate science and engineering research news to non-technical audiences, such as the mass media. Lectures focus on rationale behind and best practices for effective communication and include guest presentations by media professionals. Students learn methods of presenting scientific research to a variety of audiences and how to prepare themselves for interviews with journalists. Student will work in groups to write, film, and edit a video news release on a scientific or engineering topic aimed at a general audience.
Instructor(s): M. Spiro.

Students in the INBT training grant programs study and present topics in nanotechnology applied to biology from the scientific literature.
Instructor(s): D. Wirtz.

EN.670.616. Introduction to NanoBio Tutorials II.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): D. Wirtz.

As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.670.616
Instructor(s): D. Wirtz.

This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.

EN.670.620. Fundamental Laboratory Principles of Nanobiotechnology.
This laboratory course introduces students to fundamental concepts of materials science and cell engineering required for research in biological nanoscience. Topics covered include cell culture, quantitative light microscopy, and synthesis of nanoparticles. This laboratory course is a prerequisite for EN.500.621.

EN.670.621. NanoBio Laboratory.
This course introduces students to concepts and laboratory techniques in nanobiotechnology. The focus of the laboratory is on nanoparticle carriers for drug delivery and markers for imaging. The laboratory involves the synthesis of nanoparticles using solution phase techniques and characterization by optical techniques such as dynamic light scattering and absorbance spectroscopy. Strategies for functionalization of nanoparticles are covered with focus on methods for attaching biomolecules. The basic aspects of cell culture and optical microscopy techniques will be covered. Nanoparticles functionalized with a drug or gene will be used to perform transfection experiments and compared to standard techniques.
Prerequisites: EN.670.620
Instructor(s): D. Wirtz.

As a follow-up to NanoBio Tutorials, INBT training grant students will present scientific articles and reviews related to their current research project. Topics will also be related to nanotechnology applied to biology from scientific literature. At this time all students should be assigned a project and be able to engage participating students in their field of study. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, and Introduction to NanoBio Tutorials and NanoBio Tutorials.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.
INBT training grant students only. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, and EN.670.619
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

This course is to allow students pursuing a certificate in nanobiotechnology the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623. Certificate of Advanced Studies in Nanobiotechnology only.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

This course is to allow INBT training grant fellows the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches.
INBT training grant students only. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

EN.670.627. Commercializing Emerging Technologies.
This course will provide “hands-on” experience for pre-doctoral students in identifying viable translational commercialization pathways and establishing credible business plans for new technologies. Students will be challenged to identify possible commercial opportunities associated with their own research, to complete a market analysis, develop a project plan and to draft a business plan suitable for presentation to potential investors. While key elements of each step will be described briefly by experts in the field the focus will be on executing the critical steps rather than on business theory. Although each student will be expected to work on an individual project, the course structure will encourage class support and feedback. At the end of the course students will be expected to develop a business plan and funding proposal suitable to present to a panel of venture experts.
Instructor(s): P. Searson; T. Fekete.

EN.670.628. NanoBio Tutorials II.
As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.500.615 and EN.670.616/EN.500.616
Instructor(s): D. Wirtz.

EN.670.629. Cancer Nanotechnology Training Center (CNTC) Tutorial.
This course is to allow CNTC fellows the opportunity each week to review and present on cancer research topics. The papers and discussions covered will be on areas of human cancers and nanotechnology and include the latest developments from studies of model organisms.
Instructor(s): D. Wirtz.

EN.670.630. Cancer Nanotechnology Training Center (CNTC) Tutorial.
This course is to allow CNTC fellows the opportunity each week to review and present on cancer research topics. The papers and discussions covered will be on areas of human cancers and nanotechnology and include the latest developments from studies of model organisms.
Instructor(s): D. Wirtz.

EN.670.695. Animation in Nanotechnology & Medicine.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

Instructor(s): D. Wirtz.

This independent course presents students with engineering needs in developing countries. Teams of students will work together to design solutions for the proposed needs that are defined in part with our global partners. Students will have to rigorously research the local community and cultural context of the proposed problems to design solutions. Prototypes will be built and some teams may test prototypes in the local community to optimize solutions. Permission of Instructor.

Professional Communication

Strong communications skills are the key to success in any discipline. The Professional Communication Program (PCP) offers Johns Hopkins undergraduates a variety of hands-on courses designed to develop their abilities to research, write, speak, and display data persuasively. Starting with the highly popular foundation courses Professional Communication and Oral Presentations, the program expands to specialized workshops and seminars on topics ranging from science and research writing, engineering culture and ethics to entrepreneurship, public relations and social media. PCP students create journals, write blogs, present pitches and posters, and conduct multimedia PR campaigns. All PCP courses are small—20 or fewer students—ensuring that everyone receives the skilled attention necessary to grow as a writer and presenter. Since many of our students are international, PCP offers English as a Second Language (ESL) sections of Professional Communication and Oral Presentations as well as free ESL tutoring.

For current faculty and contact information go to http://eng.jhu.edu/wse/cle/page/our_people

Faculty
Program Director
Julie Reiser
Senior Lecturer, Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Full Time Faculty
Keith Quesenberry
Lecturer: integrated marketing communications, advertising, social media marketing, online blogging and copywriting, creative strategy, digital media, communications law and ethics.

Pamela Sheff
Senior Lecturer: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, entrepreneurship.

Part Time Faculty
Laura Davis
Lecturer: professional communication for ESL and oral presentations for ESL

Kevin Dungey
Senior Lecturer: oral presentations

Jason Heiserman
Lecturer: oral presentations

Andrew Kulanko
Senior Lecturer: oral presentations

Denise Link-Farajali
Lecturer: professional communication, financial math for ESL, research writing for ESL

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric

Benjamin Parris
Lecturer: professional communication

Jay Thompson
Lecturer: professional communication

Caroline Wilkins
Lecturer: professional communication

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.661.110. Professional Communication for Science, Business and Industry. 3 Credits.
This course teaches students to communicate effectively with a wide variety of specialized and non-specialized audiences. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. No audits.
Instructor(s): B. Parris; C. O'Donnell; C. Wilkins; J. Thompson
Writing Intensive.

EN.661.111. Professional Communication for ESL Students. 3 Credits.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Note: not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.611. No audits.
Instructor(s): L. Davis
Writing Intensive.

EN.661.120. Business Communication. 3 Credits.
Sec. 01: Sheff Sec. 02: Sheff Sec. 03: Porosky Students focus on writing business memos, resumes and cover letters, business proposals, and formal reports. They present work orally using business and professional formats, and enhance their presentations with technology-based media.
Writing Intensive.

EN.661.150. Oral Presentations. 3 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - Including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. No audits.
Instructor(s): A. Kulanko; C. O’Donnell; J. Heiserman; J. Reiser; K. Dungey
Writing Intensive.

EN.661.151. Oral Presentations for ESL. 3 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - Including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Additional attention also will be given to syntax as well as non-verbal communication patterns. Co-listed with EN.661.651. No audits.
Instructor(s): L. Davis
Writing Intensive.
EN.661.154. Blogging and Online Writing. 3 Credits.
This course will teach students how to develop, write, and manage content for websites and social media. In this highly experiential course, students will design, create, and market their own blog; write copy for online retailers and magazines; and manage the content creation process for a collaborative class blogging project. The course will emphasize best practices for search engine optimization (SEO), intuitive visual design, social media metrics, and content management strategies appropriate for publishing, marketing, and other relevant environments.
Instructor(s): J. Reiser
Writing Intensive.

EN.661.160. Media & Society. 3 Credits.
This online course takes a comprehensive and critical view of the history, roles and responsibilities of media in society. It explores the organization, creation, economics, control and effects of mass communications in the United States and the world. Students will learn how both traditional and new digital media has come to play such an integral role in our society while exploring the exciting career opportunities in journalism, public relations, advertising, radio, film, TV and the Internet. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through writing assignments. No audits.
Recommended Course Background: One writing course in any discipline.
Instructor(s): K. Quesenberry.

EN.661.170. Visual Rhetoric. 3 Credits.
A course that aims to help students design clearer, more visually engaging graphics for a wide variety of business and technical documents. Students will learn to manage essential principles of graphic design through a variety of graphic programs (Adobe Creative Suite) and MS Office software. Topics will include logos, letterhead, event posters, brochures, data graphics and some basic web design. No audits.
Instructor(s): C. O'Donnell.

EN.661.270. Working with Writer's Block. 3 Credits.
This course is designed to help anyone currently struggling with writer’s block--anything from extreme procrastination, avoidance behavior, poor writing process, or outright blockage (among others). It utilizes experimental, non-traditional, and un-orthodox methods--including mindfulness meditation and freewriting--to help students and professionals learn how to embrace their own writing process in a more open, flexible, and creative fashion. We will use the work of Jon Kabat-Zinn, Natalie Goldberg, Anne Lamott, and others. This course will only be taught pass/fail.
Instructor(s): J. Reiser
Writing Intensive.

EN.661.315. The Culture of the Engineering Profession. 3 Credits.
This course focuses on building understanding of the culture of engineering while preparing students to communicate effectively with the various audiences with whom engineers interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students will engage in discussion, argument, case study and project work to investigate: the engineering culture and challenges to that culture, the impacts of engineering solutions on society, the ethical guidelines for the profession, and the ways engineering information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. No audits. For Engineering sophomores, juniors and seniors or by permission of instructor.
Instructor(s): E. Rice; P. Sheff
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.317. The Culture of the Medical Profession. 3 Credits.
This course builds understanding of the culture of medicine as well as the ways in which different strata within society have access to and tend to make decisions about health and health related services while preparing students to communicate effectively with the various audiences with whom medical professionals interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students will engage in discussion, argument, case study and project work to investigate: the medical culture, the ways medicine is viewed by different segments of society, issues associated with access to health care, ethical dilemmas and guidelines for medical decisions, the impacts of medical and engineering solutions on society, decision making within client/patient groups, social and cultural differences that effect behavioral change, and the ways medical information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful in communication through a series of short papers and presentations associated with analysis of the writings and cases. For sophomores, juniors, and seniors or by permission of instructor. No audits.
Instructor(s): P. Sheff
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.357. Copywriting & Creative Strategy. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving “big ideas” in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.660.250. No audits.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): K. Quesenberry
Writing Intensive.
EN.661.361. Corporate Communications & P.R.. 3 Credits.
This course focuses on the ways that organizations, both for-profit and non-profit, manage their communications to deliver strategic, coherent and compelling messages to their varied stakeholders. Using case studies and team-based, real world projects, we will explore topics including public and media relations, corporate image, branding, advertising, internal and external communications, crisis management, investor relations, ethics and social responsibility. In the process, we will consider issues ranging from organizational culture and leadership styles to defining strategy, managing conflict, defending positions and disagreeing agreeably. No audits. Recommended Course Background: AS.220.105, EN.661.110, AS.060.113 or AS.060.114, AS.060.215, EN.660.250, EN.660.105, and EN.661.150
Instructor(s): P. Sheff
Writing Intensive.

EN.661.390. Online Journalism: JayStreet: A Journal of Entrepreneurship & Technology at JHU. 3 Credits.
Online journalism, especially at the intersection of science, medicine, and technology, is a rapidly growing field. This interactive course, open to students in all academic disciplines, produces Jay Street, an online journal, focusing on science, medicine, and technology with a JHU connection. Using a combination of guest speakers, interviews, investigative reporting, and selected readings, we will explore and write about some of the exciting and innovative research in science, medicine, and technology conducted at the Johns Hopkins Institutions. Serving as writers, editors and designers, students will choose a theme and design the journal, develop articles and interviews, blogs and videos, providing themselves a key credential for the future. No audits. Recommended Course Background: At least one writing intensive course and/or permission of the instructor.
Writing Intensive.

EN.661.410. Research Writing for ESL. 3 Credits.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provides intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. Undergraduates must be conducting research with a faculty member or must obtain special permission of instructor to register for the course. S/U grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.610. No audits.
Writing Intensive.

EN.661.425. Ethics of Biomedical Innovation. 3 Credits.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Co-listed with EN.580.425.
Area: Social and Behavioral Sciences
Writing Intensive.

EN.661.453. Social Media and Marketing. 3 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits.
Prerequisites: EN.660.250
Writing Intensive.

EN.661.454. Blogging and Online Copywriting. 3 Credits.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Co-listed with EN.661.654.
No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: Prereq. EN.660.250-Principles of Marketing.
Instructor(s): K. Quesenberry
Writing Intensive.

EN.661.455. Copywriting & Creative Thinking. 3 Credits.
Uncover the process of creative thinking for innovation and conceiving “big ideas” in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. No audits.
Prerequisites: EN.660.250
Writing Intensive.
EN.661.456. Marketing Communication Law & Ethics. 3 Credits.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.660.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry
Writing Intensive.

EN.661.487. Advanced Communication Skills for Science and Engineering. 3 Credits.
This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Undergraduates are required to be conducting research with a faculty member or by special permission of instructor. Co-listed with EN.661.687. No audits.
Writing Intensive.

EN.661.488. Communicating Decisions in a Crisis. 3 Credits.
Open to sophomores, juniors and seniors only or permission of instructor. This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.688. No audits.
Writing Intensive.

EN.661.610. Research Writing for ESL.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.410. No audits.
Instructor(s): D. Link-Farajali
Writing Intensive.

EN.661.611. Professional Communication for ESL.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.411.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that "edge" you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester. Financial Math students only. P/F only. No audits.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. Instructor(s): D. Link-Farajali.

EN.661.651. Oral Presentations for ESL.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. Co-listed with EN.661.151.
EN.661.653. Social Media and Marketing.
Students will design and manage their own “guerrilla” marketing and communications firm that will work with a local, non-profit client. The student-run firm will develop the client’s online presence and marketing campaign using a variety of social media resources including website development, blogging, Google Analytics, FB, Tumblr, Twitter, or other tool they determine to be critical to the project. The course is welcome to all students who have had either one writing course—in professional communications, oral presentations, expository writing, or writing seminars—or one marketing course. The course also welcomes students with graphic design, start-up, or other relevant business or management experience. Co-listed with 661.453. No audits.
Instructor(s): J. Reiser.

EN.661.654. Blogging, Editing, and Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars). Co-listed with EN.661.454. No audits.
Prerequisites: Prereq. EN.660.250-Principles of Marketing. Recommended prerequisite: one writing course in any discipline (professional communication, expository writing or writing seminars). Co-listed with 661.454. No audits.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the “real world.” Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Co-listed with EN.661.487. No audits.

This course focuses on using communication to defuse and manage crisis situations. Students work in teams to consider issues including organizational culture, defining strategy, leadership styles, project management, negotiation and conflict management, stakeholder needs, defending positions, disagreeing agreeably, managing large and small groups, ethics, and social responsibility. Co-listed with 661.488. No audits.

EN.661.710. Dissertation Writing Workshop.
This course is designed to introduce students to the dissertation writing process, explain JHU-specific rules and regulations regarding dissertation work, and facilitate the completion of new work or work already in progress. Open to students in any discipline and in any stage of the dissertation process, this course will begin with a selection of speakers from relevant JHU departments, The Graduate Board, the MSE Library and the Commercial Binding Office, the Counseling Center’s Dissertation Support Group, professors, and recently graduated students (among others). During the second half of the course, students will designate one component of the dissertation and work to bring it to completion in a supportive workshop environment. This “component” could include a prospectus, a literature review, a chapter, an introduction, an overall plan for completion, or preparation for the defense. Topics will be geared toward the individual needs of the students registered in the course but will, in general, emphasize goal setting, project planning, developing strategies for working with readers/advisors/committees, learning how to emphasize “the big picture,” working with research tools such as Refworks or Zotero, building a daily writing practice, exploring strategies to deal with the isolation/depression common to dissertation writers, navigating the submission process, and, in general, supporting the overall dissertation writing process through its various stages. Course is taught pass/fail only. Non-native speakers are encouraged to take EN.661.610 Research Writing for ESL before taking this course. No audits.
Instructor(s): J. Reiser.

This workshop is for dissertation writers who have already completed the Dissertation Writing Workshop, EN.661.710. This class provides a venue for students to hold themselves accountable, to set weekly goals, to workshop drafts, and to present work-in-progress to the whole group. Course is taught pass/fail only. Course may be repeated. No audits.
Prerequisites: Prereq: EN.661.710.

Robotics and Computational Sensing

Laboratory for Computational Sensing and Robotics

The Laboratory for Computational Sensing and Robotics (LCSR) is an interdisciplinary academic center for robotics engineering, research, and development. LCSR was founded by the Whiting School of Engineering as the principal locus for robotics research at one of the world’s premier research universities. LCSR is comprised of personnel from various academic departments including Computer Science, Mechanical Engineering, Biomedical Engineering, and Electrical and Computer Engineering at the Whiting School of Engineering, with affiliates in the JHU School of Medicine, the Bloomberg School of Public Health, the Zanvyl Krieger School of Arts and Sciences, the Kennedy Krieger Institute, and the JHU Applied Physics Laboratory. The Center fosters targeted research programs and collaboration with universities, corporations, and other research organizations worldwide. Located in Hackerman Hall at JHU’s Homewood campus in Baltimore, Maryland, this unique research center is one of the largest and most technologically advanced robotics research centers in the world.

Robotics research at Hopkins dates to the early 1960s when researchers at the Johns Hopkins University Applied Physics Laboratory (JHU APL) developed the “Hopkins Beast,” a wheeled mobile robot that could navigate hallways and automatically locate and connect to wall outlets to recharge its batteries autonomously. Robotics research at
the Whiting School of Engineering (WSE) began in the mid-1990s. The establishment of the NSF Engineering Research Center for Computer-Integrated Surgical Systems and Technology (CISST ERC) in 1998 led to a significant expansion of the robotics program, with a strong emphasis on medical robotics. The Laboratory for Computational Sensing and Robotics (LCSR) was established in 2007 to provide infrastructure for a broad interdisciplinary program in robotics research. Johns Hopkins is widely regarded as one of the top robotics research sites in the world, and a leader in medical robotics. Currently, over a dozen WSE faculty members are closely affiliated with LCSR, along with faculty members from other JHU divisions who hold secondary appointments in WSE.

Minor in Robotics
The field of robotics integrates sensing, information processing, and movement to accomplish specific tasks in the physical world. As such, it encompasses several topics, including mechanics and dynamics, kinematics, sensing, signal processing, control systems, planning, and artificial intelligence. Applications of these concepts appear in many areas including medicine, manufacturing, space exploration, disaster recovery, ordinance disposal, deep-sea navigation, home care, and home automation.

The faculty of the Laboratory for Computational Sensing and Robotics (LCSR), in collaboration with the academic departments and centers of the Whiting School of Engineering, offers a robotics minor in order to provide a structure in which undergraduate students at Johns Hopkins University can advance their knowledge in robotics while receiving recognition on their transcript for this pursuit. The minor is not “owned” by any one department, but rather it is managed by the LCSR itself. Any student from any department within the university can work toward the minor.

Robotics is fundamentally integrative and multidisciplinary. Therefore, any candidate for the robotics minor must develop a set of core skills that cut across these disciplines, as well as obtain advanced supplementary skills.

Core Skills Include the Following
- Robot kinematics and dynamics (R)
- Systems theory, signal processing and control (S)
- Computation and sensing (C)

Supplementary advanced skills may be obtained in the following areas:
- Specialized applications, such as space, medicine, underwater, or haptics
- Advanced kinematics and dynamics
- Advanced systems theory
- Advanced computation, such as AI, machine learning, motion planning
- Advanced sensing such as computer vision

The full minor course listing (available at https://www.lcsr.jhu.edu/Robotics_Minor) specifies which courses fulfill these requirements. Note that ALL core areas must be covered, but that ANY advanced/ supplementary courses can be chosen from the list. This allows students to strike a balance between breadth and depth.

Requirements
An undergraduate qualifies for the minor provided he or she has taken at least 18 credits (at the 300-level or above, with a C- or above) from an approved list of courses available at https://www.lcsr.jhu.edu/Robotics_Minor with the following requirements and restrictions:
- Between 6 and 12 credits chosen to cover the three core skills.
- At least 6 credits chosen from advanced supplementary skills.
- At least 3 credits of the 18 must be a laboratory course (at least 15 hours of laboratory time that includes working with physical hardware and/or real data);
- At most 3 credits of the 18 can be an independent research or individual study with a faculty member on the list of approved faculty advisors;
- At least 6 credits must be primarily listed in a department other than the student’s home department (it is acceptable if such a course is cross-listed in the student’s home department).
- At most one course up to 3 credits (including independent research or individual study) may be taken S/U, but all other courses must be taken for a letter grade.

Advising
- All students interested in the minor are required to make an appointment with Anita Sampath in the LCSR to be assigned to a minor advisor to receive guidance about the program.

Phone: 410-516-6841
Email: asampath@jhu.edu

When possible, you will be assigned an advisor in your department (though this is not required).

- Students who decide to pursue the minor should also review their academic transcript with their minor advisor to ensure they will be able to complete the requirements.
- Fill out and submit an Add Minor form (which can be obtained from the registrar’s office).
- Complete the Requirements Checkout tables in the CheckOut sheet, downloadable on this web page. You should meet with your minor advisor periodically (at least once per year), bringing a copy of this form for review.
- During your senior year, you must also note the Robotics Minor on your Application for Graduation.
- When all requirements have been completed, take the completed form to the Robotics Minor Program Coordinator for review and signature.

Undergraduates interested in completing the minor must be assigned a minor advisor. The advisor is responsible for helping the student choose courses and helps to ensure all requirements for the minor are met. The minor advisors are listed on the Robotics Minor website (https://www.lcsr.jhu.edu/Robotics_Minor).

Minor in Computer Integrated Surgery
The Whiting School of Engineering offers a minor in Computer Integrated Surgery (CIS) for full-time, undergraduate students at Johns Hopkins. The minor is particularly well suited for students interested in computer integrated surgery issues who are majoring in a variety of disciplines including biomedical engineering, computer science, computer engineering, electrical engineering, and mechanical engineering. The minor provides formal recognition of the depth and strength of a student’s knowledge of the concepts fundamental to CIS beyond the minimal requirements of his/her major.
In order to minor in CIS, a student will require a minor advisor from the Engineering Research Center in Computer Integrated Surgical Systems and Technology (CISST ERC) in the Laboratory for Computational Sensing and Robotics. Current faculty members available as advisors include Professors Russell Taylor (CS), Greg Hager (CS), Jerry Prince (ECE), Ralph Etienne-Cummings (ECE), Louis Whitcomb (ME), Noah Cowan (ME), Peter Kazanzides (CS), Iulian Iordachita (ME), and Emad Boctor (Radiology).

To satisfy the requirements for the minor in CIS, a student must have a fundamental background in computer programming and computer science, sufficient mathematical background, and also take a minimum of six courses (with a total of at least 18 credits, earning at least a C- in each course) directly related to concepts relevant to CIS. These six CIS courses must include three core courses, which provide the student with the fundamental basis for CIS, and three upper-level courses (300-level or above) to allow the student to pursue an advanced CIS topic in depth.

**Required Fundamental Computer Integrated Surgery Courses**

- EN.600.445 Computer Integrated Surgery I
- A design course in CIS. Either EN.600.446 Computer Integrated Surgery II or a design course in biomedical engineering, electrical and computer engineering, or mechanical engineering with substantial CIS content approved by the student’s faculty advisor in the CIS minor.

**Application Requirements for the M.S.E. in Robotics degree**

- Bachelor’s degree in engineering, science, or math. (Or demonstrated knowledge or accomplishment in these fields.)
- Graduate application
- Statement of Purpose
- Transcripts: unofficial ones uploaded; officials ones sent to the following address:
  
  Johns Hopkins University  
  The Graduate Admissions Office  
  Full time Graduate Studies in Arts and Sciences  
  28 Shriver Hall  
  3400 North Charles Street  
  Baltimore, MD 21218

- Graduate Record Examination (GRE). Current JHU students may request that this requirement be waived. Such requests will be judged on a case-by-case basis.
Departments may not count toward this course requirement.

courses such as the weekly seminar courses offered by LCSR and degree requirements must be at the 300-level or above. Non-credit the offering department/center. All courses counted toward the M.S.E. Advisor.

All incoming M.S.E. students will be assigned an M.S.E. Academic

M.S.E. Program Prerequisites

Math and Physics Proficiency Prerequisites

Proficiency in undergraduate mathematics and physics is expected for all M.S.E. students in the robotics program. This will include the following:

- Multivariable integral and differential calculus
- Linear algebra
- Ordinary differential equations
- Physics – undergraduate calculus-based mechanics, electricity, and magnetism.
- Probability and statistics

This proficiency will be assumed in the prerequisites for the core courses.

Computing Proficiency Prerequisites

Proficiency in computer programming is expected for all M.S.E. students in the robotics program. This will include the following:

- Basic numerical methods using existing programming environments.
- The ability to write well-structured and documented programs in a standard programming language such as C++, Java, or MATLAB.

M.S.E. Degree Requirements

All incoming M.S.E. students will be assigned an M.S.E. Academic Advisor.

- Course Requirements:
  - **Course Option:** 10 credit-bearing courses that total at least 30 credit-hours.
  - **Essay Option:** 8 credit-bearing courses that total at least 24 credit-hours and a Master’s Essay supervised by a WSE faculty member who has been approved by the Robotics M.S.E. Curriculum Committee to serve as a faculty advisor.

At least 6 of these courses must be at the graduate level as defined by the offering department/center. All courses counted toward the M.S.E. degree requirements must be at the 300-level or above. Non-credit courses such as the weekly seminar courses offered by LCSR and Departments may not count toward this course requirement.

- **Foundation Course Requirements:** Two core courses, weekly seminar course, and systems/implementation requirement.
- **Track Course Requirement:** Four courses fulfilling one of the following track requirements:
  - Track in Medical Robotics and Computer Integrated Surgical Systems
  - Track in Perception and Cognitive Systems
  - Track in Automation Science and Engineering

Courses counted toward the track requirement may not be used to satisfy the elective requirement.

- **Elective Course Requirement:** Four courses, or two courses and a M.S.E. Essay, fulfilling the elective requirement as described in Section 2.7. Courses may be any engineering or quantitative (designated E or Q in the course catalog) course, subject to the degree requirement limitations, as approved by the student’s M.S.E. academic advisor. Courses counted toward the elective requirement may not be used to satisfy the track requirements.
- **Academic Ethics:** online tutorial required for all incoming M.S.E. students.
- **Responsible Conduct of Research training course, (online);**
  - **AS.360.625 Responsible Conduct of Research (in-person)**, for students who will be conducting research for pay or to complete degree requirements (http://eng.jhu.edu/wse/page/conduct-of-research-training).
- **Course Grade Requirement:** No more than two C grades can apply toward graduation requirements. One D or F grade or more than two grades in the range C- to C+ inclusive is grounds for dismissal from the program.
- **Transfer Courses:** Standard WSE policy and limitations on M.S.E. transfer credits apply (http://eng.jhu.edu/wse/page/masters-transfer). In addition, use of each transfer course toward satisfaction of a specific Robotics M.S.E. degree requirement must be approved in writing by both the student’s faculty advisor and the Robotics M.S.E. Curriculum Committee.
- **Double Counting:** Standard WSE policy and limitations on double counting apply (http://eng.jhu.edu/wse/page/graduate-double-counting).
- **Duration:** Students must complete degree within 5 years from matriculation in the M.S.E. program. University-approved leave of absence does not count toward this limit.
- **Graduate Research Courses:** No more than one 1-semester graduate research course (e.g., EN.530.600 MSE Graduate Research) may be counted toward degree requirements.
- **WSE Engineering for Professionals (EP) Courses may count toward the M.S.E. degree elective requirements if they are approved in writing by the student’s faculty advisor.**
- **Residency Requirement:** Minimum residency of two full-time academic terms at WSE.

M.S.E. Degree Core Courses

Two first year graduate level courses form the core of the Robotics M.S.E. program. Although these courses can be taken in either order, it is expected that EN.600.436 Algorithms for Sensor-Based Robotics will usually be taken first, followed by EN.530.646 Robot Devices, Kinematics, Dynamics, and Control.

**EN.600.436 Algorithms for Sensor-Based Robotics**

Prerequisites:

- Basic data structures and programming; calculus; linear algebra; basic probability and statistics

Content:

- Basics of geometric modeling and perception of environment and task space
- Configuration Space
• Uncertainty characterization
• Motion and sensing planning in the presence of uncertainty
• Sensor fusion
• Simultaneous localization and mapping (SLAM)
• Software and control architectures for robotics
• Basics of human-machine cooperative systems, teleoperation, shared autonomy, and task automation
• Virtual fixtures

EN.530.646 Robot Devices, Kinematics, Dynamics, and Control

Prerequisites:

Content: Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics.

• Multivariable integral and differential calculus
• Classical physics
• Linear algebra
• Ordinary differential equations
• Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, FORTRAN, Pascal, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.

Seminar Course Requirement

Students are required to register for the following non-credit weekly robotics research seminar course every term in which they are in full-time residency:

EN.500.745 Seminar in Computational Sensing and Robotics

Systems/Implementation Requirement

• Students must demonstrate the ability to undertake substantial implementation projects requiring independent design and decision making.
• Students will be required to take one course with a project involving substantial interaction with or development of actual hardware (sensors, mechanisms, etc.) and one course requiring a substantial software implementation effort.

Course projects may have both elements but two courses are still required and the student’s individual focus in group projects must have one in each area.

• A student’s M.S.E. Essay can, if approved by their advisor, count toward one of the two required systems/implementation project courses.
• Courses that include class projects that are often well suited to satisfying these system/implementation requirement include:

EN.530.421 Mechatronics 3
EN.600.446 Computer Integrated Surgery II 3
EN.600.461 Computer Vision 3
EN.530.676 Locomotion in Mechanical and Biological Systems

The approval of course projects to satisfy the systems/implementation course requirements must be approved by the student’s faculty advisor. The course names, project names, and project dates must be identified in the Robotics M.S.E. Checkout Sheet.

M.S.E. Degree Track Requirements
(4 Courses)

Tracks consist of course sequences that provide the student with strength in a specific area. The required and recommended courses for tracks are listed below. Other courses may be substituted only with written approval of both the student’s academic advisor and the Robotics M.S.E. curriculum committee.

Track in Medical Robotics and Computer Integrated Surgical Systems

Required for the track:

EN.600.445 Computer Integrated Surgery I 4
EN.600.446 Computer Integrated Surgery II 3
Two of the following:

EN.500.410 Surgery For Engineers
EN.520.433 Medical Image Analysis
EN.600.461 Computer Vision
EN.520.432/EN.580.472 Medical Imaging Systems

Track in Perception and Cognitive Systems

Required for the track:

EN.600.461 Computer Vision 3
EN.600.435 Artificial Intelligence 3
Two of the following Courses: 6-8

EN.530.420 Robot Sensors/Actuators
EN.530.421 Mechatronics
EN.550.437 Statistical Learning With Applications
EN.530.660 Computational Analysis of Stochastic Processes
EN.530.647 Adaptive Systems
EN.530.649 System Identification
EN.600.681 Advanced Topics in Computer Vision
EN.530.676 Locomotion in Mechanical and Biological Systems
EN.600.475 Machine Learning
EN.600.660 FFT in Graphics & Vision
EN.600.681 Advanced Topics in Computer Vision
EN.600.775 Data Intensive Computing & Machine Learning Seminar

AS.080.810/.811 Readings/Systems Neuro I

Track in Automation Science and Engineering

Required for the track:

EN.530.414 Computer-Aided Design 3
EN.530.454 Manufacturing Engineering 3
### M.S.E. Degree Electives Courses

(4 Courses or 2 Courses + M.S.E. Essay)

Any engineering or quantitative (designated E or Q in the course catalog) course, subject to the degree requirement limitations, as approved by the student’s M.S.E. academic advisor. Includes but is not limited to the following:

<table>

Other courses may be substituted with both the approval of the student’s academic advisor and the approval of the Robotics M.S.E. curriculum committee. A form for approval of such a substitution is available from the academic coordinator.

### Courses

**AS.080.810. Readings/Systems Neuro I.**

This is a graduate-level seminar series on current literature in systems neuroscience. It also serves as a discussion group/journal club for students and faculty at the Krieger Mind/Brain Institute, and is open to the wider systems/cognitive neuroscience community at Homewood and other Hopkins campuses. Each week, a student or faculty member will present a recent article selected in consultation with the course directors. The selected readings will focus on the neural mechanisms of perception, attention, motor behavior, learning and memory. Pass/Fail only. Permission required for undergraduate students.

Instructor(s): E. Niebur; V. Stuphorn.

**AS.080.811. Readings/System Neuro II.**

Graduate students only or permission required. The combined journal club functions as a graduate-level seminar series on the current literature in systems neuroscience. It will also serve as a discussion group for systems neuroscience post-docs and faculty from the Homewood and Medical School campuses. All participants interested in systems/cognitive neuroscience are welcome. Each week, a student or faculty member will present a recent article selected in consultation with the course directors. The selected readings will focus on the neural mechanisms of perception, attention, motor behavior, learning and memory, as studied using physiological, psychophysical, computational and imaging techniques. Discussions and open exchanges of opinions are strongly encouraged.

Instructor(s): E. Niebur; V. Stuphorn.

**AS.110.106. Calculus I. 4 Credits.**

Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, applications for systems of linear differential equations, probability distributions. Many applications to the biological and social sciences will be discussed.

Instructor(s): R. Brown

Area: Quantitative and Mathematical Sciences.

**AS.110.107. Calculus II (For Biological and Social Science). 4 Credits.**

Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, and applications for systems of linear differential equations, probability distributions. Many applications to the biological and social sciences will be discussed.

Instructor(s): V. Pingali

Area: Quantitative and Mathematical Sciences.

**AS.110.108. Calculus I. 4 Credits.**

Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor’s theorem and applications, infinite sequences and series.

Instructor(s): B. Smithing

Area: Quantitative and Mathematical Sciences.
AS.110.109. Calculus II (For Physical Sciences and Engineering). 4 Credits.
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor’s theorem and applications, infinite sequences and series. Some applications to the physical sciences and engineering will be discussed, and the courses are designed to meet the needs of students in these disciplines.
Instructor(s): M. Arap
Area: Quantitative and Mathematical Sciences.

AS.110.202. Calculus III. 4 Credits.
Calculus of functions of more than one variable: partial derivatives, and applications; multiple integrals, line and surface integrals; Green’s Theorem, Stokes’ Theorem, and Gauss’ Divergence Theorem.
Prerequisites: Grade of C- or better in AS.110.107 OR AS.110.109 OR AS.110.113, or a 5 or better on the AP BC exam.
Instructor(s): J. Lind
Area: Quantitative and Mathematical Sciences.

AS.110.211. Honors Multivariable Calculus. 4 Credits.
This course includes the material in AS.110.202 with some additional applications and theory. Recommended for mathematically able students majoring in physical science, engineering, or especially mathematics. AS.110.211-AS.110.212 used to be an integrated yearlong course, but now the two are independent courses and can be taken in either order.
Prerequisites: Pre/Co-Requisite: 110.201 or 110.212
Instructor(s): C. McTague; R. Brown
Area: Quantitative and Mathematical Sciences.

AS.110.212. Honors Linear Algebra. 4 Credits.
This course includes the material in AS.110.201 with some additional applications and theory. Recommended for mathematically able students majoring in physical science, engineering, or mathematics. AS.110.211-AS.110.212 used to be an integrated yearlong course, but now the two are independent courses and can be taken in either order. This course satisfies a requirement for the math major that its non-honors sibling does not.
Prerequisites: Grade of B+ or better in 110.107 or 110.109 or 110.113, or a 5 on the AP BC exam.
Instructor(s): S. Zucker
Area: Quantitative and Mathematical Sciences.

EN.520.414. Image Processing & Analysis. 3 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.415. Image Process & Analysis II. 3 Credits.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation.
Prerequisites: EN.520.414
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.427. Product Design Lab. 3 Credits.
This project-based course is designed to help students learn how to turn their ideas into commercial products. In the first half of the course, emphasis will be placed on the product development process: student teams will gradually build up a complete "contract book” including a mission statement, competitive analysis, patent review, product specifications, system schematics, economic analysis, development schedule, etc. In the second half of the course, each team will be expected to implement its design and demonstrate a prototype of their product’s core functionality. At the end of the semester, a final written report will be submitted in the form of a utility patent. Students are encouraged to take this course in conjunction with Electronic Design Lab (ECE 520.448) in the Spring semester and leverage the groundwork developed here to enable production of a fully functional and marketable prototype by the end of the academic year.
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.432. Medical Imaging Systems. 3 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Co-listed as EN.580.472
Instructor(s): J. Prince
Area: Engineering.
EN.520.433. Medical Image Analysis. 3 Credits.
This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include, interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: EN.520.432 OR EN.580.472 OR EN.550.310 OR EN.550.311
Instructor(s): J. Prince
Area: Engineering.

EN.520.435. Digital Signal Processing. 4 Credits.
Methods for processing discrete-time signals. Topics include signal and system representations, z- transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.454. Control Systems Design. 3 Credits.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Prerequisites: EN.520.353 AND AS.110.201
Area: Engineering, Natural Sciences.

EN.520.448. Electronics Design Lab. 3 Credits.
An advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. Recommended: EN.600.333, EN.600.334, EN.520.349, EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: EN.520.345 or equivalent Recommended: 600.333, 600.334, 520.216, 520.349, 520.372, 520.490 or 520.491.
Instructor(s): P. Pouliquen.

EN.520.454. Control Systems Design. 3 Credits.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Prerequisites: EN.520.353 AND AS.110.201
Area: Engineering, Natural Sciences.

