This graduate seminar examines how time is used as a vehicle of political power that perpetuates racial inequality. We will also explore how/whether thinking and acting in untimely ways can challenge white supremacy and further transracial democracy. Grad students only.
Instructor(s): P. Brendesee.

AS.190.629. American Racial Politics.
Race is not a biological fact but rather a social construction. However, it is a social construction with very real consequences. Definitions of citizenship, allocation of state resources, attitudes about government and government policy, the creation of government policy, all shape and are shaped by race and racial classifications. Serving as a critical corrective to American politics treatments that ignore race, this class will examine how race functions politically in the United States. While not required, some knowledge of statistics is helpful.
Instructor(s): J. Bennett; K. Pahl.

AS.190.630. Politics of Territory and Boundaries.
This seminar will explore territorial dimensions of politics and political action, including the political construction of territorial space and the territorial construction of political space, and borders as spatial markers of fixity and flows. As supra-, sub-, multi-, trans-, inter-, and pluri-national political arenas proliferate, how are they connected, institutionally and in practice? How are they structured by - and how do they structure – the actions of individuals and groups? How does location affect the nature of political authority? Graduate students only.
Instructor(s): M. Keck; R. Marlin-Bennett.

Examines American social policy in comparative perspective. Special attention to issues of poverty and inequality, and their relation to the political system.
Instructor(s): D. Schlozman.

AS.190.632. The Development of American Political Institutions.
This course explores institutional development in American national politics, from the Founding until the present. It traces parties, Congress, the presidency, bureaucracy, and courts, and also examines how those institutions have interacted with one another across American history. Throughout the course, we will consider how ideas, interests, procedures, and sequence together shape institutions as they collide and abrade over time. Finally, although it hardly covers the entire corpus across the subfield, the course is also designed to prepare students to sit for comprehensive examinations in American politics.
Instructor(s): A. Sheingate; D. Schlozman.

The seminar will explore to what extent Hegel can be read as contributing to a feminist philosophy. We will focus on Hegelian openings onto the emotional in Phenomenology of Spirit. In addition, we will study feminist philosophers who have drawn on or offered critical readings of Hegel (Irigaray, Butler, Cavarero, Malabou, and others).
Instructor(s): J. Bennett; K. Pahl
Area: Social and Behavioral Sciences.

AS.190.634. Interest Groups.
Graduate students only.
Instructor(s): S. Teles
Area: Social and Behavioral Sciences.

AS.190.635. Theories of Constitutional Governance.
This class is focused on the nature of constitutions and the way that they should and do work within a political system, with particular emphasis on the U.S. context. We will examine both normative and empirical arguments about the relationship between politics and constitutional law. More specifically, we will think about how societies and individual actors should make meaning out of constitutional texts, how they do seem to make meaning out of those texts, and the conditions that give rise to constitutional drafting and change. Graduate students only.
Instructor(s): E. Zackin
Area: Social and Behavioral Sciences.

AS.190.636. The Many Machiavelli.
Often serving as the hinge between classical and modern thought, Machiavelli obviously stands as a central and prominent thinker in the historical canon. But Machiavelli is also the central figure for some of the most important works of political theory in the 20th century. In each of the past 8 decades a major text has been published on Machiavelli, the authors of which include the following leading thinkers; Gramsci, Strauss, Wolin, Althusser, Pocock, Pitkin, Skinner, and Honig. This graduate seminar will be devoted not necessarily to Machiavelli the historical writer, but to Machiavelli as a varied and contested figure, to the trope of Machiavelli that has emerged in 20th and 21st century political thought. Graduate students only.
Instructor(s): S. Chambers
Area: Social and Behavioral Sciences.

AS.190.637. Environment and Politics.
Grad students only.
Instructor(s): B. Allan; D. Deudney
Area: Social and Behavioral Sciences.

AS.190.638. Contentious Politics.
Social movements and revolution in comparative and global perspective. Exploration of the major theoretical approaches and of what difference globalization makes.
Instructor(s): M. Keck.

AS.190.641. Political Theories of Violence.
The aim of this course is to explore a range of theories and images of violence, from bloody war, torture, and terrorism to the “everyday” violence of policing and disciplinary practices, to the violence of conceptual, linguistic, or figural representation. As we read contemporary and classic treatments of violence, we will ask: What constitutes violence? Does violence have specific modes of agency or is it an intensification of generally available modes of action? What is the relationship between violence and bodies, violence and representation, violence and social and psychic structures? Is there a relationship between violence and technology? Violence and the sacred? From whence the force of violence? Among others we will read Nietzsche, Freud, Foucault, Arendt, Schmitt, Agamben, Sorel, Benjamin, Derrida, Levinas, and Fanon. Grad students only
Instructor(s): J. Culbert
Area: Social and Behavioral Sciences.

AS.190.645. Black Politics.
Grad Students Only.
Instructor(s): L. Spence
Area: Social and Behavioral Sciences.
Graduate students only.
Instructor(s): L. Spence; P. Brendese
Area: Social and Behavioral Sciences.

AS.190.647. Race and Memory in Politics, Theory and Literature.
This seminar will investigate various modes of theorizing experiences of race through a critical engagement of a range of literary and philosophical sources pertaining to African-American and Afro-diasporic populations. Specifically, we will explore the extent to which politically attuned approaches to literature and drama can disclose how memory and temporality function as vehicles of racial domination, resistance and identity formation. Graduate students only.
Instructor(s): P. Brendese
Area: Social and Behavioral Sciences.

AS.190.650. The Theories and Politics of Rights.
Grad Students only.
Instructor(s): E. Zackin
Area: Social and Behavioral Sciences.

AS.190.651. Policy Dynamics.
Policy dynamics is the study of changes of the political system in its entirety, from the point of view of the system’s outputs—what government actually does, or fails to do. It is dynamic in that it seeks to explain changes in what matters governments feel can or must be addressed, the tools that are available to deal with problems, and the interactions of government and non-government actors that generate change. Particular emphasis will be placed on studying policy dynamics over long periods of time, including such post-enactment issues as implementation, policy feedback on political identities and group formation, and policy durability.
Instructor(s): S. Teles.

AS.190.652. Comparative Democratization.
This seminar surveys the major debates about democracy and political development in comparative politics. We will examine how scholars have explained the emergence, consolidation, and endurance of democratic regimes. Although the process of democratization serves as the organizing theme, the readings also cover related topics in comparative politics, including revolutions, modernization theory, political and institutional change, socialist transition, authoritarian durability, and the relative analytic value of different methodological approaches.
Instructor(s): E. Chung.

AS.190.653. Organizations.
Graduate students only. *Organizations are the fundamental building blocks of economic, social and political life. This course will examine how different disciplines (sociology, economics, political science) approach the problem of explaining how organizations operate, as well as exploring the structure and development of a very wide range of organizations (firms, interest groups, charitable foundations, universities, militaries, bureaucracies, international organizations, and professions).
Instructor(s): S. Teles
Area: Social and Behavioral Sciences.

AS.190.654. The Political Economy of Neoliberalism.
Grad students only.
Instructor(s): N. Jabko.

AS.190.655. Figures of Time and Politics.
A comparative exploration of contending figures of time, including metamorphosis, linear progress, evolution, and process. Readings from Parcelsus, Darwin, Bergson, Dewey, Whitehead and Evan Thompson. We will explore the interrelations between practices of time, nature, aesthetics, and political agency within each problematic and experiment with how to move this or that element across problematics. Graduate students only.
Instructor(s): J. Bennett; W. Connolly
Area: Social and Behavioral Sciences.

AS.190.657. Hannah Arendt's Phenomenology.
This graduate-level course will focus on Hannah Arendt’s phenomenological approach to political philosophy. In addition to reading some of Arendt’s major works, including The Human Condition and Life of the Mind, students will read texts by Martin Heidegger and Maurice Merleau-Ponty, as well as texts by feminist critics of phenomenology (and readers of Arendt) such as Judith Butler.
Instructor(s): J. Culbert
Area: Social and Behavioral Sciences.

AS.190.658. Paradigms of Political Economy.
A book reading seminar in past and present political economy. Each week, we read one book and discuss it in great detail. We start with canonical authors in political economy (Smith, Marx,...). We move on to leading figures of political economy since the 1980s (Hall, Katzenstein, Esping-Andersen, Ostrom,...). We finish with a few first books authored by a younger generation of scholars and published after 2000. Special attention will be paid to the evolution of research questions, theories, and methodologies. The relevance of existing literature to the crafting of doctoral dissertations will also be discussed.
Instructor(s): N. Jabko
Area: Social and Behavioral Sciences.

AS.190.659. Crisis and Change.
The topic of institutional change has drawn intense scholarly interest in the social sciences since the 1990s. Most of the theoretical debate has revolved around the different notions of institutions that scholars bring to the table. Yet the meaning of “change”, and especially the role of crises, is often left implicit and under-theorized. The objective of this course will be to step back from the most recent debate and think about change from a broader perspective. First, we will go back to some classics of the comparative politics literature and read about different figures of change – revolutions, political and economic development, political and policy regime change, emerging and incremental change. Second, we will read about different sources and actors of change – material and ideational, collective and individual, and non-human. Themes for discussion throughout the course will include dictatorship and democratic consolidation, marketization and neoliberalism, mass politics and elite conflicts. Graduate students only.
Instructor(s): N. Jabko
Area: Social and Behavioral Sciences.

This graduate seminar will conduct close readings of the wide swath of the writings of Jacques Rancière and Arthur Bentley, considering how each eschews the style and mode of argumentation of today’s “normative” political theory. Grad students only.
Instructor(s): S. Chambers
Area: Social and Behavioral Sciences.
AS.190.661. Empire and Discipline.
The term ‘empire’ denotes a state of dominion of one political entity over key dimensions of the public and private lives of populations who are culturally and ethnically distinct from that of the ruling or imperial class. The structures, institutions, and values that give effect to empire are assembled under the rubric of ‘imperial’ while the ambition to or desire for it is ‘imperialism’. In any case, the advent of empire is a temporal, geo-strategic, ethical, and moral event predicated upon practices and traditions with deep roots in history, theology, philosophy, and economic and political theory among others. This course examines how modern empires produced the object and discipline of international relations and how disciplinary theories and associated systems of thought and their modes of inquiry may still foster a pervasive yet unacknowledged dedication to empire. Graduate students only.
Instructor(s): S. Grovogui
Area: Social and Behavioral Sciences.

AS.190.662. Technology and Politics.
Grad students only.
Instructor(s): D. Deudney
Area: Social and Behavioral Sciences.

Intensive examination of theories, old and new, which attempt to employ geographical, technological and ecological factors to explain political outcomes. Graduate students only.
Instructor(s): D. Deudney.

AS.190.666. Political Economy Of Development.
Graduate students only.
Instructor(s): E. Chung.

AS.190.667. Modes of Knowledge and Theories of International Relations.
We will explore the role of scientific, religious, ethical and other forms of knowledge in global politics by reading classic works in the sociology of knowledge alongside IR theory. Substantively, we will seek to explain and understand the effects of knowledge on, inter alia, historical change, economic policy, and global environmental politics. Graduate students only.
Instructor(s): B. Allan
Area: Social and Behavioral Sciences.

AS.190.668. Nuclear Weapons and World Order.
Instructor(s): D. Deudney
Area: Social and Behavioral Sciences.

Instructor(s): S. Grovogui
Area: Social and Behavioral Sciences.

AS.190.671. States, Regimes and Governmentality.
This course will provide a broad overview of the modern state as concept, institution and effect. Students will be introduced to conceptual, philosophical and empirically based scholarship on the modern state and its European precursors—such as the absolutist state. Civil society, citizenship and nation, though clearly related themes and categories of analysis, are not the focus of this course. Students will be introduced to key normative perspectives on the state: Marxist, Liberal, Anarchist, and Republican, as well as scholarly accounts of state formation, development, administration and transformation in a variety of regional and temporal contexts.
Instructor(s): M. Hanchard
Area: Social and Behavioral Sciences.

AS.190.672. Political Economy and Complexity Theory.
This seminar brings varieties of complexity theory to the study of political economy and vice versa, seeking to contribute to a theory in which new concepts of causality, nature/culture imbrications, and real creativity play an active role. Texts by Max Weber, William James, Karl Marx, Friedrich Hayek, Michel Foucault, Stuart Kauffman, Hans Joas, and Donald McKenzie will be summoned to engage each other.
Instructor(s): N. Jabko; W. Connolly.

AS.190.674. Rsch/Writing Workshop.
Instructor(s): M. Keck.

AS.190.676. Field Survey of International Relations.
This course provides a scaffold for the study of international relations theory, organized historically and by major approaches. The focus is on close reading and discussion of exemplars of important bodies of theory. Intended for doctoral students with IR as their major or minor field. Graduate students only.
Instructor(s): R. Katz; R. Marlin-Bennett
Area: Social and Behavioral Sciences.

AS.190.677. Civil Society in Comparative Perspective.
This course explores classic and contemporary debates on the concept of civil society and critically examines its analytical value in light of recent developments. Topics include the relationship between civil society, the state, and markets, the role of civil society in development and democratization, social capital, and transnational civil society.
Instructor(s): E. Chung.

AS.190.678. Law and Politics.
As a field, Law and Politics has evolved from the study of constitutional law and judicial politics to the political behavior of judges and their associates to the study of law and society, the operation of law and courts “on the ground” in the international arena as well as in the United States, historical institutionalism, and the carceral state. In this graduate course, we will review some of the classic texts in the field, with a focus on the tension between legal institutions and democratic politics. In particular, we will examine how that tension is manifest in the foundations of the American political system and in critical reflection on contemporary practices of American democracy. Students will turn in response papers every week on the reading. In addition, there will be two 10-20 page papers due during the semester. Graduate Students Only.
Instructor(s): E. Zackin; J. Culbert
Area: Social and Behavioral Sciences.

AS.190.679. State and Sovereignty.
Grad students only
Instructor(s): S. Grovogui
Area: Social and Behavioral Sciences.

AS.190.680. Nietzsche and Freud: Drive, Will and Eros.
A comparative study of the works of Freud and Nietzsche, with a focus on ideas about the drives, vital force, metamorphosis, and processes of subjectivity-formation.
Instructor(s): J. Bennett; S. Chambers.
AS.190.681. Strategy in Politics.
Political scientists today increasingly recognize the importance of strategy in politics. Yet they often implicitly adopt a rationalist conception of strategy directly inspired by game theory. This course will discuss the usefulness of this conception, and explore the possibility that alternative conceptions of strategy might also (and perhaps better) illuminate what a strategy is in real-world politics. We will read texts from a variety of disciplines - political science/political economy, but also sociology, organization theory, psychology, and history. Graduate Students Only.
Instructor(s): N. Jabko
Area: Social and Behavioral Sciences.

AS.190.682. A Short History of Eccentric Theory: Lucretius, Spinoza, Kafka, Serres.
An examination of the political insights yielded by the distinctive modes of inquiry pursued by these four thinkers/writers.
Instructor(s): J. Bennett
Area: Social and Behavioral Sciences.

AS.190.683. Research Seminar/Political Parties.
Instructor(s): R. Katz
Area: Social and Behavioral Sciences.

AS.190.684. ReReading Marx.
This graduate seminar will be based on the following working hypothesis: that the received readings of Marx in contemporary political theory over the past two decades have all been filtered by layers of interpretation provided by late 19th and early 20th century Marxism, mid 20th century Critical Theory, and late 20th century Analytical Marxism. We will work through, and slough off, some of those layers in order to go back and reread Marx. Grad students only.
Instructor(s): S. Chambers
Area: Social and Behavioral Sciences.

AS.190.686. The Institutions of Capitalist Democracy.
Instructor(s): N. Jabko
Area: Social and Behavioral Sciences.

AS.190.687. Philosophy and the Anthropocene.
The Anthropocene is the era in which capitalism enters into conjunctions with a host of nonhuman, partially self-organizing processes such as climate, the ocean conveyor system, drought patterns, weather events, species evolution, water-filtration systems, etc. What shifts in late-modern conceptions of explanation and political engagement are needed to address these dissonant conjunctions? Two texts by Whitehead form the center around which the seminar is organized. Selective appearances by Heidegger, Latour, Massumi, Pearce, Morton and Deleuze rotate around this center, perhaps calling upon us to modify the philosophy here and augment it there. Class presentations, discussions, and seminar paper. Grad students only.
Instructor(s): W. Connolly
Area: Social and Behavioral Sciences.

AS.190.690. Statelessness.
Instructor(s): J. Culbert
Area: Social and Behavioral Sciences.

This course examines contemporary nuclear issues through the prism of international relations theory. Topics to be considered include the origins and effect of nuclear proliferation, nuclear terrorism, the challenge of “rogue” states, the robustness of deterrence, the viability of defense, and the prospects for disarmament. These issues will be looked at through the lens of Realism, Liberalism and Constructivism, as well as other approaches. Students will be required to engage in formal and informal debates in class, present a draft of their paper to their fellow students, and (in light of comments received) complete a major research paper on some topic related to nuclear weapons. Grad students only.
Instructor(s): S. David
Area: Social and Behavioral Sciences.

AS.190.692. Race and the Neoliberal Turn.
Scholars conceive of neoliberalism as an ideology, as a set of public policies, as a governmentality, or as a combination of above. However while neoliberalism however it is conceptualized has been described as the contemporary doxa, the role of race both in the turn towards neoliberalism, and in the forms neoliberalism takes in a given space/moment has gone relatively underexamined. In this course I seek to rectify this problem, by examining neoliberalism and then charting the ways that race shapes it and is shaped by it.
Instructor(s): L. Spence.

AS.190.693. Sophocles & Kant.
What happens when two world historical thinkers from disparate times and places are placed into dissonant conjunction? The wager is that we might learn more about each and that the shocks engendered by recurrent juxtapositions might open up creative lines of thought not entirely reducible to either tradition. The texts will include the Sophocles’ Trilogy, Hesiod’s Theogeny, fragments from Heraclitus with commentary by Nietzsche, and an engagement by Bernard Williams. These will be matched by Kant’s Critique of Practical Reason, Critique of Judgment, other essays by him, joined to short commentaries by Deleuze and others. The seminar will move back and forth between the Sophoclean and Kantian traditions.
Instructor(s): W. Connolly.

AS.190.694. Comparative State Formation.
The course examines causes, effects and paths of state formation in history and across societies. Weberian and Marxist analyses of the emergence of the modern state in Western Europe are a necessary point of departure. To develop a stronger comparative perspective, however, the course will analyze theoretical approaches and historical studies on state formation in the Ancient World (Mesopotamia, Egypt and China) and in modern Latin America and Africa. The course will also examine whether variations in state formation have a systematic effect on state capacities and political regimes. Graduate Students Only.
Instructor(s): S. Mazzuca.
AS.190.695. Politics, Time and the Tragic.
What can tragic visions teach us today? What cosmological and ontological issues are posed to late modern life by tragic traditions? What conceptions of time and political aspiration can inhabit a tragic vision? What contending conceptions of politics grow out of them? This seminar starts with Hesiod’s Theogony, moves through the Sophocles Trilogy, examines attempts to rework the tragic by Friedrich Nietzsche, Bernard Williams, Judith Butler, Bonnie Honig, and James Baldwin, returns to these issues through King Lear, and explores again the issues that emerge through a close engagement with Deleuze’s philosophy and time in Cinema II.
Instructor(s): W. Connolly
Area: Social and Behavioral Sciences.