EN.520.483. Bio-Photonics Laboratory. 3 Credits.
This laboratory course involves designing a set of basic optical experiments to characterize and understand the optical properties of biological materials. The course is designed to introduce students to the basic optical techniques used in medicine, biology, chemistry and material sciences.
Instructor(s): J. Kang.

EN.520.491. CAD Design of Digital VLSI Systems I (Seniors/Grads). 3 Credits.
Seniors and Graduate Students Only
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.608. Image Reconstruction & Restoration.
This course covers the principles and methods used to reconstruct images from remotely sensed data and to restore images from blurred and noisy observations. General variational and stochastic regularization methods for ill-posed inverse problems will be covered. Those specific methods used in imaging problems, where the amount of data is typically huge, are presented in detail. Synthetic aperture radar and X-ray computed tomography will serve as motivating examples throughout the course, and specific details for reconstruction and restoration within these applications are covered. Recommended Course Background: EN.520.651.

EN.520.761. Large Scale Analog Compt.
Instructor(s): A. Andreou; R. Etienne Cummings.

EN.530.420. Robot Sensors/Actuators. 4 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors. Mechanical Engineering and Engineering Mechanics majors only.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and (110.108 and 110.109, and (110.202 or 110.211) and (650.291) or (110.201 and 110.302) or (110.201 and 110.306), and C- or better or concurrent enrollment in 530.202 or 560.202.
MechE Majors must also have taken 530.241
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.414. Computer-Aided Design. 3 Credits.
The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the “Pro/E” package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stolianovici
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors. Mechanical Engineering and Engineering Mechanics majors only.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and (110.108 and 110.109, and (110.202 or 110.211) and (EN.550.291 or AS.110.302) and (EN.530.241 or EN.520.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.421. Mechatronics. 3 Credits.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or permission of instructor
Instructor(s): G. Chirikjian
Area: Engineering.
EN.530.424. Dynamics of Robots and Spacecraft. 3 Credits.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton's principle.
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors. Mechanical Engineering and Engineering Mechanics majors only.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and 110.105 and 110.108, and (110.202 or 110.201), and (EN.550.291 or AS.110.302) and (EN.530.241 or EN.520.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.454. Manufacturing Engineering. 3 Credits.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Open only to seniors in Mechanical Engineering and Engineering Mechanics and other majors at all levels.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.495. Microfabrication Laboratory. 4 Credits.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprised of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Permission Required.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.530.616. Introduction to Linear Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. ME EN.530.616 can be used to fulfill the requirement of BME EN.580.616 or ECE EN.520.601.
Instructor(s): N. Cowan.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations. Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.
Instructor(s): L. Whitcomb.

This course is a survey of group theory with an emphasis on applications in mechanical design research. In particular, the representation theory of finite groups, compact Lie groups, and certain noncompact unimodular groups is reviewed, and Fourier analysis on these groups is applied as a tool in design problems. The concentration is on applications in CAD, discrete and computational geometry, and robotics. Specific applications include modern interpolation, deformation of solid models, and pattern matching.
Instructor(s): G. Chirikjian.

EN.530.653. Advanced Systems Modeling.
This course covers the following topics at an advanced level: Newton’s laws and kinematics of systems of particles and rigid bodies; Lagrange’s equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion: structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Langrange, Kane’s formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Holterbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research.
Instructor(s): G. Chirikjian.

EN.530.660. Computational Analysis of Stochastic Processes.
This class will cover stochastic processes (including both discrete and continuous time, and including both discrete and continuous state), leading to a rigorous treatment of stochastic differential equations and filtering, emphasizing computation. The class will draw from examples relevant to engineering, such as the Kalman filter. The course will comprehensively, but rapidly review all needed material in probability and statistics.
Prerequisites: 580.616 or 530.616 Linear Dynamical Systems.

EN.530.661. Applied Mathematics for Engineering.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.
EN.530.676. Locomotion in Mechanical and Biological Systems.
Advanced graduate course on the mechanics of locomotion in animals and machines, and neural control of locomotion. Terrestrial, aquatic, and aerial locomotion modes are considered. Topics include dynamical systems theory, linear and nonlinear differential equations, Poincaré and Floquet theory, and system identification techniques. Recommended Course Background: graduate course in robotics, controls, or dynamical systems theory, and a basic understanding of probability theory; or permission of instructor.
Instructor(s): N. Cowan.

EN.550.291. Lin Alg & Diff Equations. 4 Credits.
An introduction to the basic concepts of linear algebra, matrix theory, and differential equations that are used widely in modern engineering and science. Intended for engineering and science majors whose program does not permit taking both AS.110.201 and AS.110.302.
Prerequisites: ( AS.110.106 OR AS.110.108 ) AND ( AS.110.107 OR AS.110.109 )
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.437. Statistical Learning With Applications. 3 Credits.
Statistical modeling and inference, inductive learning and information theory together provide a cohesive framework for machine perception, which amounts to building a data-description machine converting physical measurements (images, molecular counts, etc.) to interpretations or descriptions. Recurring themes include quantifying uncertainty, estimating generalization error, Occam's razor, the bias/variance dilemma and small-sample learning. Various problems in computational vision and computational biology will be analyzed in this context, including visual tracking, object recognition, cancer diagnosis, neural decoding and learning molecular networks.
Instructor(s): D. Geman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.457. Topics in Operations Research: Supply Chains: Models and Analyses. 3 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Biomedical Imaging.
Prerequisites: EN.580.681
Instructor(s): J. Prince
Area: Engineering, Natural Sciences.

EN.550.457. Topics in Operations Research: Supply Chains: Models and Analyses. 3 Credits.
Prerequisites: ( AS.110.202 or AS.110.211 ) AND ( AS.110.201 or EN.550.291 )
Instructor(s): E. Younes
Area: Engineering, Quantitative and Mathematical Sciences.

Design and analysis of mainstream algorithms for solving optimal control, statistical/machine learning, financial engineering, compressed sensing, robust principal component analysis, sparse optimization, and structural engineering problems. Algorithms may include: sequential quadratic programming methods, interior-point methods, stochastic gradient descent algorithm, dual averaging algorithm, limited memory quasi-Newton methods, fast iterative shrinkage-thresholding algorithm, Pegasos, alternating linearization augmented Lagrangian methods, the support vector machine, Bender's Algorithm, and the method of moving asymptotes. However, other algorithms may be covered depending on the interests of the students. The goals of the course include (i) understanding the algorithms, why they work, and when they should be used; (ii) recognizing the strengths and weaknesses of each algorithm; and (iii) motivating/discussing open research questions.
Instructor(s): D. Robinson.

EN.580.471. Principles of Design of BME Instrumentation. 4 Credits.
This core design course will cover lectures and hands-on labs. The material covered will include fundamentals of biomedical sensors and instrumentation, FDA regulations, designing with electronics, biopotentials and ECG amplifier design, recording from heart, muscle, brain, etc., diagnostic and therapeutic devices (including pacemakers and defibrillators), applications in prosthetics and rehabilitation, and safety. The course includes extensive laboratory work involving circuits, electronics, sensor design and interface, and building complete biomedical instrumentation. The students will also carry out design challenge projects, individually or in teams (examples include “smart cane for blind,” “computer interface for quadriplegic”). Students satisfying the design requirement must also register for EN.580.571. Lab Fee: $150.
Recommended Course Background: EN.520.345
Instructor(s): N. Thakor
Area: Engineering, Natural Sciences.

EN.580.472. Topics in Medical Imaging Systems. 3 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. Cross-listed with Neuroscience and Biomedical Imaging.
Prerequisites: EN.580.471
Instructor(s): J. Prince
Area: Engineering.

EN.580.681. Advanced Topics in Computer Vision.
(Formerly 580.464) State-of-the-art methods in dynamic vision, with an emphasis on segmentation, reconstruction, and recognition of static and dynamic scenes. Topics include reconstruction of static scenes (tracking and correspondence, multiple view geometry, self-calibration), reconstruction of dynamic scenes (2-D and 3-D motion sementation, nonrigid motion analysis), recognition of visual dynamics (dynamic textures, face and hand gestures, human gaits, crowd motion analysis), as well as geometric and statistical methods for clustering and unsupervised learning, such as K-means, Expectation Maximization, and Generalized Principal Component Analysis. Applications in robotics and biomedical imaging are also included.
Prerequisites: Prereq: AS.110.202, EN.600.461 or instructor permission.
This class will cover machine learning techniques for modeling and segmentation of multivariate mixed data. Topics will include subspace learning (PCA, Probabilistic PCA, Robust PCA, Sparse representation, Rank minimization), manifold learning (Kernel PCA, LLE, Isomap), subspace clustering (K-subspaces, Mixtures of PPCAs, Generalized PCA, Sparse subspace clustering), and manifold clustering (LLMC). These methods will be applied to several problems in computer vision, biomedical imaging, neuroscience, and computational biology. Instructor(s): R. Vidal
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.335. Artificial Intelligence. 3 Credits.
Students may receive credit for EN.600.335 or EN.600.435, not both. Graduate level version of EN.600.335 [Applications]. Prerequisite: EN.600.226, EN.550.171; Recommended: linear algebra, prob/stat. Instructor(s): B. Mitchell
Area: Engineering.

EN.600.361. Computer Vision. 3 Credits.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling; computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] (https://crl.lcsr.jhu.edu/Vision_Syllabus)
Prerequisites: EN.600.226
Instructor(s): R. Vidal
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.361. Computer Vision. 3 Credits.
This course covers the design and implementation of data structures including collections, sequences, trees, and graphs. Other topics include sorting, searching, and hashing. Course work involves both written homework and Java programming assignments. Recommended Course Background: EN.600.107 or EN.600.120 or equivalent.
Instructor(s): P. Froehlich
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.435. Artificial Intelligence. 3 Credits.
Students may receive credit for EN.600.335 or EN.600.435, not both. Graduate level version of EN.600.335 [Applications]. Prerequisite: EN.600.226, EN.650.171; Recommended: linear algebra, prob/stat. Instructor(s): B. Mitchell
Area: Engineering.

This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Recommended Course Background: EN.600.120, EN.600.226, and AS.110.201 or permission of instructor. Recommended: EN.600.457, EN.600.461, image processing.
Instructor(s): R. Taylor
Area: Engineering.

EN.600.446. Computer Integrated Surgery II. 3 Credits.
This weekly lecture/seminar course addresses similar material to EN.600.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.600.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. Students may also take this course as EN.600.646. The only difference between EN.600.446 and EN.600.646 is the level of project undertaken. Typically, EN.600.646 projects require a greater degree of mathematical, image processing, or modeling background. Prospective students should consult with the instructor as to which course number is appropriate. [Applications] Students may receive credit for EN.600.446 or EN.600.646, but not both.
Prerequisites: Prereq for EN.600.446: EN.600.445 or permission
Instructor(s): R. Taylor
Area: Engineering.

EN.600.461. Computer Vision. 3 Credits.
Graduate version of EN.600.361. Students may receive credit for EN.600.361 or EN.600.461, but not both. Recommended Course Background: EN.600.226 & linear algebra
Instructor(s): R. Vidal
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.475. Machine Learning. 3 Credits.
This course takes an application driven approach to current topics in machine learning. The course covers supervised learning (classification/structured prediction/regression/ranking), unsupervised learning (dimensionality reduction, bayesian modeling, clustering) and semi-supervised learning. Additional topics may include reinforcement learning and learning theory. The course will also consider challenges resulting from learning applications, such as transfer learning, multi-task learning and large datasets. We will cover popular algorithms (naive Bayes, SVM, perceptron, HMM, winnow, LDA, k-means, maximum entropy) and will focus on how statistical learning algorithms are applied to real world applications. Students in the course will implement several learning algorithms and develop a learning system for a final project. [Applications]
Recommended Course Background: multivariate calculus.
Instructor(s): M. Dredze
Area: Engineering.
Graduate level version of EN.600.436 (see description above). Formerly EN.600.436. Students may receive credit for only one of EN.600.336, EN.600.436 or EN.600.636. Recommended Course Background: EN.600.226, AS.110.106, and Prob/Stat.
Prerequisites: Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): G. Hager.

EN.600.646. Computer Integrated Surgery II.
Students may receive credit for EN.600.446 or EN.600.646, but not both. Advanced version of EN.600.446. [Applications]
Prerequisites: EN.600.445 OR PERMISSION OF INSTRUCTOR
Instructor(s): R. Taylor.

EN.600.660. FFT in Graphics & Vision.
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariances, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations.
Instructor(s): M. Kazhdan.

EN.600.681. Advanced Topics in Computer Vision.
Prerequisites: Prereq: 600.461 & linear algebra or permission.
Area: Engineering.
EN.600.735. Seminar in Machine Learning.
This seminar course will look at research in machine learning. topics will be selected from those of mutual interest between students and the instructor. Sample topics include reinforcement learning, kernel methods, experimental methods in machine learning, computational learning theory, lazy learning, evolutionary computation, and neural networks. Students are expected to select papers and lead discussion.
Instructor(s): J. Sheppard.

For current faculty and contact information go to https://www.lcsr.jhu.edu/
Faculty

Professors
Gregory Chirikjian

Ralph Etienne-Cummings
Professor (Electrical and Computer Engineering): Neuromorphic Computational Sensing and Integrated Microsystems; Courses: CAD Design of Digital VLSI Systems, Electronics Design Laboratory, Product Design Laboratory, Large Scale Analog Computation.

Gregory Hager
Professor (Computer Science): Computer Vision, Human-Machine Systems, Medical Applications; Courses: Computer Vision, Artificial Intelligence, Algorithms for sensor-based robotics.

Jerry Prince
Professor (Electrical and Computer Engineering): Medical Imaging and Computer Vision; Courses: Medical Imaging Systems.

Dan Stoianovici

Robotics Faculty with Secondary Appointments in the Whiting School of Engineering: Professor (Urology, Mechanical Engineering, Neurosurgery): Medical Robotics; Mechanical Design; Courses: Computer Aided Design.

Russell Taylor
Professor (Computer Science): Medical Robotics and Computer-Integrated Interventional Systems, Medical Imaging and Modeling; Courses: Computer Integrated Surgery I & II.

Louis Whitcomb

Associate Professors
Mehran Armand
Robotics Faculty with Secondary Appointments in the Whiting School of Engineering: Associate Research Professor (Applied Physics Laboratory): Medical Robotics and Computer-Integrated Interventional Systems; Biomechanics; Courses: Kinematics and Dynamics of Robots, Robot Control.

Noah Cowan
Associate Professor (Mechanical Engineering): Robotics, Dynamics, Controls, Locomotion, System Identification.

Rene Vidal
Associate Professor (Biomedical Engineering): Biomedical Imaging, Computer Vision and Machine Intelligence; Courses: Introduction to Linear Systems, Advanced Topics in Computer Vision, Advanced Topic in Machine Learning.

Assistant Professors
Emad Docto
Robotics Faculty with Secondary Appointments in the Whiting School of Engineering: Assistant Professor (Radiology): Interventional Ultrasound.

Dennice Gayme
Assistant Professor (Mechanical Engineering): Dynamics and control of nonlinear, networked and spatially distributed systems. Applications include: the electric power grid, wall turbulence and wind farms. Courses: Nonlinear Dynamical Systems, Energy Systems Analysis.

Suchi Saria
Assistant Professor (Computer Science): Computational healthcare; machine learning; probabilistic graphical models; human-centric dynamical systems.

Assistant Research Professor
Iulian Iordachita
Assistant Research Professor (Mechanical Engineering): Medical Robotics; Mechanical Design; Sens

Marin Kobilarov
Assistant Professor (Mechanical Engineering): Computational Dynamical Systems, Robot Control and Motion Planning; Courses: Nonlinear control and planning in robotics.

Associate Research Professor
Peter Kazanzides
Associate Research Professor (Computer Science): Medical Robotics; Space Robots; Software Systems and Architectures; Robot Control Systems.
Scholarships, Fellowships, Awards, and Prizes

Provided through Gifts from Alumni and Friends of The Johns Hopkins University

Undergraduate Scholarships

Need-Based Scholarships and Loans

Recipients are chosen from those students who have applied for and received grant assistance from the Office of Student Financial Services.

Abrams Family Endowed Scholarship. Established in 1988 by Paul '56 and Natalie Abrams for undergraduate support for Arts and Sciences students from Prince Georges County, Maryland.

Aronson Family Scholarship. Established in 2011 to support Arts and Sciences students with financial need and outstanding academic merit. Recipients are required to maintain a minimum 3.5 grade point average.

Arthur and Catherine B. Adel Scholarship. Established in 2002 for the benefit of Arts and Sciences undergraduate students majoring in physics and/or astronomy.

Aslaksen Family Endowed Scholarship Fund. Established in 2012 by Henrik Aslaksen and Alexandra Artistizabal, Parents Class of 2014. The scholarship supports undergraduate students in the School of Arts and Sciences.

Nathan Albstein and Charles McKenna Memorial Scholarship. Established by Carolyn and Andrew '78 Albstein in 2001 in memory of their late fathers. This need-based scholarship is awarded annually to an academically talented student at the Zanvyl Krieger School of Arts and Sciences.

Phyllis F. Albstein and Lorraine McKenna Scholarship. Established in 2003 by Carolyn and Andrew '78 Albstein to honor both of their mothers. It is their hope that this scholarship will encourage undergraduates to participate in campus activities and contribute to enhancing the quality of student life.

American Council on Italian Matters of Maryland Scholarship. Established in 1993 by the American Council on Italian Matters of Maryland, this need-based scholarship is awarded to a young woman of American-Italian heritage, preferably from Maryland, who is an undergraduate at the Whiting School of Engineering.

Avery Scholarship. Established in 2006 by Dennis S. Avery and his wife, Sally Wong-Avery, to support undergraduate scholarships at the Zanvyl Krieger School of Arts and Sciences.

Michael S. Applestein Scholarship. Established in 1967 through a bequest from Lena Applestein, Michael Applestein’s sister, who became the beneficiary of a trust fund upon his death. A member of the Class of 1908, Michael Applestein was an inspector for the U.S. Customs House in Washington, D.C. This scholarship is awarded to students in the Zanvyl Krieger School of Arts and Sciences and is based on academic merit and financial need.

Margareta E. Augustine Scholarship. Established in 1998 by Mr. and Mrs. Norman Augustine to provide scholarships for biomedical engineering undergraduates at the Whiting School of Engineering. Mr. Augustine is a University Trustee Emeritus.

Susan J. Baisley Scholarship. Established in 2001 by Susan J. Baisley ’80 to support academically talented Zanvyl Krieger School of Arts and Sciences undergraduates who are interested in a career in communications. Students majoring in the Writing Seminars, English, or Film and Media will be eligible for the scholarship.

Henry Scott Baker Memorial Scholarship. Established in 1984 by Frances R. Baker, ’24, in memory of her husband, Henry Scott Baker, Sr., an engineering graduate from the Class of 1917. This scholarship is awarded to an engineering student based on financial need and academic merit.

Christopher and Kristy Baker Family Scholarship. Established in 2008 by Christopher J. ’85 and Kristy Z. ’95 Baker to benefit students at the Zanvyl Krieger School of Arts and Sciences.

Dr. Janet Bassett Baker and Dr. Lawrence H. Baker Memorial Scholarship. Established for need-based scholarship assistance to deserving students at the Zanvyl Krieger School of Arts and Sciences, preferably a resident of Baltimore.

Theodore F. Baker Scholarship. Established in 2010 by members of the Baker family in honor of Theodore Baker’s 72nd birthday. Mr. Baker is a member of the Whiting School of Engineering Class of 1961. He is the leader in a legacy of Hopkins graduates; his three sons, Chris, Ben, and Theodore, Jr., all followed in their father’s footsteps and attended Johns Hopkins University. The scholarship supports undergraduate students on the Homewood Campus.

Kimberly and Jeffrey Barber Family Scholarship. Established in 2008 for Zanvyl Krieger School of Arts and Sciences undergraduates by Jeffrey S. Barber and Kimberly A. Hsu-Barber, both members of the Class of 1995.

Baltimore Orioles Scholarship. Established in 1978 by the Baltimore Orioles Foundation for students who intend to pursue teaching and/or coaching careers and who demonstrate financial need.

William Sherman Bansemer Scholarship. Established in 1945 through the estate of Caroline Bansemer to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Mark C. Bauer Scholarship. Established in 2002 to support undergraduate students with financial need and outstanding academic ability. Preference is given to Arts and Sciences students majoring in natural sciences who have demonstrated a keen intellect and extraordinary potential.

William Brown Baxley Memorial Scholarship. Established in 1959 to aid needy and deserving engineering students from Maryland at the Whiting School of Engineering. The fund was established by C. Herbert Baxley, a 1919 engineering graduate, in memory of his brother, William Brown Baxley, who graduated in 1917 from the School of Engineering and lost his life in France in World War I while serving as an officer in the American Expeditionary Forces.

Martha and Wallace M. Beakley Scholarship. Established in 2011 by Christopher H. Lee and Susan D. Ginkel in honor of Chris’s grandparents. This fund supports students who are admitted to Johns Hopkins through
the Baltimore Scholars Program. Chris Lee is a member of the Class of 1974 and is a University Trustee.

**Becker Family Scholarship.** Established in 1995 by Dr. George L. Becker Jr., B.A. ’50 to support Arts and Sciences undergraduate students majoring in neuroscience.

**Gail and Gwen Becker Scholarship for Men’s and Women’s Lacrosse.** Established by Dr. Larry Becker ’60, on the anniversary of his 40th reunion in memory of Gail and Gwen Becker. Larry Becker was a varsity athlete on the lacrosse and basketball teams at Johns Hopkins. Gail and Gwen were successful athletes in their own right, Gwen a professional ballerina, and Gail a professional tennis player. The scholarship supports undergraduate members of the men’s and women’s lacrosse team, alternating each year between the two programs.

**Harris J. and Elaine Belman Scholarship.** Established in 2005 by Mrs. Elaine Schneider Belman in memory of her husband, Harris J. Belman ’64. This scholarship provides financial aid to undergraduate students at the Whiting School of Engineering with preference going to students who are conducting research which could impact the treatment or cure of double myeloma or other forms of cancer.

**Berman/Weinstein Family Scholarship.** Established in 1998 to support freshman at the Zanvyl Krieger School of Arts and Sciences. First preference will be given to a freshman undergraduate with a diagnosed learning disability (also referred to as a learning style difference).

**David and Patricia Bernstein Scholarship.** Established in 2002 by David, ’57 and Patricia Bernstein. While attending Johns Hopkins, Mr. Bernstein played on both the freshman lacrosse and soccer teams. The scholarship supports undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

**Beta Theta Pi Scholarship.** Established in 1989 by various members of Alpha Chi for students who demonstrate financial need or are members of Beta Theta Pi or progeny of Alpha Chi and Beta Theta Pi. Preference is given to students participating in university-sponsored athletics or students with need who have shown initiative in financing their education.

**Arthur Barneveld Bibbins Scholarship.** This fund was made possible by a bequest and is used to assist worthy engineering students. The scholarship is awarded based on need.

**Carl and Rachel Berg Scholarship.** Established in 2005 by Rachel K. and Carl D. Berg to provide support for undergraduate students at the Zanvyl Krieger School of Arts and Sciences, with preference given to a students studying philosophy.

**W. B. Scholarship.** Established in 1982 by Warren Bishop ’61 to honor Homewood undergraduate student athletes who demonstrate financial need.

**Scott M. Black Scholarship.** Established in 2004 by Mr. Black, who graduated from the School of Arts and Sciences in 1968 with a degree in applied mathematics and economics. He went on to receive his Master degree of Business Administration in Finance from Harvard Business School and is the founder and president of Delphi Management, Inc. The scholarship supports undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

**Frederick Edgar Blaser Scholarship.** Established in 1951 by Elizabeth Blaser Robertson as a memorial to her father. The scholarship supports students at the Zanvyl Krieger School of Arts and Sciences.

**Arnold S. and Donna R. Blaustein Scholarship.** Established in 2006 by Arnold Blaustein ’62 and his wife, Donna to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences who have demonstrated financial need and academic achievement.

**Lewis W. Bluemle Jr., M.D. Endowed Scholarship.** Established in 2002 by the Connelly Foundation to honor Lewis W. Bluemle Jr., M.D., ’43, ’46 and provide financial aid to Homewood undergraduates at the Krieger School of Arts and Sciences and the Whiting School of Engineering. Primary preference given to highly meritorious students from the Commonwealth of Pennsylvania.

**Stanley E. Blumberg Memorial Scholarship.** Established in 1992 by Norma Blumberg in memory of her husband, Stanley ’35. Mr. Blumberg was director of the alumni relations office from 1970 to 1983. A librarian with the Enoch Pratt Libraries, Mrs. Blumberg died in 2003. The scholarship supports undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

**Blum-Kovler Foundation Scholarship.** Established in 1987 by the Blum-Kovler Foundation and Mr. H. Jonathon Kovler to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences. The Blum-Kovler Foundation Scholarship. Established in 1953 and supports arts, healthcare, hospital, human services, Jewish federated giving programs, medical research, and public policy.

**Milton Blumenfeld Scholarship.** Established in 1991 through the estate of Mr. Blumenfeld, a member of the Class of 1930, to support students at the Zanvyl Krieger School of Arts and Sciences.

**Robert A. and Irene M. Boenning Endowed Scholarship.** Established in 2001 by Irene M. and Robert A. Boenning ’62 to provide need-based scholarships to students in the Department of Electrical and Computer Engineering at the Whiting School of Engineering.

**Charles F. Bonilla Scholarship.** Established in 1992 by various donors for undergraduates in the Department of Chemical and Biomolecular Engineering. The scholarship memorializes Dr. Bonilla, a former Johns Hopkins faculty member.

**Richard J. Bonnie Scholarship for Bioethics.** Established in 2012 by Richard Bonnie ’66 to support undergraduate students pursuing a minor in bioethics.

**J. Richard Boylan Scholarship in the Humanities.** Established in 1987 by the family and friends of the late J. Richard Boylan, this scholarship provides undergraduate support for students studying the humanities. Awards are based on academic merit and financial need.

**Andrew J. and Dolores M. Bozelli Undergraduate Scholarship.** Established in 2007 by Dolores Bozelli and the estate of her husband, Andrew J. Bozelli ’53, a University Trustee Emeritus. The scholarship provides support to students majoring in biomedical engineering.

**Robert J. Brauer Memorial Scholarship.** Established in 1981 by the family and friends of Robert J. Brauer ’67, to be awarded annually to deserving and needy undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Charles Harmon Bronner Scholarship.** Established in 2007 through the estate of Charles Harmon Bronner ’25. This scholarship supports students at the Whiting School of Engineering.

**Kenneth L. Brown Scholarship.** Established in 2005 by Heather Hay Murren ’88 to honor her late grandfather. It supports economics majors at
the Zanvyl Krieger School of Arts and Sciences who are from Maryland or Pennsylvania.

**Helen K. Browne Scholarship.** Established in 1994 by Stephen J. Browne in honor of his mother. Mr. Browne received his bachelor’s degree in political economy in 1968. He was a member of the band and Tau Epsilon Phi. This scholarship offers support to Zanvyl Krieger School of Arts and Sciences undergraduates majoring in economics.

**Winston T. and Mamie N. Brundige Scholarship.** Established in 1996 by Winston ’42 and Mamie Brundige to provide financial support to students at the Zanvyl Krieger School of Arts and Sciences.

**Morgan M. Buchner, Jr. Scholarship.** Established in 1996 by Morgan M. Buchner Jr. ’61, ’65, this endowment provides financial assistance to undergraduate students at the Whiting School of Engineering. The recipient is selected based on merit.

**Budnitz Family Scholarship for Men’s Lacrosse.** Established in 2012 through a bequest gift from Emil A. Budnitz, Jr. ’53 to support members of the men’s varsity lacrosse team.

**Annegard and George Bunting Scholarship.** Established in 2005 by George L. Bunting, Jr. to recognize outstanding students at the Zanvyl Krieger School of Arts and Sciences. Mr. Bunting is a University Trustee and a committed friend of Johns Hopkins. His creation of this scholarship reflects the importance friends of the university place on a Johns Hopkins education.

**Alpha Holliman Bush Memorial Scholarship.** Established in 1999 by Janice Bush ’76 and her husband, Eric L. Hagestad, in memory of Janice’s grandmother. This scholarship assists pre-medical Zanvyl Krieger School of Arts and Sciences students who demonstrates an interest and talent in music.

**Caples Family Endowed Scholarship.** Established in 2008 by Rob Caples ’78 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Edwin S. Carr Memorial Scholarship.** Established by James G. Rickards ’73, ’74 and fellow Beta Theta Pi fraternity brothers of Edwin S. Carr in Mr. Carr’s memory in 2001. The fund provides an annual need-based scholarship to a Zanvyl Krieger School of Arts and Sciences undergraduate who, like Mr. Carr, is a B.A./M.A. international studies student focusing on Russian or Eastern European Studies. It is the hope of Mr. Rickards and the other donors that through this scholarship, students will come to remember Mr. Carr as someone known for his high intelligence and quick wit which helped to build character and endeared him unforgettably to his friends.

**Richard Wolfe Casner Memorial Scholarship.** Established in 1970 in memory of Mr. Casner ’65, this scholarship gives preference to junior or senior Arts and Sciences students majoring in history, with students in Far Eastern studies given first preference.

**Centennial Scholarship.** Established in 1976 from donations made during the University’s Centennial Ball. Scholarships are awarded to engineering students who demonstrate financial need.

**Johns Hopkins Engineering Centennial Scholarship.** Established in 2012 to commemorate 100 years of engineering at Johns Hopkins by various donor. The Scholarship supports students in the Whiting School of Engineering.

**Rex T. Chao Memorial Scholarship.** Established in 1997 in memory of Rex T. Chao. This scholarship supports an incoming freshman for four years of study and is based on need and interests in the study and performance of classical music, with first preference given to a student with an intention to pursue a major in political science.

**Sidney Checket Endowed Scholarship.** Established in 1984 by Sidney Checket and the Checket Family Foundation to assist undergraduate students at the Zanvyl Krieger School of Arts and Sciences. Awards are based on academic merit and financial need.

**Karen A. Cheng Scholarship.** Established in 2003 to provide support for an international relations major with demonstrated extracurricular interest in the visual or performing arts.

**Carrie K. and Walter H. Church Scholarship.** Established to support deserving and needy undergraduate students on the Homewood Campus.

**Henry A. Ciccarone Scholarship.** Established in 1989 in memory of Henry Ciccarone to provide scholarships for lacrosse players.

**Class of 1916 Scholarship.** Established by the class to provide scholarships for Homewood undergraduates who demonstrate need.

**Class of 1925 Scholarship.** Established by the class in 1978 to provide scholarships to Homewood undergraduates demonstrating financial need.

**Class of 1929 Scholarship.** Established by the class on the occasion of their 50th reunion to support Homewood undergraduates.

**Class of 1930 Scholarship.** Established by the class on the occasion of their 50th reunion to support Homewood undergraduates who demonstrate academic excellence.

**Class of 1934 Scholarship.** Established by the class to provide scholarships for Homewood undergraduates.

**Class of 1935 Scholarship.** Established in 1991 by the class to provide need-based undergraduate support to Homewood undergraduates.

**Class of 1940 Scholarship.** Established by the class in 1987, to provide need-based undergraduate support to Homewood undergraduates.

**Class of 1941 Scholarship.** Established in 1991 by the class to provide need-based undergraduate support to Homewood students.

**Class of 1942 Scholarship.** Established by the class in 1992 to provide scholarships to Homewood undergraduates who demonstrate need.

**Class of 1943 Scholarship.** Established by the class in 1993 to provide scholarships to Homewood undergraduates who demonstrate need.

**Class of 1949 Scholarship.** Established by the class in 1996 to provide scholarships to worthy Homewood undergraduates who demonstrate need.

**Class of 1950 Scholarship.** Established by the class in 1990 to provide scholarships to Homewood undergraduates who demonstrate need.

**Class of 1951 Scholarship.** Established in 1991 by the class to provide need-based undergraduate support to Homewood undergraduates.

**Class of 1952 Scholarship.** Established by the class in 1992 to provide scholarships to Homewood undergraduates who demonstrate need.
Class of 1953 Scholarship. Established by the class in 1993 to provide annual scholarships to Homewood undergraduates demonstrating financial need.

Class of 1954 Scholarship. Established by the class in 1986 to provide scholarships for worthy Homewood undergraduates based on academic achievement.

Class of 1956 Scholarship. Established by the class in 1990 to provide scholarships for Homewood undergraduates who demonstrate need.

Class of 1957 Scholarship. Established by the class in 1992 to provide scholarship support to Homewood undergraduates.

Class of 1958 Scholarship. Established by the class in 1993 to provide annual scholarships to Homewood undergraduates demonstrating financial need.

Class of 1959 Scholarship. Established by the class to provide financial aid to need-based Homewood undergraduates.

Class of 1963 Scholarship. Established by the class in 1993 to provide annual scholarships to Homewood undergraduates demonstrating financial need.

Class of 1968 Scholarship. Established by the class in 1993 to provide need-based scholarships for Homewood undergraduates.

Class of 1971 Scholarship. Established in 1991 to provide need-based undergraduate scholarships to Homewood undergraduates.

Class of 1977 Scholarship. Established by the class to provide annual scholarships to Homewood undergraduates demonstrating financial need.

Class of 1987 Scholarship. Established in 2007 by the class to support Homewood undergraduates.

Edward W. and Madelyn S. Clauxte Scholarship. Established in 1999 by Edward W. Clauxte ’38 in memory of his wife, Madelyn Clauxte, to whom he was married for 53 years. The scholarship supports undergraduate engineering students.

William C. Clauxtey Memorial Scholarship. Established in 1995, in memory of William C. Clauxtey ’60, to provide scholarships to undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

Jerome Cohen Scholarship. Established in 2006, at the request of the late Jerome Cohen, for the Zanvyl Krieger School of Arts and Sciences.

Cordish Endowment for Men’s Lacrosse. Established in 2005 by David S. Cordish to provide scholarship support to members of the men’s varsity lacrosse team.

Cowan Family Endowment for Men’s Lacrosse. Established in 2004 by Mr. Joseph W. Cowan ’69. As an undergraduate, Mr. Cowan was a member of the lacrosse team, playing on three consecutive championship teams from 1967–1969. In 1986, Mr. Cowan was inducted into the Lacrosse Hall of Fame and into the Maryland Athletic Hall of Fame in 1990. He created this scholarship to support students on the men’s lacrosse team.

Andrew Paul Cox Scholarship. Established in 1990 by the late A. Paul Cox Jr., ’59, ’70, and his wife Trudy A. Cox, in honor of his father. This fund provides scholarships for electrical engineering students based upon merit and financial need.

Crane-Huntington Endowed Scholarship. Established in 2001 by Sharon Crane ’84, ’90 and her husband R. Danny Huntington to provide support for biology or chemistry rising sophomores who do not aspire to a medical career. The purpose of this scholarship is to encourage students to explore careers where their interests and abilities in science can be utilized other than in medicine.

L. Gordon Croft Endowed Scholarship. Established in 2011 by L. Gordon Croft ’56 to support undergraduate students enrolled in the Whiting School of Engineering. Preference is given to students residing in southern Charles County or select Maryland high schools.

L. Gordon Croft Phi Kappa Psi Scholarship. Established in 2013 by L. Gordon Croft ’56 to support Homewood undergraduate students with a preference for students who are members of the Phi Kappa Psi Fraternity at Johns Hopkins University.

William H. H. Cullimore III Memorial Scholarship. Established in 1988 by the late Emily Rodney Cullimore in memory of Mr. William Cullimore ’22, to provide undergraduate scholarships to students at the Whiting School of Engineering who graduated from the Baltimore Polytechnic Institute.

Daimler Entrepreneurial Scholarship. Established by Matt ’99 and Susan ’99 Daimler to be awarded to Homewood undergraduate students with preference given to individuals who demonstrate an interest in entrepreneurship and/or are pursuing courses in the Entrepreneurship and Management program.

Roger Dalsheimer Scholarship in the Humanities. Established in 1996 to provide undergraduate support to students majoring in the humanities at the Zanvyl Krieger School of Arts and Sciences.

Jack Davis Memorial Scholarship. Established in 1989, in memory of Mr. Davis, to provide scholarships to undergraduates at the Zanvyl Krieger School of Arts and Sciences.

Day Family Scholarship. Established in 1997 by Mrs. Betty P. Day to support any deserving student in Arts and Sciences or Engineering. Preference will be given to students from the state of Colorado.

Daniel and Conor Denhinhan Scholarship. Established in 2002 to support undergraduate scholarships for members of the men’s varsity lacrosse team.

LeRoy and Nola Dickson Endowed Scholarship. Established in 1999 by LeRoy Dickson ’60, ’62, ’68 and his wife, Nola Dickson, to provide scholarships to full-time undergraduates at the Whiting School of Engineering.

Charles C. Diggs Scholarship. Established by Charles C. Diggs ’40, ’61 in 1996 to provide need-based scholarships to undergraduates at the Whiting School of Engineering.

Nancy G. and B. Boro Djordjevic Scholarship. Established in 1998 by B. Boro Djordjevic ’78, ’80 and his wife, Nancy G. Djordjevic, to provide scholarships for undergraduate students at the Whiting School of Engineering in the areas of nondestructive evaluation, materials engineering, or mechanical engineering.

Dorsey Scholarship. Established in 1999 by Captain Herbert Dorsey ’62, in honor of his mother, to provide scholarship support for engineering students at the Whiting School of Engineering.
undergraduate students who reside in the Washington, D.C., metropolitan area.

**Sarah K. Dosha Endowment Scholarship.** Fund Established in 2012 by Jeffrey Dosha and various donors to benefit the Whiting School of Engineering as an endowed gift for undergraduate financial aid with a preference for a student majoring in chemical & biomolecular engineering or closely related major.