Grad Students only
Area: Social and Behavioral Sciences.

AS.190.697. Norm and Change in International and Comparative Perspective.
This seminar will explore the dynamics behind the origin and demise of foundational normative understandings that inform action in a variety of issue areas. Readings will be drawn from the international relations and comparative politics literatures, with attention focusing on the themes of power, discourse, and practice as well as on how these literatures relate to one another.
Instructor(s): N. Jabko; S. Schmidt
Area: Social and Behavioral Sciences.

AS.190.698. Qualitative Methods in the Social Sciences.
Some of the most important and enduring methodological innovations in the study of politics within political science have their origin in other disciplines. Quantitative and qualitative approaches alike share hold this basic fact in common. This course will trace the origin and development of several qualitative approaches to the study of politics, emphasizing methodologies culled or derived from the disciplines of anthropology, history, sociology and philosophy, utilized in some form in all sub-fields of the discipline of political science. Students will become familiar with debates concerning the relative merits and limitations of these approaches as methodological forms in their own right, and in relation to more quantitatively oriented methodologies often deployed in large N research design. Graduate students only.
Instructor(s): M. Hanchard.

AS.190.699. State and Sovereignty II.
Graduate students only.
Instructor(s): S. Grovogui.

AS.190.800. Independent Study.
Permission required.
Instructor(s): Staff.

AS.190.801. Independent Study II.
Instructor(s): D. Deudney
Area: Social and Behavioral Sciences.

Permission required.
Instructor(s): Staff.

AS.190.890. Independent Study.
Instructor(s): Staff.

AS.190.893. Political Science Practicum.
Instructor(s): R. Katz.

AS.191.105. The Bad Good Life: Cruel Optimisms, Bad Romances, and Other Political Depressions.
What if the good life that we desire turns out to be bad? This course explores the intersections of personal and political life when our hopes turn out to be damaging to ourselves or to others. Potential issues include: positive thinking, the American Dream, love, queer survival, failure, ecological crises, and the end of the world. Dean’s Teaching Fellowship. Freshmen Only.
Instructor(s): C. Shomura
Area: Humanities, Social and Behavioral Sciences.

This class offers an introduction to different approaches to the study of international politics by using film, literature, and political theory. The class explores realist, constructivist, feminist, and critical theories of global politics. It addresses two broad themes: the emergence of global political spaces and, second, the implications of ‘globalization’ for contemporary politics. The class both provides an introduction to the study of international politics and takes an in-depth look at the global.
Instructor(s): B. Meiches
Area: Social and Behavioral Sciences.

AS.191.108. Political/Science/Fiction.
Science Fiction has long been recognized for its ability to speak to the concerns of the present. In Political/Science/Fiction we will explore one theme in particular: the cultural politics of alien encounter. “Alien encounter” in this case refers to encounters with the Other—those marked as outsiders, as less-than-human. In reading works of science fiction in conjunction with those of social science, our purpose will be less to seek out new worlds than to strive for a nuanced understanding of our own.
Instructor(s): L. Wilcox
Area: Social and Behavioral Sciences.

Dean’s Prize Freshmen Seminar
Instructor(s): K. Anfinson
Area: Social and Behavioral Sciences.

The advent of European International Society to East Asia in late nineteenth century is often characterized as an ‘opening’ of the East to the West: Korea as the hermit kingdom, Commodore Perry’s opening of Japan, and Open Door policy for China. For the Americas and ‘Westerners’, it was ‘discovery.’ For Asia, it was ‘opening.’ However, the term ‘open’ is wanting in capturing the political turmoil this period witnessed, as this is a period in which the terms of global coexistence were contended and negotiated both between the East and the West, and among actors in East Asia. Seeing the period of late nineteenth century to mid-twentieth century as a period of political contestation of different visions of order in Asia, this course explores the role played by Sinocentrism, Westernization, the rise of Japan, and discourses of Asianism in reconfiguring the international relations of East Asia in modernity. Dean’s Prize Freshmen Seminar.
Area: Social and Behavioral Sciences.
AS.191.111. The Limits of Tolerance: Nation-States, Immigration, and Islam in Europe.
An examination of the politics and policies affecting the experiences of Muslim immigrants in Europe, this course explores the connections between national identity, group and individual identities, and religious beliefs.
Instructor(s): M. Luhman
Area: Social and Behavioral Sciences.

Interstate war threatens constitutional government because of various power concentrations necessary for survival. For much of its existence, the United States avoided this dilemma given its separated geographic location vis-à-vis Europe, and continental hegemony. However, technological advances, specifically nuclear weapons and intercontinental means of delivery, reduced American effective distance from large despotic powers in the 20th century. In this nuclear age, how would it be possible to prepare for total war without becoming a garrison state? Dean’s Prize Freshman Seminar
Instructor(s): R. Fried
Area: Social and Behavioral Sciences.

AS.191.113. Diet, Politics and Identity: Are We What We Eat?.
Tracing the history of the idea that "you are what you eat," this course explores the relationships between diets, bodies, selves, and politics. Readings will be both historical and contemporary and cover a variety of fields including philosophy, political theory, anthropology, and the history of science and medicine. Dean’s Prize Teaching Fellowship.
Freshman Only.
Instructor(s): A. Rebrovick
Area: Social and Behavioral Sciences.

This course will explore the theoretical underpinnings of the freedom of expression protection and some of the key contemporary debates that surround free expression in an age of mobilization, globalization, and digitization. Dean's Prize Freshman Seminar
Instructor(s): G. Jones
Area: Social and Behavioral Sciences.

AS.191.115. Who is Michel Foucault?.
Who is Michel Foucault? Philosopher? Historian? Prison abolitionist? Postmodernist? Radical? In this short course, students will read one of Foucault’s most famous works, Discipline and Punish, which explores themes including power, truth, law, norms, science and subjectivity, through a history of the modern prison. Foucault’s interviews, lectures, and a biography will supplement and support our effort to grasp the ideas and character of one of the most influential political theorists of the 20th Century.
Instructor(s): C. Forster-Smith
Area: Humanities, Social and Behavioral Sciences.

AS.191.116. Special Opportunities in Undergraduate Learning: Introduction to the Literature and Practice of Political Science: Democracy, War, and the State.
This class is designed to introduce students to basic concepts and debates in Political Science, while introducing them to the process and practice of research. Students will read texts on democracy, war, and the state, and will begin to develop a unique research project on one of these topics. Authors discussed will include Plato, Aristotle, Tilly, Lipset, Weber and Waltz. Freshmen and Sophomores only.
Instructor(s): M. Helsel.
A brief overview of the field Sports and Entertainment law, and the various legal issues confronted. We will focus on numerous areas of law, including antitrust law, labor law, copyright law, and contract law among others. We will look at real world disputes and recent cases to analyze the legal theory associated with sports and entertainment law.
Instructor(s): G. Jones
Area: Social and Behavioral Sciences.

This class explores the gap between the promise and shortcomings of American democracy. Topics include the Puritans, political participation, slavery, wealth and political power, equality, and the national security state.
Instructor(s): K. Anfinson
Area: Social and Behavioral Sciences.

In our globalized world the experience of being at home is changing. This course will examine what it means to be at home today and related notions of belonging, nostalgia, place and homelessness. We will read works by Rousseau, Heidegger, Arendt, Rushdie and Bauman.
Instructor(s): A. Blomme
Area: Humanities, Social and Behavioral Sciences.

Lu Xun is hailed as the father of Modern Chinese Literature, an iconoclast, a loner, and by Mao Zedong as a preeminent revolutionary. In a life that spanned revolutions and counter-revolutions, he depicted and critiqued China’s quest to be “modern” in all its ambiguity. This course looks at his writing to address the politics of modernity, revolution, and violence that were relevant in 20th century China and are still relevant globally today.
Instructor(s): Q. Lester
Area: Humanities.

AS.191.211. Critics and Critiques of the American Constitution.
This course will survey various critiques of the American Constitution that have emerged since its ratification. Among the topics to be covered are: anti-federalist and Jeffersonian arguments against ratification; Abolitionist tracts published before the civil war; Progressive and Economic critiques from the early twentieth century; race-based critiques from the mid and late twentieth century; feminist responses in the late twentieth century; and contemporary radical-democratic challenges.
Instructor(s): A. Rebrovick
Area: Humanities, Social and Behavioral Sciences.

AS.191.217. The End of Winter?
This course will examine the political and philosophical impact of climate change through the frame of the loss of winter. We will explore issues including: belonging, attachment, identity, statelessness, and territorial change.
Instructor(s): A. Blomme
Area: Social and Behavioral Sciences.

AS.191.218. Feminism and Film.
The purpose of this course is to understand the expression of feminist concerns in cinematic discourse. The course will explore the productive tensions between various genres of film, feminist film theory, and themes in feminist thought. The class will examine films through the lens of feminist texts that focus on topics such as the portrayal of sexuality, subjectivity, and the maternal, as well as the effects of the masculine gaze. This course is cross-listed with the Women, Gender, and Sexuality Program.
Area: Social and Behavioral Sciences.

AS.191.219. Watching Global Politics: International Relations Through Film.
This course will outline major ideas in the discipline of International Relations by an applied overview of the diverse theories, approaches, and paradigms of global politics. This will include the development of conceptual frameworks and theories to facilitate the understanding and explanation of events and phenomena in world politics. Students will gain this knowledge through pop culture and film as well as through the writings of key IR Theorists of the 20th and 21st centuries. The class will be organized around the major theories of International relations: Realism, Liberalism, and Constructivism. These will be contrasted with theories of gender, postcolonialism, and ecology. A background in International Relations is not required, but an interest in contemporary global politics is strongly encouraged. (Subfield: IR)
Instructor(s): S. Fishel
Area: Social and Behavioral Sciences.
AS.191.224. Climate Change & the Politics of Belonging.
This class will look beyond the ecological impacts of climate change to examine its potential consequences for citizenship, sovereignty and statehood, national identity, and belonging. We will explore these issues through both theoretical texts and reports from organizations working with populations and in places on the front lines of climate change.
Instructor(s): A. Blomme
Area: Social and Behavioral Sciences.

This course examines the extent to which globalization is reshaping state-society relations in contemporary East Asia, and how East Asian societies and political systems respond to, and influence, aspects of globalization in turn. Topics to be explored include the origins and trajectories of developmental states in East Asia, macroeconomic and industrial policy-making, social unrest and political organizing, export-led growth and political liberalization, the East Asian financial crisis and its aftermath, and today’s East Asian political and economic landscapes in a globalizing world.
Instructor(s): P. Leon
Area: Social and Behavioral Sciences.

AS.191.240. Manifestos.
From politics to pop and film to food, manifestos are written for almost every domain of life. Reorienting the thought and action of collectives and countries, they are some of the most important documents in history. But how do they inspire and focus cultural and political energy to achieve their ends? This class examines the method, rhetoric, aim, style, and substance of manifestos from a number of domains to understand their importance and efficacy.
Area: Social and Behavioral Sciences.

This course examines the roles of Comedy Central’s Jon Stewart and Stephen Colbert in the contemporary media and political landscape. Using recent work in media studies, political theory, and cultural studies, we will explore issues of satire, parody, and the distinctive roles Stewart and Colbert play vis a vis the major news networks. We will also look at political activism and what their popularity might mean for the future of media politics.
Area: Social and Behavioral Sciences.

What is war termination? How do diplomacy and military strategy affect the end of hostilities? These are vital questions given that wars, regardless of size, ultimately end one way or another. However, these inquiries seem under-appreciated by many policymakers leading up to and during war. This course will offer an introduction to the war termination literature with an eye toward employing its findings to present day challenges in international relations. Rationalist, domestic political, and leadership approaches to the termination of war will all be considered.
Instructor(s): A. Potter
Area: Humanities, Social and Behavioral Sciences.

AS.191.251. Globalization and Development: The Clash of Civilizations or a New World Order?
The course aims to introduce students to the major debates in globalization and development studies: Is globalization a new phenomenon? Does global interconnectedness lead to a clash of civilizations or to one-way diffusion from developed to developing countries, converting the globe into a giant mall? Are there processes of intermixing across time, space and identities? Is globalization an engine of progress or a vehicle of socio-economic polarization? Why has development been contested in some places and not in others? What would a completely developed world look like? These questions will be explored using multi-media and texts from various disciplines and historical periods.
Instructor(s): A. Ignatov
Area: Humanities, Social and Behavioral Sciences.

AS.191.260. The Practice of Law.
This course is designed to familiarize students with the world of the law and legal practice options, through the eyes of Johns Hopkins University (JHU) alumni and Baltimore City community members who are attorneys. The course will focus on the following legal specialties: Family Law, the Judiciary, Insurance Defense/Coverage, Securities and Corporate Law/the SEC, and Criminal Law. There will be a discussion with a JHU alum that is a current law student, a mock law class, and a special presentation on Judicial Clerkships.
Instructor(s): A. Drososki
Area: Social and Behavioral Sciences.

What role do guilt and sin play in politics? This course examines this problematic by addressing readings and case studies including religious texts such as the Bible, essays on economics of guilt, debt, and sacrifice, investigations into the concept of historical sin and reparation, and the contemporary psychology of lying in politics. The course includes extensive reading and weekly film viewings.
Instructor(s): B. Meiches; T. Hanafin
Area: Humanities, Social and Behavioral Sciences.

AS.191.300. Law, Politics, and Science Fiction.
Science fiction (or speculative fiction) allows us to imagine new worlds and think creatively about social problems. In doing so, it raises numerous questions that have important resonance in politics and law. These include questions about the role and structure of government, equality, citizenship, criminal justice, and international relations. In this course we will explore these fundamental political and legal questions through a variety of sources including novels, short stories, films, and television shows.
Instructor(s): G. Jones
Area: Social and Behavioral Sciences.
**AS.191.301. US Health Policy and Politics.**
This course examines the political origins and historical development of the US health care system. We will investigate the unique public-private structure of the US health care system and the policy and political challenges of lowering costs and increasing quality and access. Students will gain a broad understanding of the Medicare and Medicaid programs, as well as the system of employer-based insurance. The course will also explore the institutional hurdles and political forces that have shaped past and current efforts to reform the American health care system – with particular attention given to the Affordable Care Act. Students will debate competing policy ideas for future reform and use lessons gleaned from the history of American health care reform to understand the potential direction of policy and political change following the Affordable Care Act. Patrick Henry Post Doc.
Instructor(s): A. Kelly
Area: Social and Behavioral Sciences.

**AS.191.302. Comparative Political Institutions.**
This course will provide a detailed overview of the main executive, legislative, and judicial institutions of liberal democracies around the world. Aim is to provide students with an insight into the consequences and mechanisms of various institutions, and to analyze challenges to established and fledgling liberal democracies. An additional objective is to make students familiar with the institutional setup of liberal democracies in: Latin America, Asia, and Europe (incl. EU)
Area: Social and Behavioral Sciences.

**AS.191.303. The Rise and Fall of the State.**
This course interrogates the state as a central institution of politics, its many meanings and its purposes. It will also analyze the politics of the rise of the state in domestic and international politics and assess whether it is currently being challenged by globalization and civil war
Instructor(s): A. Naseemullah
Area: Social and Behavioral Sciences.

**AS.191.304. US-Cuba Decision Making.**
This course is a history of U.S.-Cuban relations since the Castro regime took power in 1959 and an effort to understand why the U.S. has not been able to deal successfully or even rationally with the government there even with the end of the Cold War. At this point, the U.S. is the only nation in the Western Hemisphere not to have full diplomatic and trade relations with the island. Why is that?
Instructor(s): W. Smith
Area: Social and Behavioral Sciences.

**AS.191.306. Perspectives on Globalization.**
This course introduces students to perspectives on globalization and the global economy of leading professionals in a range of fields. Presentations, discussions, and readings address the changing nature and importance of global trade and finance, emerging markets, international marketing, sustainable development, human rights and national security. The course concludes with a three-day trip to NYC, which includes visits to law, finance and marketing firms, NGOs and policy organizations. Last year’s visits included: HSBC, Jordan’s Permanent Mission to the UN, Council on Foreign Relations, and International Rescue Committee. Class meets on Homewood campus January 11-15, and 22nd. Class goes to New York, NY January 19-21, 2016. Course/trip attendees made by faculty selection.
Instructor(s): L. Judy
Area: Social and Behavioral Sciences.

**AS.191.307. Ecologies of the Good Life: Politics for a More than Human World.**
This course explores the extent to which nonhuman actors influence politics. It aims to provide a new “green” lens through which to rethink power and political participation.
Instructor(s): A. Ignatov
Area: Social and Behavioral Sciences.

**AS.191.309. Non-Western Political Theory.**
This course is designed to introduce and critically examine some of the most influential non-western traditions, thinkers, texts, and ideas in the global history of political thought. We will focus on material from the Middle East, South Asia, and East Asia. Thinkers covered in the course include: Al-Mawardi, Confucius, Lao Tzu, Sayyid Qutb, and Tiruvalluvar. We will also read key portions of the following texts: Qur’an, Law Code of Manu, and the Mahabharata.
Instructor(s): S. Gray
Area: Social and Behavioral Sciences.

**AS.191.310. American Political Development.**
American political development (APD) is the study of how political institutions and the body politic in the U.S. have changed over time. In this advanced seminar, we will explore this subfield of political science. The course is concerned with attempting to identify historical patterns within American politics as well as the disjunctures that have reshaped the nation’s trajectory. Students will engage with the APD literature and in the process learn how scholars identify the evidence they use to support their analytical claims. The course is divided into four sections. First, we will survey the subfield’s rise and discuss how (or if) APD differs from other ways of studying American politics. Next, we turn to a discussion of political culture and the Constitution as a stabilizing influence within a changing political environment. From there we shift to the study of discontinuities through a careful examination of state-building as well as the impact of anti-statism. Finally, the course concludes with an analysis of associational life within the American state, focusing particularly on issues of race and gender.
Instructor(s): W. Adler
Area: Social and Behavioral Sciences.

**AS.191.311. The Public Life of Personal Narrative.**
Michel Foucault once declared that “Western man has become a confessing animal.” In the era of Facebook and YouTube, we seem to be moving closer and closer to this definition, as we divulge increasingly private details about ourselves to increasingly broad publics. The hopes and anxieties that have attached themselves to these new media and technology, however, are not entirely novel. This course departs from a set of questions about contemporary uses of self-exposure, then turns to an examination of theoretical texts and autobiographical materials spanning several centuries, slowly winding our way back to the present. The aim of our journey will be to arrive at a fresh understanding of the political functions of personal narratives in our own time.
Instructor(s): N. Gies
Area: Social and Behavioral Sciences.