**Cyrus L. Doub Memorial Scholarship.** Established in 1977 in memory of Cyrus L. Doub '19 by his sister, Mrs. Frances Doub North, and his son, Richard M. Doub. The fund supports electrical engineering students in the Whiting School of Engineering. Awards are based on merit and financial need.

**Eleanor Chamberlain Drake and James Frederick Drake Scholarship.** Established in 2007 by Michael A. Cormack and Jennifer Drake Cormack to provide support for an undergraduate student studying the humanities at the Zanvyl Krieger School of Arts and Sciences.

**Ina and Howard Drew Scholarship.** Established in 2001 by Ina and Howard Drew, both B.A. '78. This need-based scholarship, supporting undergraduates at the Zanvyl Krieger School of Arts and Sciences, is in recognition of the benefits the Drews received from their Hopkins education and their commitment to assist talented students in coming to Hopkins. Furthermore, it is through this lasting legacy at Hopkins that Howard and Ina hope to encourage Drew Scholars to become active future members of the Hopkins alumni community.

**Hugh L. Dryden Memorial Scholarship.** Established in 1973 by Mrs. Dryden to honor her husband, a graduate of The Johns Hopkins University. The fund is used for scholarship aid at the Zanvyl Krieger School of Arts and Sciences.

**Edwin C. Duncan Scholarship.** Established in 2000 by Robert R. Duncan '71, in honor of his father, a lifelong sportsman and longtime supporter of Hopkins lacrosse. Robert Duncan is a former Hopkins varsity lacrosse player who played on two national championship teams coached by Bob Scott. This scholarship supports members of the men's varsity lacrosse team who have demonstrated academic and athletic integrity.

**Dymowski Endowed Scholarship.** Established in 1994 to assist deserving Zanvyl Krieger School of Arts and Sciences undergraduate students who demonstrate financial need. Preference is given to graduates of Calvert Hall College High School, Towson, Maryland.

**John Howard Eager Scholarship.** Established by John Howard Eager in 1957 to provide need-based scholarships to Homewood undergraduates.

**Earl Family Scholarship.** Established in 2002 by Matthew A. Earl '94 to provide support to a junior or senior at the Krieger School, who but for the financial assistance provided by this scholarship, would otherwise be unable to attend Johns Hopkins University. The recipient will have declared a major in the natural sciences.

**William Eichengreen Scholarship.** This scholarship was established in 2005 at the request of the late William Eichengreen '37. This scholarship is for undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

**Otto and Hilda Einolf Scholarship.** Established by the late Charles W. Einolf '56 and his wife, Dorothy Einolf, to support full-time or part-time students at the Whiting School of Engineering. This need-based scholarship memorializes Mr. Einolf's parents.

**Helen Eakin Eisenhower Scholarship.** Established in 1983 in memory of Helen Eakin Eisenhower, wife of Milton S. Eisenhower, eighth president of The Johns Hopkins University, to provide scholarships for engineering undergraduates.

**Dr. Milton S. Eisenhower Scholarship.** To provide financial aid to need-based undergraduates at the Zanvyl Krieger School of Arts and Sciences.

**John Engaltercheff, Jr. Scholarship.** Established in 1989 by associates of the late Mr. Engaltechfeff '30 and the Baltimore Air Coil Company to provide scholarships for full-time or part-time students at the Whiting School of Engineering.

**Engineering Emeriti Professors’ Student Aid Scholarship.** Established in 1958 by Johns Hopkins engineers to honor professors of engineering who have reached the age of retirement. It provides need-based scholarships to deserving students pursuing studies in engineering.

**Jeffrey M. Epstein and Ronit Adler Scholarship.** Established in 2003 by Jeffrey Epstein '73 and his wife, Ronit Adler, this scholarship supports an undergraduate student in the Zanvyl Krieger School of Arts and Sciences who has demonstrated an interest in the history of the Jewish people, contemporary Jewish life, and Judaism through participation in Judaic studies and Jewish community organizations.

**Harry W. Ewald, Class of 1918 Scholarship.** Established in 2004 by Edith Ewald, to honor her husband, Harry '18. The scholarship supports undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

**Debra and Joshua Feinman Family Scholarship.** Established in 2011 by Debra Feinman, A&S 1985, and her husband, Joshua N. Feinman, Ph.D., A&S 1984. The scholarship supports undergraduate students in the School of Arts and Sciences who are admitted to Johns Hopkins through the Baltimore Scholars Program.

**Felder Family Scholarship.** Established in 2006 by Mark H. Felder and Beth Ann Felder '85 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Fenzel Family Scholarship.** Established in 2006 by John Fenzel, Jr. to provide support for undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Dale Fike Memorial Scholarship.** Established in 2006 by various alumni from the classes of 1982, 1983, and 1984 in memory of Dale Fike, a 1983 alumnus of the School of Arts and Sciences. This scholarship supports undergraduates at the Zanvyl Krieger School of Arts and Sciences.

**Finston/Robertson Scholarship.** Established in 2000, this scholarship is awarded to financially needy undergraduate students in the Zanvyl Krieger School of Arts and Sciences with a diagnosed learning disability (also referred to as a learning style difference).

**Firestone Family Scholarship Fund.** Established in 2011 for Zanvyl Krieger School of Arts and Sciences by Louise R. Firestone & John Firestone to support undergraduate scholarships with a preference for international students, first-generation college students, or students majoring in international studies.

**Fischmann Endowed Scholarship.** Established in 2011 by George Fischman & Suzi Weiss-Fischmann for Zanvyl Krieger School of Arts and Sciences to provide need-based scholarship support for Jewish students consistent with the university’s nondiscrimination principles.
First Generational Scholarship. Established anonymously in 2000 by an alumnus to provide need-based support to Zanvyl Krieger School of Arts and Sciences undergraduates who are the first in his/her family to attend college, or who otherwise demonstrate financial need.

Frances Howard Flatau Scholarship. Established in 2001 by William H. B. Howard, M.D. ’59, in honor of his sister, Mrs. Frances Howard Flatau. The scholarship award is based on academic achievement and financial need and given to junior or senior undergraduate students majoring in an engineering discipline at the Whiting School of Engineering. Preference is given to biomedical engineering students.

Charlie Flynn Memorial Scholarship. Established by the Baltimore Post through the support of EA Engineering, Science and Technology. This scholarship is for students in the Whiting School of Engineering with strong academic standing. Students may also apply to other scholarships at http://www.samebalt.org under the Post Scholarships.

William Fox, Jr. Scholarship. Established in 2005 by The William Fox, Jr. Foundation to provide financial aid to undergraduate students at the Whiting School of Engineering with preference given to U.S. citizens.

Fox/Jeffrey Scholarship. Established in 2000 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences. Preference for this need-based scholarship will be given to students focusing their academic interests in the social sciences and/or the humanities.

Myer A. L. Frank Scholarship. Established in 1989 through the will of the late Mrs. Martha Frank Lauer in memory of her brother. The Myer A. L. Frank Scholarship is awarded by the university to a graduate of the Baltimore City College.

Miriam D. Frankl Memorial Scholarship. Established in 2010 upon the untimely death of Miriam Frankl, member of the Class of 2011. At Hopkins, Frankl was following in her aunt and grandmother’s footsteps as she pursued a degree in the sciences. She was a leader in her sorority, Alpha Phi, and was described as inquisitive and adventurous. The scholarship was established in Miriam’s memory by friends and family to support undergraduates at the Zanvyl Krieger School of Arts and Sciences.

Froelicher Endowed Scholarship. Established in 2012 by F. Charles Froelicher ’49 to support undergraduate students in the School of Arts and Sciences, with preference given to humanities students.

Charles Carroll Fulton Memorial. This fund was established in 1927 by Dollie Glovins Fulton in memory of her father, Charles Carroll Fulton, for scholarship assistance to needy Homewood undergraduate students.

Christina Funke Scholarship. Established in 1964 through a bequest gift from Walter A. O. Funke to support talented students at the Zanvyl Krieger School of Arts and Sciences who demonstrate financial need.

Lillian Gavurin Memorial Scholarship. Established in 2003 to support Zanvyl Krieger School of Arts and Sciences undergraduate students with financial need who have demonstrated social responsibility and tolerance of diversity through ongoing involvement in nonreligious community service. The scholarship will be awarded to a student in his or her freshman or sophomore year and granted to the same student year to year, up to four years or achievement of degree.

Elisabeth Gilman Memorial Scholarship. Established by Robert Nelson in memory of Miss Elisabeth Gilman, whose father was the first president of The Johns Hopkins University. The fund has since been augmented by the friends and family of the late S. Page Nelson, former treasurer of the University. Awards are based on academic merit and financial need.

Christopher H. Lee and Susan D. Ginkel Baltimore Scholarship. Established in 2008 by Christopher H. Lee ’74 and his wife, Susan D. Ginkel, to support tuition and related expenses for undergraduates who have demonstrated financial need and are admitted to the Johns Hopkins University as part of the Baltimore Scholars Program or subsequent programs that provide support for Baltimore City public high school graduates.

Virginia L. Gladding Scholarship. Established in 2002 to support Homewood undergraduate students.

Bernard Glatt Memorial Scholarship. Established by Jeanne L. Fink and Henry J. Fink in 1978 in memory of Bernard Glatt, an educator and former student of Johns Hopkins University. Awards are given to Arts and Sciences undergraduates based on academic merit and financial need.

Dr. Herman K. Goldberg Scholarship. Established in 2007 by Nathan Z. Goldberg to support undergraduate scholarships for two students who, but for the assistance provided by the scholarship, would otherwise be unable to attend Johns Hopkins University, and who, while receiving this scholarship, have declared a major in the premedical program.

Aurora G. Granofsky Scholarship. Established in 2001 to provide scholarship support for deserving Arts and Sciences students to the extent consistent with applicable laws and regulations. Any deserving student of Mexican citizenship or immediate descent to be given first consideration. Financial hardship is to be of first consideration.

Greenberg Family Scholarship. Established in 2003 by William S. Greenberg ’64 to aid needy undergraduates from New Jersey with preference to either graduates of Columbia High School, The Lawrenceville School, and Princeton Day School, or undergraduates from Scandinavia in recognition of the righteousness of the Scandinavian people toward the Jewish people during World War II.

David B. Greenberg Endowed Scholarship. Established in 2011 through the bequest of David B. Greenberg ’56 to support a scholarship at the Whiting School of Engineering for undergraduate students in the field of Chemical Engineering.

William S. and Betty K. W. Greenberg-Bologna Scholarship. Established in 2007 by William S. Greenberg ’64 to support Arts and Sciences undergraduate students participating in the Bologna study abroad program who are also members of ROTC.

Mr. and Mrs. Stanley D. Greenblatt and Mr. and Mrs. Alan L. Greenblatt Scholarship. Established in 1977, this scholarship is based on academic excellence and is awarded to undergraduate students on the Homewood campus at the Schools of Arts and Sciences or Engineering.

Jeff Greene Endowed Scholarship. Established in 2011 by Jeff Greene and his wife, Mei Sze Greene, through their charitable foundation, the Jeff and Mei Sze Greene Foundation, Inc. Mr. Greene completed his undergraduate studies at Johns Hopkins in three years, receiving a bachelor of arts degree in 1975. After establishing himself as a successful entrepreneur and investor, he entered the graduate program at Harvard Business School, where he earned his master’s degree in business administration in 1979. This scholarship fund assists first generation undergraduate students at Homewood.

Grey Lady Scholarship. Established in 1996 by an alumnus on the occasion of his 40th reunion. The scholarship is to be used for a student
at the Zanvyl Krieger School of Arts and Sciences who demonstrates
financial need. Preference is given to a qualified student who resides in
Nantucket.

Charles G. Groh Scholarship. Established in 2000 by Charles G. Groh
'53. The recipient of the Groh Scholarship will either be in a double degree
program with The Peabody Institute which results in two degrees—B.A.
from KSAS and Bachelor of Music from Peabody—or be a music minor
at the Zanvyl Krieger School of Arts and Sciences. The scholarship is
awarded based upon financial need.

I. Cyrus Gutman Scholarship. Established in 1986, this endowed
scholarship supports financially needy students at the Zanvyl Krieger
School of Arts and Sciences.

Hackerman Polytechnic Scholarship. Established in 1985 by Lillian and
Willard '38 Hackerman and Mrs. G.W.C. Whiting for students majoring
in engineering. Students must have demonstrated need and must be a
graduate of the Baltimore Polytechnic Institute.

A. Z. Hartman Memorial Scholarship. Established in 1917 by Mrs.
Susan M. Hartman to honor her husband, Professor A. Z. Hartman
of Baltimore City College, to provide undergraduate scholarship assistance
to students at the Zanvyl Krieger School of Arts and Sciences. Awards are
based on academic merit and financial need.

William H. Hazlehurst Scholarship. Established in 1999 by William
Hazlehurst '49 for the benefit of undergraduate students at the Zanvyl
Krieger School of Arts and Sciences with financial need.

Jeremy W. Head Scholarship. Established in 1992 by Alice Head of
Houston, Texas, in memory of her husband, Jeremy Head '62, who was
an executive at Exxon Corporation. The scholarship supports students at
the Zanvyl Krieger School of Arts and Sciences who have demonstrated
financial need.

George J. Hudgins, Jr. Scholarship. Established in 1994 to provide scholarships at the Whiting School of Engineering. Primary preference is given to recent graduates of Dundalk High School. Secondary preference is given to students studying the humanities at the Zanvyl Krieger School of Arts and Sciences with first preference given to students studying international studies, humanities or social sciences.

Robert E. Hess Memorial Scholarship. In 1984, the estate of Alice R.
Hess provided for the establishment of this scholarship in memory of her
son. Awards are given to Homewood undergraduates based on financial
need and academic merit.

Sylvia Mattin Heusch Scholarship. Established in 2000 to support
undergraduate students studying the humanities at the Zanvyl Krieger
School of Arts and Sciences with first preference given to history of art
students.

Richard and Carol Hochman Scholarship. Established in 1987,
this fund provides support to middle-income liberal arts students from
public schools in the New York metropolitan area. Awards are given to
Homewood undergraduates based on academic merit and financial need.

Selma and E. Vinson Hoddinott Scholarship. Established in 2013
through an estate gift from E. Vinson Hoddinott to support Arts and
Sciences undergraduate students.

Holland Memorial Scholarship. Established in 1991 in honor of
the late Dr. Jacob Hollander to provide scholarships to Homewood
undergraduates in the field of political economy.

Heather Murphy Holmes Memorial Scholarship. Established in 1996 by
J. Scott and Suzanne Murphy Holmes in loving memory of their daughter,
Heather. The scholarship is awarded to a Homewood undergraduate who
has demonstrated a strong commitment to enhancing the lives of children
living in the Baltimore community.

Homewood Campus Music Scholarship. Established in 1996 by Dr.
Sung Oh to support undergraduate students at the Zanvyl Krieger School
of Arts and Sciences who have a music minor.

Richard and Joan Howell Scholarship. Established in 2004 by Richard
'55 and Joan Howell to provide financial aid to undergraduate students at
the Whiting School of Engineering. Primary preference is given to recent
graduates of Catonsville High School. Secondary preference is given to
recently graduated students of Catonsville High School.

George J. Hudgins, Jr. Scholarship. Established by George J.
Hudgins, Jr. '58 in 1994 to provide scholarships at the Whiting School
of Engineering with first preference given to deserving graduates of the
Baltimore Polytechnic Institute.

Hull Family Study Abroad Fund. Established in 2012 by Carl W.
and Nanci O. Hull to support travel, enrollment, and related expenses
for Krieger School undergraduate students studying abroad at the
University's SAIS Bologna Center. Grants will be awarded annually to
defray the additional costs associated with studying abroad.

Huston Family Scholarship in Memory of Allan S. and Elsie C.
Huston. Established in 2006 by Allan S. Huston Jr. '66 and his wife, Jane
M. Huston, in memory of his parents. Scholarships are to be awarded
to well-rounded Whiting School students who demonstrate appropriate
financial need with preference given to students who have an interest in
athletics.

Albert D. Hutzel, Jr. Memorial. Established in 1986 to support Arts and
Sciences undergraduate students who demonstrate financial need.
Stanley Gene Jacobson Memorial Scholarship. Established in 1986 to assist financially needy students at the Zanvyl Krieger School of Arts and Sciences.

Sylvia and Hans Jeans Scholarship. Established in 2011 Mr. and Mrs. Jeans, proud parents to a Class of 1977 graduate. The scholarship supports undergraduate students in the School of Arts and Sciences.

K. Michael Jeffrey Scholarship. Established in 2005 by Deborah J. Jeffrey, Esq. '82 to support undergraduate students studying the humanities or social sciences. Ms. Jeffrey is a former member of the Zanvyl Krieger School of Arts and Sciences advisory board. She created this scholarship in memory of her father.

Suzanne and Joseph Jenniches Scholarship. Established in 2012 by F. Suzanne Jenniches '79 and Joseph John Jenniches '86 to support a student who is a senior in engineering and who plans on pursuing a master's degree at Johns Hopkins the following year. Second preference will be given to a student who is pursuing a master's degree elsewhere.

Jochebed Scholarship. Established in 2000 by Heather Hay Murren '88 to support Krieger School undergraduates. Preference is given to a junior or senior who has demonstrated an interest through community service, or career aspiration, in improving the health, education, or well-being of low-income mothers and their children.

Johns Hopkins University Alumni Association Scholarship. Established to provide undergraduate need-based scholarships to students at the Homewood Schools.

Christian A. Johnson Scholarship. Established by the Christian A. Johnson Endeavor Foundation in 1984 to support deserving Arts and Sciences undergraduate students who demonstrate financial need.

Paul J. and Susan D. Kadri Family Scholarship. Established in 2006 by Paul J. Kadri '87 and his wife, Susan Kadri. The scholarship supports undergraduate students from the Krieger School of Arts and Sciences or the Whiting School of Engineering with preference given to students who have graduated from high schools in which Mr. Kadri has served as an administrator.

Herbert E. Kahler Scholarship. Established in 2008 by Herbert F. Kahler '58 to benefit undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Leonidas P. Kaouris Memorial Scholarship. Established by Jon Savitz '87, Josh Givelber '88, Mark Goodman '87, and other classmates of Leo Kaouris, to honor their close friend, who in 1996 lost his life after a brave battle with cancer. The scholarship is awarded to undergraduate students at the Zanvyl Krieger School of Arts and Sciences, who demonstrate academic promise and financial need.

Geraldine Karetsky Jersey Girl Endowed Scholarship. Established by Andy Karetsky '88 and his wife Pam, to honor his mother’s “special” birthday. The fund provides a yearly scholarship to an academically talented graduate of the Bergen County, New Jersey public school system. In establishing the scholarship in her name, Andy and Pam Karetsky honor Geraldine Karetsky's commitment to higher education and her charitable spirit.

Stuart and Ellen Katchis Family Scholarship. Established in 2011 by Stuart D. Katchis, M.D., A&S 1982 and his wife, Ellen, to support Arts and Sciences undergraduate students, with a preference given to those interested in medicine and the humanities.

Z. Morton Katz Memorial Scholarship. Established in 1919 by friends of Z. Morton Katz of Baltimore, a former Johns Hopkins University student who lost his life in the Battle of Montfaucon in France. The scholarship is awarded annually to an Arts and Sciences student who is a graduate of Baltimore City College. Recipients are chosen on the basis of superior character and scholarship.

Stan and Stephanie Katz Scholarship. Established in 2006 by Dr. Stanley M. Katz to support a Krieger School undergraduate student majoring in economics, with a preference given to students who pursue course work in the Center for Financial Economics. The scholarship will be awarded in the student's sophomore year and will continue for all three years provided need is indicated.

Edgar Kemler Memorial Scholarship. Established in 1966 by Mrs. Rebecca M. Kemler in honor of her son, Edgar Kemler. This fund provides aid to an undergraduate student in the social sciences or the humanities at the Zanvyl Krieger School of Arts and Sciences. Awards are based on academic merit and financial need.

Leah E. and Morton L. Kemper Scholarship. Established in 2012 through an estate gift to support undergraduate students in the Zanvyl Krieger School of Arts and Sciences.

Marci and Larry Kenney Scholarship. Established by Marci Kenney '78, '79 and her husband, Larry Kenney Jr. '78, to support Homewood undergraduate students. Preference for this need-based scholarship is given to academically talented students.

William L. Kepper Memorial Endowed Scholarship. Established in 2001 by his children Kimberlee '78, '79, Eileen, Will, and Heidi Kepper. The need-based scholarship, awarded to a Zanvyl Krieger School of Arts and Sciences undergraduate who has demonstrated an interest in acting or film and media, recognizes Mr. Kepper's accomplishments as an actor and producer. It is the hope of his children that his memory will be carried on by those William L. Kepper Scholars who share his passion for acting and film and media.

Jeong H. Kim Scholarship. Established in 1999 by Jeong Kim '82, '89 to provide undergraduate need-based scholarships at the Whiting School of Engineering.

Benjamin and Fortuna Iseman Klotz Memorial Scholarship. Established through the estate of Fortuna Iseman Klotz in 1985, this endowed scholarship fund is used to assist financially needy Homewood undergraduate students.

Carl A. Knierim Scholarship. Established in 1981 by Dora Will Knierim in memory of her husband, Carl Adam Knierim '24, to provide financial assistance for Arts and Sciences undergraduate students majoring in chemistry. Awards are based on academic merit and financial need.

Arthur R. and Rena A. Knipp Scholarship. Established in 1972 by Mrs. Margaret K. Charny in honor of her parents. Her father graduated from Johns Hopkins and throughout his life maintained a keen interest in the university. The fund provides financial assistance for financially needy Arts and Sciences undergraduate students, preferably in the fields of physics or mathematics.

Bertram Koslin Scholarship. Established in 2001 by Elizabeth A. Koslin to support an undergraduate at the Whiting School of Engineering, with preference given to students in the field of computer science.

Milton W. Kronsberg Memorial Scholarship. Established in 1998 by Frederica Kronsberg in memory of her husband, Milton W. Kronsberg.
‘32, to aid financially needy undergraduate students at the Zanvyl Krieger School of Arts and Sciences who have demonstrated an interest in the history of the Jewish people, contemporary Jewish life, and Judaism through participation in Judaic studies and Jewish community organizations.

**Kurz Family Scholarship.** Established in 2005 by Donald A. Kurz ’77 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**KSAS 9/11 Alumni Memorial Scholarship.** Established in 2001 in honor of the sudden loss of five alumni of the Zanvyl Krieger School of Arts and Sciences in the September 11 attacks. This scholarship is to be awarded to a current undergraduate student of the school.

**Kumin Family Scholarship.** Established in 2007 by Solomon Kumin ’99 to support members of the varsity lacrosse team.

**Eli M. Lamb Memorial Scholarship.** Established in 1916 by the Alumni Association of the Friends School of Baltimore to assist financially needy students at the School of Arts and Sciences with preferences given to Friends alumni.

**Land Scholarship.** Established in 1991 by Dr. W. Everett Land ’28, ’33 and Mrs. Land, these scholarships provide support for undergraduate or graduate students in the Departments of Chemistry or Chemical and Biomolecular Engineering.

**Al and Jerrie LaPointe Scholarship.** Established in 2010 through the estate of Jerrie LaPointe to support undergraduate students on the Homewood Campus.

**Albert G. Laverty Scholarship.** Established in memory of Albert G. Laverty ’53 by his daughter, Lynn L. Eisenhans, his wife, Martha A. Laverty, and numerous family and friends who contributed to his memorial fund. This scholarship provides support to students in the Department of Chemical and Biomolecular Engineering at the Whiting School of Engineering, with preference given to students who indicate a professional desire to work in the energy industry or do research that is related to promoting safe, secure, or affordable sources of energy.

**Martha A. Laverty Scholarship.** Established in 2012 by John W. and Lynn L. Eisenhans in honor of Mrs. Eisenhans’ mother. The scholarship will give a preference to an undergraduate student studying computational medicine, computational biology, biomaterials, and biomechanics.

**W. Jeffrey Lawrence Scholarship.** Established in 2000 by W. Jeffrey Lawrence ’77, ’78. This endowed scholarship supports Krieger School undergraduate students in the B.A./M.A. program with SAIS.

**Nevin O. Lawyer Scholarship.** Established to provide need-based scholarships to Homewood undergraduates whose permanent residence prior to entering college was the state of Maryland.

**Ethan and Karen Leder Scholarship.** Established in 2010 for Zanvyl Krieger School of Arts and Sciences to provide need-based scholarship for a student from an economically disadvantaged background who is the first in his or her family to attend a four year college.

**Sidney Stanford Leichter Scholarship.** Established in 2009 by Anthony P. Leichter ’59 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences who are interested in the areas of history of art, archeology and classics.

**Krieger School of Arts and Sciences who are interested in the areas of history of art, archeology and classics.**

**Lenrow Family Scholarship.** Established in 2006 by Ruth and Jay ’76 Lenrow to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Elliot and Marjory Levi Scholarship.** Established in 1999 by Alan Levi ’71 in honor of his parents, the scholarship is awarded to an Arts and Sciences undergraduate based on academic merit and financial need. J. Elliot Levi graduated from the School of Arts and Sciences in 1934 and from the School of Medicine in 1938.

**Robert H. Levi Scholarship.** Established in 1990 by his children to provide scholarships for undergraduates at the Zanvyl Krieger School of Arts and Sciences.

**David and Marcia Levy Scholarship.** Established to provide assistance to undergraduate students at the Zanvyl Krieger School of Arts and Sciences who demonstrate financial need. Preference given to writing seminars majors.

**Lichtenstein Family Endowed Scholarship.** Established in 2011 by Samuel Lichtenstein ‘11 to support Arts and Sciences undergraduates who are interested in the humanities or social sciences and who have demonstrated financial need.

**Robert Forster and Vernon L. Lidtke Scholar.** Established in 2007 by Richard L. Posen ’72, William H. Linder ’72, and other various donors to provide support for one student each year (juniors and seniors) with a well-developed major or concentration in the social sciences. Preferences given to those students interested in history.

**Sweetser Linthicum Esquire Scholarship.** Established in 1997 to provide scholarships to deserving Arts and Sciences students majoring in the fields of history or political science.

**Donald Ho Yu Liu, M.D. and Emilie Chua Liu, M.D. Scholarship.** Established in 2005 by Diana C. Liu to provide support to a Krieger School undergraduate student with financial need who is pursuing a career in medicine.

**Norman Malcolm Locke and Octavia Capuzzi Locke Scholarship.** Established in 2012 through an estate gift from Octavia Locke to support undergraduate students in the study and writing of fiction in the writing seminars.

**William D. Loring Scholarship.** Established in 2008 by Reverend William Loring ’58 and his wife, Diane, to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**Vernon Lynch Scholarship.** Established in 1925 by Mr. Edmund Lynch of New York in memory of his brother, Vernon Lynch, who died while engaged in service during World War I. The fund supports graduates of the Baltimore City College who are accepted for undergraduate admission on the Homewood Campus.

**Morton J. and Louise D. Macks Endowed Scholarship.** Established in 2011 by the Louise D. and Morton J. Macks Family Foundation, Inc. to benefit students in the Whiting School of Engineering.

**Edward MacNichol Scholarship.** Established to provide scholarships to undergraduates at the Zanvyl Krieger School of Arts and Sciences.

**Helen and Sam Mandel and Anita and Julian Mandel Educational Scholarship.** Established by Howard Mandel ’77 and his wife, Susan, in honor of Howie’s parents’ and grandparents’ commitment to education. The fund supports undergraduate students at the Zanvyl Krieger School
of Arts and Sciences. Preference for the need-based scholarship is given to incoming freshmen from Brooklyn, New York; Queens, New York, Stuyvesant High School in New York; or Los Angeles.

**Jerome and Helen Margulies Scholarship.** Established by Frederic Margulies '69 in memory of his parents. The scholarship is need-based and is awarded to an undergraduate student at the Zanvyl Krieger School of Arts and Sciences who has demonstrated an interest in the history of the Jewish people, contemporary Jewish life, and Judaism through participation in Judaic studies and Jewish community organizations.

**Maryland Section of the American Society of Civil Engineers Scholarship.** This scholarship was established in 2006 by the Maryland Section of the American Society of Civil Engineers to support civil engineering students. Recipients are selected on academic merit and financial need, must be members of the ASCE student chapter, and shall be undergraduate students who have junior or senior standing.

**Maryland Society of Professional Engineers J. Jay Pecora Memorial Scholarship.** Established in 1999 to provide scholarships to Whiting School of Engineering students who are residents of the state of Maryland, demonstrate financial need, and are entering their senior year.

**Maryland Society of Professional Engineers Wallace S. North P.E. Memorial Scholarship.** Established in 2008 to provide scholarships to Whiting School of Engineering students who are residents of the state of Maryland, demonstrate financial need, and are entering their senior year.

**James E. McClaine Scholarship.** Established in 1999 by James E. McClaine '63 and his wife, Kay E. McClaine '64 to support undergraduate students in an engineering discipline.

**Gail J. McGovern Endowed Scholarship.** Established in 1999 by Gail J. McGovern '74 and a trustee of the university. This scholarship provides need-based assistance for students studying mathematics or science at the Zanvyl Krieger School of Arts and Sciences. First preference is given to female students who attended an urban public high school prior to attending the university.

**William E. and Elda M. Meiers Scholarship.** Established in 1999 by William E. Meiers '52 and his wife, Elda M. Meiers, to support deserving undergraduate students majoring in an engineering discipline. Mr. Meiers is retired from the Exxon Corporation, and hopes that this scholarship will attract undergraduates to the field of engineering.

**Melissaratos Family Scholarship.** Established in 1999 by Mr. Aristides Melissaratos '66, to provide scholarship support to deserving undergraduate students majoring in an engineering discipline. Preference is given to engineering students who are from the city of Baltimore, Maryland.

**Jay Menon, M.D. Memorial Scholarship.** Established in 2000 by his wife, Shama, and daughter, Seema. The scholarship supports freshmen and sophomores who have recognizable accomplishments illustrating their desire to pursue a career in medicine and who maintain at least a 3.0 GPA. The scholarship recognizes Dr. Menon's accomplishments as a renowned orthopedic and hand surgeon who trained at Johns Hopkins Hospital and Sinai Hospital from 1973–1977. The Jay Menon Memorial Scholarship is a loving tribute to the memory of an extraordinary physician and caring individual.

**Messner Family Baltimore Scholarship.** Established in 2008 by Michael G. and Jenny Messner to support tuition and related expenses for undergraduates who have demonstrated financial need and are admitted to the Johns Hopkins University as part of the Baltimore Scholars Program or subsequent programs that provide support for Baltimore City public high school graduates.

**Jean-Pierre Meyer and Steven Meyer Scholarship in Applied Mathematics and Statistics.** Established in 2011 by Steven D. Meyer '84 to promote undergraduate academic excellence and achievement in applied mathematics and statistics.

**Jean-Pierre Meyer and Steven Meyer Scholarship in Mathematics.** Established in 2011 by Steven D. Meyer '84 to promote undergraduate academic excellence and achievement in mathematics.

**Joseph Meyerhoff Scholarship.** Established in 1979 by Joseph Meyerhoff who had attended the University in 1918. The scholarship provides support to deserving students at the Whiting School of Engineering who major in civil engineering.

**Miller Scholarships.** Established in 1993 by Charles D. Miller ’49 to provide scholarships to Zanvyl Krieger School of Arts and Sciences undergraduates who previously participated in the CTY program.

**Bruce G. Miller Inner-City Scholarship.** Established in 2013 by Bruce Miller ’63 to provide undergraduate scholarships to students who graduated from select high schools in New York City and participated in the Inner-City Scholarship Fund.

**Raymond D. Miller, Jr. Scholarship.** Established by the estate of Raymond D. Miller, Jr. to provide scholarships to undergraduate students at the Whiting School of Engineering.

**Samantha Burg Miller Endowed Scholarship.** Established in 2010 by Henry and Barbara Miller, parents of Samantha Burg Miller, A&S 2011. This need-based scholarship supports Jewish undergraduate students in conjunction with nondiscrimination policies.

**Jan M. Minkowski Scholarship.** Established in 2002 in memory of Jan M. Minkowski '63, a Whiting School electrical and computer engineering professor emeritus. This scholarship supports deserving undergraduate students majoring in electrical and computer engineering, computer science, or mathematical sciences and serves to attract undergraduates to these fields.

**John G. Montebancho Foundation Endowed Scholarship.** Established in 2005 by the John G. Montebancho Foundation, Inc. to provide support for an undergraduate student, with preference given to a student who is a resident of Howard County, MD., majoring in mathematics within the Zanvyl Krieger School of Arts and Sciences.

**Patricia Biggs Morrison Scholarship.** Established in 1998 by William F. Morrison ’49, in honor of his wife to provide financial assistance for undergraduates in the Zanvyl Krieger School of Arts and Sciences.

**Tobia H. and Morton M. Mower Scholarship.** Established in 1996 to provide scholarships for undergraduate students at the Zanvyl Krieger School of Arts and Sciences who demonstrate financial need.

**James J. Murren Scholarship.** Established in 2004 by Heather Hay Murren ’88 to support a needy Krieger School undergraduate student studying art history or another area within the humanities with an interest in athletics.

**Sylvia Friedberg Nachlas Scholarship.** Established in 1988 by Sylvia F. Nachlas to support needy and deserving students at the Zanvyl Krieger School of Arts and Sciences.
Ruth Nagle Watkins Scholarship. Established in 2006 through a bequest from the late Ruth Nagle Watkins to provide scholarships for Arts and Sciences students majoring in art history.

P.R. Narvekar Scholarship. Established in 2013 by Silu Narvekar ’95 in honor of her father-in-law to support Arts and Sciences undergraduate students with financial need who are majoring in economics, international studies, or political science.

Sol and Irene Nathan Baltimore Scholarship. Established by Irvin Nathan ’64 to support Homewood undergraduate students who are admitted to Johns Hopkins University as part of the Baltimore Scholars Program or subsequent programs that provide support for Baltimore City public high school graduates.

James H. Nelson Scholarship. Established in 1998 by James Nelson ’75, an attorney from Boulder, Colorado. This scholarship is to be awarded to a financially needy Homewood freshman who demonstrates substantial academic achievement and significant non-academic promise. Geographic preferences given first to students from Boulder and Longmont, Colorado; Kauai County, Hawaii; Jackson County, Illinois.

Nguyen Family Endowed Scholarship. Established in 2006 by Chris and Elizabeth Nguyen to provide support for an undergraduate student who is a rising junior or senior at the Zanvyl Krieger School of Arts and Sciences, with preference given to a student whose focus is pre-medical education with an interest in children’s health.

Ronald M. Nordmann and Jodi E. Nordmann Undergraduate Scholarship. Established in 1999 by Mr. Nordmann ’63 to support undergraduate students at the Zanvyl Krieger School of Arts and Sciences with demonstrated financial need. Mr. Nordmann and his daughter, Dr. Jodi Nordmann Harap ’93, wanted to help students who might otherwise be unable to attend Johns Hopkins.

Dr. W. Luther Norem Scholarship. Established in 1994 to provide financial aid for deserving students at the Zanvyl Krieger School of Arts and Sciences.

Nuttle Educational Fund. Established 2011 to support English majors and/or students who are part of the Peabody/Krieger dual degree program. Students must demonstrate financial need and academic excellence.

Ralph S. O’Connor Scholarship. Established in 1993 to provide scholarships to undergraduates at the Zanvyl Krieger School of Arts and Sciences. Preference given to students from Texas or Montana.

Willie J. Oliver, Jr. Scholarship Fund. Established in 2002 by George Skegas ’77. This scholarship provides financial support for undergraduate scholar-athletes at the Zanvyl Krieger School of Arts and Sciences.

Alan T. Osserman, Sr. Scholarship. Established in 1982 by J. Julian Osserman to provide scholarship assistance to students of engineering science. Awards are based on academic merit and financial need.

Paleologos Family Scholarship. Established in 2000 to provide undergraduate scholarships for members of the men’s lacrosse team.

Mr. and Mrs. Samuel F. Palmisano Scholarship. Established in 2002 by Mr. and Mrs. Samuel J. Palmisano ’73, in honor of his parents, to provide support for well-rounded undergraduates at the Whiting School of Engineering who are studying computer science.

Kumud Arvind Patel and Arvind Vithaldas Patel Scholarship. Established by Rajul Patel ’84 in honor of his parents to award scholarships to Homewood undergraduate students based on financial need or adversity.

Joseph B. and Frances T. Payne Scholarship. Established in 1999 to support deserving and needy Homewood undergraduate students at the Johns Hopkins University.

Pansini Pearls Scholarship. Established in 2006 by Michael O. Pansini, Esq. ’82 to support Zanvyl Krieger School of Arts and Sciences undergraduate students, with preference given to those from Philadelphia.

George A. Petrossian, M.D., Scholarship. Established in 2005 by George A. Petrossian, M.D., for undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Phi Ep Buddy Scholarship. Established by various members of the Phi Epsilon Pi fraternity to provide undergraduate support for students at the Zanvyl Krieger School of Arts and Sciences.

Pilcer Family Scholarship. Established in 2012 by Grace and Samuel Pilcer, Parents Class of 2009, to support undergraduate students who are members of an under-represented minority group. In addition, preference is given to students who have graduated from high schools recognized by membership in the National Association of Independent Schools.

Neal R. Pilzer Scholarship. Established in 2000 by Neal R. Pilzer ’78 to benefit one or more undergraduate students at the Zanvyl Krieger School of Arts and Sciences, with preference given to film and media studies majors.

Abraham Pikoos Memorial Scholarship. Established in 1989 by Mindelle Weinberg in memory of her late father, Abraham Pikoos ’21, to assist students majoring in mathematics, physics, or engineering.

James F. Pitts Scholarship. Established in 2004 by James F. Pitts ’73, ’78 and his wife, F. Kay Pitts. The scholarship provides financial aid to undergraduate engineering students at the Whiting School of Engineering.

Lynn and Gray Poole Humanities Scholarship. Established in 1969 by friends and colleagues of Lynn D. Poole, director of public relations at The Johns Hopkins University from 1946 to 1966. This scholarship was created to honor his memory and to support financially needy and scholarly undergraduate students studying the humanities at the Zanvyl Krieger School of Arts and Sciences.

Timothy J. Popko Memorial Scholarship. Established by Ethan Leder ’84 and other classmates of Timothy J. Popko, to honor their close friend who tragically lost his life between his freshman and sophomore years at Hopkins. The scholarship, based on need, will be awarded to a Homewood undergraduate student who demonstrates not only academic promise, but also talent and interests in extracurricular areas.

Helen C. Potter Scholarship. Established in 1988 to support worthy and needy Arts and Sciences undergraduates in the field of political economy.

Guy Railey Lacrosse Scholarship. Established in 2004 by Beverly Railey to honor her husband, Guy Railey ’58. Mr. Railey was a teacher and coach at Johns Hopkins, as well as an alumnus of the Krieger School. Mr. Railey passed away in December 2003. This scholarship supports students on the men’s lacrosse team.

Dr. and Mrs. William F. Railing Scholarship. Established by the Railings on the occasion of Dr. Railing’s 50th reunion to provide
assistance to a third- or fourth-year undergraduate student at the Zanvyl Krieger School of Arts and Sciences, who is majoring in economics, who maintains a 3.0 grade point average and who has completed half the course work for a degree in economics. In addition, the student should have made positive contributions to the university community. The Railing Scholarship Fund is awarded based on financial need and preference is given to students who are graduates of Baltimore City College.

Anna Rappa Memorial Scholarship. Established in 1984 by the family and friends of Mrs. Rappa to assist undergraduates at the Zanvyl Krieger School of Arts and Sciences who graduated from Baltimore city or county high schools. Awards are based on academic merit and financial need.

Howard J. Read Scholarship. Established in 2000 by Howard J. Read ‘66, to support undergraduates at the Zanvyl Krieger School of Arts and Sciences.

Charles Charretton Reeder Scholarship. Established in 1992 in memory of Mr. Reeder ‘30 to provide scholarship support for undergraduate students at the Whiting School of Engineering.

Dr. Edward F. Reese Memorial Scholarship. Established in 1991 by Ralph H. Reese in memory of his father, this scholarship is designated to support Arts and Sciences undergraduates from the Monongahela Valley, with preference given to graduates of Steel Valley High School.

Riemann Family Scholarship. Established in 2006 by Christopher D. Riemann, M.D. ‘89 to provide support to undergraduate students at the Whiting School of Engineering who demonstrate financial need and who plan to attend medical school.

George L. Rogosa Undergraduate Scholarship. Established in 2000, the scholarship is awarded annually to undergraduates at the Zanvyl Krieger School of Arts and Sciences with financial need and strong academic promise.

Martha O. Roseman Scholarship. Established in 2000, this scholarship is awarded annually to a need-based undergraduate at the Zanvyl Krieger School of Arts and Sciences. First preference will be given to an undergraduate with a diagnosed learning disability.

Richard P. Rosenberg Baltimore Scholarship. Established in 2008 by Gail J. McGovern ’74 to benefit one or more Homewood undergraduate students with demonstrated financial need who qualify for tuition relief through the Baltimore Scholars Program.

Roger and Bobbi Rosenberger Scholarship. Established in 1999 by Roger Rosenberger ‘65 and his wife, Bobbi Rosenberger, to provide undergraduate scholarships for students at the Whiting School of Engineering.

Ben and Esther Rosenbloom Scholarship. Established in 1990 to provide scholarships for undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

John W. and Mary Lou Ross Scholarship. Established in 2000 by the late John W. Ross, who was a research associate in the Department of Materials Science and Engineering, and his late wife, Mary Lou Ross. This scholarship supports deserving undergraduate students at the Whiting School of Engineering who are citizens or permanent residents of the United States, academically eligible, and deserving of financial assistance. Preference is given to engineering students majoring in materials science and engineering.

Rob Roy Scholarship. Established in 2002 by Thomas L. Wheeler, Engr ’53 and his wife Carolyn C. Wheeler in honor of the late Robert H. Roy, a former Johns Hopkins Engineering dean, to provide scholarship support to undergraduate students at the Whiting School of Engineering. Awards are based on academic success and financial need.

Arthur C. Rubenstein Scholarship. Established in 1964 to support Homewood students from the District of Columbia or the area immediately adjacent, with preference to students who show promise of proficiency in basketball.

John F. Ruffle Endowed Scholarship. Established in 2001 by John F. Ruffle ’58. This scholarship supports undergraduates at the Zanvyl Krieger School of Arts and Sciences who, but for the financial assistance provided by this scholarship, would otherwise be unable to attend the Johns Hopkins University.

Marshall and Janet Salant Homewood Scholarship. Established in 2006 by Marshal L. Salant ’80, this scholarship supports Homewood undergraduate students. Preference is given to students who major in either economics or applied mathematics and statistics.

Salant Student Investment Scholarship. The Salant Student Investment Program is a non-credit project established in 1999 by Marshal L. Salant ’80 to allow students to participate in real-life investment strategies. Five percent of the profit made by the students is used to fund this scholarship. The award is given to a student interested in financial mathematics.

Sardella Scholarship for Men’s Lacrosse. Established in 2007 by Louis M. Sardella ’69. While at Hopkins, Lou played varsity soccer, but has since become an avid lacrosse fan. He established this scholarship to honor all those who have worn the Johns Hopkins uniform and represented his alma mater.

Sardella Endowed Scholarship for Engineering Undergraduates. Established in 1999 by Louis M. Sardella ’69 to support undergraduates at the Whiting School of Engineering with preference given to students from the greater Baltimore area.

Philip Schaefer Scholarship. Established in 1930 by Mrs. Johanna Raegner of New York to honor Philip Schaefer by providing financial assistance to a deserving Arts and Sciences student from the city of Baltimore who demonstrates financial need.

Robert C. Scharf Engineering Scholarship. Established in 2001 by colleagues and friends of Robert C. Scharf ’59 who was an alumnus of Johns Hopkins University’s part-time engineering program. This fund provides scholarship support to civil engineering students with preference given to students from Anne Arundel County whose needs resemble those of Robert C. Scharf some 45 years ago.

Dylan Schlott Scholarship. Established in 2000, this undergraduate scholarship supports a member of the men’s lacrosse team.

Richard S. Schlotterbeck Memorial Scholarship. Established in 2002 in memory of Richard S. Schlotterbeck ’37 to provide scholarship support to students majoring in an engineering discipline at the Whiting School of Engineering. Preference is given to first generation students.

Hermann O. Schmidt Memorial Scholarship. Established in 2000 by a bequest from Clara McMahon Schmidt ’42 in memory of her husband, Hermann Schmidt ’26, ’40. Clara Schmidt had a long relationship with Clara McMahon Schmidt ’42 in memory of her husband, Hermann Schmidt ’26, ’40. Clara Schmidt had a long relationship...
with Hopkins, serving as an associate professor emeritus of Business and Education at the time of her death. The scholarship supports undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Jerome D. Schnydrman Scholarship. Established in 2005 by friends and family to honor Mr. Schnydrman’s legacy. Jerry Schnydrman ’87 played varsity lacrosse at Hopkins from 1964–1967. A three-time All-American midfielder, he was the captain of the 1967 national championship team. Jerry continued to support the lacrosse program as a long-time assistant coach after graduation. In 1998, Jerry was inducted into the Johns Hopkins Athletic Hall of Fame, and in 2003, into the National Lacrosse Hall of Fame. This scholarship supports members of the men’s lacrosse team.

Jerome D. and Tamara T. Schnydrman Scholarship. Established in 2012 by friends and colleagues of Jerry Schnydrman on the occasion of his retirement from his long-standing position on the university staff. The scholarship supports Homewood undergraduate students with financial need.

Schrodel Endowed Scholarship. Established by Charles S. Schrodel Jr. ’57 in 2001, to benefit undergraduates at the Whiting School of Engineering.

Robert H. Scott Endowed Scholarship. Established in 2008 by the Class of 1958 reunion committee to recognize the impact their coach, teacher and motivator, Bob Scott, had on so many members of the class. Mr. Scott was head coach for the Blue Jays men’s lacrosse team for 20 years and led seven national championship teams. After retiring from coaching, he served as athletic director at Hopkins for 22 years. He was inducted into the National Lacrosse Hall of Fame in 1994 and retired from Hopkins in 1995 after 47 years of dedicated service.

Second Decade Society Scholarship. Established in 2012 by members of the Second Decade Society. The Second Decade Society is a group of alumni volunteers from the School of Arts and Sciences who are age 20 years past their graduation date. The scholarship supports Arts and Sciences undergraduates with financial need.

Ruth and Herschel Seder Scholarship. Established in 1974 by Milwaukee Valve Company, Inc. to assist students from middle-income families with preference given to students who are preparing for careers in engineering. Mr. Seder ’39 a university trustee emeritus, is president of Milwaukee Valve Company.

Demi and Frederick Seguritan Scholarship. Established in 2013 by Fred Seguritan ’00 to support Arts and Sciences undergraduates with financial need.

Edward Henry Sehrt and Helen Ludwig Sehrt Scholarship. Established in 2008 by the Helen Sehrt Trust, Trustee Nancy Hamrick to establish and award annual scholarships for undergraduate students majoring in German literature, language, or philosophy who maintain at least the equivalent of a B average in their Germanic studies.

Seidman Family Scholarship. Established in 2007 by Neil H. Seidman ’89 to support a Krieger School undergraduate student with an interest (in order of preference) in: i. History of Science and Technology, or ii. Jewish Studies. If there is no such qualified candidate, the scholarship will be awarded to a Krieger School undergraduate student with demonstrated financial need.

Ida and Jack Sekulow Scholarship Fund. Established in 1987 by Eugene Sekulow ’53, ’60, and Erwin Sekulow ’59, in memory of their parents. Provides scholarship aid to needy undergraduates at the Zanvyl Krieger School of Arts and Sciences.

Demi and Frederick Seguritan Scholarship. Established in 2013 by Fred Seguritan ’00 to support Arts and Sciences undergraduates with financial need.

Barbara and M. Sigmund Shapiro Family Scholarship. Established in 1980 by M. Sigmund Shapiro ’48 and his wife, Barbara, to provide financial support to undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Kenneth Edwin Shaw Scholarship. Established by the estate of Francine S. Shaw in 2009 in memory of her late husband, Kenneth Edwin Shaw ’67, ’68, to support undergraduate students at the Whiting School of Engineering.

LeRoy and Helen Sheets Scholarship. Established in 1995 by Helen Sheets in memory of her husband. LeRoy Sheets was a member of the Class of 1928. The scholarship supports undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Jeffrey Ma Shiu Undergraduate Scholarship. Established in 2012 by Jeffrey Shiu ’02 to support Arts and Sciences students, with preference given to students of Chinese, Taiwanese, or Hong Kong heritage.

Klara Shorey Memorial Scholarship. Established in 1997 to provide support for undergraduate students at the Zanvyl Krieger School of Arts and Sciences majoring in Russian and literature.

Leonie Shorey Scholarship. Established in 1997 to provide support for undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

Michael Shorey Memorial Scholarship. Established in 1997 to provide scholarships for undergraduate students at the Zanvyl Krieger School of Arts and Sciences majoring in chemistry.

Rajendra and Neera Singh Scholarship in the G.W.C. Whiting School of Engineering. Established in 2004 by Dr. and Mrs. Singh to provide need-based scholarship support to strong and deserving undergraduate students at the Whiting School of Engineering.

Albert and Elaine Slechter Scholarship for Engineering Undergraduates. Established in 1999 by Mr. Albert J. Slechter ’62 and his wife, Elaine, to support engineering undergraduate students with preference given to Maryland residents with financial need. Mr. Slechter is a founding member of the Society of Engineering Alumni (SEA).

Smilow Family Scholarship. Established in 1999 by Michael Smilow ’60 and his son David ’84 to provide scholarships to undergraduate students at the Zanvyl Krieger School of Arts and Sciences who are in need of financial assistance. The dean of the Krieger School will award the Smilow Family Scholarships to qualified students on the basis of evidence of the candidate’s character, interpersonal skills, and unrealized potential.

Philip S. W. Smith Scholarship. Established in 2009 by Mr. Smith ’89, to support humanities majors at the Zanvyl Krieger School of Arts and Sciences, with preference given to students from Canada.

Garrett J. Solomon Scholarship. Established in 2003 to provide need-based scholarships to undergraduate students enrolled at the Zanvyl Krieger School of Arts and Sciences. Preference is given to students from...
New England with Massachusetts as first preference who have declared a major in Humanities and will have demonstrated a commitment to extracurricular activities. In the event a student is unavailable to be named from New England, the donor wishes that a student from the Mid-Atlantic States be selected.

**Starks Scholarship.*** Established in 1999 by Scott Starks '74 and Margaret Starks. This scholarship is to support an undergraduate member or members of the women's lacrosse team.

**Dr. Karl J. Steinmueller Scholarship.*** Established to provide assistance to Homewood students who are without sufficient funds to complete their undergraduate education.

**Osmar Steinwald Memorial Scholarship.*** Established in 1995 to provide scholarships to undergraduates at the Zanvyl Krieger School of Arts and Sciences.

**S. David Sternberg, M.D. Undergraduate Scholarship.*** Established in 2000 through a bequest by S. David Sternberg, M.D. '42. This scholarship is for a Zanvyl Krieger School of Arts and Sciences undergraduate with substantial financial need.

**Ernest and Doris St. Peter Scholarship.*** Established in 1999 by Gary R. St. Peter '72, in honor of his parents. To be awarded annually to an Arts and Sciences undergraduate student who, but for financial assistance provided by this scholarship, would otherwise be unable to attend Johns Hopkins University, and who, while receiving this scholarship, actively demonstrates an ongoing commitment to community service and a commitment to helping another person by his or her volunteer participation in a local tutoring or mentoring program.

**Matt “Stoff” Stoffel Scholarship.*** Established in 2008 by various donors to support one or more male undergraduate students affiliated with the men's lacrosse program.

**Study Abroad Scholarship.*** Established in 2011 by Christian W. Hansen to provide support for students participating in Johns Hopkins Faculty-led International Programs, administered on a merit basis through the Study Abroad Office.

**Summerfield Scholarship.*** Established in 1990 by the Solon E. Summerfield Foundation, Inc. This scholarship, which provides support to outstanding engineering undergraduate students, is dedicated in memory of Solon E. Summerfield.

**Louise and Earl Sweeney Scholarship.*** Established in 2000 by William E. Sweeney, Jr., Ph.D. on the anniversary of his 40th reunion in honor of his parents. The fund will provide scholarships for undergraduate students at Homewood who are academically talented and who have demonstrated involvement in campus activities.

**Melvin and Jeannette Tabler Endowed Scholarship Fund for Undergraduate Engineering Students.*** Established in 2002 to attract undergraduates to the field of engineering and to honor Melvin Tabler '34 and his wife, Jeannette Tabler. The scholarship provides support to undergraduate students majoring in an engineering discipline at the Whiting School of Engineering.

**Morris and Charlotte Tanenbaum Scholarship.*** Established in 1996 by Dr. and Mrs. Tanenbaum of Short Hills, New Jersey. Dr. Tanenbaum '49 is a university trustee emeritus. The scholarship supports undergraduate students at the Zanvyl Krieger School of Arts and Sciences.

**John J. Tatum Memorial Scholarship.*** Established in 1994 by the estate of Beulah Benton Tatum '43, in honor of John J. Tatum '93, to provide scholarships for students at the Homewood Schools.

**Arthur and Jean Thomas Endowed Scholarship.*** Established in 2010 by Arthur M. Thomas Jr. for benefit of Whiting School of Engineering.

**Honorable Edward O. Thomas Scholarship.*** Established in 2000 by the Judge Thomas and his wife, Katherine. Judge Thomas graduated from Johns Hopkins in 1940 with a degree in Political Science. He is a retired judge with the Maryland State Government. This scholarship supports undergraduate students at the Zanvyl Krieger School of Arts and Sciences who demonstrate financial need.

**J. Trueman Thompson Student Aid Scholarship.*** Established in 1972 by professor emeritus J. Trueman Thompson to provide scholarship support to students who major in the fields of science or engineering.

**Lauren Renee Thompson Scholarship.*** Established in in celebration of Lauren’s life in 2003 by classmates to support deserving Homewood students at the Johns Hopkins University.

**William S. Todman, Sr. Scholarship.*** Established in 1977 by William S. Todman Sr. ’38 for Arts and Sciences undergraduate students who demonstrate academic excellence and financial need.

**T. Rowe Price Scholarship.*** Established by the T. Rowe Price Foundation, this scholarship is awarded to an engineering student interested in finance or mathematics.

**Triumph Scholarship.*** Established in 1999 by Kenneth K. Yagura ’63 and his wife, Terry Yagura, this scholarship provides support to deserving Homewood undergraduate students from the Los Angeles area public school system, with preference given to students from urban public schools.

**Isabel S. F. and Hadley K. Turner Scholarship.*** Established in 1973 by Mr. and Mrs. Turner in memory of their son, Julius Turner. The fund provides scholarship assistance in political science annually on the basis of character, diligence in the pursuit of learning, scholastic standing consistent with a student’s capabilities, and financial need.

**USX Scholarship Fund.*** The purpose of this fund is to provide scholarships to students in business-related majors in the Krieger School of Arts and Sciences and the Whiting School of Engineering with preference to USX employees and children.

**Venbrux Family Scholarship.*** Established in 2003 by Anthony Venbrux, this scholarship supports a Krieger School undergraduate from Washington, Alaska, Idaho, or Montana.

**Dr. William R. Van Dersal and Dr. Eva P. Gaines Van Dersal Scholarship.*** Established in 2007 by the Estate of Eva Peyton Gaines Van Dersal for undergraduate students at the Zanvyl Krieger School of Arts and Sciences with a preference for students majoring in Public Health Studies.

**Harry Van Elkan Memorial Scholarship.*** Established in 2011 by Heidi and Jeffrey Gordon for undergraduate scholarship support with demonstrated financial need for Zanvyl Krieger School of Arts and Sciences.

**Michael and Jacqueline Vassallo Scholarship.*** Established to award scholarships to students at the Zanvyl Krieger School of Arts and Sciences on the basis of true merit and nondiscrimination.
Glen Wall and Matthew O'Mahony Memorial Scholarship. Established in 2002 by alumni, family, and friends in memory of Glen Wall '84 and Matt O'Mahony '84, who lost their lives on September 11, 2001, at the World Trade Center. This scholarship will be awarded to a Krieger School undergraduate who demonstrates an interest in athletics and is well-rounded.

Severn Teackle Wallis Memorial. The Wallis Memorial Association established in 1906 a fund for scholarships to assist financially needy students.

Frederick C. Warring Memorial Scholarship. Established to provide scholarships to Arts and Sciences students who demonstrate need.

Earl Wasserman Memorial Scholarship. This scholarship was established by Stephen Weissman '57 in honor of Dr. Earl Wasserman, professor of English from 1949 to 1973, to assist an academically talented and financially needy undergraduate English major.

Walter J. Webb, Sr. Memorial Scholarship. Established in 1991 by Mr. and Mrs. William Clouspy ’59 to provide financial aid for Arts and Sciences undergraduates who demonstrate need.

Louis Weinberg Scholarship. Established in 1988 to provide undergraduate scholarships for students at the Whiting School of Engineering.

Westwind Scholarship. Established in 2004 to provide scholarship support to undergraduate students at the Whiting School of Engineering.

Captain Newton White, Jr. Scholarship. Established in 1958 by Captain Newton White, Jr., a naval officer who commanded the aircraft carrier USS Enterprise before the Second World War. White became interested in Johns Hopkins after reading a chemistry textbook by Ira Remsen. Having been educated in a one-room schoolhouse in Tennessee, White instituted the Captain Newton White, Jr. scholarships in 1958, to provide an opportunity for students from Tennessee or Maryland to attend the University.

Jack and Frank Wilen Scholarship. Established in 1973 by Ruth Wilen Cooper in honor of her husband and brother-in-law. The fund is used to provide scholarship assistance to a needy and deserving Arts and Sciences undergraduate student who could not otherwise afford an education at Johns Hopkins.

Joseph S. Wimbrough and Robert W. Gelinas Memorial Scholarship. Established in 1976 by Mr. and Mrs. Joseph N. Wimbrough in memory of their sons, Joseph S. Wimbrough and Robert W. Gelinas. Preference is given to engineering students who demonstrate financial need.

Winter Family Scholarship. Established in 2011 by James Winter ‘70 and his wife Susan. James is a university trustee and member of the Krieger School Advisory Board. The scholarship supports Arts and Sciences undergraduate students with an interest in economics or financial economics with a preference for students who have participated in the Center for Talented Youth program.

Dr. Aurel Wintner Scholarship. Established in 2012 through an estate gift from Basil Gordon '52 to support Arts and Sciences students with a preference for those who are majoring in mathematics.

Women’s Lacrosse Scholarship. Established anonymously in 2002 to support members of the women’s lacrosse team at Johns Hopkins.

William E. Woodyear Scholarship. Established in 1894 by Mrs. R. Blanche Woodyear as a memorial to her husband. Awards are based on academic merit and financial need.

Wye Scholarship. Established by Donald W. Curtis '38 in 1996 for undergraduate scholarships at the Whiting School of Engineering.

James Yewell Scholarship. Established in 2006 at the request of the late James M. Yewell. This fund is to be used for general scholarship aid.

Yaffe Family Scholarship. Established in 2000 by David Yaffe ’74 and his wife, Deborah, to support an undergraduate scholarship for a Zanvyl Krieger School of Arts and Sciences sophomore who did not receive need-based grant funding in his/her freshman year. The scholarship is awarded to academically talented students who achieve a minimum 3.0 GPA.

Yaffe Family Scholarship II. Established in 2004 by David Yaffe ’74 and his wife, Deborah, to provide support for a first generation, non-pre-medical, Krieger School undergraduate with financial need.

Zaft Family Scholarship in Memory of Jonathan Jarzyna. Established in 2013 by Matthew Zaft ’97 in memory of his classmate and friend, Jonathan Jarzyna. The scholarship supports Arts and Sciences undergraduate students.

Marlin U. Zimmerman, Jr. Scholarship. Established in 2012 through the estate of Marlin U. Zimmerman ’44 for students in the Whiting School of Engineering in the field of biomolecular engineering or bioengineering.

Zitzmann Family Scholarship. Established in 1998 to support need-based undergraduates at the Zanvyl Krieger School of Arts and Sciences. Preference given to history, English, or political science majors.

Merit-Based Scholarships

Recipients are chosen from those students who have been determined eligible for merit-based funding.

Louis Azrael Fellowship in Communications. Established to honor the memory of Louis Azrael, a distinguished Baltimore newspaperman. It is awarded annually to a sophomore or junior student who is interested in pursuing a career in journalism, writing, radio, television, or another aspect of the communications industry.

Walter S. Baird Trust Fund. Established in 1980 by the late Dr. Walter S. Baird, a university trustee emeritus, for Whiting School students interested in physics. The award is based on academic merit.

The France-Merrick Foundations. Established to provide Homewood undergraduate scholarships for students engaging in community activities.

Conrad Gebelein Memorial Scholarships. Established in 1982 by alumni and friends of Conrad Gebelein, a talented musician and composer who was the Hopkins bandleader and director from 1924 to 1980. This scholarship is awarded annually to one or more junior or senior students who are currently members of the Johns Hopkins University
Band and who exemplify such personal character traits as sensitivity, seriousness for musical excellence, and active participation in concert and sports events that endeared Conrad Gebelein to all who knew him.

**Hodson-Gilliam Success Endowment.** Established in 2005 by the Hodson Trust to provide partial tuition support for minority undergraduate students.

**Hodson Humanities Merit Award.** Established to provide undergraduate merit scholarships to Zanvyl Krieger School of Arts and Sciences students in the humanities.

**Hodson Success Award.** Established in 1993 by the Hodson Trust. The New Jersey trust was created by Thomas S. Hodson, father of Colonel Clarence S. Hodson who founded Beneficial Finance. These need-based awards assist underrepresented minority students from the mid-Atlantic region who are exceptionally talented. The scholarships guarantee that the students will be loan-free during their four years at Hopkins and have no work-study assignments during their first two years.

**Hodson Scholarship Fund.** Thomas S. Hodson, father of Colonel Clarence S. Hodson, founder of the Beneficial Finance System, created the Hodson Trust, which established the Hodson Fund. Income from this fund supports Hodson Scholarships (merit) and Hodson Success Awards (need-based) for exceptionally talented undergraduate students. Awards are made to incoming freshmen based on high school counselor nomination.

**U.S. Army ROTC Scholarships.** Army ROTC scholarships pay up to $20,000 per year and are awarded on the basis of merit rather than need. Four-year scholarships are available to high school seniors; three- and two-year scholarships are available to freshmen and sophomores, respectively. Further details may be obtained from the Director, Military Science Program, The Johns Hopkins University.

**Charles Roger Westgate Scholarship in Engineering.** Established in 1998 by Kwok-leung Li ’79 and his wife Felice V. Li, ’80 in honor of Charles Roger Westgate, the William B. Kouwenhoven Professor of Engineering. These scholarships are awarded based on merit and provide full tuition and partial support for room and board for four years of undergraduate study in engineering.

**Not all of the scholarships listed here are available or will be awarded every year.**

**Graduate Fellowships**

Graduate fellowships are determined by the academic departments. For complete information on graduate financial aid, see Graduate Students/Admissions and Finances (p. 77).

**Paul G. Agnew Fund.** Established by the bequest of Mrs. Ethna M. Agnew in 1968, this fund provides graduate fellowships in the Department of Physics.

**Mary D. Ainsworth Fund.** Created in memory of Dr. Ainsworth, former faculty member at the Zanvyl Krieger School of Arts and Sciences, to support women graduate studies.

**APL Fellowship in Science and Engineering.** The Applied Physics Laboratory has established pre-doctoral fellowships for resident graduate students whose research interests are related to research at the APL. Students in the science and engineering departments are eligible. Interested students should contact the chair of the appropriate department. Applicants must be approved by the University Fellowship Committee and by the Applied Physics Laboratory.

**ARCS Foundation Fellowships.** The Washington Chapter of the ARCS Foundation, Inc., established annual Achievement Rewards for College Scientists at The Johns Hopkins University. Fellowships are generally awarded to graduate students in the areas of engineering, life sciences, mathematics, medicine, or physical sciences.

**Susan J. Baisley ’80 Graduate Fellowship.** Created in 2007 by Susan Baisley ’80, to endow a fellowship in the humanities.

**Christina L. Balk Fellowship Fund.** Established to assist graduate student research in the Department of Earth and Planetary Sciences.

**Robert Balk Fellowship Fund.** Established in 1964 by Dr. Christina L. Balk as a memorial to her late husband. Dr. Balk received her Ph.D. in geology from Johns Hopkins in 1933. In accordance with her wishes, awards are made to assist students in financing field work in geology.

**Leon Gilbert Barnhart Memorial Fund.** Established in 1984 by Gilbert and Laal Barnhart in memory of their son who was a member of the Class of 1967, this fund provides a one-term dissertation fellowship in the Philosophy Department.

**August John Bauernschmidt Jr. Memorial Scholarship Fund.** Established through an estate gift from August Bauernschmidt to assist deserving and financially needy graduate students in the Department of Earth and Planetary Sciences.

**Isidor S. L. Bermann Memorial Fellowship.** Established in 1937 through a bequest gift from Mrs. Lilian Hunt Bermann as a memorial to her husband. The fellowship is awarded to graduate students in the Department of Philosophy.

**Dr. Nathaniel Boggs Jr. Memorial Fellowship.** Established by Paula Boggs ’81 in memory of her father to support graduate students in the sciences who have done undergraduate work at historically black colleges or universities.

**Gordon L. and Beatrice C. Bowles Fellowship.** Established in 1999 by William R. Bowles ’60, in memory of his parents, to provide financial aid to graduate students at the Whiting School of Engineering.

**Phillips and Camille Bradford Fellowship.** Established in 2004 by Phillips Bradford ’62 and his wife, Camille Bradford, to support deserving graduate students at the Whiting School of Engineering. Dr. Bradford wished to establish this fund to assist students, who like himself, want to obtain advanced degrees in engineering.

**R. W. Bromery Fund.** Established in 1995 in honor of Dr. Bromery to support graduate students in the Department of Earth and Planetary Sciences.

**Louis M. Brown Engineering Fellowship.** Established in 2004 by Louis M. Brown, Jr. ’65 to support graduate students at the Whiting School of Engineering.

**Adam T. Bruce Biology Fellowship.** This endowed fellowship was established in 1887 in memory of Adam T. Bruce, Ph.D., former faculty member, by his mother. In 1925, Mr. Frederick Bruce, brother of Dr. Bruce, added to the fund for the purpose of awarding fellowships in biology.

**Emmett and Elsie Buhle Endowed Fund in Chemistry.** Established by Dr. and Mrs. Emmett Buhle, along with matching funds from American
Home Products, to help support deserving graduate students in the Department of Chemistry.

**Stanley T. Burns Memorial Fellowship.** Established through gifts from various donors in 2010 to provide need-based funding for a returning adult student intent on pursuing a career in writing.

**Francis D. “Spike” Carlson Fellowship Fund.** Established in 2000 by a grateful alumnus in memory of Francis D. Carlson ’42 who was a distinguished faculty member and chair of the Department of Biophysics at the Zanvyl Krieger School of Arts and Sciences. This fellowship provides stipends or research grants to outstanding graduate students in the Jenkins Department of Biophysics.

**Fred A. and Annarie P. Cazel Endowed Fellowship.** Established in 2011 to provide an annual award to a talented and promising graduate student in the History of Art or History Department at the Zanvyl Krieger School of Arts and Sciences.

**Arthur Douglas and Ivan Fleming Chambers Fellowship in Chemistry.** Established by Mrs. Grace Baker Chambers of Charlotte, North Carolina, to honor the memory of her husband, Ivan Fleming Chambers (Ph.D., Chemistry, University of Geneva, 1925) and his father, Arthur Douglas Chambers (Ph.D., Chemistry, The Johns Hopkins University, 1896). The fellowship supports exceptionally promising graduate students in the Department of Chemistry.

**Chemical Foundation Fellowships.** The Chemical Foundation, Inc., provided a gift to create this fellowship in the Department of Chemistry.

**Howard and Jacqueline Chertkof Endowed Fellowship for Engineering Graduate Students.** Established in 1999 by Howard L. Chertkof ’57 and his wife, Jacqueline Chertkof, to support graduate engineering students with preference given to students studying in the fields of emerging technologies.

**Carl Christ Fellowship.** Established to support outstanding graduate students who are at the dissertation stage of their research in the Department of Economics.

**Walter L. Clark Fellowship.** Established by bequest, this fund supports graduate students with first preference given to students enrolled in the J.D./Ph.D. program in the Department of Psychological and Brain Sciences.

**Ernst Cloos Memorial Fellowship.** Established in 2007 by Miner B. Long ’53, to support a graduate fellowship in the Department of Earth and Planetary Sciences.

**Bernard M. Cohen Scholarship.** A bequest by Dr. Cohen of Arlington, Virginia, established this fund to aid needy students in the sciences and humanities.

**Harriet H. Cohen Engineering Fellowship.** Established in 2004 by Neil L. Cohen ’83 and his wife, Sherry Z. Cohen, in memory of Mr. Cohen’s mother to provide support for graduate students at the Whiting School of Engineering.

**Charles and Catherine Counselman Endowed Fellowship.** Established in 2000 by Charles C. ’38 Catherine Counselman to provide financial aid to graduate students in the Department of Applied Mathematics and Statistics at the Whiting School of Engineering.

**Creel Family Engineering Fellowship.** Established in 2004 by George C. Creel ’55 to support graduate students at the Whiting School of Engineering.

**Gordon Croft Endowed Fellowship.** Established in 1987 by L. Gordon Croft ’56. This is awarded to students at the Whiting School of Engineering who are citizens of the United States.

**Allan C. and Dorothy H. Davis Fellowship.** Established to provide graduate fellowship support to the Department of Physics and Astronomy for students in the field of astrophysics.

**William and Lois Diamond Fellowship.** Established to provide support to a graduate student in the Department of History and is awarded on the basis of academic merit.

**H.A.B. Dunning Fellowship for Chemical Research.** Established in 1932 by Dr. H.A.B. Dunning to create a fellowship for chemical research.

**Charles Albert Earp Fellowship.** Established in 2005 to support graduate or prospective graduate students in the Department of History who are concentrating their studies in the areas relating to the American Civil War.

**Dr. J. Brian Eby Fellowship in Geology.** Established in 1976 by Dr. Eby, who received his undergraduate and graduate training at the university, this fellowship is awarded to a graduate student in the Department of Earth and Planetary Sciences.

**Emma J. Edelstein Memorial Fellowship.** Created by the will of Dr. Ludwig Edelstein, former professor, in memory of Mrs. Edelstein. It is awarded annually to a graduate student in the Department of Classics.

**Dwight D. Eisenhower Fellowship.** In commemoration of General Eisenhower’s birthday in 1963, a substantial number of members of the Capitol Hill Club of Washington, D.C., subscribed to the Dwight D. Eisenhower Scholarship Fund to be given to an institution selected by him. He selected The Johns Hopkins University, and a fellowship was established to support students studying American history.

**A. Marshall Elliott Romance Scholarship.** Established through a bequest gift from Dr. A. Marshall Elliott to support graduate students in the Department of Romance Languages.

**David W. Elliott Memorial Fund.** Established to assist graduate students engaged in independent field work and to enhance in other ways geological field studies by students.

**Endowed Fellowship in the Zanvyl Krieger School of Arts and Sciences.** Established by various donors with the purpose of attracting the most outstanding students to the Zanvyl Krieger School of Arts and Sciences.

**Doris Roberts Entwisle Teaching Fellowship.** Supports an advanced graduate student in the Department of Sociology teaching an undergraduate course in the area of his or her dissertation research.

**G. Heberton Evans, Jr. Graduate Fellowship.** Established by students, colleagues, and friends in memory of G. Heberton Evans Jr., A.B., Ph.D., professor and chair of Political Economy, and dean of the Faculty of Philosophy.

**Gloria Flaherty Fellowship.** Established in 1998 to provide graduate fellowships to worthy students specializing in eighteenth century literature in the Department of English.
F. Millard Foard Fellowship. Established in memory of F. Millard Foard, a graduate of Johns Hopkins University, Class of 1920, to be awarded to a graduate student studying the languages.

Georg Wilhelm Gail Fellowship Fund. Established by the will of Georg Philip Landmann Gail in memory of his father, Georg Wilhelm Gail. The fellowship is used as the university may direct to aid deserving graduate students in the German and Romance Languages and Literatures Department.

David C. Gakenheimer Fellowship. Established in 2012 by David C. Gakenheimer '65 to benefit graduate students in the Whiting School of Engineering and the Institute for Computational Medicine with a preference for a student conducting heart research in developing and advancing diagnostic methods such as detecting, classifying and treating rhythm disorders, including atrial fibrillation and atrial flutter.

William Gardner, Ph.D. Fellowship. Created by William Bentley Gardner, Ph.D. 1968, to support graduate students in the Department of Physics and Astronomy.

General Electric Foundation Fellowship. Established in 1982 by the foundation to encourage outstanding scholars in engineering and computer science to pursue academic careers. The fellowship is awarded to a graduating senior to assist with the first year of graduate work in a doctoral program in physics, chemistry, engineering, or computer science.

Basil L. Gildersleeve Fellowship. Established in 1925 by alumni and friends to honor Dr. Basil Lanneau Gildersleeve, former professor of Greek. In her will, Professor Gildersleeve’s widow added to the fund. The resulting annual fellowship is reserved for a student of Greek.

Jack Greene Endowed Fellowship. Supports research and travel for graduate students in the Department of History.

Gregory Fellowship in Engineering. Established in 2005 by the estate of Richard Sears Gregory ’42 to support graduate students at the Whiting School of Engineering.

Harriet K. Greif Fellowship. Established in 1997 by David L. Greif II to support students participating in the Master of Liberal Arts program.

Eugene W. Gudger Fellowship. Established by Dr. Eugene W. Gudger in 1946 to provide a fellowship for graduate students in biology.

Clarence M. Guggenheimer Fund. Established in 1976 by Mrs. Irma H. Guggenheimer in memory of her late husband. Awards are made to graduate students in the field of political economy.

Lee and Albert H. Half Student Award. Established in 2005 by Dr. Albert H. Half '50 to provide support to a doctoral student with exceptional work in the Department of Geography and Environmental Engineering at the Whiting School of Engineering.

Ferdinand Hamburger, Jr. Fellowship in Electrical Engineering. Established in 1994 by the estate of Dr. Hamburger '24, '31 and his wife, Opal L. Hamburger '39. This fellowship is named for professor emeritus and former chair of the Electrical Engineering Department, Ferdinand Hamburger, Jr., this fund provides fellowships for graduate students in electrical engineering.

Cornelia G. Harcum Fellowship. Established through a bequest gift from Miss Cornelia G. Harcum, former student in the Department of Archaeology. The fellowship supports female students in classical archaeology.

Ralph Harper Endowment. Supports students participating in the Master of Liberal Arts program.