**AS.191.312. Who Do We Think We Are?: The Politics of Being Human.**
Today the question of who - or what - is a human being animates many pressing political and cultural debates like human rights, abortion, climate change, the development of technology and artificial intelligence, and so on. This course will take up the question of what it means to “be human” and trace how answers to this question inform contemporary debates over the terms of political and ethical life.
Instructor(s): D. Walker
Area: Social and Behavioral Sciences.
**AS.191.313. The Worlds of Globalization.**
The language of “globalization” is now widely used to describe the modern world—a world that is increasingly interconnected, economically homogenous, and culturally convergent. Even political and economic alternatives are commonly framed in terms of forging other “global” formations, be they justice globalization, grassroots globalization, or globalization from below. This class examines how the concept of globalization emerged as the definitive term for conceptualizing the modern world, debates the usefulness of this concept, and identifies alternative ways of conceptualizing the world as a social totality. In this class we look at four particular discourses of globalization—those of global cities, global activism, global capitalism, and global culture—while examining historical and contemporary alternatives to these discourses. The final project will use these theoretical tools to critically examine the city of Baltimore.
Instructor(s): I. Kamola
Area: Social and Behavioral Sciences.

**AS.191.314. Business and Politics.**
This course will examine the multifaceted relationship between government, politics, and business. We will examine the role of business in American domestic policy and politics, including the historical development of the American political economy and the continued role of the government in American economic development. The course will also investigate the nexus of business and government in comparative perspective, looking at both developing and developed nations. The course will focus on the role of business as a political actor and the interaction between business and government in the policy process. The course will examine topics including the politics of regulation and theories of state capture, the role of the state in economic development, interest group formation, maintenance, and influence, and the delegation of governing responsibility and authority to private actors. The course will revolve around questions of how business participates in the political process and influences policymaking through lobbying and elections. The course will be designed around a combination of theoretical readings and discussions with case studies that explore policy areas such as healthcare, pharmaceuticals, tobacco, and finance.
Instructor(s): A. Kelly
Area: Social and Behavioral Sciences.

**AS.191.315. Chinese Foreign Relations.**
This course examines China’s foreign relations since the beginning of the economic reforms. Readings will draw on a diversity of perspectives, both Chinese and non-Chinese, to examine China’s foreign policy debates and strategic choices.
Instructor(s): G. Christoffersen
Area: Social and Behavioral Sciences.

**AS.191.317. Interest Groups, Social Movements and the Policy Process.**
Instructor(s): C. Thurston
Area: Social and Behavioral Sciences.

**AS.191.318. On War and Its Discontents.**
War is a phenomenon we regularly discuss, but what do we mean when we invoke the concept of war? Is there an abstract essence of war, or is war a convenient label for a set of historical relationships? Beginning with Clausewitz’s classic On War, the class addresses conceptual dilemmas of war and themes including violence, sovereignty, globalization, technology, humanitarianism, genocide, and trauma. We will examine a number of classical texts, film, and other media.
Area: Social and Behavioral Sciences.

**AS.191.319. Plato’s Republic.**
A three-week intensive course on Plato’s Republic. We will read the entire text along with selected secondary commentaries. Class time will consist of equal parts lecture and discussion. There will be a significant writing component consisting mainly of weekly exegetical papers. There is no prerequisite for the course but students should have some background in political theory, philosophy, or ancient history.
Instructor(s): T. Hanafin
Area: Humanities, Social and Behavioral Sciences.

**AS.191.320. Geopolitics, Geography, Technology, and Power.**
Geopolitics studies the natural world and the ways it constrains development, politics, conflict and sustainability. Societal resources and patterns of warfare are tied to humans’ physical environment and technological level.
Instructor(s): T. Williams
Area: Social and Behavioral Sciences.

**AS.191.321. Anti-colonial and Post-colonial Revolutions.**
This course will explore various revolutions in the colonial world first looking to the Haitian and Spanish American revolutions of the 19th century. Then moving to the 20th century, we examine African and Indian independence through the writings of Franz Fanon on the Algerian revolution and through Gandhi’s treatise on Indian self-determination. We subsequently examine revolutionary movements in the context of the Cold War and the tension between the communist tradition and a budding non-aligned movement among former colonial states. We explore these issues through the works of leaders like Ho Chi Minh, Jawaharlal Nehru and Thomas Sankara. Lastly, we turn to Steven Biko and his writing on the South African anti-Apartheid revolution and to Eastern European independence from the Soviet Union through the writings of Vaclav Havel. In the final class we will wrap up by exploring some of the themes from the course and their relevance for our thinking about the Arab Spring. The course aims at an international understanding of the ideas that traversed these revolutions and of how the people involved understood the relationship of their movement to their imaginings and aspirations for broader global change. We explore how important leaders made innovations to the political vocabulary of their time in their pursuit of change. But in thinking through their ideas, we will pose critical questions on themes like race, class and gender.
Instructor(s): A. Stack
Area: Social and Behavioral Sciences.
This course will focus on socio-economic changes and challenges that the developing world faces in today’s globalized world. It will introduce students to the interaction between politics and economics in developing countries by examining political and economic development (and underdevelopment). It will evaluate the role of globalization and neoliberal reforms not just as the engine of economic change, but also as the source of social conflict. The first part of the course will introduce conventional theories and approaches to development, and evaluate how globalization and open markets have significantly changed the trajectory of economic growth and development through various substantive and country-specific readings. The second part of the course will examine the contemporary debates relating to globalization, particularly whether and how it has affected growth, human development, equality, and poverty in the developing world. A key to the summer will be on the relationship of the state to social welfare and the delivery of public goods. Finally, the course will also analyze the implications of globalization for crucial contemporary problems such as immigration, transnational flows, women’s rights/ gender roles, state-building and democratization, civil society/NGOs and governance, and ethnic violence.
Instructor(s): S. Chidambaram
Area: Social and Behavioral Sciences.

This course is concerned with the relationship between energy security and human security. It will study the energy issues of East Asian countries as they make difficult energy policy choices, attempting to achieve simultaneously economic growth, energy security, and environmental sustainability.
Instructor(s): G. Christoffersen
Area: Social and Behavioral Sciences.

AS.191.324. International Relations of Security and Development.
This course will examine the relationships between “global North” and “global South”, engaging both historical and contemporary debates around intervention, humanitarianism and development.
Instructor(s): C. McNeill
Area: Social and Behavioral Sciences.

AS.191.325. Introduction to International Relations through Comics.
This course will present an overview of the different theories in the discipline of International Relations. The course will be organized around the question of the causes of conflict between and within states. A special emphasis will be given on reading primary literature. By the end of the course students should be well versed in the main approaches in the discipline.
Instructor(s): T. Tutunji
Area: Social and Behavioral Sciences.

AS.191.326. Sex, Gender and War.
In this course we will explore what different perspectives on sex and gender from feminist theory and the social sciences have to contribute to the understanding of key questions about the nature of war. Topics covered include nuclear politics, the concept of a just war, terrorism and the War on Terror, and humanitarian wars. This is a discussion seminar involving approximately 20 pages of writing. It also presupposes prior work in International Relations.
Instructor(s): L. Wilcox
Area: Social and Behavioral Sciences.

AS.191.327. Cities and Sovereignty.
For the first time in history, the majority of the world population lives in cities. This course asks how this event and the ongoing process of global urbanization have transformed political life. From the Occupy movement’s reclamation of a right to the city to the practices of urban warfare in Iraq and Afghanistan, this course will examine how the city has become a medium of politics.
Instructor(s): D. Denman
Area: Social and Behavioral Sciences.

Feminists have long wrestled with how differences in the social locations and life trajectories of women (like race, class, religion, and ability) matter for political organizing. Political movements of sexual minorities have likewise explored interactions between gender, sexuality, and other differences. This course will investigate the history and theories of these traditions on their own and in case studies for exploring a more general set of questions about human differences and their intersections.
Area: Humanities, Social and Behavioral Sciences.

AS.191.329. Hayek on Liberty and Order.
Friedrich Hayek’s reconstruction of liberalism had a major effect on thought in the 20th century and beyond. Hayek was a key participant in debates over the viability of socialist planning, Keynesianism, the welfare state, and liberal theory. His ideas continue to be the object of everything from sweeping admiration and hostile dismissal by politicians and theorists. This course examines Hayek’s enduring legacy and his critics.
Instructor(s): C. England
Area: Social and Behavioral Sciences.

AS.191.330. The Political Subject of Economics.
Instructor(s): T. Hanafin
Area: Social and Behavioral Sciences.

AS.191.331. Interest Group Politics and Advocacy.
Interest groups play a central though at times controversial role in US politics. This course explores practical questions about how they emerge and seek to influence policy. It also considers their place in politics in light of theories of representation.
Instructor(s): D. Fernandes
Area: Social and Behavioral Sciences.

AS.191.332. Civilians in the Path Of War.
In this course, we will examine ideas about violence in international affairs by both states and non-state actors. More specifically, we will investigate some of the conditions that give rise to conflict in the international system, the range of actors engaged in violence, their diverse motives, and the strategies of governments and the international system to mitigate conflict.
Instructor(s): M. Abrahms
Area: Social and Behavioral Sciences.
AS.191.333. Philosophies of Capitalism from Rousseau to Hayek.
Although we commonly speak of “capitalism” as if there were a consensus regarding the basic tendencies of this peculiar economic system, there is a vast amount of disagreement among philosophers and social scientists about the most fundamental issues. These arguments range from moral arguments over the (in)justice of capitalist economies to more profound ontological debates about what capitalism is and what it means for human experience. This course examines these issues by reading in conjunction a set of profound economic thinkers, including Rousseau, Adam Smith, Hayek, and Karl Polanyi.
Instructor(s): C. England
Area: Social and Behavioral Sciences.

This course explores diverse definitions and theoretical explanations of American exceptionalism in US intellectual history. Also, it investigates the political/academic debates surrounding the role of exceptionalism in American foreign policy.
Instructor(s): T. Cha
Area: Social and Behavioral Sciences.

AS.191.335. Arab-Israeli Conflict (IR).
The course will focus on the origin and development of the Arab-Israeli conflict from its beginnings when Palestine was controlled by the Ottoman Empire, through World War I, The British Mandate over Palestine, and the first Arab-Israeli war (1947-1949). It will then examine the period of the Arab-Israeli wars of 1956, 1967, 1973, and 1982, the Palestinian Intifadas (1987-1993 and 2000-2005); and the development of the Arab-Israeli peace process from its beginnings with the Egyptian-Israeli treaty of 1979, the Oslo I and Oslo II agreements of 1993 and 1995, Israel’s peace treaty with Jordan of 1994, the Road Map of 2003; and the periodic peace talks between Israel and Syria. The conflict will be analyzed against the background of great power intervention in the Middle East, the rise of political Islam, and the dynamics of Intra-Arab politics, and will consider the impact of the Arab Spring.
Instructor(s): R. Freedman
Area: Social and Behavioral Sciences.

AS.191.336. On Diet: Are We What We Eat?.
Tracing the history of the idea that "you are what you eat," this course explores the relationships between diets, bodies, selves, and politics. Readings will be both historical and contemporary and cover a variety of fields including political theory, philosophy, anthropology, and the history of science and medicine.
Instructor(s): A. Rebrovick
Area: Social and Behavioral Sciences.

This course examines why the United States quintupled its incarceration rate over the last 40 years to become the world’s leading jailer and explores the consequences for American politics.
Instructor(s): D. Dagan de Picciotto
Area: Social and Behavioral Sciences.

AS.191.338. Diaspora in World Politics.
This course examines the politics of diaspora communities in international perspective. Its main focus is on the impact of diaspora communities on national security and foreign policies of “host-countries” and “homelands.” In addition, the course tries to unpack the political meanings and uses of the term diaspora.
Instructor(s): Y. Abramson
Area: Social and Behavioral Sciences.

This course examines the role of popular music in politics in the Americas, with case studies of Cuba, Brazil and the United States. Students will consider the use of music by states in promoting and projecting a national identity, and by civil society groups in resisting or advocating for actions by the state. Analysis will draw on theoretical literatures on nationalism and contentious politics and will also include the examination of musical texts.
Instructor(s): A. Gillman
Area: Social and Behavioral Sciences.

This seminar analyzes trends, developments, and future challenges related to the politics of urban public schooling with a concentration on community political dynamics and the struggle for equal educational opportunity and quality education. The course emphasizes the impact of socioeconomic class inequality, racial/ethnic conflict, and gender politics on the changing character of public school reform since the 1954 Supreme Court decision of Brown v. Board of Education. Cross-listed with Africana Studies.
Instructor(s): F. Hayes
Area: Social and Behavioral Sciences.

This seminar exposes students to tools for thinking critically about life and politics by introducing them first, to important texts in postcolonial studies, and second, to debates about development and its current criticisms.
Instructor(s): T. Zille
Area: Social and Behavioral Sciences.

The Politics of Conversion: Empire, Modernity, Critique: Designed to provide an interdisciplinary survey of the way conversion produces and threatens political projects, this course will examine the role of conversion at key points in political history. Students will appraise and discuss subjects ranging from Renaissance disputes regarding the obligation to respect the governments and customs of New World peoples, to Indian nationalist projects in the 19th century, to disputes over the role of Islam in contemporary France.
Instructor(s): M. Helsel
Area: Social and Behavioral Sciences.

AS.191.345. Russian Foreign Policy (IR).
This course will explore the evolution of Russian Foreign Policy from Czarist times to the present. The main theme will be the question of continuity and change, as the course will seek to determine to what degree current Russian Foreign Policy is rooted in the Czarist(1613-1917) and Soviet(1917-1991) periods, and to what degree it has operated since 1991 on a new basis. The main emphasis of the course will be on Russia’s relations with the United States and Europe, China, the Middle East and the countries of the former Soviet Union--especially Ukraine, the Baltic States, Transcaucasia and Central Asia. The course will conclude with an analysis of the Russian reaction to the Arab Spring and its impact both on Russian domestic politics and on Russian foreign policy.
Instructor(s): R. Freedman
Area: Social and Behavioral Sciences.
**AS.191.346. American Political Parties.**
This course examines the major American political party organizations and the party system in relation to the electorate, interest groups and the institutions of American government since 1964.
Instructor(s): A. Hiramatsu
Area: Social and Behavioral Sciences.

**AS.191.347. U.S.-Chinese Relations.**
This course examines key issues in U.S.-Chinese relations. We will take an in-depth look at the politics, policies, and topics surrounding strategic balancing, trade, energy, nuclear proliferation on the Korean Peninsula, relations across the Taiwan Strait, China's rise and the response of the United States and its allies. We will place the relationship between the United States and China in the context of its geopolitical implications not only for the two countries but also for the international system.
Instructor(s): P. Leon
Area: Social and Behavioral Sciences.

**AS.191.348. Domestic Politics of Contemporary China.**
This course examines salient issues in the domestic politics of contemporary China. It begins with a brief historical overview of China's developments that led to the revolutions of 1911 and 1949, as well as the Cultural Revolution. The main part of the course will explore the era of economic reform and opening that began in the late 1970s and that still continues today. Topics include the relationship between business and politics, obstacles to economic and political reforms, the interplay between foreign relations and domestic politics, institutional and bureaucratic sources of policy-making, the social and political impact of economic growth, the relationship between central and provincial governments, and the questions of political opening and leadership transitions.
Instructor(s): P. Leon
Area: Social and Behavioral Sciences.

**AS.191.349. Global Urbanism: Planet of Slums or World Cities.**
This course will address the relationship between development and the political and economic structure of the world economy in the built environment of the city. By drawing upon both classical texts about cities (do they still work for us, what can they account for) and on a diverse literature on cities and slums, we will focus our attention to the contemporary challenges faced in cities both in the more developed and in the developing world. Through a variety of disciplinary perspectives we will try to understand the underlying social and economic changes and the profound transformations under way throughout the global urban world.
Instructor(s): D. Pasciuti.

**AS.191.350. History of American Environmentalism.**
This course explores the emergence and evolution of environmentalism in American political thought, in three main periods. First, early American conservatism focused on the edifying power of nature (Muir, Thoreau, Whitman, Marsh). Second, environmentalists in the 1960s-70s rejected the excesses of industrialization and capitalism, and embraced the idea of a unified planet (Carson, Ehrlich, Commoner, Lovelock). Third, contemporary eco-modernists favor embracing technology to restructure society for efficiency and ecological harmony (Brand, Lomborg, Beck, Bookchin).
Instructor(s): E. Mendenhall
Area: Humanities, Natural Sciences.

**AS.191.352. American Constitutionalism and War Making.**
This course explores the issue of security in the United States beginning with the 1787 constitutional founding and moving into the modern era. We will examine the role of the United States in world politics with a special emphasis on how the United States, as well as the international system changed in the 20th century, as well as the domestic constitutional challenges this presented.
Instructor(s): R. Fried
Area: Social and Behavioral Sciences.

**AS.191.353. Africa and American Foreign Policy.**
This course examines the political, economic, and social relationships between the United States and various African countries. We start by critically examining various ways American foreign policy thinkers conceptualize Africa, before turning our attention to issues concerning conflict, intervention and peacekeeping, economic aid and development, and the Arab Spring. In particular, we will look at: the Rwandan genocide and the Congolese War, the Darfur conflict, Somali piracy, the Millennium Development goals, debates around foreign aid, NGO-based development, China's presence in Africa, and the U.S.'s recent support of Libyan rebels.
Instructor(s): I. Kamola
Area: Social and Behavioral Sciences.

**AS.191.354. History of US Latin American Relations.**
History of U.S. relations with Latin America, from founding of the U.S. until today.
Area: Social and Behavioral Sciences.

**AS.191.355. The Military in American Politics.**
This course explores how Americans have wrestled with questions of military power. Topics include civil-military relations, the military-industrial complex, civil liberties during wartime and how coercion has shaped American identity.
Instructor(s): W. Adler
Area: Social and Behavioral Sciences.

**AS.191.356. The Politics and Philosophy of Laughter.**
What is the political significance of laughter? How does laughter undermine, strengthen, or disrupt political life? We read philosophical, social scientific, and literary texts to explore these questions.
Instructor(s): P. Giamario.

**AS.191.357. Political Theory and Human Survival.**
In this class, students will read contemporary political thought about the future. We'll pay special attention to the six ways humans generally die: heat, cold, thirst, hunger, illness, and injury. Students will be encouraged to draw on their own skill sets and backgrounds to generate solution sets for survivable futures.
Instructor(s): J. Mohorcich
Area: Humanities, Social and Behavioral Sciences.

**AS.191.359. Size Matters: Small, medium and large states in global politics.**
Do large states dictate the terms in global politics? Are small states doomed to vulnerability in an anarchic world? And are medium states stuck-in-between, incapable of exerting any real influence? This course explores whether size is a determinant of foreign policy, security calculus, democratic or authoritarian proclivity, and success in global political economy.
Instructor(s): J. Wang
Area: Social and Behavioral Sciences.
AS.191.361. Political Structures of Europe.

This course offers students an in-depth analysis of the politics and political structures of Europe. Despite some attention to implications of the EU, it is not about the EU. The course is divided into two. Part one addresses theoretical topics including: presidential vs. parliamentary systems, political cleavages, multi-party and two-party systems, government coalitions, consociationalism. Part two surveys individual European countries. Students are presented alternatives to US democracy and tool-kits for thinking about institutionalizing democracy. Instructor(s): F. Bauwens

Area: Social and Behavioral Sciences.

What happens when our images of the good life seem to be harming us? When letting go of hopes, relationships, and attachments is so hard or painful that we cling to them and risk being destroyed? What might we do so that unmaking our lives becomes preferable to keeping a damaging one? This course explores such impasse matters, where political and personal life meet in struggles to endure, change, and thrive. Specific impasses that might arise in our discussions include the American Dream, intimacy, and climate change. We will engage readings and films of diverse genres to grapple with the threat and promise of the unmaking of our lives. Dean's Teaching Fellowship course.

Instructor(s): C. Shomura

Area: Social and Behavioral Sciences.

This course will explore the theoretical underpinnings of free expression protection and some of the key contemporary debates that surround free expression in an age of mobilization, globalization, and digitization. Dean's Teaching Fellowship course.

Instructor(s): G. Jones

Area: Social and Behavioral Sciences.

This course provides an introduction to the key institutions and relationships that make up the modern Chinese political system. The course will examine both theoretical and historical understandings of Chinese politics, considering alternative models of Chinese politics. It examines a range of current Chinese domestic governance issues: the political impact of the economic reforms, state-society relations, the legitimacy of the Communist Party, and Chinese understandings of politics.

Instructor(s): G. Christoffersen

Area: Social and Behavioral Sciences.

AS.191.367. US Environmental Policy.

This course provides an intensive introduction to the emergence, development, and functioning of key environmental policies in the United States.

Instructor(s): J. Greear

Area: Social and Behavioral Sciences.

AS.191.368. International Relations of the Asia-Pacific.

This course will introduce and analyze the international relations of the Asia-Pacific, weighing the various approaches that scholars use for theoretical understanding and policy prescription. From the 19th c. to the 21st c., realist balance of power politics have prevailed. Since the early 20th c., liberal-institutionalism has emerged to challenge realist assumptions in both Track I and Track II organizations such as the Institute of Pacific Relations, APEC, the ASEAN Regional Forum, East Asian Summit, and CSCAP. Constructivism questions these older approaches, focusing on national and regional identity formation in explaining foreign policy outcomes. The course will consider realist, institutionalist and constructivist approaches to Pacific Asia in examining prospects for peace and stability.

Instructor(s): G. Christoffersen

Area: Social and Behavioral Sciences.

An introduction to the political thought of democratic Athens (508-322 BCE). A close study of classical texts of by theorists and critics of ancient democracy such as Thucydides, Sophocles, Aristophanes, Plato, Aristotle, and Demosthenes.

Instructor(s): P. Livingston

Area: Social and Behavioral Sciences.

AS.191.370. Theories of International Political Economy.

This course is concerned with three general questions: What causes economic inequality among nations? Does free trade lead to economic growth? What causes financial crisis? How one answers these questions, however, depends upon one's fundamental conceptualization of what constitutes "the economy." To answer these questions, therefore, we will read seminal texts in the study of political economy, including Adam Smith's Wealth of Nations, Karl Marx's Capital, Vol. 1. and various thinkers who have built upon this theoretical work (for example, Hayek, Friedman, Keynes, Polanyi, Harvey etc).

Instructor(s): I. Kamola

Area: Social and Behavioral Sciences.

The second half of the 20th century witnessed a number of anti-colonial struggles across the African continent. This course reads the work of various theorists, novelists and organic intellectuals from these struggles in order to examine a number of important theoretical questions, such as: What is 'Africa'? How does colonial rule operate? What might political, economic and social liberation look like? These analyses will then be used to examine a number of contemporary issues facing the African continent. Cross-listed with Africana Studies.

Instructor(s): I. Kamola

Area: Social and Behavioral Sciences.

Aitchison Students Only.

Instructor(s): S. Strom

Area: Social and Behavioral Sciences.

AS.191.373. Greek and Christian Political Theory.

This seminar will carefully examine some of the most important and influential texts and thinkers in the early Greek and Christian traditions. We will read works by Homer, Hesiod, Thucydides, Sophocles, Plato, Aristotle, Augustine, and Aquinas.

Instructor(s): S. Gray

Area: Social and Behavioral Sciences.
This course examines the interplay of economic ideas, institutions and domestic politics in the United States, from the Founding through the financial crisis. Topics include industrialization, regulation, interest groups, voting behavior, and inequality.
Instructor(s): C. Thurston
Area: Social and Behavioral Sciences.

AS.191.375. Thinking Organizationally about Politics.
Aitchison Students Only.
Instructor(s): S. Teles
Area: Social and Behavioral Sciences.

AS.191.376. Public Policy Writing.
Aitchison Students Only.
Instructor(s): P. Longman
Area: Social and Behavioral Sciences.

AS.191.379. Thinking Strategically.
Aitchison Students Only.
Instructor(s): K. Mueller
Area: Social and Behavioral Sciences.

AS.191.380. First Amendment Freedoms.
The course will explore the historical, political and legal dimensions of the First Amendment and the freedoms it protects: religion, speech, press, assembly, and petition. We will explore how First Amendment doctrine has developed over time, with attention to the social and political context of changes in the law. A major theme of the course will be to ask how contemporary issues like combating terrorism, digital technologies, and social media might reshape existing First Amendment debates.
Instructor(s): G. Jones
Area: Social and Behavioral Sciences.

AS.191.381. Thinking Politically.
Aitchison Students Only
Instructor(s): S. Teles
Area: Social and Behavioral Sciences.

AS.191.382. Thinking Economically.
Aitchison Students Only.
Instructor(s): D. Baker
Area: Social and Behavioral Sciences.

AS.191.384. Thinking Legally.
Aitchison Students Only.
Instructor(s): M. Greve
Area: Social and Behavioral Sciences.

AS.191.388. Ethnic Politics.
Ethnic conflict has become one of the major sources of inter-state and within-state strife in many regions of the world today. This course is designed to provide a broad overview of the relationship between ethnicity and politics. The purpose is to introduce key concepts, debates and contemporary research in the field of ethnic politics, and to develop an understanding of how political institutions can influence the course and consequences of ethnic conflict. There are no text book required for this course.
Instructor(s): S. Chidambaram.
AS.191.395. Law and Religion.
The First Amendment to the U.S. Constitution contains the Establishment Clause, which prohibits the government from promoting religion, and the Free Exercise Clause, which guarantees religious liberty. Together, these are known as the Religion Clauses, and they have been at the center of some of the Supreme Court's most controversial decisions, such as school prayer, state funding for religious schools, and the placement of religious displays on public property. Many scholars, judges, and politicians have proclaimed that the Court's church-state decisions are "incoherent" and even "contradictory." This course will examine these criticisms of the Court's church-state jurisprudence and explore whether any consistent principles underlie this area of the law. Is there a basis on which "separationists," who advocate for a strict separation of church and state, and "accommodationists," who believe that government may promote some religious activities, can find common ground?
Instructor(s): J. Merriam
Area: Social and Behavioral Sciences.

AS.191.396. Politics of South Asia.
This course is intended as an introductory seminar in comparative politics designed to acquaint participants with academic debates on a range of topics that are relevant to understanding the politics of contemporary South Asia. South Asia is a region that not only has a rich and complex history and culture, but also a region to study themes such as colonialism, nationalism, economic growth and development, democracy vs. authoritarianism, religious fundamentalism, and ethnic conflict. Whether it is the emerging radicalization of politics and consequent social strife in Pakistan, the paradox of democracy in India that is on the economic ascendant yet still beset by poverty and a poor track record in human development, whether it is the brutality of the military regime in Myanmar or the democratization of Bangladesh, whether it is the violent sectarian conflicts that have wracked the region or the grassroots social movements that have set an example, developments in the South Asian subcontinent continue to draw our attention to how developments within these countries shape global interactions as well as how international factors shape their political trajectories in turn. Drawing on multidisciplinary scholarship, this course will explore the history, culture, political economy, and contemporary debates in what has emerged as a strategically and economically vital region. Since the overwhelming majority of academic publications concerning the region use India as their case, the assigned readings may tend to have an India bias. However, we will use the theories developed in the Indian context to understand the politics of the other South Asian states, and ask how India-specific theories might be extended to capture the dynamics of its neighbors. The themes discussed during the course will be those that are crucial not only to understanding South Asia's trajectory, but also to a general study of politics in a developing country.
Instructor(s): S. Chidambaram
Area: Social and Behavioral Sciences.

AS.191.397. Freedom.
This course will explore the concept of freedom as it develops in modern and contemporary political thought. We will examine contending conceptions of public (civic republican) and private (liberal) freedom, robust subjectivism, constraints of disciplinary power, and anarchism. This course concludes by tracking elements of these conceptions into contemporary American life. We will read the works of: Rousseau, J. S. Mill, Nietzsche, Foucault, Goldman, and Franzen.
Instructor(s): S. Gray
Area: Social and Behavioral Sciences.

AS.191.398. The International Politics of Genocide.
This course examines the creation of the concept of genocide and explores its controversial evolution in international law, humanitarian efforts, and global politics. Dean's Teaching Fellowship course.
Instructor(s): B. Meiches
Area: Social and Behavioral Sciences.

AS.191.399. The Political Economy of Development.
Ideas about the processes of economic development have undergone significant change since the end of World War II. The theory and practice of "development" has evolved over the intervening decades as both the structures of national economies and global markets have changed. Indeed, we might no longer agree what development is, who it is for and whether it is desirable. Today, development as a concept and a rallying cry is often expanded and reshaped to mean enforcing 'market reform,' monitoring multi;ilateral aid programs, or even hastening globalization. How did this happen? What does it mean? How did we get to where we are today?
Instructor(s): A. Naseemullah
Area: Social and Behavioral Sciences.

AS.191.402. Numbers, Pictures, Politics.
Aitchison students only.
Instructor(s): B. Chartoff; L. Drutman
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.191.403. Communicating Political and Policy Ideas In The Public Sphere.
This workshop is designed to hone the communications skills of those engaged in public policy analysis and advocacy. Topics include how to develop effective op-ed pieces, position papers, essays, speeches, magazine articles, presentations, and the other forms of communications needed to advance policy ideas outside of the academy. Students receive intensive individual instruction, including close editing of their work and advice on how to publish or promote it the public sphere.
Instructor(s): P. Longman.

Develops an understanding of what human rights are and how they work at the international level. Also examines critical accounts of human rights as vehicles of power.
Instructor(s): A. Ross
Area: Social and Behavioral Sciences.

Studies how and why international organizations wield authority in a world of sovereign states. Also considers non-state actors and the globalized context of communication in which global governance is practiced.
Instructor(s): A. Ross
Area: Social and Behavioral Sciences.

AS.191.421. A Normal Country German Politics and Identity.
This seminar deals with questions pertaining to the formation of modern German nationalism and national identity through the perspective of German politics and history. Dean’s Teaching Fellowship
Instructor(s): F. Bauwens
Area: Social and Behavioral Sciences.

Instructor(s): M. Lind
Area: Social and Behavioral Sciences.
AS.191.444. International Law.
This course provides an introduction to international law, including its history and theoretical foundations; how it takes shape and is enforced, and the role it plays in modern foreign policy.
Instructor(s): P. Spector
Area: Social and Behavioral Sciences.

AS.191.609. Historical Research Methods and the Study of Politics.
This course is designed for graduate students across the Social Sciences and the Humanities interested in the study of transnational politics from a historical perspective. Taught by Visiting Hinckley Professor Robert A. Hill, students will be introduced to methods of historical interpretation in the examination of archival documents and other sources of scholarly evidence. Utilizing materials and examples from Prof. Hill’s own extensive archive of Garveyism, Rastafarianism, Black Hebraism, and other transnational, millenarian political and social movements, students will become familiar with the unique research challenges posed by various forms of political and historical articulation, ranging from formal records of state governments, intelligence records, personal archives, to publications and memoirs of non-governmental actors and organizations.
Instructor(s): R. Brown

Cross Listed Courses

History of Art
AS.010.147. South Asian Art, Culture and Politics: Empire, Colony, Nation.
This course explores the visual culture and politics of South Asia from early archaeological settlements to contemporary installation art. Themes will include: the role of the patron, the relation of text and image, architecture and ritual/political space, colonialism, nationalism, modernity, and postcoloniality. Cross-listed with Political Science
Instructor(s): R. Brown
Area: Humanities.

AS.010.327. The Harem and the Veil: Space and Gender in the Islamic World.
This course explores the constructed imagery of the harem and the veil in relation to politics and visual culture in the Middle East, North Africa, India, and Euro-America. Topics will include: Ottoman palace architecture, Orientalist painting, mandating/banning the veil, Islamic feminisms. We will address visual culture broadly, including advertising, architecture, contemporary art, film, news media.
Instructor(s): R. Brown
Area: Humanities.

AS.010.666. Exhibiting the Other.
Despite challenges to museum practices in the 1970s and 1980s, the approach to displaying the art and visual culture of regions and periods outside of the European and North American mainstream remains caught between scholarly theorizing and demands for the commodification of the exotic. The ongoing exclusionary logic of collecting and display practices and the shrinking budgets for museums undermine efforts to rethink and challenge longstanding institutionalized patterns. In this seminar we will assess the politics, theory, and practice of displaying what still operates as the “other”, reading across art history, museum studies, politics, and anthropology. Open to senior undergraduates with permission of instructor. Cross-listed with Political Science and Programs in Museums and Society
Instructor(s): R. Brown

Anthropology
We track secrecy as a social process. We examine secrets – their concealment and modes of existence (secret societies, esoteric rituals, state secrecy); the politics of their revelation (from colonial contexts to Wikileaks); and their modes of existence thereafter in the modern world (within public spheres, as intellectual property).
Instructor(s): U. Nair
Area: Humanities, Social and Behavioral Sciences.

AS.070.294. Political Anthropology of Africa.
The course will explore classical and contemporary ethnographies of the political in Africa, examining how their authors address issues of power, hierarchy and symbol. We will study various articulations of state, ethnicity and community that are analyzed by observing relations between power and resistance or between law, economy and violence through war, custom and ritual. The seminar will also address the way in which Africa has been constituted as a key source of the sub-field of political anthropology through colonial trajectories, postcolonial detours and the political imagination of the past and the future.
Instructor(s): J. Obarrio
Area: Humanities, Social and Behavioral Sciences.

How does incarceration generate sociality? How do prisons and policing figure in anthropological thought and social theory? This seminar explores both the emergence of prisons as forms of punishment and reform as well as sociality, and consider policing in relation to concepts of population as well as neighborhood. It draws from classic topics in anthropology of law, custom, and crime as well as explores contemporary engagements with topics of incarceration and security. It draws widely from ethnography, social and political theory, film, public health studies, and sociological works on incarceration.
Instructor(s): C. Han
Area: Humanities, Social and Behavioral Sciences.

AS.070.344. Muslim Societies and Modern States: Ethnographic Encounters.
Through a close reading of four recent ethnographies, this course explores the diverse ways Muslims encounter the power of modern states in the contemporary world. Topics include: state-led efforts to reform educational discipline and curricula in Yemen, the imaginary topos of dreams as a space of encounter in Egypt, and legal institutions in Egypt and Pakistan. Diverse ethnographic approaches to a common theme raise such questions as: how do legal reforms constrain, enable or express forms of moral striving in everyday life? what forms of knowledge are sanctioned by the state and what forms exceed its limits? what kinds of community become possible in the grip or the margins of modern governance?
Instructor(s): J. Bush
Area: Humanities, Social and Behavioral Sciences.

AS.070.368. Modern South Asia.
Area: Humanities, Social and Behavioral Sciences.
AS.070.621. An Ontological Turn?.
Recent years have seen a number of ambitious and controversial efforts to find, in ontology, a means of surpassing the inherited humanism, culturalism, and essentialism of anthropology. This course will critically examine this proposition of a fundamental “turn” in our thinking, juxtaposing recent work on matters of perspectivism, materialism, relationality, and divinity with earlier attempts in anthropology to grasp being and becoming otherwise.
Instructor(s): A. Pandian.

History
AS.100.343. Diaspora, Nation, Race, and Politics.
For millions of people across the globe, political fate in the 20th century was defined at the intersection of diaspora, race, and nation — and this may be true in the 21st century as well. This course, a collaborative effort involving a historian and a political scientist, explores the parallels and divergences in the deployment of these terms in nationalist and transnational mobilization, literature and aesthetics, and group identity formation in Eastern Europe, Africa and the New World of the Americas. Set against the backdrop of the fall of significant empires in the late 19th and early 20th centuries, we will explore themes of migration, human rights, the nation-state system, and racism through history, political sociology, and political and social theory. We will pay particular attention to the theoretically exemplary Jewish and Black experiences of diaspora, race, and nation, engaging both with how those experiences were specially shaped by the imposition of national and racial logics and with Black and Jewish politics and thought in relation to those categories. Readings include Max Weber, W. E. B. Du Bois, Booker T. Washington, Theodor Herzl, Hannah Arendt, Benedict Anderson, Rogers Brubaker, Andrew Zimmerman, Michele Mitchell, David Scott.
Instructor(s): K. Moss; M. Hanchard
Area: Humanities, Social and Behavioral Sciences.

AS.100.404. John Locke.
Seminar style course in which John Locke's major works will be read intensively, together with some of his contemporaries' works, and select scholarly interpretations.
Instructor(s): J. Marshall
Area: Humanities, Social and Behavioral Sciences.

Philosophy
AS.150.310. Marx’s Critique of Capital.
This course is devoted to exposition and examination of Marx’s mature critical theory of capitalism, as expounded in the first volume of Capital. Special attention will be given to clarification of Marx’s method as well as the basic categories of his theory. No previous course in philosophy or social sciences is required.
Instructor(s): A. Abazari; E. Connolly
Area: Humanities.

Public Policy
AS.195.477. Intro To Urban Policy.
Perm. Req’d. 195.477 & 195.478 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Area: Social and Behavioral Sciences.

195.478 & 195.477 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman.

German Romance Languages Literatures
AS.211.174. Media of Propaganda.
Today, promoting a particular political or personal point of view is not viewed as “propaganda,” but rather as building a community of equally minded people. But where do we draw the line, and when does the use of a medium in service of a certain message become intrusive and misleading? What role do democracy and cultural values play in this use or abuse of media? In this class the term “propaganda” will be evaluated carefully and applied to such historical media case studies as the informational use of the radio in World War One, Leni Riefenstahl’s Nazi propaganda films, the legendary success of advertisement campaigns in the 1950s and 1960s, the AIDS movement and other mobilization strategies from the 1980s to the 1990s, and the new values of friendship and propaganda in our current facebook nation.
Area: Humanities.