James Hart Fellowship in Political Science. Established in 1972 through a bequest gift from Jane Lewis Hart.

Carl E. Heath Fellowship for Support of Graduate Women in Engineering. Established by Dr. Carl E. Heath Jr. ’52. The fund provides support for female graduate students at the Whiting School of Engineering.

Richard C. Henry Fund. Established in 1993 in honor of Dr. Henry to support graduate students who display academic interest in contributing a project to the Space Grant Consortium or in the department of Physics and Astronomy.

Ada Sinz Hill Fellowship. This fellowship is to be awarded to a woman graduate student in the Department of Chemistry.

Hodson Fellowship Fund in the Humanities. Established by the Hodson Trust to support outstanding graduates who intend to pursue careers in college teaching. The Hodson Trust was created by Thomas S. Hodson, brother of Colonel Clarence S. Hodson, who was the founder of the Beneficial Hodson Finance System.

Laurence B. Holland Graduate Fellowship in American Literature. Established to provide dissertation year support for a doctoral candidate pursuing research in American literature in the Department of English.

Alfred, Meta E., Ella, Charles and Maggie Horstmeier Memorial Fund. Established by the bequest of Ella M. S. Horstmeier in 1947. The fund is used to provide tuition for a student or students of advanced German and German prose composition.

Warren B. Hunting Scholarship. Established in 1925 by Mrs. Alice E. Hunting to honor her son, Warren Belknap Hunting. The scholarship is open to graduate students in the field of political science.

Rufus P. Isaacs Graduate Fellowship. Established in 1982 by the Department of Mathematical Sciences in memory of Rufus Isaacs, engineering professor emeritus, to provide a first-year fellowship for a student in mathematical sciences at the Whiting School of Engineering.

Joel Stewart Ish Fellowship. Established to honor the memory of Joel Stewart Ish ’69, ’71, ’75 by his family and friends, this fund annually provides one or more graduate fellowships in the Department of Political Science.

Samuel Iwry Fund. Founded with the generous help of Mr. Alvin Blum, Class of 1930, to honor Professor Samuel Iwry, this fund provides assistance to graduate students of biblical and Hebraic studies in the Department of Near Eastern Studies.

Fred Jelinek Fellowship. Established in 2011 by Google, Inc. and various donors to provide support to graduate students studying in the Center for Language and Speech Processing (CLSP) or engaged in research most similar to the work in CLSP.

George and Sylvia Kagan Graduate Fellowship. Established in 2005 through the estate of George M. Kagan to support doctoral candidates in the Department of History.

Martha and Rebecca Katz Graduate Loan Fund. Established to provide loans for graduate students at the School of Arts and Sciences.
Adolf Katzenellenbogen Memorial Fund. Established by the Maryland Vassar Club in 1966 through contributions from friends and students, this memorial fund honors Professor Adolf Katzenellenbogen, who came to Johns Hopkins from Vassar to become chair of the Department of History of Art. Awards are made to outstanding students in this department.

Cornelia Hohenberg Kaye Memorial Research Grant in German-Austrian Culture. Established to provide travel and research money to a graduate student planning a dissertation on some aspect of modern (late-19th- and 20th-century) culture in Germany and/or Austria.

Donald E. Kerr Sr. and Barbara Kerr Stanley Fellowship in the Department of Physics and Astronomy. Established in 1999 by Mrs. Stanley in memory of her first husband, who taught in the department from 1949 to 1975. The fellowship will be awarded to a graduate student of exceptional promise who exemplifies Dr. Kerr’s dedication to the field of physics.

Martin and Mary Kilpatrick Fellowship. Established by the estate of Martin and Mary Kilpatrick, this fellowship provides support for students of exceptional ability and promise in the Department of Chemistry.

Alexander Kossiakoff Fellowship. Established in 1997 to provide an annual award to a graduate student in the Department of Chemistry.

Samuel H. Kress Foundation Fellowship. Established in 1964 to support graduate students in the History of Art.

History of Art Department Internship Program at the Walters Art Museum. Established in 1999 by Zanvyl Krieger ’28, as a gift to, and matched by, The Walters Art Museum. The fellowship funds doctoral students at the dissertation stage in the history of art to conduct curatorial work at the Walters and, after being awarded the Ph.D., to serve there as postdoctoral fellows. The School of Arts and Sciences was named for Mr. Krieger in 1995.

Carrie M. Kurrelmeyer Fund Endowment. Created in 1992 by a planned gift from Dr. Carrie M. Zintl, the funds are to be used for fellowships and library acquisitions for the Department of History of Art.

Professor William Kurrelmeyer Fund. Established by Dr. Carrie M. Kurrelmeyer Zintl, the fund supports fellowships for needy and deserving graduate students in the Department of German, especially those who are engaged as instructors in said department.

Malcolm Lauchheimer Fellowship. Established to support graduate fellowships in history or political science.

Leon Lauer Fellowship. Established in 1941 by the gift from Mrs. Martha Frank Lauer, to provide a fellowship for a student at the Schools of Arts and Sciences or Engineering.

Hassie Roseman Lichtenstein and Reuben Roseman Fellowship. Established by Dr. Ephraim Roseman ’33, in memory of his sister Hassie R. Lichtenstein and his brother Reuben ’29, ’33, the fellowship will support a graduate student in the Department of Chemistry.

Richard A. Macksey Fellowship in the Humanities. Established in 2000 by an alumnus of the class of 1981 to honor Professor Richard Macksey and his dedication to the humanities and to undergraduate and graduate education. This fellowship will be awarded to the graduate student assigned to coordinate the Honors Program in the Humanities Center, which the donor cites as “one of the great highlights of a Hopkins education.”

Leon Madansky Postdoctoral Fellowship in the Henry A. Rowland Department of Physics and Astronomy. Established in 2000 by Rena Madansky in memory of her husband who was a professor in the Department of Physics and Astronomy from 1948 until his death in 2000. This fellowship will support a postdoctoral graduate in theoretical high energy (particle) physics who demonstrates intellectual independence and exceptional creativity.

Ernest M. Marks Graduate Fellowship. Established to support an outstanding graduate student in the Department of Chemistry.

William H. McClain Dissertation Fund. Established by friends and alumni of the Department of German in honor of Professor William McClain, this fund provides dissertation support for a doctoral candidate in the German Department.

Medtronic Fellowship in Biomedical Engineering. Funded by The Medtronic Foundation, this fellowship awards graduate students in the field of biomedical engineering with preference given to women, underrepresented minorities, or economically disadvantaged students who many not have been able to attend graduate school for financial reasons.

Joseph Meyerhoff Fellowship. Established in 1979 by Joseph Meyerhoff who had attended the University in 1918. The fellowship provides support to deserving students at the Whiting School of Engineering who are studying civil engineering at the graduate level.

Mellon Endowment for Doctoral Students in the Humanities. Established by the Andrew W. Mellon Foundation in 1983 to support doctoral students in the humanities.

Hortense G. Moses Scholarship. Established by the Federation of Jewish Women’s Organizations for the encouragement of education in Hebrew at the university and is to be awarded annually to a student for outstanding work in elementary Hebrew.

James M. Motley Fellowship. The income of this fund is to be awarded each year by the university to a student doing advanced work in the humanities.

Nancy Norris Fellowship. Supports students participating in the Master of Liberal Arts program.

Leonard Obert Graduate Fellowship Fund. Established through the generosity of Dr. Leonard Obert ’38, to provide awards made to graduate students at the Zanvyl Krieger School of Arts and Sciences based upon academic accomplishment and financial need.

George Owen Fellowship. Established in 1992 by Dr. Deha Owen in memory of her late husband. The fund supports graduate fellowships at the Krieger School of Arts and Sciences.

Charles Lathrop Pack Fellowship in Memory of John Grier Hibben. This fellowship is available to a graduate student at the Krieger School of Arts and Sciences.

Charles Lathrop Pack Fellowship in Memory of Walter Hines Page. This fellowship is available to a graduate student at the Krieger School of Arts and Sciences who is interested in international relations.

Shirley Passow and Ruth Rickard Humanities Fellowship. Established in 2009 by David Yaffe ’74 and his wife Deborah to provide support to graduate students in the humanities.
Payback Fellowship. Established in 2004 by an anonymous donor to support graduate students at the Whiting School of Engineering. The fund was established to “pay back” the state of Maryland for Senatorial Scholarships the donor received while attending Johns Hopkins.

George Peabody Scholarship Fund. Established in 1912 to support graduate or undergraduate students in the Department of Sociology whose focus is in the field of education.

Francis J. Pettitjohn Scholarship in Geology in the Department of Earth and Planetary Sciences. This scholarship will support a graduate student in the Department of Earth and Planetary Sciences and be awarded based on merit and financial need.

Bridgette Phillips Memorial Fund. This fund supports a fellowship in Byzantine and medieval studies in the Department of History.

Robert B. Pond, Sr. Fellowship. Established by an anonymous donor in 2004 to support deserving graduate students at the Whiting School of Engineering.

T. Rowe Price Memorial Fellowships. Established in 1984 to honor the memory of Mr. T. Rowe Price by the T. Rowe Price Associates Foundation, this fund makes available two fellowships each year for the most outstanding doctoral candidates in the Department of Economics: one to a first-year and the other to a continuing student. Preference is given to students interested in international economics.

Walter Cottrell Quincy Fund. Established by a bequest gift from Mrs. Martha R. Quincy to provide four annual awards for deserving students in the Department of Physics.

William S. Rayner Fellowship. Established by Mrs. Bertha Rayner Frank and Mr. Albert W. Rayner in memory of their father. Candidates are selected from those doing advanced work in Semitic languages.

William A. Reinsch Fellowship. Established to augment stipends and provide research support for promising young scholars in the Department of Political Science whose work relates to one of the following areas of interest: the emergence of China, globalization, or international trade and security.

Paul V. Renoff Fund. Established in 2004 from a commitment made by the late Paul V. Renoff ’32 to support studies in the field of engineering.

Hoomes Rich Graduate Fellowship. Established through an estate gift, this fund provides first-year fellowship support for graduate students in the Department of Civil Engineering at the Whiting School of Engineering.

Walter L. Robb Fellowship. Established in 2003 by Walter L. Robb to support deserving graduate students at the Whiting School of Engineering.

Donald S. Rodbell Memorial Fellowship. Established by Adele Rodbell in memory of her husband, Donald S. Rodbell ’49, ’53 to support second-year Ph.D. candidates in the Department of Materials Science and Engineering who best exemplify the interests and determination of Dr. Rodbell, an engineer, physicist, and materials scientist.

Edmund Law Rogers Fellowship. Endowed by Mrs. Edmund Law Rogers and her daughter, Mrs. Kirby Flower Smith, this fellowship is awarded annually in the Classics Department.

George Henry Rogers and Mary Rogers Memorial Fellowship. Established in 1950 through a bequest gift from Mrs. Keziah Rogers for research in the Departments of Chemistry and Physics.

Ben and Esther Rosenbloom Foundation Fellowship. This fund was established to provide fellowships for graduate students at the Krieger School of Arts and Sciences.

John W. and Mary Lou Ross Fellowship in the Department of Materials Science and Engineering. Established through the estate of John W. and Mary Lou Ross to provide graduate support for students at the Whiting School of Engineering who are academically eligible and deserving of financial need. Preference is given to students majoring in materials science and engineering.

Sadie and Louis Roth Fellowship. Established by Anthony Paul Leichter ’59 to provide assistance for graduate students studying art history.

Dean Robert H. Roy Fellowship. Established in 1990 by various alumni and friends in recognition of Rob Roy ’28, former dean of the School of Engineering. This fund supports interdepartmental fellowships for graduate education at the Whiting School of Engineering.

Wilfrid E. Rumble Fellowship in Political Science. Established in 2012 through an estate gift from Wilfrid Rumble to provide fellowships in political science.

David Sachs Graduate Fellowships in Philosophy. Established in 1999 by the estate of David Sachs, professor emeritus of philosophy. A member of the faculty from 1969 to 1992, he was noted for his scholarship in the areas of ancient philosophy, philosophy of the mind, and ethics. The fellowship assists academically meritorious graduate students in philosophy.

Jay D. Samstag Engineering Fellowship. Established in 2004 by Jay D. Samstag ’60 in honor of his parents, Phil and Helen Samstag, to provide support for graduate students at the Whiting School of Engineering.

Dr. Benjamin T. Sankey Fellowship. Established to assist graduate students in the writing seminars department of the Zanvyl Krieger School of Arts and Sciences.

William H. Schwarz Fellowship. Established in 2000 by alumni from the Class of 1953 to honor William H. Schwarz, ’51, ’55, ’57 and his commitment to making the Undergraduate Chemical Engineering Laboratory a defining moment of undergraduate education. The fellowship supports graduate students who are teaching in the laboratory.

John Adams Scott Fellowship. Established in 1928 by John C. Schaffer for a student in Greek, honoring Professor Scott of Northwestern University, who received the degree of doctor of philosophy from Johns Hopkins in 1897.

Siebel Scholars Program. Established by The Siebel Scholars Foundation, this fellowship is awarded to students entering the final year of their master’s or doctoral program in a biomedical engineering discipline. The fellows are selected based on merit.

Charles S. Singleton Estate. Established to support graduate fellowships for the study of Italian literature and provides travel funds to and from Italy for that purpose.

Ella E. Slack Scholarship. Endowed by the bequest of Mrs. Ella E. Slack of Baltimore, Maryland, to provide a fellowship for graduate students.
John W. Snow Fellowship. Supports students participating in the Master of Liberal Arts program.

Rudolph Sonneborn Fellowship. Established by Dr. and Mrs. Henry Sonneborn III and Mr. Rudolf G. Sonneborn, this award provides a fellowship in the Department of Chemistry.

Villa Spelman Travel Fellowship. Established in 1994 to enable graduate students to travel to Italy for the study of works of art.

Joseph Evans Sperry Fellowship. Established through a bequest gift from Mrs. Lee Wilson Sperry for a student whose doctoral dissertation will be concerned with the history of architecture.

Leonard and Helen R. Stulman Fellowship in the Humanities. Established by Leonard Stulman '25 and Helen Stulman to support humanities graduate students in the Krieger School of Arts and Sciences.

Nicole Suveges Fellowship. Created in 2008 in memory of Nicole Suveges, a Hopkins graduate student in the Department of Political Science who was killed in Iraq. The fund supports field research among graduate students in comparative politics or international relations.

Doris S. Sweet Fellowship. Supports students participating in the Master of Liberal Arts program.

Gaston I. Sweitzer Fellowship Fund. As a result of a bequest of Ida Lockwood Sweitzer, this fund was established to aid minority students at the Krieger School of Arts and Sciences.

Richard A. and Rachel M. Swirnow Fellowship. Established in 2007 by Richard A. Swirnow '55 and his wife, Rachel M. Swirnow, through The Swirnow Charitable Foundation, Inc. This graduate fellowship is awarded to biomedical engineering students with preference given to students majoring in biomedical engineering design.

Ellen E. Swomley, Ph.D. '46, Endowed Fellowship Fund in Physics and Astronomy. The purpose of this fund is to provide fellowship aid for qualified graduate students in the Department of Physics and Astronomy.

Roszel C. Thomsen Scholarship. Supports students participating in the Master's of Liberal Arts program.

Frederick Jackson Turner Society Fellowship. This fund supports graduate students in the Department of History.

United States Steel Foundation Loan Fund. This fund provides loans for graduate students at the Schools of Arts and Sciences and Engineering.

University Fellowships and Teaching Assistantships. A number of fellowships and teaching assistantships are provided by the university to all departments in the School of Arts and Sciences and School of Engineering on an annual basis. Fellowships may provide stipends and tuition support.

Robert S. Waldrop and Dorothy L. Waldrop Fellowship. Established in 2007 to provide fellowship support for promising graduate students in the Department of Psychological and Brain Sciences.

William F. Ward, Jr. Fellowship. Established in 2012 by William F. Ward, Jr. '73, a University Trustee, to be awarded to a returning U.S. military service person who is attending Johns Hopkins as a full-time graduate student after three years of active duty and having received no less than an honorable discharge or a medical discharge under honorable circumstances.

Arnold E. Waters, Jr. and Elizabeth Stewart Waters Fund. Income from this fund is used to support students in the Department of Earth and Planetary Sciences.

Herman A. Weinstein M.L.A. Fellowship. Supports students participating in the Master of Liberal Arts program.

Marshall K. Wiley Fellowship. Supports students participating in the Master of Liberal Arts program.

Lois V. Williams Fellowship. Established in 2003 through the estate of Lois V. Williams '46 to support graduate students at the Zanvyl Krieger School of Arts and Sciences.

M. Gordon Wolman Fellowship. Established in 2010 by various donors in memory of M. Gordon “Reds” Wolman ’49, to benefit graduate students in the Department of Geography & Environmental Engineering.

Harry Woolf Fellowship. Established in 1990 to support graduate fellows in the Department of History of Science and Technology.

Jun Wu and Yan Zhang Endowed Graduate Student Fellowship. Established in 2006 by Jun Wu ’98, ’03 and his wife, Yan Zhang, for graduate fellowships in the Department of Computer Science at the Whiting School of Engineering.

Virginia and Edward Wysocki, Sr. Memorial Fellowship in Electrical and Computer Engineering. Established in 2004 by Edward M. Wysocki, Jr. ’72, ’77 in memory of his parents. This fund provides financial aid to graduate students in the Department of Electrical and Computer Engineering at the Whiting School of Engineering.

Dr. Eugene W. Zeltmann and Susan C. Zeltmann Fellowship in Chemistry. Established in 1999 by Eugene Zeltmann, Ph.D., who received his doctorate in chemistry from Johns Hopkins in 1967, and his wife, Susan. The fellowship will provide support to graduate students in the Department of Chemistry at the Zanvyl Krieger School of Arts and Sciences.

Awards and Prizes

Awards and prizes are determined by the academic department or by selected committees.

William H. and Martha P. Amend Award. This award is given to a student participating in ROTC who demonstrates outstanding leadership ability and academic accomplishment.

American Institute of Chemical Engineers Award for Scholastic Achievement. Presented to the chemical and biomolecular engineering student with the highest scholastic standing after the sophomore year.

American Society of Mechanical Engineers Award. This award is given in recognition of outstanding effort and accomplishment on behalf of the JHU American Society of Mechanical Engineers student chapter.

Applied Mathematics and Statistics Achievement Award. This award recognizes outstanding achievement by an applied math and statistics undergraduate across a broad spectrum of departmental activities including academic performance, research, pedagogy, and leadership.
Alexander K. Barton Cup. The Alexander K. Barton Cup is awarded each year to that member of the senior class of any undergraduate department of the university who has most faithfully served the interests and ideals of the university and who, by his character and influence throughout his collegiate course, has best exemplified the qualities which earned and held for Alexander K. Barton, of the Class of 1914 of The Johns Hopkins University, the respect and affection of his fellows, both during his course and his life outside.

James F. Bell Award. Established in honor of James F. Bell, professor emeritus in the Department of Mechanical Engineering, this award recognizes outstanding research and scholarly achievement in mechanical engineering.

Biomedical Engineering Distinguished Service Award. This award is presented to biomedical engineering students who have demonstrated outstanding service to the academic community through their work with the Biomedical Engineering Society (BMES) or the Biomedical Engineering Honor Society (BMEHS).

Biomedical Engineering Research Day Award. This award is given to the top three presentations of the Undergraduate Research Day event.

H. L. Brown Family Travel Award. Awarded to an undergraduate majoring in international studies to assist with travel expenses related to their major.

Lucien Brush Award for Excellence in Environmental Engineering. Established in memory of Lucien M. Brush, Jr., who was a faculty member in the Department of Geography and Environmental Engineering for 25 years. This award is presented annually to the graduating senior with outstanding achievement in environmental engineering.

Alexander R. and Avis M. Butler Prize. This prize is awarded annually in the Department of History for the best research paper written by a student in the first year of graduate study. The prize was established in 1957 by Professor Butler, who received his doctoral degree from the Department of History.

Center for Leadership Education Course Assistant Excellence Award. Established in 2003 to honor the commitment and dedication of outstanding course assistants who have served the Center for Leadership throughout the year. Selection is based on student, faculty, and staff evaluations.

Chemical and Biomolecular Engineering Undergraduate Research Award. Awarded to an undergraduate student who demonstrates contributions to research in chemical and biomolecular engineering.

Chemical and Biomolecular Engineering Special Service Award. Awarded to a student who has made outstanding contributions to the Department of Chemical and Biomolecular Engineering.

Civil Engineering Award. This award is given for outstanding achievement by a graduating senior for academic excellence, leadership, and service in the Department of Civil Engineering.

James S. Coleman Award. This award was established by the Department of Sociology in 1994 in honor of Dr. James S. Coleman, first chair of the department. The award is for outstanding academic achievement by a senior majoring in sociology and is presented at graduation.

Computer Science Outstanding Senior Award. Presented annually to a senior computer science major for academic excellence, leadership, and service in computer science.

Computer Science Outstanding Teaching Award. Presented annually to a student who has demonstrated outstanding effort and skill in assisting with the teaching of computer science courses.

Computer Science Special Service Award. Presented annually to a student who has performed outstanding work to benefit the Department of Computer Science, Johns Hopkins University, and the community.

Charles A. Conklin Award. This award honors Charles A. Conklin III '27 and is presented to outstanding electrical and computer engineering seniors to recognize their academic achievements.

Paul A. C. Cook Award. This award, established by Mrs. Ellie Cook in memory of her husband Paul A. C. Cook '52, an alumnus of the School of Engineering, is presented annually to an outstanding chemical and biomolecular engineering student who is a sophomore or junior.

Cree Family Teaching Assistant Award. Established in 2004 by George C. Creel '55 to honor the effort, enthusiasm, and contribution of teaching assistants in the Department of Mechanical Engineering.

Evangelia Davos Prize. Established in 2007 by Peter Davos '00 in memory of his aunt, this prize is awarded annually to the classics major or minor whose work in Greek studies has been outstanding.

Professor Joel Dean Undergraduate Teaching Awards. Established by Whiting and Krieger School parent Joel Dean, Jr. in honor of his father and funded by the Joel Dean Foundation, this award honors graduate student teaching assistants in the Departments of Mathematics and Economics who demonstrate an intense devotion to teaching.

Professor Joel Dean Awards for Excellence in Teaching. Established by Whiting and Krieger School parent Joel Dean, Jr. in honor of his father and funded by the Joel Dean Foundation, is given annually to one or more teaching assistants or faculty members in the Department of Applied Mathematics and Statistics who demonstrate an intense devotion to teaching and a talent for making mathematics more understandable. The award is based on a review of recommendations from students and faculty and recipients receive a $1,500 prize to honor their work.

Milton S. Eisenhower Library Achievement Award. This award is given to the members of Tau Beta Pi in recognition of their demonstrated academic excellence.

Christopher B. Elser Award. Established in 2004 by friends and family of the late Christopher Elser. In his time at Hopkins, Chris dedicated himself to his friends, soccer, his studies, and the community around him. Awarded annually to a bright and talented upperclassman who shares Chris’s passion for athletics and dedication to the community, it is the family’s hope that this award will keep Chris’s spirit alive on the Homewood campus and beyond.

Electrical and Computer Engineering Student Involvement Award. This award recognizes significant achievement by a graduating senior for academic excellence, leadership, and service in the Department of Electrical and Computer Engineering.

Faculty Award for Service and Academic Achievement Department of Geography and Environmental Engineering. This award is given
to a senior for outstanding service and academic achievement in the Department of Geography and Environmental Engineering.

Francis J. and Mary T. Fisher Research Award. Established by the Fisher family to honor Francis J. Fisher ’63, a committed supporter of the Whiting and Krieger Schools. This award is given annually to an undergraduate student who is excelling academically and is engaged in basic or applied cancer research.

William J. Friday Award. Established in 1997 through the estate of William J. Friday. It is given annually to students in the graduating class who have been designated by the faculty as deserving students.

Genentech Process Research and Development Outstanding Student Award. Established in 2008. Genentech recognizes an outstanding chemical and biomolecular engineering student in disciplines related to the needs of the biotechnology industry.

Robert George Gerstmyer Award. Established in 1993 in memory of Mr. Gerstmyer ‘43 by his two sons and awarded for outstanding undergraduate achievement in mechanical engineering.

Father George S. Glanzman Award. Established in memory of Father George S. Glanzman, a former faculty member of the Department of Near Eastern Studies, this prize is awarded annually for the outstanding paper by an undergraduate or graduate student in Near Eastern Studies.

Louis E. Goodman, M.D. Award. Established by the late Dr. Goodman, a member of the Class of 1934, and his family, to encourage the cultural interests of premedical students at Johns Hopkins and to foster their sensitivity to ideas and matters beyond the realm of medicine. Awarded to a student in his or her junior year to carry out an independent project in the arts or humanities.

Belle and Herman Hammerman Award. This award was established by Belle and Herman Hammerman in honor of their son, Judge Robert I.H. ’50. It is presented to a senior who is entering law school and has combined academic excellence with outstanding qualities of leadership. The award, which includes an inscribed gold medal, is presented at commencement.

Max Hochschild Fund. This prize fund was established in 1954 by Mrs. Charles R. Austrian and Mrs. Albert D. Hutzler to honor their father, Max Hochschild, on his 100th birthday. The prize is awarded annually to the undergraduate student in economics who has shown the greatest promise and proficiency in this field. The recipient of the prize is determined by the Department of Economics and receives the award at commencement.

Jacob H. Hollander Prize Fund. For a number of years Professor Jacob H. Hollander, former chair of the Department of Political Economy, awarded a prize for the best contribution to a college student journal. He bequeathed a sum to the university, the income from which is now awarded annually to an outstanding undergraduate enrolled in the Writing Seminars as selected by the faculty of that department.

William H. Huggins Awards. Established in 1985, these awards are presented to a senior and a junior in the Department of Electrical and Computer Engineering for outstanding scholarship and service to the department and to his or her fellow students.

William H. Huggins Excellence in Teaching Award. Established in 2001 through the estate of William H. Huggins, professor emeritus in the Department of Electrical and Computer Engineering, this award recognizes outstanding faculty at both the undergraduate and graduate levels who demonstrates dedication to students.

Howard Hughes Summer Research Program. The goal of the Howard Hughes Undergraduate Summer Research Fellowship Program is to encourage undergraduates in the Schools of Arts and Sciences and Engineering to pursue a career in biomedical and/or basic research. Fellows receive a stipend of $3,000 and work in the lab of their choice for nine weeks during the summer. Their research results are presented at the end of the program at a poster session. This program, which is open to freshmen, sophomores, and juniors, not only offers an invaluable learning experience but also helps develop important skills in proposal writing, obtaining research funding, carrying out a project, and reporting the results. The Johns Hopkins University gratefully acknowledges the Howard Hughes Medical Institute, which provides the funding for this program.

Richard J. Johns Award. This award was established in honor of Richard J. Johns, M.D., former director of the Department of Biomedical Engineering. It is presented to students who have achieved a high level of academic success.

Johns Hopkins Alumni Association Excellence in Teaching Award. This award honors extraordinary dedication to the University’s teaching mission, exceptional performance in the classroom, and a continuing commitment to tomorrow’s leaders.

Joseph L. Katz Award. Established in 2008, this award is given to chemical and biomolecular engineering seniors for academic excellence in the engineering senior lab course.

Professor Donald E. Kerr Memorial Physics Award. Established by Mr. Albert Nerken in memory of Professor Kerr of the Department of Physics, this award and a medal are awarded annually to the outstanding undergraduate student majoring in physics.

Arthur M. Kouguell Prize. This award was established by the parents and friends of the late Arthur M. Kouguell, Class of 1973. The prize is given annually by the Department of History to the graduating senior whose overall academic performance as a history major best represents Arthur Kouguell’s commitment to scholarly and humane values.

Martin C. Larrabee Award in Biophysics. This award was established by the colleagues, former students, and other friends of Martin C. Larrabee, faculty member in the Department of Biophysics, on the occasion of his 70th birthday. It is awarded annually to a senior for meritorious research in biophysics.

Ernest M. Marks Award. This award is made to graduate teaching assistants in the Department of Chemistry in recognition of excellence in instruction.

Irini J. Maroulis Award. Established in 2010 by Maria Maroulis ‘96, ’01 in memory of her mother, Irini J. Maroulis, this award recognizes an undergraduate engineering student who best exemplifies her dedication to community service and outreach.

Materials Science and Engineering Achievement Award. Awarded for outstanding achievement by a graduating senior in the Department of Materials Science and Engineering.

Senior Design Engineering Award. Recognizes an undergraduate with outstanding contributions to the design and conduct of an independent research project in the Department of Materials Science and Engineering.
Paul A. McCoy Prize. In 1958, a fund was established by Mr. and Mrs. Neal McCoy in memory of their son, a former graduate student in political science at the university. An annual gift for the most distinguished master’s essay in political science is awarded to a student selected by a professional committee of that department.

Capers and Marion McDonald Award for Excellence in Mentoring and Advising. Established in 2005 by Capers and Marion McDonald, this award is given to honor those teachers, researchers, and administrators who have consistently supported the personal and professional development of their students.

Charles A. Miller Award. Named for Charles A. Miller, Jr., ’40, this award recognizes outstanding academic achievement by a mechanical engineering undergraduate.

William Miller Essay Prize. The William Miller Essay Prize is awarded annually for a self-contained essay of outstanding quality in any field of philosophy. The $1000 award is open to students in philosophy at the pre-dissertation stage of their graduate work.

William Kelso Morrill Award. Awarded every spring to the mathematics graduate student who best exemplifies the traits of Kelso Morrill: a love of mathematics, a love of teaching, and a concern for students.

Einora Streb Muly Award. Established by Mr. William Muly ’38 in memory of his wife, Einora Streb Muly. This award sponsors students majoring in chemical engineering who are conducting independent study or independent research on practical problems identified by engineers working in the chemical industry.

Michael J. Muuss Research Award. Established by Dr. Rolf Muuss in memory of his son, Michael J. Muuss ’79. The award is given each year to a Department of Computer Science undergraduate for the best application of research to practice.

Naddor Prize. Established in honor of the late Professor Eliezer Naddor, the first recipient of a Ph.D. in operations research in the United States and a long-time faculty member in the department, this prize is awarded to a non-senior applied mathematics and statistics student for significant achievement in departmentally related academic and extracurricular activities.

David Olton Memorial Endowment Fund. This memorial was established in 1994 in memory of David S. Olton, a former professor in the Department of Psychological and Brain Sciences at The Johns Hopkins University. This fund provides an annual award to a graduating senior for undergraduate excellence in psychology. It also sponsors a yearly speaker in the area of behavioral neuroscience in honor of Dr. Olton’s important contributions in that field.

Christopher J. Pinto Memorial Award. Established by alumni of the Tau Epsilon Phi Fraternity, members of the Class of 1984, and friends of the Pinto family, this award is presented to a senior reflecting the academic and leadership abilities and strong moral character of Chris Pinto, a member of the class of 1984 who died in his senior year.

Joseph C. Pistritto Research Award. Established in 2000 by Joseph C. Pistritto ’79, ’80, a Department of Electrical and Computer Engineering alumnus, this undergraduate research award in computer science is designed to support and foster excellence in undergraduate research. Awardees are selected by a committee, based on students’ research proposals and recommendations.

Robert B. Pond Sr. Achievement Award. Established by the colleagues, former students, and other friends of Professor Robert B. Pond, Sr. This award is given annually by the Department of Materials Science and Engineering to the graduating senior who best exemplifies Robert Pond’s commitment to scholarly and humane values.

Robert B. Pond, Sr. Excellence in Teaching Award. This award is given for commitment to and excellence in instruction, success in instilling the desire to learn, and dedication to undergraduate students. The award is in honor of Robert B. Pond, Sr., professor emeritus in the Department of Materials Science and Engineering.

The Provost’s Undergraduate Research Awards. The Provost’s Undergraduate Research Awards program is an effort to encourage undergraduates to engage in research activity. This program was founded on the belief that involvement in research not only enhances a student’s learning experience, but helps develop important skills in proposal writing, obtaining research funding, carrying out a project, and reporting the results. When students work with faculty sponsors, these skills are nurtured and fine-tuned. The research is performed in either the summer or fall, and any freshman, sophomore, or junior is eligible to apply. Each year, students receive awards in amounts up to $2,500, with the option of conducting their research for academic credit. The Johns Hopkins University gratefully acknowledges the Hodson Trust which has donated the funding for this program.

Sarah and Adolph Roseman Achievement Award. This award in chemistry was established in 1966 by Dr. Ephraim Roseman in memory of his parents. The annual gift is awarded in recognition of outstanding accomplishment in chemistry. The chair of the department determines the student recipient or recipients, and presentation is made at commencement.

Robert Bruce Roulston Prize. Contributions were received beginning in 1944 from former students, colleagues, and friends of Professor Roulston of the Department of German to establish this fund to honor him on the occasion of his retirement from the University. Income from the fund is used for the annual Robert Bruce Roulston Prize for German, which is awarded to the best student in German.

Royal Society of Arts Silver Medal. This prize is awarded for distinguished achievement by an undergraduate in the application of art or science in the field of commerce or industry, and for significant participation in student activities.

Dr. Diane O’Connor Salazar Award. This award was established in memory of Diane O’Connor Salazar ’89 by her family. This is an annual award in the Department of Chemistry, with first preference given to a female graduate student.

David G. Sandberg Award for Campus Leadership. This award, established in 1991 in honor of David G. Sandberg, a member of the Class of 1972, is presented annually to an outstanding junior who has demonstrated dedication to a variety of co-curricular organizations and activities.

Gerard H. Schlimm Award. The Schlimm Award is presented annually to an undergraduate student for exceptional accomplishments in the field of civil engineering.

William N. Sharpe, Jr. Award for Student Involvement. This award honors Professor William N. Sharpe, Jr., founding chair of the Department of Mechanical Engineering, and recognizes significant leadership or
achievement by a mechanical engineering student in extracurricular activities.

Shriver-Howard Scholar Athlete Award. Established by Dr. William H. B. Howard '63 in honor of George Van Bibber Shriver, John Schultz Shriver, William Hand Browne Howard, and Harriet Shriver Rogers, this award is made to the graduating senior who has demonstrated outstanding achievement both academically and athletically while at Johns Hopkins.

Smile Train Award. The Smile Train is a nonprofit organization that is dedicated to helping children born with cleft lips and cleft palates. Working internationally, the Smile Train’s goal is to eradicate the problem of clefts through a comprehensive approach to training doctors, making surgeries available to children and supporting research to find a cure. Additional information on the Smile Train can be found at www.smiletrain.org. Internship awards are being offered to undergraduates who may work in various areas as they apply to cleft lips and palates. Project scope may include but is not limited to clinical studies, genetic research, computer profiling, virtual surgery, speech pathology, psycho/social aspects, healthcare coverage, and internships with craniofacial teams. These are paid internships and include a trip to New York City where the Smile Train scholars will provide a written report on their project and participate in a symposium.

George M. L. Sommerman Engineering Graduate Teaching Assistant Award. Established by electrical engineering alumnus Dr. George M. L. Sommerman ’29, ’33, this annual award recognizes one or more Whiting School of Engineering graduate teaching assistants who have demonstrated excellence and talent in their instruction of undergraduate students.

Julian C. Stanley Award. Established to provide an annual award to an undergraduate student in the Department of Psychological and Brain Sciences who most closely approximates Dr. Stanley’s personal and professional standards of excellence.

Louis Sudler Prize in the Arts. Awarded at commencement to a graduating senior from the Krieger School of Arts and Sciences or the Whiting School of Engineering or a fourth-year student at the School of Medicine who, in the opinion of the faculty, has demonstrated excellence or the highest proficiency in performance, execution, or composition in one of the following general areas: music, theater, writing, painting, sculpture, or visual media such as film, photography, or videotape. The prize is made possible through the generosity of Mr. Louis Sudler, chairman of Sudler and Company, Chicago, who has had a lifelong commitment to the arts and particularly to music.

Tau Beta Pi Appreciation Awards. Recognizes the most active senior members of the Johns Hopkins chapter of Tau Beta Pi.

Linda Trinh Memorial Award. Established in memory of Linda Trinh, Class of 2005, this is awarded to a biomedical engineering design team that embodies her spirit, qualities, and accomplishments.

Robert Tucker Prize in International Studies. Awarded to the best undergraduate senior thesis in international studies.

Julius Turner Memorial Prize. Parents, friends, and relatives of the late Julius Turner, former student and teacher of political science, have contributed funds to make available an annual prize every spring for the best senior essay in the Department of Political Science. A committee consisting of faculty and alumni makes the presentation annually. All majors in the Department of Political Science are eligible to compete.

Severn Teackle Wallis Memorial Prize. Received from the Wallis Memorial Association in 1906, this fund provides a prize for an outstanding essay in Spanish literature or history.

The Florence “Meg” Long Walsh/Second Decade Society Leadership Award. This award was established in memory of Meg Walsh ’84 by her family, The Second Decade Society, classmates, and friends to honor Meg's leadership in the global community and to develop the next generation of Hopkins leadership. The award provides a graduating senior of the Krieger School with a stipend for a year of travel and independent study abroad. It is the largest award of its kind at Hopkins. The Second Decade Society is the leadership development organization for the Krieger School of Arts and Sciences. Society members, elected 10 to 20 years after graduation, are leaders in their professions and communities.

John Boswell Whitehead Award. Established in 1980 by the faculty in the Department of Electrical and Computer Engineering, this award is presented annually for outstanding achievements in electrical and computer engineering by an undergraduate student.

Loy Wilkinson Award. Named for Emeritus Trustee Loy Wilkinson ’54, this award is presented for a demonstrated record of academic excellence, leadership, and service in chemical and biomolecular engineering by graduating seniors.