AS.211.341. Power and Resistance: Approaches to French Political Thought.
Even as a coherent, rational conception of state power emerged in France in as early as the Renaissance, French thinkers never stopped challenging the ways by which power justified itself in order to foster obedience and consensus. In so doing, they focused critically as much on the claims of sovereignty issuing from the top as on the willingness of the governed to submit to them. The course will examine the dialectic between the legitimation and delegitimation of power, from the Renaissance wars of religion to the Revolution and beyond: the haunting fear of the corruption and death of the political body; the notion of permanent crisis; the right to revoke the social contract; the reach of power in shaping minds and bodies. Readings may include works by La Boétie, Bodin, Bayle, Rousseau, Sade, Saint-Just, Constant, Maistre, Tocqueville, Foucault, Lefort and Rancière. Readings and discussion in English.
Instructor(s): E. Russo; W. Anderson
Area: Humanities.

AS.211.394. Brazilian Culture & Civilization.
This course is intended as an introduction to the culture and civilization of Brazil. It is designed to provide students with basic information about Brazilian history, art, literature, popular culture, theater, cinema, and music. The course will focus on how indigenous Asian, African, and European cultural influences have interacted to create the new and unique civilization that is Brazil today. The course is taught in English, but ONE extra credit will be given to students who wish to do the course work in Portuguese. Those wishing to do the course work in English for 3 credits should register for section 01. Those wishing to earn 4 credits by doing the course work in Portuguese should register for section 02. The sections will be taught simultaneously. Section 01: 3 credits Section 02: 4 credits (instructor's permission required)
Instructor(s): F. De Azeredo Cerqueira
Area: Humanities.
AS.212.341. Power and Resistance: Approaches to French Political Thought...
Even as a coherent, rational conception of state power emerged in France in as early as the Renaissance, French thinkers never stopped challenging the ways by which power justified itself in order to foster obedience and consensus. In so doing, they focused critically as much on the claims of sovereignty issuing from the top as on the willingness of the governed to submit to them. The course will examine the dialectic between the legitimation and delegitimation of power, from the Renaissance wars of religion to the Revolution and beyond: the haunting fear of the corruption and death of the political body; the notion of permanent crisis; the right to revoke the social contract; the reach of power in shaping minds and bodies. Instructor(s): E. Russo; W. Anderson
Area: Humanities.

AS.212.789. Literature & Identity in the Age of Globalization.
In this seminar we will examine a selection of literary reflections on and engagements with globalization and its mounting failures and burdens, as it has emerged in Europe and the Americas from the mid-twentieth century to the present. From the economic, constitutional, and cultural politics around the unification of Europe, to the ideological and imperial misfortunes of the U.S. after the collapse of the “End-of-History” thesis, to the resurgence of state populism in Latin America in the wake of neoliberal exhaustion, literary fiction has been deployed to posit, explore, and contest national and post-national myths of identity. The seminar will interrogate how this engagement functions both as aesthetic and theoretical discourse. Readings may include novels by Albert Camus, W. G. Sebald, Leonardo Sciascia, Orhan Pamuk, Javier Marías, Roberto Bolaño, and Jonathan Franzen, along with theoretical writings by Gianni Vattimo, Jürgen Habermas, Rodolphe Gasché, and others.
Instructor(s): E. Gonzalez; W. Egginton
Area: Humanities.

AS.213.368. German Political Thought.
This course will introduce students to major figures in German political thought from Martin Luther to Karl Marx and Immanuel Kant to Carl Schmitt. The class will explore such issues as the notion of sovereignty, the relationship between church and state, the theory of parliamentary democracy, and the political and economic ramifications of liberalism. Reading and discussion in English.
Instructor(s): R. Tobias
Area: Humanities.

The seminar will explore to what extent Hegel can be read as contributing to a feminist philosophy. We will focus on Hegelian openings onto the emotional in Phenomenology of Spirit. In addition, we will study feminist philosophers who have drawn on or offered critical readings of Hegel (Irigaray, Butler, Cavarero, Malabou, and others). Co-listed with AS.190.633
Instructor(s): J. Bennett; K. Pahl
Area: Humanities.

AS.215.327. Modern Political Thought in Latin America.
Sophomores, Juniors and Seniors only. The course is an introduction to modern political thought in Latin America. It draws on essays and novels written by major and influential political thinkers such as D.F. Sarmiento, Gonzalez Prada, J.C. Mariategui, Leopoldo Zea, J. E. Rodo, Octavio Paz, Jose Revueltas, Jose Maria Arguedas, Mario Vargas Llosa, Darcy Ribeiro, Enrique Dussel and the authors of the Sumac Kawsay as well as Liberation Theology central writings. The course will be taught in English. Students wishing to do work in the original Spanish or Portuguese will be encouraged to do so.
Instructor(s): S. Castro-Klaren
Area: Humanities.

Graduate students or advanced seniors. This seminar will explore the corpus of political thought in Latin America since independence (1810) to the present by focusing on the discourses that constructed and continue to construct 5 key questions in the negotiation of power in the post-colonial res poltica: territory, nationhood, national subjectivation, cultural imagination, justice and regimes of inclusion and exclusion. Readings will include the work of Sarmiento, Euclides da Cunha, Gonzalez Prada, Mariategui, Marti, Revueltas, Paz, Dussel, Ribeiro, Freire, Arguedas, Liberation Theology and Sumac Kawsay authors.
Instructor(s): S. Castro-Klaren

AS.216.398. Zionism: Literature, Film, Thought.
This course studies the relation between Israeli culture and Zionism. Based on a close reading of both literary and non-literary Zionist texts, we will explore the thematic, social and political aspects of the Zionist movement. The course focuses on primary sources and its main goal is to familiarize students with the history of Zionism and its influence on Israeli culture. In the last part of the semester we will investigate the different meanings of Post-Zionism through contemporary literary and non-literary texts as well as recent Israeli films. Students wishing to do additional work in Hebrew should enroll in section 2 where students will meet for an additional hour at a time TBD and will earn 4 credits for the course.
Prerequisites: Students may receive credit for AS.216.398 or AS.300.398, but not both.
Instructor(s): N. Stahl; Z. Cohen
Area: Humanities.

Sociology

This course explores the interaction between political power and social forces in macro-comparative and international perspectives, focusing on how political institutions (such as states, political parties, and international governing bodies) are shaped by actions of different social groups (such as classes, ethnic groups, social movements), and vice versa. The class will cover the historical emergence of sovereign nation-state as the most salient political organization across the world, as well as its evolution into the form as we know it today. The class will also discuss the array of challenges that modern nation-states are facing under globalization and restructuring of world order following the end of Cold War. Cross-listed with Political Science.
Instructor(s): H. Hung
Area: Social and Behavioral Sciences.

AS.230.275. Revolution, Reform and Social Inequality in China.
This course explores various aspects of social inequality in China during the Mao Zedong and the post-Mao reform eras. We will examine inequality within villages, the rural/urban divide, urban inequality, education and health policies, and gender and ethnic inequality. Each of these issue areas will be tackled analytically, but the aim is also to understand what it was/is like to live in China during and after the Mao era. Formerly offered as AS.230.321.
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

AS.230.318. State and Society in Modern India.
This course examines the complex, at times conflicting, relationship that has emerged between Indian seats of power from above and Indian expressions of society from below. Attention will be placed on the period between 1947 to the present.
Instructor(s): R. Agarwala
Area: Social and Behavioral Sciences.

AS.230.357. Baltimore as an Urban Laboratory.
This course uses the city of Baltimore as a lens through which to explore issues of urban inequality. We will focus on Baltimore’s history of racial segregation and concentrated poverty, and its effect on the social and economic well-being of the city and its residents, with attention to education, employment, health and crime. Students will learn how to employ Census data, GIS approaches, and sociological research to inform questions about population change, inequality and the distribution of resources across the city and metropolitan region. Students will also work on one or more policy relevant studies based in Baltimore, including: a project on abandoned and vacant housing, a desegregation intervention, and a longitudinal study of inner city youth. Finally, students will become familiar with Baltimore City’s programs and policy approaches to addressing the city’s most pressing problems, and design innovative and effective and innovative solutions as part of their course assignments. Enrollment restricted to Social Policy minors only.
Prerequisites: Students that took AS.360.357 may not take AS.230.357
Instructor(s): S. Deluca
Area: Social and Behavioral Sciences.

AS.230.374. Poverty and Public Policy.
This course examines the causes and consequences of U.S. urban poverty, it’s implications for health and wellbeing, and explores strategies for addressing it. We cover the major theoretical explanations scholars have advanced to explain the persistence of urban poverty including labor markets, residential segregation, welfare policy, family structure, and the criminal justice system. Within each topic area, students are introduced to a range of interventions aimed at alleviating urban poverty. Students will conduct a formal policy analysis of 20 pages and participate in a mock congressional hearing. Enrollment restricted to Social Policy minors only.
Prerequisites: Students that took AS.360.372 may not take AS.230.374.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.

Humanities Center

This course studies the development of modern Hebrew literature through its relation to Zionism and Post-Zionism. Based on a close reading of both literary and non-literary Zionist and Post-Zionist texts, we will explore the thematic, social, political, aesthetic and stylistic influences that these two movements have had on modern Hebrew literature. Writers to be discussed include: Hertzl, Nordau, Achad ha-Am, Jabotinsky, Kluasner, Brenner, Berdyczewski, Agnon, Greenberg, Kahana-Carmo, Oz, Yehoshua, Grossman, Castel-Bloom, and Laor. Students may receive credit for AS.216.398 or AS.300.398, but not both.
Prerequisites: Students may receive credit for AS.216.398 or AS.300.398, but not both.
Instructor(s): N. Stahl
Area: Humanities.
East Asian Studies

This course explores the global circulation of political ideas and the formation of transnational social, intellectual, and aesthetic movements in Japan, China, and Korea from the 1880s to the 1980s.
Instructor(s): A. Bronson
Area: Humanities, Social and Behavioral Sciences.

This survey course is designed to introduce students to Southeast Asia -- the ten member countries of the Association of Southeast Asian Nations (ASEAN) plus Australia and New Zealand. Southeast Asia is an integral part of the broader region of East Asia and a geographic bridge to the Indian subcontinent (South Asia). Southeast Asia has been one of the great success stories in the saga of modernization and development of post-colonial Afro-Asia over the last six decades. Its resulting economic importance is matched by its strategic significance given the presence of imbedded jihadist networks and the emergence of China as a regional great power and aspirant superpower. Nevertheless, the region has been largely overlooked by senior foreign policy and defense officials in Washington. This course will equip students to fill that void by examining the region from the perspective of national security strategy -- broadly understood in its multiple dimensions. Students will be challenged to formulate some element of a viable U.S. national security strategy for the region.
Instructor(s): M. Ott
Area: Social and Behavioral Sciences.

This course introduces students to China’s contemporary political history and current political system. It helps students develop a critical understanding of China’s governance institutions and processes, political economy, and state-society relations. The course focuses primarily on China’s domestic politics but also covers China’s changing role in Asia and the world.
Instructor(s): Y. Yang
Area: Humanities, Social and Behavioral Sciences.

A dramatic rise of popular protests in China today has spurred lively discussions about the causes, dynamics, and impact of these protests. This course will provide students with an opportunity to understand these issues by discussing the social, institutional and cultural background of protests, major forms of protest, social groups involved, government responses, and social implications of various kinds of protests. The first part of the course will explore significant socio-economic changes since 1978 and the effects of these changes on China’s social structure and stratification. This part will also examine changes in governance and political systems in the reform era and review important theories of contentious politics. The second part will examine protests by distinct social groups, including peasants, workers, homeowners, and ethnic minority groups, pro-democratic activists, among others. This part will identify similarities and differences in the demands and actions of different groups, introduce the major forms of popular resistance, and explore how the state deals with them accordingly. The course will conclude with discussion of the outcomes of social protests in China and make a cross-national comparison between protests in China and other authoritarian states. By taking China as an example, this course will enhance students’ knowledge about forms of popular contention and government responses in an authoritarian regime as well as help students develop analytical and critical thinking skills with regard to contentious politics.
Instructor(s): Y. Li
Area: Social and Behavioral Sciences.

AS.310.334. Southeast Asia: Contestations, Continuities, Changes.
‘Southeast Asia’ designates a geographical region comprised of countries such as Thailand, Indonesia, Malaysia, Vietnam, the Philippines, and Singapore. These countries are often more different than alike, and their cultural, ethnic, religious and political diversity resists easy reduction. As such, this is not a survey course of the area. Rather, we will examine elements of the Southeast Asian experience that speak to contemporary debates on cultural, political, and religious diversity in globalization’s second wave, and what it can teach us about assimilation, acculturation, and acceptance. We will try to get a feel of the variegated texture of Southeast Asian societies through historically and theoretically oriented texts drawn from different disciplines. Specifically, we will concentrate on responses to European colonialism, nationalist identity formations, and the impact of these histories upon contemporary contentions over the role of religion in public life, migratory practices, and second-wave globalization.
Instructor(s): D. Kwek.

We will examine how major political events, players, norms and institutions have shaped US-Asia relations in the modern era.
Instructor(s): Staff
Area: Social and Behavioral Sciences.
This course explores how the concept of international relations was introduced, challenged, and negotiated in East Asia. Implicitly comparative, the course illuminates the divergent understanding of familiar terms such as order, hierarchy, history, community, border/territoriality, and law, in light of the East Asian modernity. Students will be asked to reflect on questions of identity in relation to China, Korea and Japan and to ponder the extent to which those identities may be translated and understood to Western categories. Specifically this course will consider the role played by Sino-centrism, the rise of Japan later, and Westernization in shaping international relations in East Asia.
Instructor(s): H. Koyama.

AS.310.600. Advanced Topics in East Asian Studies.
This interdisciplinary seminar gives graduate students in East Asian Studies opportunities to present and receive comments on their dissertation chapters, prospectuses, conference papers, and/or potential publications.
Instructor(s): E. Chung
Area: Humanities, Social and Behavioral Sciences.

Interdepartmental
This course will introduce students to basic concepts in economics, political science and sociology relevant to the study of social problems and the programs designed to remedy them. It will address the many inequalities in access to education and health care, unequal treatment in the criminal justice system, disparities in income and wealth, and differential access to political power. The focus will be on designing effective policies at the national and local level to address these pressing issues. This course is open to all students, but will be required for the new Social Policy Minor. The course is also recommended for students who are interested in law school, medical school, programs in public health, and graduate school in related social science fields.
Cross list with Sociology, Economics and Political Science. Freshman, Sophomore and Juniors only.
Instructor(s): B. Morgan; D. Schlozman; K. Edin
Area: Social and Behavioral Sciences.

This course will introduce students to quantitative methods for studying social policy problems. Topics to be covered include descriptive statistics and sampling, correlation and causation, simple and multiple regression, experimental methods, and an introduction to cost-benefit analysis. The emphasis will be on the selection, interpretation and practical application of these methodologies in specific policy settings, rather than with formal proofs. Skills will be reinforced by hands-on exercises using statistical software. Over the course of the semester, students will critically analyze policy reports and empirical research in a range of policy areas and learn how to present this research to a non-specialist audience. Finally, we will discuss the pros and cons of quantitative vs. qualitative methodologies. The course will conclude with group presentations that draw on all these skills. Enrollment restricted to Social Policy minors only.
Instructor(s): B. Morgan
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.360.366. Public Policy Writing Workshop.
This workshop is designed to hone the analytical and communications skills necessary for effective formulation and advocacy of public policy. Topics include how to develop op-ed pieces and other forms of advocacy journalism, memoranda, position papers, and grant proposals. The workshop puts special stress on how to make a clear and persuasive exposition of complex or counter-intuitive policy arguments in the market place of ideas, including the challenges of writing for popular journals and communicating to specific audiences both in and out of government. Students receive intensive individual instruction, including close editing of their work and advice on how to publish or promote it in the public sphere. Enrollment restricted to Social Policy minors only.
Instructor(s): P. Longman
Area: Social and Behavioral Sciences.

AS.360.372. Poverty and Public Policy.
This course examines the causes and consequences of U.S. urban poverty, it's implications for health and wellbeing, and explores strategies for addressing it. We cover the major theoretical explanations scholars have advanced to explain the persistence of urban poverty including labor markets, residential segregation, welfare policy, family structure, and the criminal justice system. Within each topic area, students are introduced to a range of interventions aimed at alleviating urban poverty. Students will conduct a formal policy analysis of 20 pages and participate in a mock congressional hearing. Permission of instructor required.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.

This course analyzes the distinctive US welfare state in historical and comparative perspective. We begin with a survey of the policy context, an historical overview from the poorhouses through the Great Society, and a tour of welfare states across the rich democracies. We then survey developments – and explain the actual workings of policy – across jobs, education, welfare, pensions, and health care. We explore the institutional and political factors behind their divergent trajectories through conservative revival and the age of Obama. Students will write a seminar paper exploring policy development over time in a program or area of their choosing. Enrollment restricted to Social Policy minors only.
Instructor(s): D. Schlozman
Area: Social and Behavioral Sciences.

Program in Latin American Studies
This course proposes to look at various Latin American texts through an unconventional lens: that of dissent. Partly inspired by French philosopher Jacques Rancière (2001), we will take as a premise the idea of dissent not simply as a moment of protest or resistance, nor of the collective plea for rights, but the moment when already given or accepted ways of living and institutional forms are unexpectedly modified by subjects not previously recognized as political. We will draw from diverse materials, ranging from political theory texts, Latin American literature, the literature on development, to the experiences of various social movements in the region. Recommended Course Background: an introductory level course in International Studies, Political Science, Anthropology, or Sociology.
Instructor(s): T. Zille
Area: Humanities, Social and Behavioral Sciences.
This course explores the social and political history of third wave democracy in Latin America over the last three decades, including “neopopulism,” “delegative democracy” and “participatory democracy” and will compare fledgling democracies of the 1980s, neoliberal governments of the 1990s and radical populist regimes of recent years, with a special emphasis on Argentina’s populist tradition. Writing intensive. Cross-list with International Studies and Political Science.
Instructor(s): E. Cervone; S. Ellner
Area: Humanities, Social and Behavioral Sciences.

This course is designed to introduce students to the literary and artistic production originated by Peronismo and particularly by Evita. It explores the historical period that consolidated Peronismo and devotes great amount of time to the controversial figure of Evita. She has fed the popular imagination; her representations have reached far beyond the limits of Argentina. The materials will include different genres: biographical, historical, fictional, and documentary.

Center for Africana Studies

AS.362.175. Freshman Seminar: Remembering the Black Power Movement.
This course explores trends, developments, contradictions, and dilemmas related to the Black Power Movement. The objective of studying this historical movement is not to engage in nostalgia, but to think through and learn the lessons of this historic social movement. An active participant in the Black Power Movement as a university undergraduate and graduate student, I do not approach this subject merely as a set of interesting intellectual issues and dynamics that can be explored with complete dispassion and objectivity. Rather, I seek to examine critically some of the contradictions and dilemmas that I, too, was caught up in, seeking to come to grips with and clarify my own participation and activities. We study these historical events with the expectation of making a positive contribution to the future.
Instructor(s): F. Hayes
Area: Humanities, Social and Behavioral Sciences.

This course investigates the impact of white supremacy and anti-black racism, as a global system of power, on the political development of the United States of America.
Instructor(s): F. Hayes
Area: Social and Behavioral Sciences.

AS.362.344. Education Politics in Urban America.
This seminar analyzes trends, developments, and future challenges related to the politics of urban public schooling with a concentration on community political dynamics and the struggle for equal educational opportunity and quality education. The course emphasizes the impact of socioeconomic class inequality, racial/ethnic conflict, and gender politics on the changing character of public school reform since the 1954 Supreme Court decision of Brown v. Board of Education. Cross-listed with Africana Studies.
Instructor(s): F. Hayes
Area: Social and Behavioral Sciences.

Black existentialism is a branch of Africana philosophy—the philosophical tendencies that arose out of the experience of the African Diaspora. This course is a philosophical interrogation into the meaning of the lived experience of being black in the context of an anti-black world through addressing such existential questions as freedom, identity, anguish, dread, responsibility, embodied agency, evil, resentment, liberation, and nihilism.
Instructor(s): F. Hayes.

This seminar will pursue an in-depth, critical analysis of the history and philosophy of black nationalism and its relationship to other trends in black political thought. Readings from Alexander Crummell, Martin Delany, Frederick Douglass, W. E. B. DuBois, Marcus Garvey, Malcolm X, James Baldwin, and others.
Instructor(s): A. Culver
Area: Humanities, Social and Behavioral Sciences.

Study of Women, Gender, Sexuality

This course aims to familiarize students with a wide-range of feminist and queer conceptions of love as a political force. While reading theoretical texts and selections of poetry, students will be encouraged to interrogate the political implications of different conceptions of love, Eros, and desire.
Instructor(s): K. Glanz
Area: Humanities.

Where might one turn for intimacy if its available forms are dissatisfying? What happens when politics authorizes certain forms of intimacy but not others? How might intimacies and their discontents lack a language to do them justice? This course explores problems with normative intimacies such as monogamy, family, and intimate publics. It covers issues such as optimism, ambivalence, trauma, queerness, war, and longing. It also explores how authors try to describe intimacy through different genres, such as poems, aphorisms, novellas, essays, and scholarly articles.
Instructor(s): C. Shomura
Area: Humanities.

Psychological and Brain Sciences

Psychological and Brain Sciences are concerned with understanding the biological and psychological processes underlying animal and human behavior, and with the effects of environmental influences on behavior at all stages of development.

The undergraduate program leading to the baccalaureate degree is intended to provide students with a sound background in psychological and brain sciences and, at the same time, to prepare them for advanced study.

The program for doctoral students in psychological and brain sciences is scientifically oriented and emphasizes research methodology. The broad aims of the graduate program are to train students to become scientists rather than practitioners, and to provide them with the knowledge and skills they need to help solve the problems of contemporary society.
Facilities

The department’s offices and laboratories contain dozens of desktop computers (PCS and Macintoshes) and UNIX workstations used for experimental control and for computational studies, simulation, data analysis, and manuscript preparation.

The F. M. Kirby Research Center for Functional Brain Imaging houses 3.0T and 7.0T Philips research-directed MRI scanners for fMRI studies of human perception, memory, and cognition.

The cognitive psychology and cognitive neuroscience laboratories contain a wide range of computer equipment and special-purpose research equipment, including image-processing and large-format graphics systems, eye-movement monitors, speech recognition and analysis systems, stereoscopic graphic systems, video equipment, and other stimulus-presentation and response-collection devices.

The biopsychology laboratories have all the facilities necessary to conduct modern behavioral neuroscience research, including equipment for behavioral and operant testing, electrophysiology, histology, surgery, neurochemistry, and systems for the analysis and synthesis of audio signals.

The courses in psychological and brain sciences have four purposes:

1. to acquaint all interested students with a sampling of topics through a variety of introductory and advanced courses;
2. to prepare majors for graduate work in psychology and related disciplines through a program that meets the admission requirements of the outstanding graduate departments in the United States;
3. to offer a distribution of courses for a minor concentration in psychology as well as several fields of concentration for area majors in the social and behavioral sciences; and
4. to provide an honors track designed for exceptional students who want training beyond that provided by the standard undergraduate curriculum.

Psychology Major Requirements

Also see Requirements for a Bachelor's Degree. (p. 20)

General Requirement:
All classes taken for the major (including those for NQE credit) must be taken for a grade and be completed with a C- or better.

Specific Requirements:

- **Intro Level Course Requirement:** Three 100-level psychology courses. These are typically taken during Year 1 and Year 2.
- **Math/Science Requirement:** AS.110.106 Calculus I or AS.110.108 Calculus I, EN.550.111 Statistical Analysis I, EN.550.112 Statistical Analysis II, and AS.200.207 Research Methods in Experimental Psychology. Calculus is usually taken in Year 1, Stats 1 & 2 in Year 2, and Research Methods in fall of either Year 3 or Year 4.
- **Upper Level Course Requirement:** Five upper level psychology courses (200- or 300-level), three of which have to be at the 300-level. These are typically dispersed through Years 2-4.
- **Small Group Experience:** 3 credits of either research, internship, independent study or an additional 300-level psychology course with an enrollment cap of 19 students or less. Students who are interested in graduate work in psychology are encouraged to get involved in research/internship activity starting in Year 2 and to continue throughout their time at Hopkins.

- **9 NQE Credits:** Students must complete 9 additional NQE credits using courses not taught within the psychology department (AS.200.XXX) and not counting otherwise toward the psychology major (e.g., AS.110.106 Calculus I, AS.110.108 Calculus I, EN.550.111 Statistical Analysis I, EN.550.112 Statistical Analysis II, etc.).

Please note that not all courses offered by the Department of Psychological & Brain Sciences (AS.200.XXX) will fulfill the requirements of the Psychology Major/Minor (ex. AS.200.220 Discover Hopkins Health Studies: Application of Abnormal Psychology to Forensic Cases). Consult with your advisors to ensure appropriate progress toward degree completion.

<tr>
<td>Three additional courses at the 300-400 level</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* The seminar course must have a maximum enrollment of 19 students. Courses used to fulfill the five upper-level course requirements may not be used to satisfy this requirement. Students may take 1-3 credits in any given semester to fulfill this requirement. All students are required to discuss their plans with their faculty advisor before junior clearance.
One upper level course in Cognitive Science may be used to satisfy these course credits with the approval of the director of undergraduate studies. Research, independent study, and internships may not be used to satisfy these course requirements.

Students who are planning advanced study in psychological and brain sciences are strongly encouraged to engage in psychological research and/or clinical internships.

### III. Sample Program

### Restrictions

No courses taken during Intersession or through the School of Education and the Carey Business School may be counted toward the requirements for the B.A. degree in Psychological and Brain Sciences (although a limited number of such courses may be counted toward the 120 credits required for graduation).

Most courses offered by Psychological & Brain Sciences (AS.200.XXX) through the Summer at Hopkins program will not count toward the Psychology major or minor. However, exceptions may include summer courses that are also offered and counted toward the major/minor during the Fall and Spring semesters. You may make an appointment with Dr. Stephen Drigotas, Director of Undergraduate Advising for Psychological & Brain Sciences, to ensure that your enrollments will be considered toward your academic progress in the manner you intend.

### Preparation for Graduate Work in Psychology

The Department of Psychological and Brain Sciences provides preparation for graduate training in all areas of psychology, including clinical and counseling. Virtually all psychology graduate programs, including those that provide training in clinical or counseling psychology, expect students to have a strong background in scientific psychology, including statistics. The department encourages students to obtain additional practical experiences outside the classroom, including research in a laboratory and/or an internship in a mental health care setting. These additional experiences are particularly salient to graduate school admission committees.

### Honors Program in Psychology

The B.A. degree with honors provides recognition for outstanding achievement in formal course work and research. The requirements for
a degree with honors include those for the regular B.A. degree, plus the following:

- A minimum grade point average of 3.5 in psychology courses (exclusive of independent study or research) through the fall semester of the student’s junior year.
- A formal application to be submitted to the director of undergraduate studies by March 31 of the student’s junior year. The application must include a copy of the student’s transcript, a brief description of the proposed honors research project, and written endorsement of the application by the student’s faculty sponsor. The sponsor must have a full-time faculty appointment at Johns Hopkins and either a primary or a joint appointment in the Department of Psychological and Brain Sciences. Admission into the Honors Program is not guaranteed.
- Completion of two 300- or 600-level psychology courses, in addition to those required for the regular B.A. degree. Neither of these can be research or reading courses. These additional courses are not in addition to the 120 credits required for graduation.
- Completion of an independent research project under the supervision of a member of the department’s faculty, culminating in a written honors thesis. The student will enroll in AS.200.519 Seniors Honors Research and AS.200.520 Seniors Honors Research during both semesters of the senior year. The honors thesis must be submitted no later than March 31 of the senior year and must be read and approved in writing by two members of the faculty.
- Students considering application to the honors program should begin discussing possible thesis research topics with a faculty sponsor no later than the fall semester of their junior year.

**Minor in Psychology**

A minor in psychology is available to undergraduates majoring in any department. Students electing to minor in psychology should declare their intention directly to the director of undergraduate studies in the Department of Psychological and Brain Sciences by the end of junior year. All classes taken for the minor must be taken for a grade and be completed with a C- or better. The minor requires successful completion of the following:

Select three of the following:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>

</tbody>
</table>

One psychology course at any level 3

Two psychology courses at the 300-600 level * 6

**Total Credits** 18

* No course from the Carey Business School or School of Education may count toward the minor.

** No more than one research or readings course may count toward the minor.

**Undergraduate Academic Awards**

The Department of Psychological and Brain Sciences offers two undergraduate academic awards. The G. Stanley Hall Prize is awarded for outstanding achievement by an undergraduate in psychology. The Julian C. Stanley Award is given to the psychology major who most closely approximates Dr. Stanley’s personal and professional standards of excellence.

**Master of Arts in Psychology**

A student who has been admitted into the Ph.D. program can earn a Master of Arts degree in partial fulfillment of the requirements for the Ph.D. degree. Normally, candidates for the Ph.D. degree in psychology will qualify for the M.A. degree at the end of their second year, after having completed two area seminars and at least two courses in psychological research design and/or advanced statistics, provided that their performance is of the quality judged satisfactory for the M.A. level. There is no terminal master’s program.

**Requirements for the Ph.D. Degree**

The Department of Psychological and Brain Sciences emphasizes training and experience in the research methods essential to the development of new knowledge in the various fields of psychology. The core program for training doctoral students emphasizes scientific methodology and provides training in both pure research and research related to problems in the everyday world, with emphasis on the ways in which basic research methodology can be adapted to the study of applied problems. Each doctoral candidate is expected to become familiar with both a relatively narrowly defined area and a broad spectrum of knowledge related to the student’s topic of specialization.

In addition to general university requirements, the Department of Psychological and Brain Sciences has the following regulations:

**Statistics**

Most students will take AS.200.314 Advanced Statistical Methods during the first semester and AS.200.318 Quantitative Methods for Brain Sciences during the second semester. Students with exceptional statistical training should take two more advanced courses by arrangement with the director of graduate studies.

**Fundamentals and Core Topics in PBS**

AS.200.613 Fundamentals of Psychological & Brain Sciences, AS.200.654 Psychological & Brain Sciences Core Topics A, and AS.200.655 Psychological & Brain Sciences Core Topics B will offer an introduction to the fundamental principles of cognitive and physiological psychology and psychological and brain sciences. Students will read seminal and contemporary papers in topics that cover the breadth of the field.

**First-Year Research Report**

During the first year, the student, together with the faculty advisor, chooses a research project that will provide extended research experience. Normally, the student designs a study as a larger ongoing project. A project proposal must be submitted by April 15 of the first year; this presents the nature of the problem, reviews the relevant literature, and describes the study in detail, together with the anticipated data, means of analysis, and interpretations. A final report must be submitted by December 15 of the second year; this includes all the information appropriate for published work.
Advanced Examination
Each student must pass an in-depth examination in his/her chosen area. This examination, which includes both a written and an oral part, is graded by a committee of at least two faculty members. The student must pass the advanced examination by the beginning of the third year.

Advanced Study
Each student with a faculty advisor plans a course of study consisting of intermediate and advanced topical and research seminars.

Topical Seminars
One or more faculty members lead seminars on topics of special interest, such as cognitive processes, developmental psycholinguistics, neuro-physiological aspects of behavior, mathematical psychology, and information processing. Through these seminars a student gets intensive knowledge in particular specialties. Topics vary from semester to semester and are determined by the interests of both faculty and graduate students.

Research Seminars
Students and faculty engaged or interested in research in particular areas organize these seminars. Participants discuss their own research and other current research in the area.

Teaching Requirement
Teaching requirements are fulfilled by graduate students serving as teaching assistants to members of the department’s faculty, in courses taught in the School of Arts and Sciences. All graduate students are expected to TA a total of four semesters, as follows: second semester-first year students; first and second semester-second year students; first semester-third year students. A committee composed of graduate student representatives participates each semester in the selection of teaching assignments.

Advanced students may apply for a Dean’s Teaching Fellowship. A course is proposed by the student and is sponsored by a faculty member. These are highly competitive and prestigious awards. For details please visit http://krieger.jhu.edu/teachingfellowship/.

Literature Review
The literature review should be modeled on articles appearing in professional journals. Ordinarily the review provides a background for the thesis plan, but it may be prepared on a topic other than the one selected for the thesis. It is a separate document and is evaluated by the same committee that evaluates the thesis plan.

Thesis Plan
By the end of the third year or at least one calendar year before receiving the Ph.D. degree, each doctoral candidate must develop a plan for the dissertation research and present the plan before a departmental committee. With the committee’s approval, the student then prepares a dissertation.

Dissertation
The dissertation represents the student’s finest piece of scholarly work. It establishes the pattern for a research career and the basis for postgraduate employment. The Graduate Board of the University administers the final oral examination, a defense of the thesis. The doctoral dissertation must be in a form suitable for and worthy of publication.

Financial Aid
Financial support packages are available to all doctoral students, with 9-month stipends that are competitive with those of other universities. Financial support includes tuition remission. Summer research assistantships are available in the department.

For further information on graduate study in psychology, contact Academic Program Coordinator, Laura Dalrymple, Department of Psychological and Brain Sciences, 410-516-6175.

For current faculty and contact information go to http://pbs.jhu.edu/directory/

Faculty
Chair
Susan Courtney
Professor: cognitive neuroscience, functional neuroimaging, working memory, attention

Professors
Howard Egeth
perception & cognition, attention & attentional selectivity, memory, eyewitness testimony, psychology & law
Lisa Feigenson
cognitive development, numerical cognition
Michela Gallagher
Krieger-Eisenhower Professor: learning & memory, neurobiology of aging
Justin Halberda
cognitive & developmental psychology, reasoning, language acquisition
Peter Holland
Krieger-Eisenhower Professor: mechanisms of behavior, learning, memory, motivation, behavioral ecology
Patricia Janak
Bloomberg Distinguished Professor: behavioral & neurobiological mechanisms of associative learning, addiction
Cynthia Moss
auditory information processing, spatial attention & perception, learning & memory, memory & sensorimotor integration

Assistant Professors
Marina Bedny
brain development & plasticity, cognitive neuroscience, concepts
Jason Fischer
visual scene understanding using fMRI, psychophysics, computational modeling
Jonathan Flombaum
visual perception, attention, cognition
Shreesh Mysore
neural circuits for behavior (attention, decision-making, etc),
computational neuroscience, comparative approach to the design of
neural circuits

Associate Faculty
Richard Allen
Associate Professor; School of Medicine (Neurology): clinical & medical
psychology

Kirsten (Kisi) Bohn
Assistant Research Professor: acoustic communication, vocal
production, social behavior, neuroethology, evolution of vocal
complexity

Stephen Drigotas
Teaching Professor & Undergraduate Advisor: social psychology,
interpersonal relationships, friendship networks, intergroup behavior,
social dilemmas

David H. Edwin
Associate Professor; School of Medicine (Psychiatry & Behavioral
Sciences): clinical & medical psychology

Heather Roberts Fox
Senior Lecturer: industrial/organizational psychology

Linda Gorman
Teaching Professor: neuroscience

Paul J. Hofer
Adjunct Associate Professor; U.S. Sentencing Commission (Washington,
D.C.): law & psychology

Chelsea Howe
Lecturer: forensics, abnormal psychology, dual diagnosis, therapy,
assessment

Ann Jarema
Junior Lecturer: clinical psychology

Chris Kraft
Psychologist & Instructor; School of Medicine (Psychiatry & Behavioral
Sciences, Center for Marital & Sexual Health); Senior Lecturer: human
sexuality & behaviors

Meghan McGlaughlin
Junior Lecturer: clinical psychology

Alison Papadakis
Associate Teaching Professor: clinical & adolescent psychology,
developmental psychopathology of depression in adolescence

Lawrence Raifman
Adjunct Assistant Professor; Private Practice & Director of Forensic
Services (Springfield Hospital Center): forensic psychology, law
& decision-making, clinical applications of psychology & the law,
behavioral finance

Veit Stuphorn
Associate Professor; School of Medicine (Neuroscience):
neurophysiological studies of decision-making

Jason Trageser
Lecturer: neuroscience

Joint Faculty
Marilyn Albert
Professor & Director (Division of Cognitive Neuroscience; School of
Medicine): aging, cognition, memory

Arnold Bakker
Assistant Professor (Psychiatry; School of Medicine): psychiatric
neuroimaging

Greg Ball
Research Professor: biopsychology, behavioral neuroendocrinology,
neuroethology

Charles (Ed) Connor
Professor & Director (Mind/Brain Institute): neurophysiology of visual
perception & object recognition

Barry Gordon
Professor (Therapeutic Cognitive Neuroscience, Neurology & Cognitive
Science); Director (Cognitive Neurology/Neuropsychology): language
disorders, memory disorders, severe organic amnesia, focal amnesia,
retrograde amnesia

Steven Gross
Associate Professor (Philosophy): philosophy of language, philosophy of
mind, metaphysics

Stewart Hendry
Professor (Mind/Brain Institute): functional organization of primate visual
system, primate functional neuroanatomy

Alfredo Kirkwood
Associate Professor (Mind/Brain Institute): mechanisms of cortical
modification

James Knierim
Associate Professor (Mind/Brain Institute): behavioral neurophysiology of
the hippocampal formation

Barbara Landau
Dick & Lydia Todd Faculty Development Professor & Chair (Cognitive
Science): language acquisition, cognitive development, spatial
representation, acquisition of the lexicon

Hey-Kyoung Lee
Associate Professor (Mind/Brain Institute): cellular/molecular
mechanisms of synaptic plasticity underlying memory formation

Michael E. McCloskey
Professor (Cognitive Science): language, vision, memory, cognitive
neuropsychology, developmental cognitive deficits

Guy McKhann
Professor (Mind/Brain Institute): patterns of cognitive decline after
coronary artery bypass grafting

Ernst Niebur
Associate Professor (Mind/Brain Institute): computational neuroscience

Brenda C. Rapp
Professor (Cognitive Science): cognitive neuropsychology, attention,
reading & writing

Peter R. Rapp
Senior Investigative Chief (National Institute on Aging): Laboratory of Experimental Gerontology
Rudiger von der Heydt
Professor (Mind/Brain Institute): perceptual organization in visual cortex

Professor Emeritus
Bert F. Green jr.
psychological measurement, quantitative methods, and computer methods

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

AS.200.101. Introduction to Psychology.
This course surveys all the major areas of scientific psychology, including the physiological bases of behavior; sensation and perception; learning, memory and cognition; developmental, social, and personality psychology; and psychopathology.
Instructor(s): S. Drigotas
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.110. Introduction to Cognitive Psychology.
Introductory survey of current research and theory on topics in cognitive psychology. The course will cover a range of topics in perception, attention, learning, reasoning, and memory, emphasizing relationships among mind, brain, and behavior.
Instructor(s): J. Flombaum
Area: Natural Sciences, Social and Behavioral Sciences.