Wolman Award. Established in memory of M. Gordon “Reds” Wolman, a faculty member in the Department who contributed to the academic growth of the university through service as a department chair and interim provost and through strong advocacy of interdisciplinary studies. This award is given annually to a graduating senior who exhibits both promise and spirit in regards to interdisciplinary work.

Woodrow Wilson Undergraduate Research Fellowship Program. Established in 1999 through the endowment of the James B. Knapp Sr. Deanship, this program provides support for undergraduate research in the humanities, natural sciences, and social sciences. Awards are based on academic merit.

Additional Grants and Funds

Bander Family Fund for Undergraduate Independent Study in Arts and Sciences. Believing that creative minds often seek learning experiences outside the conventional classroom, Neil Bander ’69 established the Bander Family Fund to support undergraduate independent study at the Krieger School of Arts and Sciences. Income from the fund will provide an annual award, on a competitive basis, to one or more qualified sophomores, juniors, or seniors who submit a proposal to pursue independent study. All work must be supervised by a faculty sponsor with a preference (but not a requirement) that it be for academic credit.

Morton K. Blaustein Memorial Fund. Established in 1991 to provide funds for innovative research by students and young faculty members.

John and Diane Cooke History of Art Graduate Travel Fund. Created to provide travel stipends for graduate students to see the objects of their study.
Wm. Hooper Grafflin Fund. Established in 1915 to support and promote original research in the line of industrial chemistry.

William S. Greenberg, Class of 1964, Athletic Education Fund.
In celebration of his 35th reunion, Mr. Greenberg created this fund to recognize the value and importance of the educational experience provided by the men’s varsity fencing program at Johns Hopkins. As a tribute to past, current, and future members of the team, the fund supports the operation and training, including foreign travel, of the men’s varsity fencing program.

J. Brien Key Graduate Student Assistance Fund. This fund is used to provide graduate students at the Krieger School of Arts and Sciences with funds to be used for miscellaneous expenses that they might encounter while pursuing their degrees. This money could be used for books and other fees or other expenses associated with attending the school which may arise, i.e., travel to conduct research or attend scholarly meetings, and any other extemporaneous expenses needed while attending graduate school.

Richard P. Longaker Endowment. Established in 1989 by Dr. Longaker to support research and travel for graduate students whose work focuses on Eastern European studies, especially but not exclusively related to Italy, and on the humanities.

Lita Osmundsen Fund for Summer Field Research. Established in 1993 to support summer field work and research for first-year graduate students in the Department of Anthropology.

Richard B. and Ruth D. Palmer Field Work Fund. Established by graduate alumnus Richard Palmer and his wife, Ruth, the fund encourages students of Earth science to spend time in the field by supporting field work integral to their graduate research in the Department of Earth and Planetary Sciences.
Faculty Listings

Select the school faculty tab for a complete listing of Johns Hopkins University faculty on the Homewood campus.

In listing the members of the teaching staff of the School of Arts and Sciences, the date in parentheses indicates the year of original appointment. Joint appointments or directorships are listed last.

Emeritus Faculty

Professors Emeriti

John Baldwin, Ph.D.
Charles Homer Haskins Professor Emeritus History

Charles Albro Barker, Ph.D.
American History

Stephen Barker, Ph.D.
Philosophy

John Barth, M.A.
The Writing Seminars

Michael Beer, Ph.D.
Biophysics

Maurice Bessman, Ph.D.
Biology

John Boardman, Ph.D.
Mathematics

Luigi Burzio, Ph.D.
Cognitive Science

Carl F. Christ, Ph.D.
Economics

Jerrold Cooper, Ph.D.
W.W. Spence Professor Emeritus of Semitic Languages Near Eastern Studies

Joseph Cooper, Ph.D.
Political Science

Matthew Crenson, Ph.D.
Political Science

Charles Dempsey, Ph.D.
History of Art

Marcel Detienne, Ph.D.
Classics

Gabor Domokos, Ph.D.

Professors

Peter Achinstein (1962)
Professor, Philosophy

Rina Agarwala (2006)
Assistant Professor, Sociology
B.A. 1995, Cornell University; M.A. 1999, Harvard University
Ph.D. 2006, Princeton University

Emily Agree (2012)
Research Professor, Sociology

Karl Alexander (1974)
Professor and Chair, Sociology

John Dewey Professor of Sociology

Bentley Allan (2012)
Assistant Professor, Political Science
Ph.D. 2012, Ohio State University

Ronald Allen (1991)
Adjunct Professor, Physics and Astronomy

Nadia Altschul (2011)
Assistant Professor, German and Romance Languages and Literatures
M.A. 1998, Yale University; M.P.H. 1999, Ph.D. 2002

David Altschuler (1987)
Adjunct Associate Professor, Sociology

Wilda C. Anderson (1978)
Professor, German and Romance Languages and Literatures
B.A. 1972, Cornell, M.A. 1976, Ph.D. 1979

Joel Andreas (2003)
Associate Professor, Sociology
B.A. 1995, University of Illinois at Chicago
M.A. 1998, University of California, Los Angeles Ph.D. 2003

Maxim Arap (2011)
J.J. Sylvester Assistant Professor, Mathematics

N. Peter Armitage (2005)
Assistant Professor, Physics and Astronomy
B.Sc. 1994, Rutgers University
Ph.D. 2002, Stanford University

John Astin (2001)
Visiting Professor, The Writing Seminars
Program in Theater Arts and Studies

Paul Attewell (2010)
Visiting Professor, Sociology

Professor, Physics and Astronomy; Mathematics
Krieger-Eisenhower Professor
Interim Provost (9/2012)
Vice Provost for Graduate Programs and Special Projects (3/2008)

Martina Bagnoli (2008)
Adjunct Associate Professor, History of Art

Jorge Balat (2012)
Assistant Professor, Economics
M.Sc. 2007, Universidad Nacional de La Plata
M.A. 2008, Yale University; M.Phil. 2009; Ph.D. 2012

Gregory F. Ball (1991)
Professor, Psychological and Brain Sciences
Vice Dean for Science and Research Infrastructure (2010)
B.A. 1977, Columbia; Ph.D. 1983, Rutgers

Laurence Ball (1/1994)
Professor, Economics
B.A. 1980, Amherst; Ph.D. 1986, M.I.T.

Bruce Barnett (1976)
Professor, Physics and Astronomy
B.A. 1965, Harvard
Ph.D. 1970, University of Maryland

Olivier Barnouin (2010)
Associate Research Professor, Earth and Planetary Sciences

Douglas Barrick (1997)
Professor, Biophysics; Biology
B.A. 1986, University of Colorado
Ph.D. 1993, Stanford

Karen Beemon (1981)
Professor, Biology; Biophysics
B.S. 1969, University of Michigan
M.A. 1972, UC Berkeley, Ph.D. 1974

Charles Bennett (1/2005)
Gregory Bowman (2005)
Assistant Professor, Biophysics; Biology
B.S. 1994, University of North Carolina
Ph.D. 2001, Princeton University

Arthur Bragg (2010)
Assistant Professor, Chemistry
B.A. 1999, Albion College
Ph.D. 2004, University of California, Berkeley

Ludwig Brand (2012)
Academy Professor
A.B. 1955, Harvard; Ph.D. 1960, Indiana University

Philip Brendese (2013)
Assistant Professor, Political Science
B.A. 1998, Siena College
M.A. 2000, University of Albany
Ph.D. 2005, Duke University

Collin Broholm (1990)
Professor, Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
M.Sc. 1985, University of Copenhagen, Ph.D. 1986

Jeffrey P. Brooks (1990)
Professor, History
B.A. 1965, Antioch; Ph.D. 1972, Stanford

Donald D. Brown (1969)
Adjunct Professor, Biology; Carnegie Institution

Rebecca Brown (2008)
Teaching Professor (2012), History of Art

Betsy Bryan (1986)
Professor, Near Eastern Studies; History of Art

Alexander Badawy Professor of Egyptian Art and Archaeology
B.A. 1971, Mary Washington College
M.A. 1975, Yale, M.Phil. 1976, Ph.D. 1980

Tamas Budavari (2011)
Associate Research Professor, Physics and Astronomy

Angus Burgin (2010)
Assistant Professor, History
B.A. 2002; Ph.D. 2009, Cambridge University

Sharon Cameron (1978)
Professor, English

William R. Kenan Jr. Professor of English
B.A. 1968, Bennington College
M.A. 1969, Brandeis, Ph.D. 1973

Stephen Campbell (2002)
Professor and Chair, History of Art

Henry M. and Elizabeth P. Wiesenfeld Professor
B.A. 1985, Trinity College
M.A. 1988, University of North Carolina
Ph.D. 1993, Johns Hopkins University

Marc Caplan (2006)
Assistant Professor, German and Romance Languages and Literatures
Zelda and Myer Tandetnik Professor in Yiddish Language, Literature and Culture
M.A. 1997 New York University, Ph.D. 2003

Adjunct Assistant Professor, Physics and Astronomy

Christopher Carroll (1995)
Professor, Economics

Victoria Cass (2010)
Visiting Associate Professor, Humanities Center

Sara Castro-Klarén (1/1987)
Professor, German and Romance Languages and Literatures
B.A. 1962, UCLA, M.A. 1965, Ph.D. 1968

Thomas Cebula (2008)
Visiting Professor, Biology

Christopher Celenza (2005)
Professor, German and Romance Languages and Literature’s, Classics; History; Humanities Center

Charles Homer Haskins Professor of History
B.A. 1998, SUNY; M.A. 1989
Ph.D. 1995, Duke University
D.Phil 2001, University of Hamburg

Emma Cervone (2007)
Assistant Professor, Anthropology

Associate Director Program in Latin American Studies
A.B. 1987 Instituto Universitario Orientale
M.A. 1990 University of St. Andrews, Ph.D. 1997

Samuel Chambers (2008)
Associate Professor, Political Science
B.A. 1993 Pomona College
M.A. 1994 Vanderbilt University
Ph.D. 1998 University of Minnesota

Xin Chen (2008)
Assistant Professor, Biology
B.S. 1996 University of Science and Technology, Hefei, China
Ph.D. 2002 University of Texas

Andrew J. Cherlin (1976)
Professor, Sociology; Institute for Policy Studies

Public Policy Program
Benjamin H. Griswold III Professor of Public Policy
B.S. 1970, Yale; M.S. 1974, UCLA, Ph.D. 1976

Chia-Ling Chien (1976)
Professor, Physics and Astronomy

Jacob L. Hain Professor in Arts and Sciences
B.S. 1965, Tunghai University, M.S., 1968
Ph.D. 1973, Carnegie Mellon

Chenghao Chu (2008)
J.J. Sylvester Assistant Professor, Mathematics

M.S. 2003, B.S. 2000, University of Science and Technology of China
Ph.D. 2008, Northwestern University

Associate Professor, Political Science

Charles D. Miller Professor
B.A. 1991, University of California
M.A. 1994, University of Washington
Ph.D. 2003, Northwestern University

Orna Cohen-Fix (2012)
Adjunct Professor, Biology

James Coleman (2010)
Visiting Assistant Professor, German and Romance Languages and Literatures

Richard A. Cone (1969)
Professor, Biophysics; Biology

Nathan Connolly (2008)
Assistant Professor, History
B.A. 1999 Thomas University
M.A. 2000, University of Chicago
M.A. 2004, University of Michigan, Ph.D. 2008

William E. Connolly (1985)
Professor, Political Science
Krieger-Eisenhower Professor
B.A. 1960, University of Michigan, Flint
M.A. 1962, University of Michigan, Ann Arbor
Ph.D. 1965

Caterina Consani (2005)
Professor, Mathematics
B.S. 1986, University of Genoa
Ph.D. 1993, Universities of Genoa-Turin
Ph.D. 1996, University of Chicago

Joseph Cooper (2012)
Academy Professor

Victor Corces (2009)
Adjunct Professor, Biology

Susan Courtney (1999)
Professor, Psychological and Brain Sciences
B.A. 1988, Williams, M.S. 1990
Ph.D. 1993, University of Pennsylvania

Matthew Crenson (1969)
Professor, part-time, Political Science
B.A. 1963, Johns Hopkins University
M.A. 1965, University of Chicago, Ph.D. 1969

Jennifer Culbert (2001)
Associate Professor, Political Science
B.S. 1986, Georgetown
M.S. 1987, London School of Economics and Political Science

Kyle Cunningham (8/1994)
Professor, Biology
B.A. 1984, Johns Hopkins University
Ph.D. 1989, UCLA

Annalisa Czeczulin, M.A.

Adjunct Assistant Professor, Center for Language Education-Russian

Paul Dagdigian (1974)
Professor, Chemistry

Arthur D. Chambers Professor of Chemistry
B.A. 1967, Haverford
Ph.D. 1972, University of Chicago

Andrew Daniel (2007)
Assistant Professor, English
A.B. 1993, University of California, Berkeley
A.B. 1995, Oxford University
Ph.D. 2006, University of California, Berkeley

Ronald Daniels (3/2009)
Professor, Political Science
President, Johns Hopkins University

Veena Das (2000)
Professor, Anthropology, Humanities Center
Krieger-Eisenhower Professor
B.A. 1964, University of Delhi, M.A. 1966, Ph.D. 1970

Steven R. David (1981)
Professor, Political Science
Vice Dean for Undergraduate Education-8/2010, Zanvyl Krieger School of Arts and Sciences
B.A. 1972, Union College; M.A. 1975, Stanford

Carlos Del Castillo (2008)
Associate Research Professor, Earth and Planetary Sciences

Lisa DeLeonardis (2001)
Visiting Associate Professor, History of Art
Austen-Stokes Professor in the Art of the Ancient Americas

Paul Delnero (2008)
Assistant Professor, Near Eastern Studies
B.A. 1994, Purdue University
Ph.D. 2006, University of Pennsylvania

Stefanie DeLuca (2002)
Associate Professor, Sociology
B.A. 1997, University of Chicago
Ph.D. 2002, Northwestern

Daniel Deudney (1998)
Associate Professor, Political Science
Ph.D. 1989, Princeton

Hent de Vries (2003)
Professor, Humanities Center; Philosophy (2004)
Russ Family Professor of the Humanities
M.A. 1983, University of Leiden, Ph.D. 1989

Jocelyne DiRuggiero (2008)
Associate Research Professor, Biology, Earth and Planetary Sciences-(11/2011)

Toby Ditz (1982)
Professor, History
B.A. 1972, Northwestern; M.A. 1975, Columbia
M.Phil. 1976, Ph.D. 1982

Gabor Domokos (1968)
Professor, part-time, Physics and Astronomy
M.A. 1956, Eotvos Lorand University (Budapest)
Doctor of Physical and Mathematical Sciences 1963, Joint Institute of
Nuclear Research, Dubna, Russia

David Draper (1980)
Professor, Chemistry; Biophysics; Biology
Vernon K. Kriebel Professor of Chemistry
B.A. 1971, UC Berkeley
Ph.D. 1977, University of Oregon

Stephen Drigotas, Ph.D.
Teaching Professor (2010), Psychological and Brain Sciences

Gregory Dufree (2008)
Professor, Economics

Carl Christ Professor of Economics
B.A. 1983, Macalester College
Ph.D. 1990, Harvard University

Michael Edidin (1966)
Professor, Biology
B.S. 1960, University of Chicago
Ph.D. 1963, University of London

Howard Egeth (1965)
Professor, Psychological and Brain Sciences, Cognitive Science
A.B. 1961, Rutgers
Ph.D. 1966, University of Michigan

William Egginton (2006)
Professor and Chair, German and Romance Languages and Literatures
Andrew W. Mellon Professor of the Humanities
A.B. 1991, Dartmouth University
M.A. 1994, University of Michigan
A.M. 1996, Stanford University, Ph.D. 1999

Doris Entwisle (1/2003)
Research Professor, Sociology

Joyce Epstein (1975)
Research Professor, Sociology

Hülya Eraslan (2008)
Associate Professor, Economics
B.S. 1991, Bilkent University
M.A. 1994, State University of New York
Ph.D. 2001, University of Minnesota

D. Howard Fairbrother (1997)
Professor, Chemistry
B.A. 1989, Brasenose College, Oxford
Ph.D. 1994, Northwestern

S. Michael Fall (1/2002)
Adjunct Professor, Physics and Astronomy

Christopher Falzone (2007)
Teaching Professor, Chemistry; Biophysics

Chen-Ming Fan (1997)
Adjunct Professor, Biology

Steven Farber (2004)
Adjunct Assistant Professor, Biology

Jon Faust (1/2006)
Professor, Economics

Louis J. Maccini Professor
B.S. 1981, University of Iowa
M. Phil. 1985, Oxford University
Ph.D. 1988, University of California, Berkeley

Lisa Feigenson (2003)
Associate Professor, Psychological and Brain Sciences; Cognitive Science
B.A. 1997, Cornell University
Ph.D. 2003, New York University

Paul D. Feldman (1967)
Research Professor, Physics and Astronomy
A.B. 1960, Columbia College
Ph.D. 1964, Columbia University

Henry Ferguson (2002)
Adjunct Professor, Physics and Astronomy

Professor, Earth and Planetary Sciences
B.S. 1971, Stanford, M.S. 1971
Ph.D. 1975, Harvard

Ann Finkbeiner (1999)
Visiting Associate Professor, part-time, The Writing Seminars

Michael Finkenthal (2003)
Research Professor, Physics and Astronomy

Karen Fleming (2000)
Associate Professor, Biophysics; Biology
B.A. 1987, University of Notre Dame
Ph.D. 1993, Georgetown

Jonathan Flombaum (2008)
Assistant Professor, Psychological and Brain Sciences
A.B. 2002, Harvard
M.S. 2004, M. Phil. 2005
Ph.D. 2008, Yale University

Caroline Fohlin (2004)
Research Professor, Economics

Holland Ford (1988)
Research Professor, Physics and Astronomy
B.S. 1962, University of Oklahoma
Ph.D. 1970, University of Wisconsin

Pier Massimo Forni (1985)
Professor, German and Romance Languages and Literatures
B.A. 1974, University of Pavia
M.A. 1977, Catholic University, Milan
Ph.D. 1981, UCLA

Eckart Förster (2001)
Professor, Philosophy

Humanities Center, German and Romance Languages and Literatures (2002)
B.Phil 1979, Oxford, D.Phil. 1982

Ernesto Freire (1986)
Professor, Biology; Biophysics
B.S. 1972, University Pervana Cayetano Heredia
Medical School, M.S. 1973
Ph.D. 1977, University of Virginia

Michael Fried (1975)
Professor, Humanities Center; History of Art
James R. Herbert Boone Professor of Humanities
B.A. 1959, Princeton; Ph.D. 1969, Harvard

Yulia Frumer (2012)
Assistant Professor, History of Science and Technology
Bo Jung and Soon Young Kim Professor of East Asian Science and Technology
B.A. 2002, Tel Aviv University
M.A. 2004; Ph.D. 2012, Princeton

Joseph G. Gall (1983)
Adjunct Professor, Biology; Carnegie Institution

Michela Gallagher (1996)
Professor, Psychological and Brain Sciences
Krieger-Eisenhower Professor
B.A. 1969, Colgate
Ph.D. 1977, University of Vermont

Bertrand Garcia-Moreno E. (1992)
Professor and Chair of Biophysics; Biology
A.B. 1981, Bowdoin; Ph.D. 1986, Indiana University

Mark Gersovitz (1994)
Professor, Economics
B.A. 1971, McGill
M.A. 1972, Yale, M.Phil. 1973, Ph.D. 1975

Riccardo Giacconi (1982)
University Professor, Physics and Astronomy

Benjamin Ginsberg (1992)
Professor, Political Science
David H. Bernstein Professor of Political Science
B.A. 1968, University of Chicago, M.A. 1970
Ph.D. 1973

Oliver Gjoneski (2011)
J.J. Sylvester Assistant Professor, Mathematics

Anand Gnanadesikan (2011)
Associate Professor, Earth and Planetary Sciences
A.B. 1988, Princeton University
Ph.D. 1994, Massachusetts Institute of Technology

Patrick Godon (2010)
Visiting Assistant Research Professor, Physics and Astronomy

David Goldberg (1998)
Professor, Chemistry
B.A. 1989, Williams
Ph.D. 1995, M.I.T

Eduardo González (1982)
Professor, German and Romance Languages and Literatures
B.A. 1965, University of South Florida, M.A. 1967
Ph.D. 1975, Indiana University

Linda Gorman, Ph.D.
Teaching Professor (2010), Psychological and Brain Sciences

Marc Greenberg (2002)
Professor, Chemistry
B.S. 1982, New York University; B.E. 1982
The Cooper Union School of Engineering
Ph.D. 1988, Yale University

Andrei Gritsan (2005)
Associate Professor, Physics and Astronomy
B.S. 1994, Novosibirsk State University, Russia
M.S. 1996
Ph.D. 2000, University of Colorado

Steven Gross (2006)
Associate Professor, Philosophy
Cognitive Science; PBS-(2012)
A.B. 1987, Harvard University, Ph.D. 1998

Siba Grovogui (1995)
Professor, Political Science
M.A. 1984, University of Wisconsin, Ph.D. 1988

John Grunsfeld (2010)
Research Professor, Physics and Astronomy

Jane Guyer
Professor, Anthropology; History
B.A. 1965, London School of Economics and Political Science
Ph.D. 1972, University of Rochester

Niloofar Haeri (1990)
Professor and Chair, Anthropology

Thomas Haine (1999)
Professor and Chair, Earth and Planetary Sciences
Morton K. Blaustein Professor and Chair of Earth and Planetary Sciences
B.A. 1988, St. Catharines College, University of Cambridge
Ph.D. 1992, University of Southampton

Justin Haidera (2003)
Associate Professor, Psychological and Brain Sciences, Cognitive Science
College of Charleston
Ph.D. 2001, New York University

Bruce Hall (2012)
Assistant Professor, History
B.A. 1994, University of Toronto
M.A. 1995, Queens University-Canada
Ph.D. 2005, University of Illinois

Marnie Halpern (1994)
Adjunct Professor, Biology
Bruce Hamilton (1973)
Professor part-time, Economics
B.A. 1968 Grinnell College
Ph.D. 1972, Princeton University

Clara Han (2007)
Assistant Professor, Anthropology
B.A. 1997, Princeton University
M.D. 2007, Harvard University, Ph.D. 2007

Michael Hanchard (2006)
Professor, Political Science
Society of Black Alumni Presidential Professor
A.B. 1981, Tufts University
M.A. 1985, New School for Social Research
Ph.D. 1991, Princeton University

Lingxin Hao (1996)
Professor, Sociology
B.A. 1982, South China Teachers University
M.A. 1985, Zhongshan University
Ph.D. 1990, University of Chicago

Michel Harrower (2010)
Assistant Professor, Near Eastern Studies
Earth and Planetary Sciences-(2011)
B.A. 1998, Simon Frazier University
M.A. 2001; Ph.D. 2000, Ohio State University

Samer Hattar (2004)
Associate Professor, Biology
B.S. 1991, Yarmouk University
M.S. 1993, American University of Beirut
Ph.D. 2000, University of Houston

Michael Hauser (1/1997)
Adjunct Professor, Physics and Astronomy

Timothy Heckman (1/1989)
Professor, Physics and Astronomy

A. Hermann Pfund Professor
B.A. 1973, Harvard
Ph.D. 1978, University of Washington

Edward M. Hedgecock (1988)
Professor, Biology
B.S. 1974, California Institute of Technology
Ph.D. 1976, UC Santa Cruz

Richard C. Henry (1968)
Academy Professor (2012)
Research Professor, Physics and Astronomy
B.Sc. 1961, University of Toronto, M.A. 1962
Ph.D. 1967, Princeton

Jared Hickman (2008)
Assistant Professor, English
B.A. 2001, Bowdoin College
Ph.D. 2008, Harvard University

Vincent Hilser (2010)
Professor, Biology; Biophysics
B.S. 1987, St. Johns University
M.S. 1991, Manhattan College

Ph.D. 1995, Johns Hopkins University

Linda Hinnov (2004)
Research Professor, Earth and Planetary Sciences

Paul Hofer (1988)
Adjunct Assistant Professor, Psychological and Brain Sciences

Peter Holland (2001)
Professor, Psychological and Brain Sciences
Krieger-Eisenhower Professor
B.S. 1972, Michigan State University
Ph.D. 1976, Yale

M. Andrew Hoyt (1/1988)
Professor, Biology
B.S. 1977, State University of New York at Stony Brook
Ph.D. 1983, UC Berkeley

Yingyao Hu (2011)
Associate Professor, Economics
B.E. 1994, Tsinghua University, Beijing
M.A. 1997, Fudan University, Shanghai
M.S.E., M.A. 2001, Johns Hopkins University, Ph.D. 2003

Ru-Chih Huang (1965)
William David McElroy Research Professor, Biology
B.S. 1953, National Taiwan University
M.S. 1956, VPI; Ph.D. 1960, Ohio State University

Ho-Fung Hung (2011)
Associate Professor, Sociology
B.Soc.Sc. 1995, Chinese University of Hong Kong
M.Phil. 1998
M.A. 1999, State University of New York
Ph.D. 2004 Johns Hopkins University

Nicholas Ingolia (2010)
Adjunct Assistant Professor, Biology

John T. Irwin (1977)
Professor, The Writing Seminars; English
The Decker Professor in the Humanities
B.A. 1962, University of St. Thomas
M.A. 1970, Rice University, Ph.D. 1970

Nicolas Jabko (2011)
Associate Professor, Political Science
M.A. 1994; Ph.D. 2001, University of California, Berkley

Richard Jasnow (1995)
Professor, Near Eastern Studies
B.A. 1977, University of Wisconsin
M.A. 1986, University of Chicago, Ph.D. 1988

Olivier Jeanne (2008)
Professor, Economics
1987, Graduate, Ecole Nationale des Ponts et Chaussée, Paris
Ms.C 1991, London School of Economics
Ph.D. 1996, Ecole des Hautes Etudes en Sciences Sociales

Peter Jelavich (2001)
Professor, History
B.A. 1975, Amherst
M.A. 1977, Princeton, Ph.D. 1982
Margaret Johnson (2012)
Assistant Professor, Biophysics
B.S. 2004, Columbia University
Ph.D. 2009, University of California-Berkeley
Michael Johnson (1994)
Professor, History
A.B. 1963, Knox College
M.A. 1967, Stanford, Ph.D. 1973
Mayumi (Yuki) Johnson (2010)
Teaching Professor and Director, Center for Language Education
B.A. 1979, Seijo University
M.A. 1989, University of Michigan
Ph.D. 1994, University of Minnesota
Richard Kagan (1972)
Professor, History; German and Romance Languages and Literatures
Arthur O. Lovejoy Professor of History
B.A. 1965, Columbia
Ph.D. 1968, Cambridge University
Patricia Kain (2004)
Teaching Professor, English
Director, Expository Writing Program (EWP)
Marc Kamionkowski (2011)
Professor, Physics and Astronomy
B.A. 1987, Washington University;
Ph.D. 1991, University of Chicago
David Kaplan (2002)
Professor, Physics and Astronomy
B.A. 1991, University of California, M.S. 1996
Ph.D. 1999, University of Washington
Jared Kaplan (2012)
Assistant Professor, Physics and Astronomy
B.S. 2005, Stanford University;
Ph.D. 2009, Harvard University
Robert Kargon (1965)
Professor, History of Science and Technology
Willis K. Shepard Professor of History of Science
B.S. 1959, Duke; M.S. 1960, Yale
Ph.D. 1964, Cornell
Kenneth Karlin (1989)
Professor, Chemistry
Ira Remsen Professor of Chemistry
B.S. 1970, Stanford; Ph.D. 1975, Columbia University
Edi Karni (1981)
Professor, Economics
Scott and Barbara Black Professor of Economics
B.A. 1965, The Hebrew University, M.A. 1970
M.A. 1971, University of Chicago, Ph.D. 1971
David Katz (2006)
Visiting Assistant Professor, Near Eastern Studies
Richard S. Katz (1976)
Professor and Chair, Political Science
A.B. 1969, University of Michigan
M.Phil. 1971, Yale, Ph.D. 1974
Margaret Keck (1995)
Professor, Political Science; German and Romance Languages and Literatures
Herbert L. Kessler (1976)
Professor, History of Art
B.A. 1961, University of Chicago
M.F.A. 1963, Princeton, Ph.D. 1965
Professor, Economics
Abram G. Hutzler Professor of Political Economy
B.S. 1969, London School of Economics
M.Phil. 1972, Yale, Ph.D. 1973
Naveeda Khan (2006)
Assistant Professor, Anthropology
B.A. 1992, Vassar College
M.A. 1995, New School for Social Research
Ph.D. 2003, Columbia University
Dong-Won Kim (1999)
Visiting Professor, History of Science and Technology
Sharon Kingsland (1981)
Professor, History of Science and Technology
B.S. 1973, University of Toronto, M.A. 1977, Ph.D. 1981
Nitya Kitchloo (2010)
Professor, Mathematics
B.S. 1993, California Institute of Technology
Ph.D. 1998, Massachusetts Institute of Technology
Matthew Klam (2009)
Assistant Professor, The Writing Seminars
B.A. 1986, Hollins College
M.A. 1992, University of New Hampshire
James Knierim (2/2009)
Associate Research Professor, Psychological and Brain Sciences
Franklin Knight (1973)
Professor, History
Leonard and Helen R. Stulman Professor of History
Director, Center for Africana Studies, (1/2011)
B.A. 1964, London University of the West Indies
M.A. 1965, University of Wisconsin, Ph.D. 1969
Melvin L. Kohn (2012)
Academy Professor
B.A. 1948, Cornell, Ph.D. 1952
Douglas Koshland (1987)
Adjunct Professor, Biology; Carnegie Institution
Susan Kövesi-Domokos (1974)
Professor, part-time, Physics and Astronomy
Ph.D. 1963, Eotvos Lorand University (Budapest)
Sharon Krag (2005)
Adjunct Professor, Biology
Jonathan Kramnick (1/2013)
Professor, English
B.A. 1989, Cornell University
M.A. 1992, Johns Hopkins University; Ph.D. 1995

Elena Krasnokutskaya (2010)
Assistant Professor, Economics
B.A. 1993, Fudan University, B.Ed. 1990
M.A. 1995, University of Virginia
Ph.D. 2000, University of Pennsylvania

Andrea Krauss (2011)
Assistant Professor, German and Romance Languages and Literatures
Ph.D. 2001, Freie Universität Berlin

Professor, Physics and Astronomy
S.B. 1971, M.I.T.
Ph.D. 1977, University of California

Reiji Kuruvilla (2005)
Associate Professor, Biology
B.Sc. 1987, Calcutta University, B.Ed. 1990
Ph.D. 1998, University of Houston

Michael Kwass (2011)
Associate Professor, History
B.A. 1986, University of Pennsylvania
M.A. 1989, University of Michigan; Ph.D 1994

Barbara Landau (1/2000)
Professor, Cognitive Science, Psychological and Brain Sciences
Dick and Lydia Todd Faculty Development Professor of Cognitive Science
Vice Provost for Faculty Affairs (2011)
B.A. 1970, University of Pennsylvania
Ed.M. 1977, Rutgers
Ph.D. 1982, University of Pennsylvania

Pier Larson (1998)
Professor, History
B.A. 1985, University of Minnesota
M.A. 1987, University of Wisconsin, Ph.D. 1992

Jacob Lauinger (2010)
Assistant Professor, Near Eastern Studies
B.A. 1999, Princeton University
M.A. 2001; Ph.D. 2007, University of Chicago

Thomas Leckta (6/1994)
Professor, Chemistry
Jean and Norman Scowe Professor of Chemistry
B.A. 1985, Oberlin; Ph.D. 1991, Cornell

Juliette Lecomte (2007)
Professor, Biophysics; Biology
B.S. 1977, Université de Liège, Belgium
M.S. 1979, Carnegie Mellon University, Ph.D. 1982

Yuan Chuan Lee (1965)
Research Professor, Biology McCollum—Pratt Institute
B.S. 1955, National Taiwan University, M.S. 1957
Ph.D. 1962, Iowa State University

Young-Sam Lee (2010)
Assistant Professor, Biology
B.S. 1995; M.S. 1997, Seoul National University, Korea
M.S. 2000, Indiana University
Ph.D. 2005, University of Chicago

Geraldine Legendre (1995)
Professor, Cognitive Science
B.A. 1971, Lycée d’Etat Marguerite de Navarre, Bourges, France
Ph.D. 1987, UC San Diego

Robert Leheny (2000)
Associate Professor, Physics and Astronomy
A.B. 1989, Princeton
Ph.D. 1997, University of Chicago

Brad Leithauser (2007)
Professor, The Writing Seminars
B.A. 1975 Harvard University
J.D. 1980, Harvard University

Lori Leonard (2007)
Adjunct Associate Professor, Anthropology

Stuart W. Leslie (1984)
Professor and Chair, History of Science and Technology History (2004)
B.A. 1974, Carleton
M.A. 1976, University of Delaware, Ph.D. 1980

Michael Levien (2013)
Assistant Professor, Sociology
B.A. 2001, Williams College
M.A. 2007, University of California-Berkeley
Ph.D. May 2013

Naomi Levin (2009)
Assistant Professor, Earth and Planetary Sciences
B.A. 2000, B.S. 2000, Stanford University
M.S. 2002, University of Arizona
Ph.D. 2008, University of Utah

Theodore Lewis (2002)
Professor, Near Eastern Studies
Blum-Iwry Professor of Near Eastern Studies
B.A. 1978, University of Wisconsin, M.A. 1979
Ph.D. 1986, Harvard

Ruth Leys (1980)
Professor, Humanities Center; History
Henry M. and Elizabeth P. Wiesenfeld Professor
B.A. 1961, Oxford University

Michael Joseph Lichten (2012)
Adjunct Professor, Biology

John Lind (2011)
J.J. Sylvester Assistant Professor, Mathematics

Hans Lindblad (1/2011)
Professor, Mathematics
M.S. 1985, Lund Institute of Technology; Ph.D. 1989

Leonardo Lisi (2008)
Assistant Professor, Humanities Center
B.A. 2002, University of York
M.Phil. 2004, M.A. 2004, Ph.D. 2008; Yale University

Morris Low (1/2007)
Adjunct Associate Professor, History of Science and Technology
B.S. 1982, Griffith University, B.S. 1984
Ph.D. 1993, University of Sydney

Richard Macksey (1958)
Professor, part-time, Humanities Center, The Writing Seminars

Petar Maksimovic (1/2001)
Professor, Physics and Astronomy
B.S. 1992, University of Belgrade
Ph.D. 1997, M.I.T.