How does scientific psychology study aspects of human behavior that are seemingly unscientific, such as free will, consciousness, dreams, ESP, etc.? This course will provide a general overview of the recent work done by psychologists in all these topics. Students will read primary articles testing hypotheses about these "unscientific" domains and will discuss whether these can be studied as a science, and what the consequences are for science’s role in society.
Instructor(s): D. Odic
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

There will be 9 lecture topics related to reward mechanisms in the brain which include natural (e.g. food and maternal care) and non-natural (drugs of abuse) rewards. Reading materials will be given to students before each lecture, and will include literature in the field and peer-reviewed journal articles. Lecture topics will include: history and theory of the brain reward system, research models, drugs addiction, eating disorders, and mood disorders.
Instructor(s): A. Blouin; N. Liang
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.120. Your Lifestyle, Your Memory.
Variables affecting bodily function also affect brain function, one of the most critical being memory. The ability to form, store, and recall past events plays a critical role in guiding behavior in a complex and dynamic environment. Lifestyle choices involving diet, exercise, caffeine, stress and sleep processing related to memory function. This course will explore how these types of decisions affect the brain physiologically and the mind psychologically, specifically in regards to memory performance.
Area: Social and Behavioral Sciences.

AS.200.121. Moral Cognition.
How do we know what is good and what is evil? Do we have to learn right from wrong, or is it inborn? How does culture affect our moral sense? In this course, we’ll explore these questions through contemporary readings and class discussion. We’ll visit classic moral dilemmas and find out what people’s responses to these dilemmas can tell us about moral cognition.
Instructor(s): M. Kibbe
Area: Social and Behavioral Sciences.

AS.200.122. History of Evolutionary Thought.
This course will address century-old, and ongoing, controversies regarding the credibility and implications of evolutionary theory from two main perspectives: philosophy of science and biology. The first half of the course will focus on the oppositions encountered from the creationist movement. The second half of the course will discuss how much evolutionary biology can reveal about fundamental issues of human nature such as selfishness, altruism, free will, and foundations for ethical principles.
Instructor(s): O. iyilikci
Area: Humanities, Social and Behavioral Sciences.

How do the senses of smell and taste play a role in daily life? The course will begin with the basic neurobiology of the olfactory and gustatory systems to understand how cues in the environment get sent as signals to the brain to produce behavior. Topics will include conditioned taste aversion, loss of senses, and how the chemical senses interact with learning and culture. Reading materials will include peer-review scientific publications that use both human and non-human animal models.
Instructor(s): Y. Treesukosol
Area: Natural Sciences, Social and Behavioral Sciences.

This course focuses on various psychological factors involved in war and genocide, exploring the perspectives of all parties involved. Topics to be discussed include the psychology of killing, mental states of soldiers and prisoners of war, negotiation tactics and war strategies, post-genocide identity crises, using media as a tool of persuasion and war mongering, among others. Historical and current events will be used as case studies to put the material into context.
Area: Humanities, Social and Behavioral Sciences.

Infants are remarkably social creatures, even from birth. This course will review and synthesize findings in the emerging field of social cognitive development. Topics include infants’ recognition of social agents, understanding others’ intentions, production of helping behavior, development of moral reasoning, etc. The ultimate goal of this course is to understand the development of social knowledge and behavior, focusing on the first two years of life.
Area: Social and Behavioral Sciences.
This course is designed for psychology and cognitive science major students who are interested in programming for experimental tasks and data analysis. We will first cover some basic knowledge of Matlab, including matrix, arithmetic operations, conditional and iteration execution. Then we will cover some major functions of Psychtoolbox and start to develop full experimental tasks. Students will be able to independently realize experiment designs with Matlab Psychtoolbox. Students with different levels of programming background are welcome. Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.128. Altered Perceptions.
We have learned a great deal about sensory processing and perception in healthy individuals through the neuropsychological study of special populations. This course will provide a survey of some conditions (i.e. phantom limbs, prosopagnosia, synesthesia, etc.) that have contributed to our understanding of human perception. Emphasis will be placed on the value of patient research for informing our understanding of difficult questions in cognitive psychology such as consciousness. Area: Social and Behavioral Sciences.

AS.200.129. Early Learning and Child Education.
This course is ideal for those who are interested in psychology, education, policy making, and application of scientific findings. There will be two main parts of the course. The first part will learn about topics in developmental, social and education psychology, as well as diverse early education models. During the second part, students will read about current advances in psychology and they will have discussions about their implications for education. Area: Natural Sciences, Social and Behavioral Sciences.

Despite the rich contents of our awareness, most of the computations in our mind/brain are achieved unconsciously. This course will introduce some unconscious computations spanning from perception to social cognition, and introduce how scientists study these hidden computations. We will start by examining unconscious processing in visual awareness, as exhibited in phenomena such as continuous flash suppression and inattentional blindness. This will be followed by more discussions about computations underlying different cognitive functions, such as language and math processing, decision-making, and social priming. We will talk about what is consciousness in the end, and discuss the how artificial intelligence affect the understanding of consciousness.
Instructor(s): F. Yang
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.200.132. Introduction to Developmental Psychology.
An introductory survey of human development from the prenatal period through adolescence. The developing child is examined in terms of cognitive, social, emotional, motor, and language development.
Instructor(s): L. Feigenson
Area: Social and Behavioral Sciences.

AS.200.133. Introduction to Social Psychology.
An introductory survey of social psychology. Topics include social perception, social cognition, attitudes, prejudice, attraction, social influence, altruism, aggression, and group behavior.
Instructor(s): S. Drigotas
Area: Social and Behavioral Sciences.

In this 30 hour course students will discover the happiness as a direct experience and develop soft leadership skills through a special rhythmic breathing technique called Sudarshan Kriya Yoga (SKY), interactive work projects, games, subtle yoga, and meditation. SKY integrates mind, body and heart alleviating the effect of anxiety, anger, depression, impulsivity and stress. This program will benefit students achieving higher academic performance and improved well-being during their academic tenure and life.
Instructor(s): J. Stevenson; N. Goel
Area: Social and Behavioral Sciences.

AS.200.137. Profiling Mentally Ill Mass Murderers.
Mass Shootings by mentally ill are a scourge upon society. Factors like easy access to guns by dangerous mentally ill, inadequate commitment laws, the lack of treatment, the inability to predict dangerous behavior, and media frenzy, contribute to an increasing death toll. This course uses case studies to highlight the role played by diagnostic assessment (suicide by cop, psychopathic behavior, PTSD, major mental disorders), inadequate prevention and gun policy strategies, and stigmatization of the mentally ill as dangerous.
Instructor(s): L. Raifman.

AS.200.159. Freshmen Seminar: Evolutionary Psychology.
In this course we discuss evolutionary psychology, which is the idea that the mind can be understood as an adaptation to our ancestral environment by means of natural selection. Freshmen only.
Instructor(s): H. Egeth
Area: Social and Behavioral Sciences.

AS.200.161. Illusions, delusions, and other confusions: Why what you think you know about human nature is (largely) wrong.
This course is suitable for all, but would be especially useful for a student who does not expect to take many (or any) additional psychology or cognitive science courses. We will explore what modern psychology has uncovered about how our intuitions concerning human nature deceive us. Freshmen Only.
Instructor(s): H. Egeth
Area: Social and Behavioral Sciences.
AS.200.162. Childhood Disorders & Treatments: Online.
This is an online course. The class will meet for ten weeks from May 27 to August 1 and will follow the deadlines for Term I for add/drop/withdraw and grade changes. This course examines the psychological disorders that are usually first diagnosed prior to adulthood. Some of the specific disorders that will be discussed are Attention-Deficit and Disruptive Behavior Disorders, Pervasive Developmental Disorders, Learning Disorders and Mental Retardation. Students will become familiar with various diagnoses, etiologies, and methods of treatment.
Instructor(s): A. Jarema
Area: Social and Behavioral Sciences.

Freshman Seminar; This introductory class will highlight some of the key findings in neuroscience over the past century and a half that have revolutionized our understanding of how the brain works. The goal is to convey both the essence of, and the excitement surrounding, neuroscience breakthroughs that caused paradigm-shifts. We will also look at recent neuroscience-related headlines in popular media and unpack them from a scientific perspective. Topics covered will include “Is the brain just one big lump of tissue?”, “Telephones in the brain?”, “The frog with upside-down vision”, “Brains vs. hard-drives”, “Monkey see=monkey do neurons”, Epigenetics, “Changing the brain’s wiring diagram”, “Do ants have GPS?”, The science behind the movie ‘Memento’, “Implanting false memories into brains”, “My brain sees you, but I don’t”, etc. For each big question, we will first examine the thinking that previously existed, and then explore the shift in thinking.
Instructor(s): S. Mysore
Area: Natural Sciences.

The field of forensic psychology is focused on answering legal questions about the causes of human behavior. This survey course will explore the work that forensic psychologists do; their research, assessment, and clinical methods; and how their work influences lawyers, judges, and other legal practitioners. Specific topics will include mental capacity assessment, psychopathy, claims of mental distress, child custody evaluations, juvenile delinquency, forensic treatment, and forensic neuropsychological assessments.
Prerequisites: Students can only receive credit for AS.200.202 or AS.200.325, not both.
Instructor(s): L. Raifman
Area: Social and Behavioral Sciences.

AS.200.204. Human Sexuality.
Course focuses on sexual development, sexuality across the lifespan, gender identity, sexual attraction and arousal, sexually transmitted disease, and the history of commercial sex workers and pornography. Juniors and seniors only within the following majors/minors: Behavioral Biology, Biology, Neuroscience, Psychological & Brain Sciences, Public Health, and the Study of Women, Gender, & Sexuality. All registration will be done during the normal registration period and you must meet all requirements to register. Formerly taught as AS.200.302.
Prerequisites: Students may enroll in both AS.200.204 and AS.290.420, but cannot do so in the same semester.
Instructor(s): C. Kraft
Area: Social and Behavioral Sciences.

Formerly known as Lab in the Analysis of Psychological Data (LAPD), this course is an overview of research methods used in psychology, experimental designs, interpreting results in psychology, and research ethics. Each student will complete an individual research project on a topic of his/her choosing as part of the course training. The class is taught interactively through lectures and labs.
Prerequisites: EN.550.111 (Statistical Analysis I) or EN.550.112 (Statistical Analysis II)
Instructor(s): H. Egeth
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

Examines basic principles of animal behavior (orientation, migration, communication, reproduction, parent-offspring relations, ontogeny of behavior and social organization). Evolution and adaptive significance of behavior will be emphasized.
Prerequisites: Prereqs: AS.020.151 AND ( AS.110.106 OR AS.110.108)
Instructor(s): K. Bohn
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.209. Personality.
This is a survey course focused on theory and research on human personality. Topics include personality traits, motivation, unconscious processes, self-regulation, cognitive and behavioral aspects of personality, biological and evolutionary influences on personality, and dysfunctional manifestations of personality.
Instructor(s): C. Howe
Area: Social and Behavioral Sciences.

AS.200.211. Sensation & Perception.
A survey of the psychological and neurophysiological basis of seeing, hearing, touching, tasting, and smelling.
Instructor(s): S. Hendry
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.212. Abnormal Psychology.
A survey of the major syndromes of psychological disorders. Research and theory about the mechanisms, development, and diagnosis of psychopathology are emphasized.
Instructor(s): A. Papadakis
Area: Social and Behavioral Sciences.

This course examines popular “facts” about the brain and cognition, exploring the origins, how they are perpetuated in the media, and the empirical data that support or refute the claims. Recommended Course Background: One previous course in psychology or neuroscience.
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.218. Alcohol Use & Abuse: From Pub to Lab.
Alcohol is one of the oldest and most commonly used recreational drugs. This course will explore the use and abuse of alcohol, from societal implications to laboratory research designed to better understand the behavioral and neural processes underlying substance abuse. In particular, this course will focus on the roles of learning and motivation in alcohol-seeking, craving, and relapse. To this end, we will examine animal models used in alcohol research, connecting them to work done with human participants.
Instructor(s): J. Maddux
Area: Natural Sciences, Social and Behavioral Sciences.
This introductory course will examine the basic diagnostic psychology principles with special application to forensic psychology. The class will focus on investigating forensic psychology queries including: Does my client have a mental illness? Why did he or she act in such a self-defeating way? Does the law require special disposition? Should my client be punished or rehabilitated? We will explore the reasons behind why a movie star would shoplift or a famous athlete would engage in a series of extra marital relationships; why a policeman would commit a series of bank robberies in broad daylight; or why someone would shoot a Congresswoman and kill and wound many others in the process. As part of this course, students will visit with doctors and lawyers (including Judges), view and analyze video and movies about forensic cases, and participate in mock trial exercises.
Instructor(s): L. Raifman
Area: Social and Behavioral Sciences.

A Forensic Psychologist Confronts Criminality in the Internet Age: Profiling criminal behavior, assessing insanity, and counter-intuitive (self-defeating) motivations for criminal acts typically occupy forensic psychologists who work in the criminal justice system. This course initially looks into traditional forensic psychologist pursuits, and then expands the inquiry to new forms of criminality profiling for "relational aggression" crimes like cyber-bullying & sexual harassment, computer assisted crimes, hate crimes, child pornographers, as well as those high profile (media attention catching) crimes, e.g., spree killing, murder suicide, or terrorism due to political extremism and/or religious fundamentalism. Students will study with a practicing forensic psychologist and police detectives, forensic crime lab professionals, newspaper reporters, SWAT team members, mental health doctors, computer cyber crime investigators. Finally, valuable excerpts from "The Wire," and "Serial, the podcast" will supplement class discussion and analysis. Come prepared to analyze actual forensic cases.
Instructor(s): L. Raifman.
Area: Social and Behavioral Sciences.

AS.200.222. Positive Psychology.
The course will review the growing field of positive psychology and will review the research on positive human attributes such as optimism, happiness, hope, resiliency, self-esteem, altruism, empathy, and forgiveness. This course will explore the research on how such positive attributes are developed and how they relate to psychological and physical well-being.
Instructor(s): J. Halberda
Area: Social and Behavioral Sciences.

AS.200.223. Psychotic at the White House.
This introductory course focuses on the problem of delusional, morbidly depressed, and/or thought disordered persons who target federal officials or cites in Washington, DC. Contributing factors include: inadequate mental health commitment laws, an inability to successfully profile and prevent rarely occurring but potential dangerous behavior, pre trial commitment challenges, the insanity defense, problems associated with easy access to Federal buildings and inter agency rivalries, as well as the inevitable frenzied media response that leads to problems of copy cat behavior. Forensic psychological case studies will be featured, including presidential attempted assassin John Hinckley, Secret Service "White House cases," Miriam Carey's death following a car chase ending at the US Capitol, the Beltway sniper case, and others. Finally, the need for increased sensitivity to the problem of stigmatization of mentally ill non-dangerous persons will be included.
Instructor(s): L. Raifman
Area: Humanities, Natural Sciences, Social and Behavioral Sciences.

AS.200.226. Neurobiology of Food Intake and Overeating.
This course will examine the role of learning and its interaction in the regulation of body weight, food intake and overeating. Topics covered will include: the neurobiology of learning and motivation; the role of central and peripheral mechanisms in food intake; and biological and psychological factors that lead to overeating and obesity. In addition, students will be expected to complete a written exam.
Instructor(s): A. Johnson
Area: Humanities, Natural Sciences, Social and Behavioral Sciences.

AS.200.301. History Of Psychology.
A survey of leading figures, schools, and systems in the history of psychology. The course will emphasize the development of experimental psychology in late 19th century Germany and its establishment in America at Johns Hopkins, Harvard, Chicago, and Columbia. Special topics will include the development of clinical and applied psychology and psychological testing. Juniors and seniors only. Recommended Course Background: two prior Psychology courses.
Instructor(s): P. Hofer
Area: Humanities, Social and Behavioral Sciences.

Area: Natural Sciences, Social and Behavioral Sciences.

This course will survey the neural mechanisms of decision-making. Current experimental research and theory concerning selection, control, and evaluation of actions are examined in humans and animals. Topics will range from simple perceptual judgements to complex social behavior. The course involves a weekly lecture about a specific topic followed by a student presentation of a current research paper. Cross-listed with Neuroscience.
Prerequisites: AS.080.305 OR AS.080.205 OR AS.200.141
Instructor(s): V. Stuphorn
Area: Natural Sciences.

AS.200.306. Psychology in the Workplace.
Industrial-organizational (I-O) psychology is the scientific study of the workplace. Rigor and methods of psychology are applied to issues of critical relevance to business, including talent management, coaching, assessment, selection, training, organizational development, performance, and work-life balance.
Instructor(s): H. Roberts Fox
Area: Social and Behavioral Sciences.
AS.200.308. Neurobiology of Learning and Memory.  
This course is an advanced survey of the scientific study of learning and memory. An interdisciplinary approach is used to integrate the state of the field across levels from the cellular-molecular basis of synaptic plasticity to functional circuitry implicated in learning to memory systems in the brain. The course is designed to provide a deep understanding of the outstanding issues and current debates in learning and memory research with a specific emphasis on animal models. This is an interactive lecture/seminar course with active student participation. Recommended Course Background: AS.200.370 or AS.200.141 or AS.080.305/AS.080.306 or AS.020.306.  
Instructor(s): M. Yassa  
Area: Natural Sciences, Social and Behavioral Sciences.

This course examines the evolution of human adaptive behaviors. In particular it examines evolutionary contributions to behaviors concerned with problems of survival such as mating strategies, parenting, and group living. Recommended Course Background: AS.200.101.  
Instructor(s): H. Petri  
Area: Social and Behavioral Sciences.

This course examines the neural basis of “cognitive control”. What is happening in our brains that enables control our thoughts and behavior? What does it mean neurologically when we say someone has “lost control”? What contributions do the neural processes of attention, memory, habits and emotions make? This is a very active area of current research, and this upper-level seminar will make broad use of the primary cognitive and systems neuroscience literature.  
Prerequisites: AS.080.203 OR AS.050.203 OR AS.200.141 OR AS.200.305  
Instructor(s): S. Courtney-Faruqee  
Area: Natural Sciences.

AS.200.312. Imaging the Human Mind.  
Prerequisites: EN.550.111 AND (AS.080.203 OR AS.050.203)  
Instructor(s): S. Courtney-Faruqee  
Area: Natural Sciences, Social and Behavioral Sciences.