Douglas Mao (2007)
Professor, English
B.A. 1987, Harvard University
Ph.D. 1993, Yale University

Nina Markovic (2002)
Associate Professor, Physics and Astronomy
B.S. 1993, University of Zagreb, Croatia
Ph.D. 1998, University of Minnesota

Renee Marlin-Bennett (2007)
Professor, Political Science
B.A. 1981, Pomona College
S.M. 1983, M.I.T., Ph.D. 1987

Paola Marrati (2003)
Professor, Humanities Center; Philosophy (2004)
M.A. 1988, Università degli studi di Pisa
D.E.A. 1989, École des Hautes Études en Sciences Sociales
Ph.D. 1995 Université Marc Bloch, Strasbourg

Tobias Marriage (2010)
Assistant Professor, Physics and Astronomy
A.B. 2000; Ph.D. 2006, Princeton University
C.A.S.M. 2001, University of Cambridge

Bruce Marsh (1974)
Professor, Earth and Planetary Sciences
B.S. 1969, Michigan State University
M.S. 1971, University of Arizona
Ph.D. 1974, UC Berkeley

Professor, History
B.A. 1983, Cambridge University
M.A. 1985, Johns Hopkins University; Ph.D. 1990

J. Michael McCaffery (2006)
Research Professor, Biology

Stephan McCandliss (1999)
Research Professor, Physics and Astronomy

P. Kyle McCarter Jr. (1985)
Professor, Near Eastern Studies
William Foxwell Albright Professor of Biblical and Ancient Near Eastern Studies
B.A. 1967, University of Oklahoma
M.Div. 1970, McCormic Theological Seminary
Ph.D. 1974, Harvard

Susan McCarter (2000)
Adjunct Assistant Professor, Near Eastern Studies
Professor and Chair, Chemistry Bernard N. Baker Professor in Chemistry
B.S. 1985, SUNY at Albany
Ph.D. 1989, University of Wisconsin

James Meyer (2012)
Adjunct Professor, History of Art

Tobie Meyer-Fong (2000)
Associate Professor, History
B.A. 1989, Yale

Deborah Mifflin (1999)
Associate Teaching Professor, German and Romance Languages and Literatures
Coordinator, German Language Program

William P. Miniccozi II (1994)
Professor, Mathematics
Krieger-Eisenhower Professor
B.A. 1990, Princeton
Ph.D. 1994, Stanford

Sidney Mintz (2004)
Research Professor, Anthropology

Michele Miozzo (2005)
Assistant Research Professor, Cognitive Science

Robert A. Moffitt (1995)
Professor and Chair, Economics; Institute for Policy Studies Public Policy Program
Krieger-Eisenhower Professor
B.A. 1970, Rice
M.A. 1972, Brown, Ph.D. 1975

Silvia Montiglio (2010)
Professor, Classics
Gildersleeve Professor of Classics
Laurea 1984, University of Pavia

H. Warren Moos (1964)
Research Professor, Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
Sc.B. 1957, Brown, M.A. 1959
Ph.D. 1961, University of Michigan

Jack Morava (1980)
Professor, Mathematics; Physics and Astronomy
Ph.D. 1969, Rice University

Philip Morgan (2000)
Professor and Chair, History
Harry C. Black Professor of History
B.A. 1971, Cambridge University
Ph.D. 1977, University College London

Anne Eakin Moss (2012)
Assistant Professor, Humanities Center
B.A. 1995, Harvard
M.A. 1998, Stanford; Ph.D. 2005

Kenneth Moss (2002)
Associate Professor, History
Felix Posen Professor of Modern Jewish History
B.A. 1996, Rutgers University

Evangelos N. Moudrianakis (1965)
Professor, Biology; Biophysics
B.S. 1959, University of Athens
M.A. 1963, Johns Hopkins University, Ph.D. 1964

Charles Mountain (2005)
Professor, part-time, Physics and Astronomy

Dean Moyar (2002)
Associate Professor, Philosophy
B.S. 1994, Duke University
M.A. 1998, University of Chicago, Ph.D. 2002

Stephen Murray (2009)
Research Professor, Physics and Astronomy

Christopher Nealon (2008)
Professor, English
B.A. 1989, Williams College
M.F.A. 1993, Warren William College
Ph.D. 1997, Cornell University

Jacques Neefs (2006)
Professor, German and Romance Languages and Literatures
James M. Beall Professor of French Literature
Maîtrise 1968, Ecole Normale Superieure (Ulm)
Ph.D. 1987, Universite de Paris VIII

David Neufeld (1989)
Professor, Physics and Astronomy
B.A. 1981, Cambridge University
M.Sc. 1983, University of Sussex
Ph.D. 1987, Harvard

Katherine Newman (9/2010)
Professor, Sociology

James B. Knapp Dean (9/2010)
Zanvyl Krieger School of Arts and Sciences
B.A. 1975, University of California, San Diego
Ph.D. 1979, University of California, Berkeley

Stephen Nichols (2010)
Research Professor, German and Romance Languages and Literatures

Predrag Nikolic (2009)
Adjunct Assistant Professor, Physics and Astronomy

Adjunct Professor, History of Art

Aaron Noonberg (1989)
Adjunct Assistant Professor, Psychological and Brain Sciences

Colin Norman (12/1983)
Professor, Physics and Astronomy
B.E. 1969, University of Melbourne
D.Phil. 1973, Oxford

Juan Obarrio (2009)
Assistant Professor, Anthropology
Licenciado 1996, University of Buenos Aires
M. Phil. 2001, Ph.D. 2006, Columbia University

Kate Okikiolu (1/2011)
Professor, Mathematics
B.A. 1986, Cambridge University
Ph.D. 1991, UCLA

Peter Lee Olson (1977)
Professor, Earth and Planetary Sciences
B.A. 1972, University of Colorado
M.A. 1974, UC Berkeley, Ph.D. 1977

Akira Omaki (2011)
Assistant Professor, Cognitive Science
B.A. 2002, University of Hawaii
M.A. 2005, Sofia University
Ph.D. 2010, University of Maryland

Yi-Ping Ong (2010)
Assistant Professor, Humanities Center
B.A. 2001, Oxford University
M.A. 2004, 2006; Ph.D. 2009; Harvard University

Thomas Osborn (1987)
Research Professor 1/1/2009, Earth and Planetary Sciences
Engineering A.B. 1963, University of Illinois, M.S. 1964
Ph.D. 1969, UC San Diego

Katrin Pahl (8/2005)
Associate Professor, German and Romance Languages and Literatures
Maîtrise 1992, Université de Paris, IV, Sorbonne
Ph.D. 2001, University of California, Berkeley

Anand Pandian (2007)
Associate Professor, Anthropology
B.A. 1994, Amherst University
Ph.D. 2004, University of California, Berkeley

Nick Papageorge (2012)
Assistant Professor, Economics
B.A. 2000, University of Chicago
M.A. 2005, Die Humboldt University
Ph.D. 2012 Washington University

Gabriel Paquette (2011)
Assistant Professor, History
B.A. 1999, Wesleyan University
M.A. 2001, National University of Island
M.Phil. 2002; Ph.D. 2006, University of Cambridge

Soojin Park (2011)
Assistant Professor, Cognitive Science
B.A. 2004, Yonsei University, Korea
M.S. 2005; M.Phil. 2006; Ph.D. 2008, Yale University

Benjamin Passey (2009)
Assistant Professor, Earth and Planetary Sciences
B.S. 2001, M.S. 2004, Ph.D. 2007, University of Utah

Elizabeth Patton (1999)
Visiting Assistant Professor, Humanities Center

Felipe Pereda (2011)
Professor, History of Art
Nancy H. and Robert E. Hall Professor of the Humanities

B.A. 1991, Universidad Complutense de Madrid
B.A. 1994, Universidad Nacional de Educacion Distancia
Ph.D. 1996, Universidad Autonoma de Madrid

Herbert Petri (1992)
Adjunct Professor, Psychological and Brain Sciences

Cedomir Petrovic (2007)
Adjunct Professor, Physics and Astronomy

Stephen Plank (1997)
Associate Professor, Sociology
B.A. 1990, Northwestern
M.A. 1992, University of Chicago, Ph.D. 1995

Douglas Poland (1969)
Professor, Chemistry
B.A. 1961, Cornell, Ph.D. 1966

Deborah Poole (2002)
Professor, Anthropology
B.A. 1974, University of Michigan
Ph.D. 1984, University of Illinois

Maria Portuondo (2008)
Associate Professor, History of Science and Technology
B.S.E.E. 1984, University of Miami
Ph.D. 2005, Johns Hopkins University

Gary H. Posner (1969)
Research Professor, Chemistry

Jean and Norman Scowe Professor of Chemistry
B.A. 1964, Brandeis
Ph.D. 1968, Harvard

Lawrence Principe (1997)
Professor, History of Science and Technology
Chemistry; Philosophy (2004)

Drew Family Professor in the Humanities
B.A. and B.S. 1983, University of Delaware
Ph.D. 1988, Indiana University
Ph.D. 1996, Johns Hopkins University

Peter Privalov (1991)
Research Professor, Biology; Biophysics

Faculty of Physics 1956, Tbilisi University, Georgia USSR
Ph.D. 1964

Lawrence Ralifman (1992)
Adjunct Assistant Professor, Psychological and Brain Sciences

Brenda Rapp (1994)
Professor and Chair, Cognitive Science
Psychological and Brain Sciences
B.S. 1979, University of Maryland
M.A. 1987, Johns Hopkins University, Ph.D. 1991

Peter Rapp (2008)
Adjunct Professor, Psychological and Brain Sciences

Kyle Rawlins (2010)
Assistant Professor, Cognitive Science
B.A. 2003; B.S. 2003, University of Massachusetts M.A. 2006
Ph.D. 2008, University of California, Santa Cruz

Daniel Reich (1990)
Professor and Chair, Physics and Astronomy  
Ph.D. 1988, University of Chicago  

Brian Reilly (2010)  
Visiting Assistant Professor, German and Romance Languages and Literatures  

Sharlyn Rhee (2005)  
Visiting Assistant Professor, Humanities Center  

Adam Riess (1/2006)  
Professor, Physics and Astronomy  
Thomas J. Barber Professor of Physics and Astronomy  
B.S. 1992, M.I.T.  
A.M. 1994, Harvard University  
Ph.D. 1996, Harvard University  

Mark O. Robbins (1/1986)  
Professor, Physics and Astronomy  
B.A. 1977, Harvard; M.A. 1977  
Ph.D. 1983, University of California  

Elijah Roberts (2012)  
Assistant Professor, Biophysics  
B.S. 1996, Ohio University;  
Ph.D. 2010, University of Illinois  

James Roberts (2010)  
Assistant Research Professor, Earth and Planetary Sciences  

Elizabeth Rodini (2004)  
Teaching Professor/Director of Museums and Society  
B.A. 1986, University of Wisconsin  
M.A. 1989, University of Michigan  
Ph.D. 1995, University of Chicago  

Steven Rokita (2012)  
Professor, Chemistry  
B.S. 1979, University of California-Berkeley  
Ph.D. 1983, MIT  

Matthew Roller (1994)  
Professor, Classics  
B.A. 1988, Stanford  
M.A. 1990, UC Berkeley, Ph.D. 1994  

George Rose (2002)  
Professor, Biophysics, Krieger-Eisenhower Professor  
B.S. 1963, Bard College  
M.S. 1972, Oregon State University, Ph.D. 1976  

Jesse Rosenthal (2010)  
Assistant Professor, English  
B.A. 1998, Swarthmore College  
M.A. 2003; M.Phil. 2005  
Ph.D. 2009, Columbia University  

Justine Roth (2003)  
Associate Professor, Chemistry  
B.S. 1994, University of Florida  
Ph.D. 2000, University of Washington  

Erin Rowe (2012)  
Assistant Professor, History  
Ph.D. 2005, Johns Hopkins University  

William Rowe (1982)  
Professor, History  
John and Diane Cooke Professor of Chinese History  
A.B. 1967, Wesleyan  
M.A. 1976, Columbia University, Ph.D. 1980  

Catherine Royer (2005)  
Visiting Professor, Biophysics  

Elena Russo (2000)  
Professor, German and Romance Languages and Literatures  
Baccalaurat 1977, Lycée Chateaubriand  
Licence ès Lettres 1982, Université de Genève  
Ph.D. 1988, Princeton  

Marina Rustow (2010)  
Associate Professor, History  
Charlotte Bloomberg Professor in the Humanities  
M.A. 1998; M.Phil 1999  
Ph.D. 2004, Columbia University  

Mary Ryan (2002)  
Professor, History  
John Martin Vincent Professor in History  
B.A. 1967, University of Wisconsin, M.A. 1968  
Ph.D. 1971, University of California  

Robert Rynasiewicz (1986)  
Professor, Philosophy  
Sc.B. 1974, Brow  
Ph.D. 1981, University of Minnesota  

Lester M. Salamon (1986)  
Professor, Political Science  
B.A. 1964, Princeton; Ph.D. 1971, Harvard  

Mary Jo Salter (2007)  
Professor and Co-Chair, The Writing Seminars  
B.A. 1976, Harvard University  
M.A. 1978, University of Cambridge  

Olya Samilenko (1992)  
Adjunct Associate Professor, Center for Language Educatio-Russian  

Yuya Sasaki (2012)  
Assistant Professor, Economics  
B.S. 2002, Utah State University  
M.S. 2007; Ph.D. 2012, Brown University  

George Scangos (1/1992)  
Adjunct Professor, Biology  

Joel Schildbach (1996)  
Professor, Biology  
B.A. 1986, Oregon State University  
Ph.D. 1992, Harvard  

Robert Schleif (1989)  
Professor, Biology, Biophysics  
B.S. 1963, Tufts; Ph.D. 1967, UC Berkeley  

Daniel Schlozman (2012)  
Assistant Professor, Political Science  

Elizabeth Rodini (2004)  
Teaching Professor/Director of Museums and Society  
B.A. 1986, University of Wisconsin  
M.A. 1989, University of Michigan  
Ph.D. 1995, University of Chicago  

Steven Rokita (2012)  
Professor, Chemistry  
B.S. 1979, University of California-Berkeley  
Ph.D. 1983, MIT  

Matthew Roller (1994)  
Professor, Classics  
B.A. 1988, Stanford  
M.A. 1990, UC Berkeley, Ph.D. 1994  

George Rose (2002)  
Professor, Biophysics, Krieger-Eisenhower Professor  
B.S. 1963, Bard College  
M.S. 1972, Oregon State University, Ph.D. 1976  

Jesse Rosenthal (2010)  
Assistant Professor, English  
B.A. 1998, Swarthmore College  
M.A. 2003; M.Phil. 2005  
Ph.D. 2009, Columbia University  

Justine Roth (2003)  
Associate Professor, Chemistry  
B.S. 1994, University of Florida  
Ph.D. 2000, University of Washington  

Erin Rowe (2012)  
Assistant Professor, History  
Ph.D. 2005, Johns Hopkins University  

William Rowe (1982)  
Professor, History  
John and Diane Cooke Professor of Chinese History  
A.B. 1967, Wesleyan  
M.A. 1976, Columbia University, Ph.D. 1980  

Catherine Royer (2005)  
Visiting Professor, Biophysics  

Elena Russo (2000)  
Professor, German and Romance Languages and Literatures  
Baccalaurat 1977, Lycée Chateaubriand  
Licence ès Lettres 1982, Université de Genève  
Ph.D. 1988, Princeton  

Marina Rustow (2010)  
Associate Professor, History  
Charlotte Bloomberg Professor in the Humanities  
M.A. 1998; M.Phil 1999  
Ph.D. 2004, Columbia University  

Mary Ryan (2002)  
Professor, History  
John Martin Vincent Professor in History  
B.A. 1967, University of Wisconsin, M.A. 1968  
Ph.D. 1971, University of California  

Robert Rynasiewicz (1986)  
Professor, Philosophy  
Sc.B. 1974, Brow  
Ph.D. 1981, University of Minnesota  

Lester M. Salamon (1986)  
Professor, Political Science  
B.A. 1964, Princeton; Ph.D. 1971, Harvard  

Mary Jo Salter (2007)  
Professor and Co-Chair, The Writing Seminars  
B.A. 1976, Harvard University  
M.A. 1978, University of Cambridge  

Olya Samilenko (1992)  
Adjunct Associate Professor, Center for Language Educatio-Russian  

Yuya Sasaki (2012)  
Assistant Professor, Economics  
B.S. 2002, Utah State University  
M.S. 2007; Ph.D. 2012, Brown University  

George Scangos (1/1992)  
Adjunct Professor, Biology

Professor, Biology  
B.A. 1986, Oregon State University  
Ph.D. 1992, Harvard  

Robert Schleif (1989)  
Professor, Biology, Biophysics  
B.S. 1963, Tufts; Ph.D. 1967, UC Berkeley  

Daniel Schlozman (2012)  
Assistant Professor, Political Science
Faculty Listings

A.B. 2003 Harvard University; Ph.D. 2011

Trina Schroer (1/1990)
Professor, Biology
B.S. 1980, Stanford; Ph.D. 1986, UC San Francisco

Regine Schulz (2008)
Adjunct Professor, Near Eastern Studies
Glenn Schwartz (1996)
Professor and Chair, Near Eastern Studies
Whiting Professor of Archaeology
B.A. 1976, Yale, M.Phil. 1980, Ph.D. 1982

Loreto Sánchez Serrano (1999)
Associate Teaching Professor (2010), German and Romance Languages and Literatures

Alan Shapiro (1997)
Professor, Classics; History of Art
W. H. Collins Vickers Professor of Archaeology
B.A. 1971, Swarthmore
M.A. 1972, UC Berkeley; Ph.D. 1977, Princeton

Adam Sheingate (2000)
Associate Professor, Political Science
B.S. 1991, University of Wisconsin, M.A. 1993
Ph.D. 1998, Yale

Amy Shelton (1/2002)
Associate Professor, Psychological and Brain Sciences
B.S. 1993, Illinois State University
Ph.D. 1999, Vanderbilt

Todd Shepard (2008)
Associate Professor, History; German and Romance Languages and Literatures
B.A. 1991, Wesleyan University
Ph.D. 2002 Rutgers University

Bernard Shiffman (1973)
Professor and Chair, Mathematics
B.S. 1964, M.I.T.; Ph.D. 1968, University of California

Vyacheslav Shokurov (1991)
Professor, Mathematics
D.Sc. 1976, Steklov Institute
Ph.D. 1976, Moscow State University

Stephen Shore (2007)
Assistant Professor, Economics
A.B. 1998, Princeton University
M.A. 2001, Harvard University, Ph.D. 2003

Harry Sieber (1967)
Professor, German and Romance Languages and Literatures
History B.A. 1963, Baylor
Ph.D. 1967, Duke University

Joseph Silk (2010)
Homewood Professor, Physics and Astronomy

Beverly J. Silver (1992)
Professor, Sociology
B.A. 1980, Barnard

Ph.D. 1992, SUNY, Binghamton

Harris J. Silverstone (1/1965)
Professor, Chemistry
A.B. 1960, Harvard
Ph.D. 1964, California Institute of Technology

David Smith (1/2003)
Professor, The Writing Seminars
Elliott Coleman Professor
B.A. 1965, University of Virginia
M.A. 1969, Southern Illinois University
Ph.D. 1976, Ohio University

Wayne Smith (2000)
Adjunct Professor, Political Science
Brian Smithling (2012)
Assistant Professor, Mathematics
S.B. 2001, MIT
M.S. 2003, University of Chicago; Ph.D. 2007

Paul Smolensky (1994)
Professor, Cognitive Science
Krieger-Eisenhower Professor
A.B. 1976, Harvard
M.S. 1977, Indiana University, Ph.D. 1981

Christopher Sogge (1996)
Professor, Mathematics
J.J. Sylvester Professor
B.A. 1982, University of Chicago
Ph.D. 1985, Princeton

Rachel Somerville (11/1/2008)
Associate Research Professor, Physics and Astronomy

Research Professor, Economics

Lester Spence (2005)
Associate Professor, Political Science
B.A. 1991, University of Michigan, Ph.D. 2001

Gabrielle Spiegel (1993)
Professor, History
Krieger-Eisenhower Professor
B.A. 1964, Bryn Mawr; M.A.T. 1965, Harvard
M.A. 1970, Johns Hopkins University, Ph.D. 1974

Allan Spradling (1980)
Adjunct Professor, Biology; Carnegie Institution

Joel Spruck (1992)
Professor, Mathematics
J.J. Sylvester Professor of Mathematics
B.S. 1967, Columbia University
M.S. 1969, Stanford, Ph.D. 1971

Neta Stahl (2008)
Assistant Professor, Humanities Center
B.A. 1996, Tel Aviv University, M.A. 1998, Ph.D. 2005

Walter Stephens (1999)
Professor, German and Romance Languages and Literatures
Charles S. Singleton Professor of Italian Studies
B.A. 1972, Yale, M.A. 1976; Ph.D. 1979, Cornell
Mark Stiles (2004)
Adjunct Professor, Physics and Astronomy
Richard Stolarski (2010)
Research Professor, Earth and Planetary Sciences
Maureen Stone (1996)
Adjunct Professor, Cognitive Science
Carl Strehlke (1998)
Adjunct Professor, History of Art
Darrell F. Strobel (1984)
Professor, Earth and Planetary Sciences; Physics and Astronomy
B.S. 1964, North Dakota State University
A.M. 1965, Harvard, Ph.D. 1969
Elisabeth Strowick (1/2008)
Professor, German and Romance Languages and Literatures
Diploma 1994, Ph.D. 1998, University of Hamburg
Associate Professor, Psychological and Brain Sciences; Mind/Brain Institute
Robert G. Merrick Jr. Research Chairholder
B.S. 1993, Ph.D. 1998, Ruhr-Universitat Bochum, Germany
Hirotaka Sugawara (2008)
Visiting Professor, Physics and Astronomy
Michael Sullivan (2007)
Visiting Assistant Professor, Classics
Eric Sundquist (2010)
Professor and Chair, English
Andrew W. Mellon Professor of the Humanities
B.A. 1974, University of Kansas
M.A. 1976; Ph.D. 1978, Johns Hopkins University
Raman Sundrum (2000)
Professor, Physics and Astronomy
Alumni Centennial Professor
B.Sc. 1984, University of Sydney; Ph.D. 1990, Yale
Dimitri A. Sverjensky (1984)
Professor, Earth and Planetary Sciences
B.S. 1974, University of Sydney
M.Phil. 1977, Yale, Ph.D. 1980
Morris Swartz (1998)
Professor, Physics and Astronomy
B.S. 1976, Worcester Polytechnic Institute
Ph.D. 1983, University of Chicago
Alexander Szalay (1989)
Professor, Physics and Astronomy
Alumni Centennial Professor
B.Sc. 1969, Kossuth University
M.Sc. 1972, Eotvos University, Ph.D. 1975
Katalin Szlavecz (1998)
Associate Research Professor, Earth and Planetary Sciences
Oleg Tchernyshyov (2002)
Associate Professor, Physics and Astronomy
Engineer-physicist 1990, Moscow Institute of Physics and Technology
Ph.D. 1998, Columbia University
Mark Teaford (2003)
Adjunct Professor, Biology
Steven Teles (2008)
Associate Professor, Political Science
B.A. 1989, George Washington University
Ph.D. 1995, University of Virginia
L. Nandi Theunissen (2012)
Assistant Professor, Philosophy
Duane L. Peterson Professor of Ethics
B.A. 2002, University of Western Australia
B.A. 2003 University of Sydney, M.A. 2006
Ph.D. 2012, Columbia
Mark Thompson (2010)
Associate Professor, English
B.A. 1993, University of Virginia
M.A. 1998; Ph.D. 2001, New York University
Rochelle Tobias (1996)
Professor, German and Romance Languages and Literatures
Mihai Tohaneanu (2011)
J.J. Sylvester Assistant Professor, Mathematics
Joel Tolman (2002)
Associate Professor, Chemistry
B.A. 1990, Rutgers
Ph.D. 1997, Yale
John Toscano (1995)
Professor and Chair, Chemistry
B.A. 1987, Princeton
Ph.D. 1993, Yale
John Tovar (2005)
Associate Professor, Chemistry
B.S. 1997 UCLA.; Ph.D. 2002, M.I.T.
Craig Townsend (1976)
Professor, Chemistry; Biology; Biophysics
Alsoph H. Corwin Professor of Chemistry
B.A. 1969, Williams; Ph.D. 1974, Yale
Kellee Tsai (2000)
Professor, Political Science
Vice Dean for Humanities and Social Sciences (2010)
B.A. 1989, Barnard
M.Phil. 1996, Columbia University, Ph.D. 1999
Pier Luigi Tucci (2010)
Assistant Professor, History of Art
Ph.D. 2001, University of Rome
Kathryn Tuma (2005)
Associate Professor, History of Art
Second Decade Society Career Development Assistant Professor
Herica Valladares (2005)
Assistant Professor, Classic
B.A. 1995 Oberlin College
M.A. 1999, Columbia University, M.Phil 2000, Ph.D. 2005
Roeland Van der Marel (2002)
Adjunct Professor, Physics and Astronomy
Mark Van Doren (1999)
Professor, Biology
B.A. 1987, Cornell
Ph.D. 1994, UC San Diego
David R. Veblen (1981)
Professor, Earth and Planetary Sciences; Engineering
Curtis Ventriss (2008)
Adjunct Professor, Institute for Policy Studies-Public Policy Program
Ceres Gomes Victora (2010)
Visiting Associate Professor, Anthropology
Gary Vikan (1984)
Adjunct Professor, History of Art
Ben Vinson (2006)
Professor, History
Herbert Baxter Adams Professor of History
Vice Dean for Centers Graduate Programs and Interdepartmental Programs (1/2011)
A.B. 1992, Dartmouth University
M.Phil, M.A. 1992, Columbia University, Ph.D. 1998
Judith Walkowitz (1989)
Professor, History
A.B. 1967, University of Rochester, M.A. 1968, Ph.D. 1974
Ronald Walters (1970)
Professor, Histot
A.B. 1963, Stanford
M.A. 1965, UC Berkeley, Ph.D. 1971
Darryn W. Waugh (1997)
Professor, Earth and Planetary Sciences
B.S. 1985, University of Waikato; M.S. 1987
Ph.D. 1991, University of Cambridge
Hal Weaver (2006)
Research Professor, Physics and Astronomy
Kimberly Weaver (1998)
Adjunct Professor, Physics and Astronomy
Bernadette Wegenstein (2006)
Research Professor, German and Romance Languages and Literatures
David Weishampel (2006)
Adjunct Professor, Biology
Beverly R. Wendland (1998)
Professor and Chair, Biology; Biophysics
B.S. 1986, UC San Diego; Ph.D. 1994, Stanford
Meredith Williams (2000)
Professor, Philosophy
B.A. 1969, New York University
M.A. 1970, University of Chicago
Ph.D. 1974, New York University
Michael Williams (2000)
Professor and Chair, Philosophy
Krieger-Eisenhower Professor
B.A. 1968, Oxford University
Ph.D. 1973, Princeton
Robert Williams (11/1993)
Adjunct Professor, Physics and Astronomy
Associate Professor, Cognitive Science
B.A. 1995, University of Colorado
Ph.D. 2000, Johns Hopkins University
W. Stephen Wilson (1977)
Professor, Mathematics
Nathaniel Winstead (2010)
Assistant Research Professor, Earth and Planetary Sciences
Sarah Woodson (3/1999)
Professor, Biophysics; Biology
Thomas C. Jenkins Professor of Biophysics
B.A. 1982, Kalamazoo College
Ph.D. 1987, Yale
Jonathan Wright (2008)
Professor, Economics
B.A. 1990, Trinity College, Dublin
M.Sc. 1992, London School of Economics
A.M. 1995, Harvard University, Ph.D. 1997
Rosemary Wyse (1987)
Professor, Physics and Astronomy
B.Sc. 1978, University of London
Ph.D. 1982, University of Cambridge
Steven Yantis (1986)
Professor and Chair, Psychological and Brain Sciences
Cognitive Science B.S. 1978, University of Washington
Ph.D. 1985, University of Michigan
David R. Yarkony (1977)
Professor, Chemistry
D. Mead Johnson Professor of Chemistry
B.A. 1971, SUNY Stony Brook
Ph.D. 1975, UC Berkeley
Michael Yassa (2011)
Assistant Professor, Psychological and Brain Sciences
B.A. 2002; M.A. 2007, Johns Hopkins University
Ph.D. 2010, University of California, Irvine
Dimitrios Yatromanolakis (2003)
Associate Professor, Classics; Anthropology
Humanities Center
B.A. 1992, University of Athens
M.St. 1993, D.Phil. 1998, University of Oxford

H. Peyton Young (2009)
Research Professor, Economics

Emily Zackin (2013)
Assistant Professor, Political Science
B.A. 2002, Swarthmore College
M.A. 2004, Columbia; Ph.D. 2010, Princeton

Benjamin Zaitchik (2008)
Assistant Professor, Earth and Planetary Sciences
A.B. 1998, Harvard University
M.S. 2001, Cornell University
Ph.D. 2006, Yale University

Nadia Zakamska (2010)
Assistant Professor, Physics and Astronomy
B.Sc. 1999; M.Sc. 2001, Moscow Institute of Physics and Technology
Ph.D. 2005, Princeton University

Alessandro Zannirato (2005)
Associate Teaching Professor, German and Romance Languages and Literatures

David Zappulla (2008)
Assistant Professor, Biology
B.A. 1995, Middlebury College
Ph.D. 2002, Stony Brook University

Melinda Zeder (2001)
Adjunct Professor, Near Eastern Studies

Haiqing Zhao (2002)
Associate Professor, Biology
B.S. 1985, Beijing University, M.S. 1988
Ph.D. 1997, Yale University

Yixian Zheng (1999)
Adjunct Professor, Biology

Larzer Ziff (1/2000)
Research Professor, English

Steven Zucker (1984)
Professor, Mathematics

Other Faculty Appointments

Lecturers
Fadel Abdallah, M.S.
Center for Language Education-Arabic 2007

Muhammed Alan, Ph.D.
Mathematics 2009

Bruce Anderson Alan, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2010

Emily Anderson, Ph.D.
Classics 2010

Catherine R. Arthur, M.A.

History 2008

Sanchita Balachandran, M.A.
Senior Lecturer, Near Eastern Studies
Curator JH Archaeological Museum

Carl Bausch, J.D.
Earth and Planetary Sciences

Turgay Bayraktar, Ph.D.
Mathematics 2011

Glenn Blake, M.A.
Senior Lecturer
The Writing Seminars 2006; 2008

Anne Elizabeth Brodsky, Ph.D.
English (EWP) 2007

Richard Brown, Ph.D.
Senior Lecturer
Mathematics 2009

Lucy Bucknell, M.A.
Senior Lecturer
The Writing Seminars 2000; 2008

Beatrice Caplan, Ph.D.
German and Romance Languages and Literatures 2006

Aiguo Chen, M.A.
Center for Language Education-Chinese 2008

Xin Chen, Ph.D.

Joan Chen-Main, Ph.D.
Cognitive Science 2012

Clay Cogswell, M.F.A.
The Writing Seminars 2010

Zri Y. Cohen, Ph.D.
Center for Language Education-Hebrew 2011

Kristin Cook-Gailloud, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2009

Tristan Davies, M.A.
Senior Lecturer
The Writing Seminars 1987; 1997

Lisa DeLeonardis, Ph.D.
Senior Lecturer, History of Art 2004

Linda DeLibero, M.A.
Senior Lecturer, Writing Seminars 2001
Director, Film and Media Studies

Margaret Denithorne
The Writing Seminars
(Program in Theater Arts and Studies) 2007

Larissa D’Souza, Ph.D.
Senior Lecturer, Chemistry 2012
William Evans, M.F.A., M.A.  
Senior Lecturer, English 2005

Emily Fisher, Ph.D.  
Biology 2008

Carolyn Fitch, Ph.D.  
Senior Lecturer, Biophysics 2012

Patrick Fleming, Ph.D.  
Senior Lecturer  
Biophysics 2004; 2007

Heather Roberts Fox, Ph.D.  
Psychological and Brain Sciences 2011

Paula Gefaell-Borras  
German and Romance Languages and Literatures 2008

James Glossman  
The Writing Seminars  
(Program in Theater Arts and Studies) 2004

Aaron Goodfellow, Ph.D.  
Senior Lecturer, Anthropology 2012

Aaron Goodfellow, Ph.D.  
Senior Lecturer, Anthropology 2010

James D. Goodyear, Ph.D.  
Senior Lecturer  
Associate Director, Public Health Studies Program 2000

Jane Greco, Ph.D.  
Senior Lecturer, Chemistry 2006

Claude Guillemand, D.E.A.  
Senior Lecturer  
German and Romance Languages and Literatures 1991

Stephen Harris, J.D.  
Sociology 1/1993 (part-time)

Floyd Hayes, Ph.D.  
Senior Lecturer  
Center for Africana Studies 2004  
Coordinator, Programs in Africana Studies

Robert Horner, Ph.D.  
Senior Lecturer  
Biology 1989

Audrey Huang, Ph.D.  
Biology 2005

Aranzazu M. Hubbard, M.A.  
German and Romance Languages and Literatures 2010

Ann Jarema, M.S.  
Psychological and Brain Sciences 2007

Veronika Jicinska, Ph.D.  
German and Romance Languages and Literatures 2010

Gregory Kane  
Lecturer

The Writing Seminars 2008 (part-time)

Choonwon Kang, Ph.D.  
Center for Language Education-Korean 1990

Satoko Katagiri, M.A.  
Center for Language Education-Japanese 2003

Jian Kong, Ph.D.  
Senior Lecturer  
Mathematics 2004

Chris Kraft, Ph.D.  
Psychological and Brain Sciences 2002

Huei-ying Kup, Ph.D.  
Senior Lecturer, Sociology 2011

Senior Lecturer, The Writing Seminars

Lu Li, M.A.  
Center for Language Education-Chinese 2010

Liman Lievens, B.A.  
Center for Language Education-Chinese 1996

Farrah Madison, Ph.D.  
Psychological and Brain Sciences 2011

Sarah Manekin, B.A.  
English 2008

John Mann, Ed.D.  
Senior Lecturer  
The Writing Seminars 2004; 2008

Joseph H. Martin, Ph.D.  
The Writing Seminars  
(Program in Theater Arts and Studies) 2007

Naiara Martinez-Velez, M.A.  
German and Romance Languages and Literatures 2011

Laura Mason, Ph.D.  
Senior Lecturer  
History 2011

Don Mathis, Ph.D.  
Cognitive Science 2012

David McNeal, M.A.  
Center for Language Education-Chinese 2011

Robert Mintz, Ph.D.  
Program in Museums and Society 2010

Alexios Monopolis, Ph.D.  
Earth and Planetary Sciences 2012

Barbara Morgan, Ph.D.  
Senior Lecturer  
Economics 2006

Anne-Elizabeth Murdy Brodsky, Ph.D.  
English 2007
Makiko Nakao, M.A.
Center for Language Education-Japanese 1994

Carolyn Norris, Ph.D
Senior Lecturer
Biology 2000

Marie Theresa O’Connor, Ph.D.
English 2010

Sakiko Olsen, Ph.D.
Senior Lecturer
Earth and Planetary Sciences 1996

George Oppel, Ph.D.
English 2010

Louise Pasternack, Ph.D.
Senior Lecturer
Chemistry 2001

Rebecca Pearlman, Ph.D.
Senior Lecturer
Biology 2001

Sergio Ruiz Perez, M.A.
German and Romance Languages and Literatures 2011

Martin Perschler, Ph.D.
History of Art 2009

Matthew Porterfield
The Writing Seminars (Film and Media Studies) 2008

Maria del Rosario Ramos, Ph.D.
German and Romance Languages and Literatures 2008

Ellen Robbins, Ph.D.
Near Eastern Studies 1992

Christov Roberson, Ph.D.
Biology 2012

Jimmy J. Roche, M.F.A.
The Writing Seminars-Film and Media Studies 2010

William Roche
The Writing Seminars (Program in Theater Arts and Studies) 2004

Mark Rom, Ph.D.
Political Science 2010

Sara Romero, M.A.
German and Romance Languages and Literatures 2012

Suzanne Roos, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 1993

Uma Saini, M.A.
Senior Lecturer
Center for Language Education-Hindi 2000

Steve Scafidi, M.F.A.
The Writing Seminars 2008

Richard Shingles, Ph.D.

Joanne Simpson
The Writing Seminars 1999

Khairi Tahrawi, Ph.D.
Center for Language Education-Arabic 2004

Alexandra Tan, Ph.D.
Biophysics 2012

Kathryn Tifft, Ph.D.
Biology 2012

Michelle Tracy, M.A.
German and Romance Languages and Literatures 2007

Jason Trageser, Ph.D.
Psychological and Brain Sciences 2011

Tina Trapane, Ph.D.
Senior Lecturer
Chemistry 1999

Jason Tyler, B.A.
The Writing Seminars (Film and Media Studies) 2011

Magda von der Heydt, Ph.D.
Senior Lecturer
Sociology 2006

Christine Waddail, M.A.
Center for Language Education 2007

Kathryn Wagner, Ph.D.
Senior Lecturer
Political Science 2010
Program Coordinator Aitchison Program

Meredith Ward, M.A.
The Writing Seminars (Film and Media Studies) 2008

Sue Waterman, M.L.S.
German and Romance Languages and Literatures 2003

Barry Weingarten, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 1999

Heidi Wheeler, M.A.
Senior Lecturer
German and Romance Languages and Literatures 1999

Greg Williamson, M.A.
Senior Lecturer
The Writing Seminars 1989

April Wuensch, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2004
Coordinator, French Elements

Julia Yarmolinskaya, Ph.D.
Cognitive Science 2011
Center for Language Education 2007

Nan Zhao, M.Ed.
Center for Language Education 2012

Military Science

Paul Carroll
Lieutenant Colonel
Director and Professor of Military Science

Laurie Forand
Major
Training and Operations Officer

Matthew Dusablon
Captain
Executive Officer

Erik Mineo
Captain, Director of Scholarship and Enrollment

Garth Ambersley
Master Sergeant
Senior Army Instructor

Jelani A. Edwards
Master Sergeant
Senior Military Instructor

Joint Appointments

Marilyn Albert, Ph.D.
Professor (Medicine)
Psychological and Brain Sciences 2005

Mariam Alexander, M.D., M.P.H.
Assistant Professor (Public Health)
Public Health Studies Program 2010

Richard Allen, Ph.D.
Assistant Professor (Medicine)
Psychological and Brain Sciences 1997

Nan Marie Astone, Ph.D.
Associate Professor (Public Health)
Sociology 1989

Jay Baraban, Ph.D.
Professor (Medicine)
Psychological and Brain Sciences 2007

Stanley Becker, Ph.D.
Professor (Public Health)
Public Health Studies Program 2008

David Bishai, Ph.D.
Associate Professor (Public Health)
Economics 2006
Public Health Studies Program 2008

Amanda Blackford, Sc.M.
Biostatistician (Medicine)
Public Health Studies Program 2010

Dana F. Boatman
Associate Professor (Medicine)
Cognitive Science 5/1993

Jef Boeke, Ph.D., D.Sc.
Professor (Medicine)
Adjunct Professor, Biology, 2007

Lee Bone, M.P.H., R.N.
Associate Professor (Public Health)
Public Health Studies Program 2010

Lynda Burton, Sc.D.
Adjunct Associate Professor (Public Health)
Public Health Studies Program 2010

Shiyi Chen, Ph.D.
Professor (Engineering)
Physics and Astronomy 4/2006

Lawrence Cheskin, M.D.
Associate Professor (Public Health)
Public Health Studies Program 2011

Nathaniel Comfort, Ph.D.
Associate Professor (Medicine)
History of Science and Technology 2004

Charles Edward Connor, Ph.D.
Professor (Medicine)
Director, Krieger Mind/Brain Institute
Psychological and Brain Sciences 2006

Leslie Cope, Ph.D., M.S.E.
Assistant Professor (Medicine)
Public Health Studies Program 2010

Robert Dalrymple, Ph.D.
Professor (Engineering)
Earth and Planetary Sciences 1/2002

John Desmond, Ph.D.
Associate Professor (Medicine)
Cognitive Science 2007

William Eaton, Ph.D.
Professor (Public Health)
Sociology 1989

David Edwin, Ph.D.
Associate Professor (Medicine)
Psychological and Brain Sciences 1990; 1999

Jason Eisner, Ph.D.
Associate Professor (Engineering)
Cognitive Science 2002

Margaret Ensminger, Ph.D.
Professor (Public Health)
Sociology 1992

Joshua Epstein, Ph.D.
Professor (Medicine)
Economics 2010

Greg Eyink, Ph.D.
Professor (Engineering)
Mathematics 2004
Physics and Astronomy 4/2006

Ruth Faden, Ph.D.
Professor (Public Health)
Policy Studies Program, Institute for Policy Studies
Arts and Sciences 9/1992

Michael Falk, Ph.D.
Professor (Engineering)
Physics and Astronomy 2009

Mary Fissell, Ph.D.
Professor (Medicine)
History 1/2007
History of Science and Technology 1/1992

Carolyn Furr-Holden, Ph.D.
Assistant Professor (Public Health)
Public Health Studies Program 2011

Kelly Gebo, M.D., M.P.H.
Associate Professor (Medicine)
Sociology 2008
Director, Public Health Studies Program, KSAS

Barry Gordon, M.D.
Professor (Medicine)
Cognitive Science 1992

David Gracias, Ph.D.
Associate Professor (Engineering)
Chemistry 2004

Seth Guikema, Ph.D.
Assistant Professor (Engineering)
Earth and Planetary Sciences 2011

Steve Hanke, Ph.D.
Professor (Engineering)
Economics 1971

Marta Hanson, Ph.D.
Assistant Professor (Medicine)
History of Science and Technology 2005

Kevin Hemker, Ph.D.
Professor (Engineering)

Stewart Hendry, Ph.D.
Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002

Argye Hillis-Trupe, Ph.D.
Professor (Medicine)
Cognitive Science 1999

Steven Hsiao, Ph.D.
Associate Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002

Pien-Chien Huang, Ph.D.
Professor (Public Health)
Biophysics 2004

Takeru Igusa, Ph.D.
Professor (Engineering)
Mitsukuni Nishida, Ph.D.
Assistant Professor (Business)
Economics 2010

Catherine Norman, Ph.D.
Assistant Professor (Engineering)
Economics 2010

Randall Packard, Ph.D.
Professor (Medicine)
History 2003
History of Science and Technology 1/2002

Cindy Parker, M.D., M.P.H.
Assistant Professor (Public Health)
Earth and Planetary Sciences 2010

Darcy Phelan, Ph.D.
Assistant Scientist (Public Health)
Public Health Studies Program 2011

Paula Pitha-Rowe, Ph.D.
Professor (Medicine)
Biology 2007

Gianna Pomata, Ph.D.
Professor (Medicine)
German and Romance Languages and Literatures 2010
History of Science and Technology 2008

Kenneth Rose, Ph.D.
Professor (Medicine)
Earth and Planetary Sciences 2011

Erica J. Schoenberger, Ph.D.
Professor (Engineering)
Anthropology 1989

Peter Searson, Ph.D.
Professor (Engineering)
Physics and Astronomy 2006

Robert Siliciano, M.D., Ph.D.
Professor (Medicine)
Biology 2007

Katherine Smith, Ph.D.
Associate Professor (Public Health)
Sociology 2005

Marc Stein, Ph.D.
Assistant Professor (Education)
Sociology 2012

Donald Steinwachs, Ph.D.
Professor (Public Health)
Public Health Studies Program 2010

James Tielsch, Ph.D.
Professor (Public Health)
Public Health Studies Program 2010

Daniel Todes, Ph.D.
Professor (Medicine)
History of Science and Technology 1984

Michael Trush, M.P.H.
Professor (Public Health)
Public Health Studies Program 2010

Amy Ong Tsui, Ph.D.
Professor (Public Health)
Sociology 2002

Rudiger von der Heydt, Ph.D.
Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002

David Weishample
Professor (Medicine)
Earth and Planetary Sciences 2012

Susan Weiss, Ph.D.
Chair/Faculty (Peabody)
German and Romance Languages and Literatures 2002

Peter Wilcock, Ph.D.
Professor (Engineering)
Earth and Planetary Sciences 2011

Michael Yu, Ph.D.
Associate Professor (Engineering)
Chemistry 2001

Scott Zeger, Ph.D.
Professor (Public Health)
Public Health Studies Program 2011

Barry Zirkin, M.P.H.
Professor (Public Health)
Public Health Studies Program 2010

_In listing the members of the teaching staff of the School of Engineering, the date in parentheses indicates the year of original appointment. Any joint appointments or directorships are listed last._

**Professors Emeriti**

John Boland, Ph.D.
Geography and Environmental Engineering

Moise H. Goldstein Jr., D.Sc.
Electrical and Computer Engineering

Willis Gore
Electrical and Computer Engineering

Robert Green, Ph.D.
Materials Science and Engineering

Richard I. Joseph, Ph.D.
Electrical and Computer Engineering

Joseph L. Katz, Ph.D.
Chemical and Biomolecular Engineering

Jerome Kruger, Ph.D.
Materials Science and Engineering
C. Harvey Palmer Jr., Ph.D.
Electrical and Computer Engineering

Wilson J. Rugh, Ph.D.
Electrical and Computer Engineering

William Sharpe, Ph.D.
Mechanical Engineering

Eugene D. Shchukin, Ph.D.; Dr.Sc.
Research Professor Emeritus, Geography and Environmental Engineering

Charles (Roger) Westgate, Ph.D.
Electrical and Computer Engineering

**Professors**

Soumyadipta Acharya (2010)
Assistant Research Professor, Biomedical Engineering

Yanif Amad (2010)
Assistant Professor, Computer Science
B.E. 2001, Imperial College of Science, Technology and Medicine
M.S., 2004, Brown University, Ph.D. 2009

Associate Research Professor, Biomedical Engineering

Yair Amir (1995)
Professor, Computer Science
B.S. 1985, Technion, Haifa, M.S. 1990
Ph.D. 1995, Hebrew University of Jerusalem

Andreas Andreou (1987)
Professor, Electrical and Computer Engineering
B.S. 1978, Higher Technical Institute, Cyprus
M.S. 1982, Johns Hopkins University, Ph.D. 1986

Gregory Aranovich (2002)
Research Professor, Chemical and Biomolecular Engineering

Giuseppe Ateniese (1999)
Associate Professor, Computer Science
B.S. 1995, University of Salerno
Ph.D. 2000, DISI, University of Genoa

Athreya Avanti (2011)
Assistant Research Professor, Applied Mathematics and Statistics

Joel Bader (2003)
Associate Professor, Biomedical Engineering
Computer Science
B.S. 1986, Lehigh University
Ph.D. 1989, UC Berkeley

William P. Ball (1992)
Professor, Geography and Environmental Engineering; Civil Engineering
B.S. 1976, University of Virginia
M.S. 1977, Stanford, Ph.D. 1990

John Baty (2012)
Assistant Research Professor, Materials Science and Engineering

Michael J. Betenbaugh (1988)
Professor, Chemical and Biomolecular Engineering
B.S. 1981, University of Virginia
Ph.D. 1988, University of Delaware

Michael Bevan (2008)
Associate Professor, Chemical and Biomolecular Engineering
B.S. 1994, Lehigh University
Ph.D. 1999, Carnegie Mellon University

Edward J. Bouwer (1985)
Abel Wolman Professor and Chair, Geography and Environmental Engineering; Civil Engineering
B.S. 1977, Arizona State University
M.S. 1978, Stanford, Ph.D. 1982

Vladimir Braverman (2011)
B.S. 1998; M.S. 2004, Ben-Gurion University at Negev
Ph.D. 2011, University of California, Los Angeles

Grace S. Brush (1978)
Professor, Geography and Environmental Engineering
B.S. 1949, St. Francis Xavier University
M.S. 1951, University of Illinois
Ph.D. 1956, Harvard

Randal Burns (2001)
Associate Professor, Computer Science
B.S. 1993, Stanford
M.S. 1997, UC Santa Cruz, Ph.D. 2000

Chris Callison-Burch (2007)
Assistant Research Professor, Computer Science

Robert C. Cammarata (1987)
Professor, Materials Science and Engineering
Mechanical Engineering

Stephen Checkoway (2012)
Assistant Research Professor Computer Science

Kai Loon Chen (2008)
Assistant Professor, Geography and Environmental Engineering
B.E. 2001, University of Singapore; M. E. 2003, National University of Singapore
M.S. 2004, Yale University; Ph.D. 2008, Yale University.

Gregory S. Chirikjian (1992)
Professor, Mechanical Engineering; Computer Science; Electrical and Computer Engineering;
Applied Mathematics and Statistics
B.S. 1988, Johns Hopkins University; M.S. 1988
Ph.D. 1992, California Institute of Technology

Noah Cowan (2003)
Associate Professor, Mechanical Engineering;
Computer Science
B.S. 1995, Ohio State, M.S., 1997
Ph.D. 2001 University of Michigan

Honggang Cui (2010)
Assistant Professor, Chemical & Biomolecular Engineering
B.S. 1999 Beijing University of Chemical Technology
M.S. 2002, Tsinghua University
Ph.D. 2007, University of Delaware

The Willard & Lillian Hackerman Professor, Civil Engineering; Earth and Planetary Sciences in Arts and Sciences
A.B. 1967, Dartmouth
M.S. 1968, University of Hawaii
Ph.D. 1973, University of Florida

Nitin Daphalapurkar (2012)
Assistant Research Professor, Mechanical Engineering

Frederic M. Davidson (1970)
Professor, Electrical and Computer Engineering
B.S. 1964, Cornell
Ph.D. 1969, University of Rochester

Marc D. Donohue (1979)
Professor, Chemical and Biomolecular Engineering Director, Advanced Technology Lab
B.S. 1973, Clarkson College of Technology
Ph.D. 1977, UC Berkeley

Andrew S. Douglas (1983)
Professor, Mechanical Engineering; Biomedical Engineering
Vice Dean for Faculty, Whiting School of Engineering (2007), Interim Dean, Whiting School of Engineering
B.S. 1975, University of Cape Town, M.S. 1977
Ph.D. 1982, Brown University

Jason Eisner (2000)
Professor, Computer Science
B.S. 1990, Harvard; M.S. 1993, Cambridge University
Ph.D. 2001, University of Pennsylvania

Jafaar El-Awady (2010)
Assistant Professor, Mechanical Engineering
B.S. 2001 Cairo University M.S. 2003
Ph.D. 2008, University of California, Los Angeles

Mounya Elhilali (2008)
Assistant Professor, Electrical and Computer Engineering
B.S. 1998, Al Akhawayn University
M.S. 2003, University of Maryland; Ph.D. 2004

J. Hugh Ellis (1984)
Professor, Geography and Environmental Engineering; Chair, Civil Engineering
B.S. 1979, University of Waterloo, M.S. 1981, Ph.D. 1984

Jonah Erlebacher (2000)
Professor, Materials Science and Engineering
Chemical and Biomolecular Engineering
B.S. 1991, Yale; Ph.D. 1999, Harvard

Ralph R. Etienne-Cummings (1998)
Professor, Electrical and Computer Engineering
Associate Director of Education and Outreach Programs in the Engineering Research Center for Computer-Integrated Surgical Systems and Technology.
B.S. 1988, Lincoln University
Ph.D. 1995, University of Pennsylvania

Gregory Eyink (2002)
Professor, Applied Mathematics and Statistics; Mechanical Engineering; Mathematics (A&S)
B.S. 1981, Ohio State, Ph.D. 1987

Michael Falk (2008)
Professor, Materials Science and Engineering
B.A. 1990, Johns Hopkins University; M.S.E. 1991
Ph.D. 1998, University of California

James A. Fill (1988)
Professor, Applied Mathematics and Statistics
Computer Science
B.S. 1976, University of Illinois; M.S. 1979, University of Chicago, Ph.D. 1980

Donniell Fishkind (2001)
Associate Research Professor, Applied Mathematics and Statistics

Amy Foster (2010)
Assistant Professor, Electrical and Computer Engineering
B.S. 2003, State University of New York at Buffalo
M.S. 2007, Cornell University, Ph.D. 2009

Mark Foster (2010)
Assistant Professor, Electrical and Computer Engineering

Joëlle Fréchette (2006)
Assistant Professor, Chemical and Biomolecular Engineering
B.E. 1998, École Polytechnique de Montréal
M.A. 2000, Princeton University, Ph.D. 2003

Zachary Gagnon (2011)
Assistant Professor, Chemical and Biomolecular Engineering
B.S. 2003, University of Massachusetts
M.S. 2005, Notre Dame; Ph.D. 2009

Dennice Gayme (2012)
Professor, Applied Mathematics and Statistics
Electrical and Computer Engineering
B.S. 1997, McMaster University
M.S. 1998, UC Berkeley
Ph.D. 2010, California Institute of Technology

Donald Geman (2001)
Professor, Applied Mathematics and Statistics
Electrical and Computer Engineering
B.S. 1965, University of Illinois
Ph.D. 1970, Northwestern

Helyette Geman (2011)
Research Professor, Applied Mathematics and Statistics

Sharon Gerecht (2007)
Associate Professor, Chemical and Biomolecular Engineering
B.A. 1994, Technion – Israel Institute of Technology; M.Sc. 1999, Tel Aviv University; Ph.D. 2004, Technion-Israel Institute of Technology

Somnath Ghosh (2011)
The Michael G. Callas Professor, Civil Engineering
B.S. 1980, Indian Institute of Technology
M.S. 1983, Cornell University
Ph.D. 1988, University of Michigan, Ann Arbor

John I. Goutsias (1986)
Professor, Electrical and Computer Engineering; Applied Mathematics and Statistics
David Gracias (2003)  
Professor, Chemical and Biomolecular Engineering  
M.S. 1986, Indian Institute of Technology  
Ph.D. 1999, UC Berkeley  

Lori Graham-Brady (2000)  
Professor, Civil Engineering  

Jeffrey Gray (2002)  
Associate Professor, Chemical and Biomolecular Engineering  
B.S.E. 1994, University of Michigan  
Ph.D. 2000, University of Texas  

Matthew Green (2011)  
Assistant Research Professor, Computer Science  

John L. Griffin (2008)  
Assistant Research Professor, Computer Science  

James K. Guest (2005)  
Assistant Professor, Civil Engineering  
B.S.E. 1998, University of Pennsylvania  
M.S.E. 2001; M.A. 2003 Princeton University  
Ph.D. 2005, Princeton University  

Seth Guikema (2008)  
Assistant Professor, Geography and Environmental Engineering  
B.S. 1997, Cornell University  
M.E. 1999, University of Canterbury  
M.S. 1999, Stanford University; Ph.D. 2003  

Gregory D. Hager (1999)  
Professor and Chair, Computer Science; Electrical and Computer Engineering  
B.S. 1983, Luther College  
M.S. 1985, University of Pennsylvania, Ph.D. 1988  

Steve H. Hanke (1969)  
Professor, Geography and Environmental Engineering; Economics  
B.S. 1964, University of Colorado, Ph.D. 1969  

Ciaran Harman (2012)  
Assistant Professor, Geography and Environmental Engineering  
B.A. 2003, University of Western Australia; B.E. 2003  
M.Sc. 2007, University of Illinois at Urbana-Champaign; Ph.D. 2011  

Kevin J. Hemker (1993)  
Alonso G. Decker Professor and Chair, Mechanical Engineering  
Materials Science and Engineering; Earth and Planetary Sciences  
B.S. 1985, University of Cincinnati  
M.S. 1987, Stanford, Ph.D. 1990  

Cila Herman (1992)  
Professor, Mechanical Engineering  
B.S. 1982, University of Novi Sad, Yugoslavia  
M.S. 1988; Ph.D. 1992, University of Hanover, Germany  

Hynek Hermansky (2008)  
Julian S. Smith Professor, Electrical and Computer Engineering  
M.S. 1972, Technical University Brno  
D. Eng. 1983, University of Tokyo  

Margarita Herrera-Alonso (2007)  
Assistant Professor, Materials Science & Engineering  
B.S. 1997, Facultad de Quimica, M.S. 1999  
M.S. 2004, University of Massachusetts, Ph.D. 2004  

Benjamin F. Hobbs (1996)  
Theodore M. & Kay W. Schad Professor, Geography and Environmental Engineering  
Applied Mathematics and Statistics  
B.S. 1976, South Dakota State University  
M.S. 1978, SUNY, Syracuse; Ph.D. 1983, Cornell  

Susan Hohenberger-Waters (2007)  
Associate Research Professor, Computer Science  
B.S. 2000, Ohio State University  
M.S. 2003, MIT; Ph.D. 2006, MIT  

Kalina Hristova (2001)  
Professor, Materials Science and Engineering  
B.S. 1987, University of Sofia, M.S. 1988  
Ph.D. 1994, Duke  

Todd Hufnagel (1996)  
Professor, Materials Science and Engineering  
B.S. 1989, Michigan Technological University  
M.S. 1991, Stanford, Ph.D. 1995  

Youngmi Hur (2008)  
Assistant Professor, Applied Mathematics and Statistics  
B.S. 1993, Korea Advanced Institute of Science and Technology  
M.S. 1997; Ph.D. 2006, University of Wisconsin  

Pablo Iglesias (1991)  
Edward J. Schaefer Professor, Electrical and Computer Engineering  
Applied Mathematics and Statistics  
Biomedical Engineering  
B.S. 1987, University of Toronto  
Ph.D. 1991, Cambridge University  

Takeru Igusa (1999)  
Professor, Civil Engineering  
Applied Mathematics and Statistics  
B.S. 1977, Harvard;  
M.S. 1979, UC Berkeley, Ph.D. 1983  

Iulian Iorachita (2010)  
Assistant Research Professor, Mechanical Engineering  

Associate Research Professor, Applied Mathematics and Statistics  

Jin Ung Kang (1999)  
Jacob Suter Jammer Professor in Electrical Engineering and Chair,  
Electrical and Computer Engineering  
B.S. 1992, Western Washington University  
M.S. 1993, University of Central Florida, Ph.D. 1996  

Alexander E. Kaplan (1986)  
Professor, Electrical and Computer Engineering  
M.S. 1961, Moscow Institute for Physics and Technology; Ph.D. 1967,  
USSR Academy of Sciences  

Rachel Karchin (2006)  
Associate Professor, Biomedical Engineering  
B.S. 1998, University of California, Santa Cruz
M.S. 2000, University of California, Santa Cruz
Ph.D. 2003, University of California, Santa Cruz

Professor and Chair, Materials Science and Engineering
B.S. 1978, Massachusetts Institute of Technology
Ph.D. 1982, University of California, Los Angeles

Joseph Katz (1987)
William F. Ward Distinguished Professor, Mechanical Engineering
Geography and Environmental Engineering
B.S. 1977, Tel Aviv University; M.S. 1978, California Institute of Technology, Ph.D. 1982

Peter Kazanzides (2003)
Associate Research Professor, Computer Science

Associate Professor, Computer Science
B.A. 1997, Harvard

Sanjeev Khudanpur (2001)
Associate Professor, Electrical and Computer Engineering
Computer Science
B.S. 1988, Indian Institute of Technology
Ph.D. 1997, University of Maryland

Jacob Khurgin (1988)
Professor, Electrical and Computer Engineering
M.S. 1979, Leningrad Institute of Optics
Ph.D. 1987, Polytechnic University of New York

Omar Knio (1991)
Professor, Mechanical Engineering
B.S. 1984, American University of Beirut
M.S. 1986, M.I.T., Ph.D. 1990

Marin Kobilarov (2012)
Assistant Professor, Mechanical Engineering
B.Sc. 2003, Trinity College
Ph.D. 2008, University of Southern California, Los Angeles

Konstantinos Konstantopoulos (1997)
Professor and Chair, Chemical and Biomolecular Engineering; Biomedical Engineering
B.S. 1989, National Technology University of Athens; Ph.D. 1995, Rice University

Edward J. Schafer Professor, Computer Science
Applied Mathematics and Statistics
B.S. 1964, Andhra University
M.S. 1966, Indian Institute of Technology
Ph.D. 1969, University of Pennsylvania

Rajesh Kumar (2007)
Assistant Research Professor, Computer Science

Benjamine Langmead (2012)
Assistant Professor, Computer Science
B.A. 2003, Columbia University
M.Sc. 2009, University of Maryland-College Park; Ph.D. 2012

Nam Lee (2008)
Assistant Research Professor, Applied Mathematics and Statistics

Andre Levchenko (2001)
Professor, Biomedical Engineering
B.S. 1992, Moscow Institute of Physics and Technology
M.S. 1995, Columbia University, Ph.D. 1998

En (Evan) Ma (1998)
Professor, Materials Science and Engineering
B.S. 1982, Tsinghua University, China, M.S. 1985
Ph.D. 1989, California Institute of Technology

Feilim Mac Gabhann (2009)
Assistant Professor, Biomedical Engineering
Institute for Computational Medicine
B.E. 1997, University College, Dublin
Ph.D. 2006, Johns Hopkins University

Hai-Quan Mao (2002)
Professor, Materials Science and Engineering
B.S. 1988, Wuhan University, Ph.D. 1993

Gerald M. Masson (1981)
Professor, Computer Science; Director, Johns Hopkins University Information Security Institute
B.S. 1966, Illinois Institute of Technology
M.S. 1968, Northwestern, Ph.D. 1971

Patricia McGuiggan (2006)
Associate Research Professor, Materials Science and Engineering

Charles V. Meneveau (1990)
Louis M. Sardella Professor, Mechanical Engineering; Geography and Environment Engineering
B.S. 1985, University Federico Santa Maria, Chile
M.S. 1987, Yale, Ph.D. 1989

Gerard G. L. Meyer (1973)
Professor, Electrical and Computer Engineering
M.S. 1967, UC Berkeley, Ph.D. 1970

Michael I. Miller (1998)
Herschel and Ruth Seder Professor, Biomedical Engineering
Director, Center for Imaging Science
Electrical and Computer Engineering
Applied Mathematics and Statistics; Computer Science
B.S. 1976, SUNY; M.S. 1978, Johns Hopkins University, Ph.D. 1983

Judith Mitrani-Reiser (2010)
Assistant Professor, Civil Engineering
B.S. 2000, University of Florid
M.S. 2001, University of California, Berkely
Ph.D. 2007, California Institute of Technology

Rajat Mittal (2009)
Professor, Mechanical Engineering
B.E. 1989, Indian Institute of Technology
M.S. 1991, University of Florida
Ph.D. 1995, University of Illinois at U.C.

Timothy Mueller (2012)
Assistant Professor, Materials Science and Engineering
A.B. 1998, Harvard University
Ph.D. 2007, Massachusetts Institute of Technology
Professor and Chair, Applied Mathematics and Statistics
B.S. 1977, Cornell; M.S. 1979, University of Illinois, Ph.D. 1982

Narutoshi Nakata (2007)
Assistant Professor, Civil Engineering
B.S. 1999, Kyoto University; M.S. 2001
Ph.D. 2007, University of Illinois at U.C.

Nassir Navab (2013)
Professor, Computer Science
Ph.D. 1993, INRIA (Institut National de Recherche en Informatique et en Automatique)

Thao (Vicky) Nguyen (2007)
Assistant Professor, Mechanical Engineering
B.S., 1999 Massachusetts Institute of Technology
M.S., 2000 Stanford University, Ph.D. 2004

Marc Ostermeier (2000)
Professor, Chemical and Biomolecular Engineering
B.S. 1990, University of Wisconsin
Ph.D. 1996, University of Texas, Austin

Theodore O. Poehler (1973)
Research Professor, Electrical and Computer Engineering
Materials Science and Engineering

Carey S. Pribe (1994)
Professor, Applied Mathematics and Statistics
Computer Science
B.S. 1984, Purdue
M.S. 1988, San Diego State University
Ph.D. 1993, George Mason University

Jerry L. Prince (1989)
William B. Kouwenhoven Professor and Associate Director for Research in Engineering Research Center for Computer-Integrated Surgical Systems and Technology, Electrical and Computer Engineering; Computer Science; Applied Mathematics and Statistics
B.S. 1979, University of Connecticut

Andrea Prosperetti (1985)
Charles A. Miller Jr. Distinguished Professor in Mechanical Engineering; Geography and Environmental Engineering
B.S. 1968, Universita di Milano
M.S. 1972, California Institute of Technology, Ph.D. 1974

Kaliat T. Ramesh (1988)
Elonzo G. Decker Jr. Professor in Science and Engineering, Mechanical Engineering
Materials Science and Engineering
B.S. 1982, Bangalore University, India
M.S. 1987, Brown, Ph.D. 1987

Tilak (John) Ratnanather (1998)
Assistant Research Professor, Biomedical Engineering, Center for Imaging Science

A. Lynn Roberts (1993)
Professor, Geography and Environmental Engineering
B.S. 1977, Pomona College
M.S. 1984, University of Waterloo

Ph.D. 1993, M.I.T.

Daniel Robinson (2011)
Assistant Professor, Applied Mathematics and Statistics
B.A. 2001, James Madison University
M.A. 2003, University of California-San Diego, Ph.D. 2007

Aviel Rubin (2003)
Professor, Computer Science

Suchi Saria (2012)
Assistant Professor, Computer Science
B.A. 2004, Mount Holyoke College
Ph.D. 2011, Stanford University

Sridevi Sarma (2009)
Assistant Professor, Biomedical Engineering
Institute for Computational Medicine
B.S. 1994, Cornell University

Benjamin Schafer (2000)
Professor and Chair, Civil Engineering
B.S. 1993, University of Iowa; M.S. 1995, Cornell, Ph.D. 1997

Vice Dean for Education, Whiting School of Engineering (2008)
Professor, Applied Mathematics and Statistics; Computer Science

Erica J. Schoenberger (1984)
Professor, Geography and Environmental Engineering
B.S. 1974, Stanford; M.S. 1979, UC Berkeley, Ph.D. 1984

Rebecca Schulman (2011)
Assistant Professor, Chemical and Biomolecular Engineering
B.S. 1999, Massachusetts Institute of Technology
Ph.D. 2007, California Institute of Technology

Peter C. Searson (1990)
Joseph R. Reynolds Professor, Materials Science and Engineering
Chemical and Biomolecular Engineering
B.S. 1978, University of Manchester, M.S. 1980, Ph.D. 1982

Sauleh Siddiqui (2012)
Assistant Professor, Civil Engineering
B.A. 2007, Franklin and Marshall College
Pd.D. 2011 University of Maryland, College Park

Scott F. Smith (1988)
Professor, Computer Science
B.S. 1983, Purdue University
Ph.D. 1989, Cornell University

James Spall (2004)
Research Professor, Applied Mathematics and Statistics
Alexander A. Spector (1998)
Research Professor, Biomedical Engineering

James B. Spicer (1993)
Professor, Materials Science and Engineering
B.S. 1985, Southern Methodist University
Ph.D. 1991, Johns Hopkins University

J. Webster Stayman (2013)
Assistant Research Professor, Biomedical Engineering
Alan Stone (1983)
Professor, Geography and Environmental Engineering; Civil Engineering
B.S. 1978, University of Maryland
M.S. 1981, California Institute of Technology, Ph.D. 1983

Sean Sun (2003)
Professor, Mechanical Engineering
B.S. 1994, Pennsylvania State University
Ph.D. 1998, UC Berkeley

Danielle Tarraf (2008)
Assistant Professor, Electrical and Computer Engineering
B.E. 1996, American University of Beirut
M.S. 1998, Massachusetts Institute of Technology; Ph.D. 2006

John C. Malone Professor, Computer Science
Mechanical Engineering
Director, Center for Computer Integrated Surgical Systems and Technology
B.S. 1970, Johns Hopkins University
Ph.D. 1976, Stanford University

Trac Duy Tran (1998)
Professor, Electrical and Computer Engineering
B.S. 1994, M.I.T., M.S. 1994
Ph.D. 1998, University of Wisconsin

Natalia Trayanova (2006)
Murray B. Sachs Professor, Biomedical Engineering, Institute for Computational Medicine
M.S. 1982, Sofia University, Bulgaria
Ph.D. 1986, Bulgarian Academy of Sciences

Fijoy Vadakkumpadan
Assistant Research Professor, Institute for Computational Medicine

Associate Professor, Biomedical Engineering
Computer Science; Mechanical Engineering
B.A. 1995, Catholic University
M.S. 2000, UC Berkeley, Ph.D. 2003

Chao Wang (2012)
Assistant Professor, Chemical and Biomolecular Engineering
B.S. 2004, University of Science and Technology of China
M.S. 2005, Brown University; Ph.D. 2008

Professor, Mechanical Engineering
B.S. 1995, University of Patras; M.S. 1997, UCLA

Professor, Materials Science and Engineering
Mechanical Engineering
B.S. 1983, Dartmouth; M.S. 1985
Ph.D. 1990, Stanford University

Howard L. Weinert (1974)
Professor, Electrical and Computer Engineering
B.S. 1967, Rice; M.S. 1968, Stanford, Ph.D. 1972

James West (2003)
Research Professor, Electrical and Computer Engineering

Louis L. Whitcomb (1994)
Professor, Mechanical Engineering
Computer Science
B.S. 1984, Yale University
M.S. 1988, Ph.D. 1992

John C. Wierman (1981)
Professor, Applied Mathematics and Statistics
Director, Center for Leadership Education
B.S. 1971, University of Washington, Ph.D. 1976

Peter R. Wilcock (1987)
Professor, Geography and Environmental Engineering

Denis Wirtz (1994)
Theophilus Halley Smoot Professor, Chemical and Biomolecular Engineering
Materials Science and Engineering
B.S. 1998, University of Belgium
M.S. 1990, Stanford, Ph.D. 1993

David Yarowsky (1996)
Professor, Computer Science
B.S. 1987, Harvard University
M.S. 1993, University of Pennsylvania, Ph.D. 1996

Laurent Younes (2003)
Professor, Applied Mathematics and Statistic
M.S. 1985, University Paris Sud, Ph.D. 1988

Michael Yu (2001)
Associate Research Professor, Materials Science and Engineering
Chemical and Biomolecular Engineering; Chemistry

Other Faculty Appointments

Lecturers

William Agresti
Lecturer, JHU Information Security Institute, 2012

Michael Agronin, M.S.
Lecturer, Center for Leadership Education, 2012

Hedy Alavi, Ph.D.
Associate Teaching Professor and Assistant Dean for International Programs
Geography and Environmental Engineering, 1997
Lawrence Aronhime, M.B.A.
Senior Lecturer, Center for Leadership Education, 2001
David Audley, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 1997
Eoghan Casey, Ph.D.
Lecturer, JHU Information Security Institute, 2008
Beryl Castello, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2004
Donna Crane, M.A.
Senior Lecturer, Center for Leadership Education, 2011
Lise Dahuron, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2007
Laura Davis, M.A.
Lecturer, Center for Leadership Education, 2011
Mohammad Dehghani, Ph.D.
Lecturer, Mechanical Engineering, 2010
Marc De Vries, M.A.
Lecturer, Center for Leadership Education, 2011
Kevin Dungey, Ph.D.
Senior Lecturer, Center for Leadership Education, 1998
Kevin Fairbanks, Ph.D.
Lecturer, JHU Information Security Institute, 2012
David Fisher, J.D.
Lecturer, Center for Leadership Education, 2001
Mark Franceschini
Senior Lecturer, Center for Leadership Education, 2000
Nora Frenkel, J.D.
Lecturer, Center for Leadership Education, 2009
Peter Fröhlich, Ph.D.
Senior Lecturer, Computer Science, 2005
Sean Furlong, M.A.
Lecturer, Center for Leadership Education, 2013
Robert E. Glaser, Ph.D.
Lecturer, Electrical and Computer Engineering, 1987
An Goffin, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2008
Daniel Gutman, J.D.
Lecturer, Geography and Environmental Engineering, 2012
Eileen Haase, Ph.D.
Lecturer, Biomedical Engineering, 2003
Brian Haberman, Ph.D.
Lecturer, Computer Science, 2012
Jason Heiserman, Ph.D.
Lecturer, Center for Leadership Education, 2009
Illysa Izenberg, MBA
Lecturer, Center for Leadership Education, 2010
Michael Jacobs
Lecturer, Computer Science, 1999
Robert E. Jenkins, M.S.
Senior Lecturer, Electrical and Computer Engineering, 1988
Theresa Jones, M.B.A.
Lecturer, Center for Leadership Education, 2010
George Kalb
Lecturer, Computer Science, 2000
Leslie Kendrick, M.B.A.
Senior Lecturer, W.P. Center for Leadership Education, 2000
Michael Kociemba, M.S.
Lecturer, JHU Information Security Institute, 2012
Sheela Kosaraju, J.D.
Lecturer, Computer Science, 2008
Andrew F. Kulanko, M.S.
Senior Lecturer, Center for Leadership Education, 2001
Darren Lacey, J.D.
Lecturer, JHU Information Security Institute, 2004
Harold Lehmann, M.D., Ph.D.
Lecturer, Computer Science, 1993
Annette Leps, M.B.A.
Senior Lecturer, Center for Leadership Education, 2006
Xiangyang Li, Ph.D.
Senior Lecturer, JHU Information Security Institute, 2012
Denise Link-Farajali, Ed.M.
Lecturer, Center for Leadership Education, 2011
Steven Marra, Ph.D.
Senior Lecturer, Mechanical Engineering, 2011
John Matteo, M.S.E.
Lecturer, Civil Engineering, 2008
Donald McNeilly, Ph.D.
Lecturer, Center for Leadership Education, 2009
Charles Morton, J.D.
Lecturer, Center for Leadership Education, 2007
Charlotte O’Donnell, M.F.A.
Lecturer, Center for Leadership Education, 2009
Martin Ozimek, Ph.D.
Lecturer, Mechanical Engineering, 2011
Christopher Pappacena, Ph.D.
Lecturer, Computer Science, 2011
Benjamin Parris, Ph.D.
Lecturer, Center for Leadership Education, 2013
Josianne Pennington, M.S.
Lecturer, Center for Leadership Education, 2012
Jack L. Powell Jr., C.F.A., C.M.A.
Senior Lecturer, Center for Leadership Education, 1997
Keith Quesenberry, M.S.
Lecturer, Center for Leadership Education, 2012
Brian Rakes, J.D.
Lecturer, Center for Leadership Education, 2012
Julie Reiser, Ph.D.
Senior Lecturer, Center for Leadership Education, 2007
Joshua Reiter, Ed.D.
Lecturer, Center for Leadership Education, 2007
Eric Rice, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006
Yury Ronzhes, Ph.D.
Lecturer, Mechanical Engineering, 2008
Douglas S. Sandhaus, J.D.
Senior Lecturer, Center for Leadership Education, 2002
Rachel Sangree, Ph.D.
Lecturer, Civil Engineering, 2009
William Sauers, J.D.
Lecturer, JHU Information Security Institute, 2012
Nathan Scott, Ph.D.
Senior Lecturer, Mechanical Engineering, 2011
Joanne Selinski, Ph.D.
Associate Teaching Professor, Computer Science, 1996
Pamela Sheff, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006
William Smedick, Ed.D.
Lecturer, Center for Leadership Education, 2007
Stephanie Stone, Ph.D.
Lecturer, Engineering Research Center, 2012
Christopher Thacker, M.A.
Lecturer, Center for Leadership Education, 2012
Federico Torcaso, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2002
Eric Vohr, M.A.
Lecturer, Center for Leadership Education 2007
Caroline Wilkins, Ph.D.
Lecturer, Center for Leadership Education, 2012
Cheryl Williams
Lecturer, Center for Leadership Education, 2011
Orla Wilson, Ph.D.
Lecturer, Materials Science and Engineering, 2008
Gail Wright, M.S.
Lecturer, Center for Leadership Education, 2012

Joint Appointments
Stephen Belkoff, Ph.D.
Associate Professor, Orthopedic Surgery (Medicine)
Mechanical Engineering 2001
Emad Boctor, Ph.D.
Assistant Professor, Radiology and Radiological Sciences (Medicine)
Computer Science, 2009
Paul Bottomly, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering 2000
Patrick Breysse, Ph.D.
Professor, Environmental Health (Public Health)
Chemical and Biomolecular Engineering
Michael Edidin, Ph.D.
Professor, Biology (Arts and Sciences)
Materials Science and Engineering, 2005
Jennifer Elisseeff, Ph.D.
Professor, Biomedical Engineering (Medicine)
Chemical and Biomolecular Engineering, 2012
Liliana Florea, Ph.D.
Assistant Professor, General Internal Medicine (Medicine)
Computer Science, 2013
Eric Frey, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering, 2010
John Isaacs, Ph.D.
Professor, Chemical Therapeutics (Medicine)
Chemical and Biomolecular Engineering
Rangaramar Kannan, Ph.D.
Professor, Center for Nanomedicine (Medicine)
Materials Science and Engineering, 2011
Stuart W. Leslie, Ph.D.
Professor, History of Science and Technology (Arts and Sciences)
Geography and Environmental Engineering 1997
Elliot McVeigh, Ph.D.
Professor, Biomedical Engineering (Medicine)
Electrical and Computer Engineering
Michael Ochs, Ph.D.
Associate Professor, Oncology (Medicine)
Computer Science, 2013
Aleksander S. Popel, Ph.D.
Professor, Biomedical Engineering (Medicine)
Mechanical Engineering 1986
Chemical and Biomolecular Engineering
Arman Rahmim, Ph.D.
Assistant Professor, Radiology (Medicine)
Electrical and Computer Science 2010
Mark Robbins, Ph.D.
Professor, Physics and Astronomy (Arts and Sciences)
Mechanical Engineering 2001

Steven Salzberg, Ph.D.
Professor, Internal Medicine (Medicine)
Computer Science, 2011

Dan Stoianovici, Ph.D.
Professor, Urology (Medicine)
Mechanical Engineering, 2005

Alexander Szalay, Ph.D.
Professor, Physics and Astronomy (Arts and Sciences)
Computer Science 2001

Nitish Thakor, Ph.D.
Professor, Biomedical Engineering (Medicine)
Electrical and Computer Engineering, 2007

Benjamin Tsui, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering 2006

Raimond L. Winslow, Ph.D.
Professor, Biomedical Engineering (Medicine)
Director, Center for Cardiovascular Bioinformatics and Modeling,
Computer Science 1991