Topics in applied probability and statistical inference; analysis of variance; experimental design. Intended for graduate students in psychology. Recommended Course Background: one statistics course.  
Prerequisites: Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR AS.280.345 OR AS.200.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430  
Instructor(s): L. Jager  
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

Second half of graduate statistics sequence, covering complex research design and analysis. Signature required for undergrad registration.  
Prerequisites: AS.200.314 or equivalent  
Instructor(s): A. Shelton  
Area: Quantitative and Mathematical Sciences.

AS.200.316. Thought and Perception.  
This year’s topic: Temporal Experience. Do we perceive time? If so, through what sense(s)? How long is the conscious “now”? Does the temporal order of our perceptions mirror the temporal order of what we perceive? Must the experience of a temporal duration itself be extended in time? What is the relation between the experience of time (for example, the experience of time’s passage) and memory? Does our experience of time accurately represent temporal features of reality, or is it actually illusory? How does attending to time’s passage affect its perceived rate of passage (and what is it to attend to time’s passage)? We will explore these and other questions through an examination of both psychological and philosophical work. [This course meets jointly with Professor Gross’s AS.150.476]  
Instructor(s): J. Flombaum; S. Gross  
Area: Humanities, Social and Behavioral Sciences.

AS.200.317. Interpersonal Relations.  
This course will investigate interpersonal processes ranging from attraction and courtship to relationship functioning and distress. Open to Psychology and Behavioral Biology majors only.  
Prerequisites: AS.200.133  
Instructor(s): S. Drigotás  
Area: Social and Behavioral Sciences.

Focus on frequently-used quantitative methods used in the study of brain sciences, including gaining conceptual understanding of techniques, analysis and summarization of data, extracting the process underlying a data set, explaining data as a function of variables, data visualization, etc. Enrollment is limited to undergraduate seniors and graduate students with instructor approval. Recommended Course Background: Probability & Statistics.  
Instructor(s): S. Mysore  
Area: Quantitative and Mathematical Sciences.

This course focuses on mental disorders in children and adolescents. The course begins with an exploration of the general models and theories for why psychopathology occurs in childhood. The second portion of the course provides a systematic review of the symptoms, course, risk factors, theories, and treatments for specific disorders, including mood disorders, anxiety disorders, autism, ADHD, eating disorders, and behavioral disorders.  
Prerequisites: AS.200.212  
Instructor(s): A. Papadakis  
Area: Social and Behavioral Sciences.

AS.200.325. Law Psychology: Clinical Application.  
Introduction to legal standards governing criminal forensic psychology assessments, e.g., competence to stand trial, criminal responsibility, mitigation of death penalty, negation of mens rea, and other criminal law forensic applications. Cross-listed with Behavioral Biology.  
Instructor(s): L. Raifman  
Area: Social and Behavioral Sciences.

AS.200.326. Law, Psychology and Public Policy.  
An introduction to applications of psychological research in policy analysis. Special emphasis is given to the use and misuse of psychology in Supreme Court advocacy and decision making in the areas of children’s rights, adult sexuality, and educational and employment opportunity. Recommended Course Background: Statistics & Regression Analysis  
Instructor(s): P. Hofer  
Area: Social and Behavioral Sciences.
A critical examination of the methods of observation, description, reasoning, inference, measurement and intervention that underlie the clinical practice of psychology and psychiatry. Cross-listed with Behavioral Biology. Open to Senior & Junior Behavioral Biology, Cognitive Science, Neuroscience, Psychology, and Public Health majors only OR with Instructor Approval.
Prerequisites: AS.200.212
Instructor(s): D. Edwin
Area: Social and Behavioral Sciences.

The recent world financial crisis has arguably been the most important event of the new millennium. Understanding the financial crisis requires knowledge of: “What happened & how the crisis unfolded?” “Why did it happen?” “How was the crisis eventually managed?” “Further, who were hurt?” “Who succeeded well?” And finally, “what policy decisions intended to protect markets by government officials succeeded to forestall further damage. Taking a behavioral finance focus, the course offers an analysis of heuristic decision errors that lead to bubbles and crashes in markets, and the failure of market models to avoid them. Instructor(s): L. Ralfman
Area: Social and Behavioral Sciences.

AS.200.332. Counseling Psychology.
This course provides an introduction to the field of counseling psychology. Professional identity and development, history, theories and processes of counseling are surveyed, as are a variety of specializations and settings in which counseling is practiced. Discussions, demonstrations, and exercises will give students an opportunity to explore counseling psychology as a career path. Recommended Course Background: AS.200.101
Instructor(s): C. Gasser
Area: Social and Behavioral Sciences.

The class is designed as a seminar including discussion of primary readings of social psychology articles ranging in topics from interpersonal relationship to behavior in large groups. Rising junior & senior Psychology majors only.
Prerequisites: AS.200.133
Instructor(s): S. Drigotas
Area: Social and Behavioral Sciences.

This is an advanced, discussion-based course covering the developmental, biological, environmental, and cultural bases of attentional, mood, psychotic, anxiety, trauma-based, eating, somatic, and personality disorders. Case formulations in class and review papers will be required.
Prerequisites: AS.200.212
Instructor(s): J. Neemann
Area: Social and Behavioral Sciences.

An interdisciplinary investigation into the innateness of concepts: perception, number, language, and morality, physics discussed. Evidence from animals, infants, patients, brains. Students collect data in sections investigating claims from the readings. Cross-listed with Cognitive Science and Philosophy.
Instructor(s): J. Halberda; L. Feigenson
Area: Social and Behavioral Sciences.

How do children acquire knowledge about the world? In this course, we will explore how children understand the world, looking at concepts of objects, number, space, and other people. Students will read both empirical and theoretical writing on these topics, participate in class discussions, and complete short critical writing assignments and final literature review paper.
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.341. Positive Psychology.
This course is graded S/U and does not count toward the psychology major. The course will review the growing field of positive psychology and will review the research on positive human attributes such as optimism, happiness, hope, resiliency, self-esteem, altruism, empathy, and forgiveness. This course will explore the research on how such positive attributes are developed and how they relate to psychological and physical well-being. Instructor(s): J. Neemann
Area: Social and Behavioral Sciences.

AS.200.343. Motivation.
Current biological, behavioral, and cognitive research and theory concerning the motivation of behavior are examined. Both human and non-human animal research is reviewed. Topics include the role of genetics, arousal, biological regulatory systems, incentives, expectancies, attributions, social processes and self-actualization in the general behavior. Recommended Course Background: AS.200.101 and AS.200.146 or instructor permission.
Instructor(s): H. Petri
Area: Social and Behavioral Sciences.

An examination of the effects of hormones on behavior in non-human and human animals. Topics will include the effects of hormones on sexual differentiation, reproductive behavior, parental behavior, homeostasis and biological rhythms, regulation of body weight, learning and memory. Cross-listed with Behavioral Biology and Neuroscience.
Prerequisites: Prereqs: ( AS.200.141 OR AS.080.305 ) OR (AS.020.151 AND AS.020.152) OR ( AS.020.305 AND AS.020.306 ) or instructor's permission
Instructor(s): K. Bohn
Area: Natural Sciences, Social and Behavioral Sciences.

The recent world financial crisis has arguably been the most important event of the new millennium. The course will initially answer: “What happened?” “Why did it happen?” “How was the crisis temporarily fixed?” “Who was hurt?” “Who succeeded?” Thereafter, the focus shifts to an analysis of the quality of decisions made by the market protectors who chose to intervene with policies to protect markets, and a comparison of investors who made winning compared with losing investment decisions. The final segment considers whether behavioral economic/cognitive psychological research best explains those decisions, and ways to lessen the risk inherent in current volatile recovering financial markets. In sum, the course will review the recent financial crisis by evaluating strategic investment decisions of the market protectors, winners, and losers.
Area: Social and Behavioral Sciences.
This course will apply insights from cognitive psychology decision-making research to the stock market. The course investigates whether investors can beat the market benchmarks by exploiting marketplace investor sentiment. Juniors and seniors only. Recommended Course Background: six credits of Psychology course work.
Area: Social and Behavioral Sciences.

The 2007-8 financial crisis, considered the most severe of its kind since the Great Depression, is our primary focus. The course will initially answer two critical questions: “What happened to bring about the financial crisis?” and “Who was hurt and who succeeded well?” We will then study specific crisis decisions to determine if a behavioral finance analysis contributes to a better understanding of decision making under conditions of uncertainty.
Instructor(s): L. Raifman
Area: Social and Behavioral Sciences.

The course is based upon an integrative strategy that focuses upon: (1) scientific research underlying forensic psychology expertise, (2) the formulation of expert opinions, and (3) the presentation of expert witness testimony in court cases. The course syllabus identifies examples from insanity defense that raises research questions answered by studies from psychology that focus on: battered spouse syndrome, sleep disorders/criminal behavior, pedophilia, settled psychosis, and the application of death penalty to juveniles or mentally ill persons.
Instructor(s): L. Raifman
Area: Social and Behavioral Sciences.

Psychological tests and measures are used in several settings including research, clinical, business, forensic, school and other applied settings. This course will consider the methodological and practical issues involved in test construction, the evaluation of instruments, and the uses of psychological tests across settings and for different purposes. Examples of assessments that may be discussed are aptitude and achievement tests; personality and behavioral inventories; neuropsychological tests, observations and interviews; and tests for employment and forensic use. Restricted to Junior & Senior Behavioral Biology, Cognitive Science & Psychology Majors.
Instructor(s): H. Roberts Fox
Area: Social and Behavioral Sciences.

How do nature and nurture shape the human mind? How does experience contribute to the development of visual perception, language and social reasoning? This course explores insights into these age-old questions from neuroscience and psychology. Studies of infant behavior reveal rich knowledge about objects and people in the first months of life. At the same time, experience has profound effects on behavior and neurobiology. For example, temporary absence of vision (i.e. blindness) during development permanently alters visual perception and the visual cortex. Key evidence also comes from studies of naturally occurring variation in human experience (e.g. blindness, deafness, socioeconomic and cultural differences). We will discuss what such studies of cognitive and neural function tell us about the origins of human cognition. This is a writing intensive course with weekly lectures and seminar style discussion of primary sources. Students will be required to write weekly responses to readings and a term paper.
Prerequisites: AS.200.141 OR AS.050.105 OR AS.080.105 OR AS.050.203 OR AS.020.312 OR AS.200.386 OR (AS.080.305 AND AS.080.306 ) OR AS.080.203
Instructor(s): M. Bedny
Area: Natural Sciences, Social and Behavioral Sciences.

How do children acquire knowledge about the world? In this seminar course, we will explore how children understand the world, looking at concepts of objects, number, space, and other people. Students will read both empirical and theoretical writing on these topics and complete writing assignments. Classes will primarily be discussion-based.
Instructor(s): M. Kibbe
Area: Social and Behavioral Sciences.

This course is designed to address the growing literature on the neurobiology of motivational behaviors, integrating studies from invertebrates to birds, rodents, primates and humans. The course will begin with a century old, yet ongoing, discussion on how researchers define ‘motivation’. Following this primary introduction, we will discuss the brain circuitry that underlies emotion, reward, and motivation, so that students attain the necessary foundations for understanding the neurobiology of motivated behavior. In particular, we will proceed with an in-depth exploration of an inherently motivated and naturally rewarding social interaction, sexual behavior, which will be discussed at multiple levels. Subsequent lectures will address literature on how humans activate the same brain reward systems artificially by using drugs of abuse. Drawing on these theoretical and empirical foundations, we will then explore the possible involvement of these motivational systems on distinctly human pleasures such as religious experience, visual arts, and music.
Prerequisites: AS.200.141 OR AS.080.105 OR ( AS.080.305 AND AS.080.306) OR Permission required.
Instructor(s): O. Iyilikci
Area: Natural Sciences, Social and Behavioral Sciences.
Episodic memory, or autobiographical memory, has been said to be a capacity that is uniquely human. Consisting of the what, when, and where components of our experiences, episodic memory is what makes each of us who we are. This course will explore each of these components individually—the psychology and neural underpinnings of each component—before discussing them in combination as episodic memory. Finally, we will visit one of the greatest ongoing debates in the memory literature: whether or not this ability is truly “uniquely human” or if our nonhuman animal counterparts also have this capacity. Throughout the course, we will draw on evidence from empirical articles based on studies in a variety of species including rodents, primates, and birds.
Prerequisites: AS.200.101 OR AS.200.141 OR AS.080.105 OR (AS.080.305 AND AS.080.306) OR Permission required.
Instructor(s): J. Asem
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.368. Sleep, Dreams, and Altered States of Consciousness.
Sleep, dreaming, resting and arousal to waking represent very different states of consciousness which differ dramatically both psychologically and physiologically. This course focuses on cognitive, psychological, physiological, biological and genetic aspects characterizing each of these states with some reference to other altered states. The course includes a focus on the major pathologies affecting sleep-wake states. Clinical cases will be considered. These inform about both psychological and biological aspects of these states. The relative biological functions of each state will be evaluated with particular attention to the mystery of why we have and apparently need REM and NREM sleep. Actual physiological recordings of sleep states will be reviewed and the student will learn how these are obtained and how to evaluate these. The circadian rhythms, ontogeny and evolution of these sleep-wake states will also be covered. This will include a review of information learned from non-human animal sleep. The change from sleep to full awakening reflects change toward increasing brain organization supporting consciousness. Understanding of the neurobiology of these states will be used to explore some of the more modern and scientific concepts of human self-awareness or consciousness.
Prerequisites: AS.080.203 OR AS.050.203 OR AS.200.101 or permission required.
Instructor(s): R. Allen
Area: Natural Sciences, Social and Behavioral Sciences.

This course will explore the neurobiological bases of motivated behavior, including eating, drinking, and reproduction, tracing the history of our understanding from early neuroscientific studies to the modern day, with a focus on mammalian model systems. We will discuss innate motivated behaviors, and well as how learning can guide the expression of these behaviors. Neural mediation of processes such as reward and aversion will be considered in depth, as well as applications of these findings to the understanding of addiction and other behavioral disorders. The course will be a mixed lecture/seminar format; we will read original research articles and scholarly reviews.
Prerequisites: AS.200.366. Exclude students who have taken AS.200.366.; AS.200.141 OR (AS.080.305 AND AS.080.306)
Instructor(s): P. Janak
Area: Natural Sciences.

This course examines the general organizing principles of the anatomy of the human central nervous system and how this anatomical organization relates to function, from the level of neural circuits, to systems, to behavior. Students will learn to identify neuroanatomical structures and pathways in dissections and MRI images through computerized exercises. Readings and lectures will emphasize general structure-function relationships and an understanding of the functional roles of particular structures in sensory, motor, and cognitive systems.
Prerequisites: AS.080.250 OR AS.080.305
Instructor(s): S. Courtney-Faruquee
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.372. The Aging Brain.
We will examine what current research can tell us about changes in mental abilities as we grow older, what biological changes in the brain during aging cause cognitive decline, and finally, how scientists are meeting the challenge of maintaining the functions of the mind into advanced old age.
Instructor(s): M. Gallagher
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.376. Psychopharmacology.
Designed to provide information about how drugs affect the brain and behavior. The course focuses on biological concepts underlying structures and functions of the brain that relate to mental disorders. An introduction to neurobiology and brain function is presented as it applies to the interaction of various classes of drugs with the individual neurotransmitter systems in the brain. A brief historic review is followed by a discussion of clinical relevance. Cross-listed with Behavioral Biology and Neuroscience.
Prerequisites: AS.200.141 OR (AS.020.312 AND AS.020.306) OR (AS.080.305 AND AS.080.306) or permission required.
Instructor(s): H. Adwanikar; L. Gorman
Area: Natural Sciences, Social and Behavioral Sciences.

A comparative and evolutionary approach to understanding the neural underpinnings of biologically relevant behaviors in vertebrate and invertebrate animals.
Prerequisites: AS.020.151 or equivalent
Instructor(s): C. Moss
Area: Natural Sciences.

A small group exploration of current issues in clinical psychology, aimed at developing students’ empirical research skills. Following critical analysis of the empirical literature, students develop research proposals for novel research and/or conduct research and author research reports. Topics vary by semester. In the current offering, the topic will be stress, coping, emotion-regulation, peer relationships, and psychopathology among adolescents and emerging adults.
Prerequisites: AS.200.212
Instructor(s): A. Papadakis
Area: Social and Behavioral Sciences.
The complexity of human behavior surpasses even our closest primate relatives. Only humans communicate through language, build complex technology, devise legal system and wage war. What neurobiological capacities set humans apart from other animals? This course will explore the neurobiology of cognition, focusing on cognitive domains that are particularly developed in the human species: language, social cognition, number, executive function and concepts. The course format will consist of lectures and in class workshops.
Instructor(s): M. Bedny
Area: Natural Sciences, Social and Behavioral Sciences.

This course reviews the major models of psychotherapy, including psychodynamic, cognitive, behavioral, interpersonal, and family therapy, with a focus on modern and empirically supported treatments. The application of the models through the analysis of clinical case studies is emphasized. Restricted to Junior & Senior Psychology Majors & Minors.
Prerequisites: AS.200.212
Instructor(s): A. Papadakis
Area: Social and Behavioral Sciences.

A cross-disciplinary investigation of space representation and navigation in a broad range of animal species. Topics will include sonar orientation, landmark use, the role of dead reckoning, spatial memory, long-distance migration, and map-making.
Prerequisites: AS.200.141 OR (AS.080.305 AND AS.080.306) or equivalent.
Instructor(s): C. Moss
Area: Natural Sciences.

Examine relations between brain, mind, and behavior in nonhuman animals, focusing on topics such as learning, memory, attention, decision-making, navigation, communication, and awareness. We will take a variety of approaches, including behavioral, computational, evolutionary, neurobiological, and psychological perspectives.
Prerequisites: (AS.200.141 OR AS.200.208 OR AS.290.101) OR permission of instructor.
Instructor(s): P. Holland
Area: Social and Behavioral Sciences.

We tend to feel that we are thinking the hardest in social situations. In contrast, we barely feel the complicated processing that produces our vivid and salient visual experiences; in fact, we cannot even access most of this processing directly. This course will explore the relationship between visual perception and social cognition, especially the ways that the visual system supplies crucial raw materials for more elaborate social processing, and the ways that our social agendas may, in turn, influence vision. Topics will include what we find physically attractive in mates (and why); the quick formation of social impressions; the neural, cognitive, and evolutionary basis of aesthetic perception; and the extent to which perception might be socially constructed (i.e. whether vision can be influenced from the 'top-down'). All readings will come from primary scientific literature, and students should have some experience reading this kind of material. Limited to juniors, seniors, and graduate students.

AS.200.388. Occupational Health Psychology.
Occupational Health Psychology (OHP) concerns the application of psychology to improving the quality of work life, and to protecting and promoting the safety, satisfaction, health, and well-being of workers. This course will consider a broad range of topics in OHP including the role of work on well-being, job stress and burnout, diversity and work, safety climate, work-family balance, conflict, and counterproductive work behaviors. The emphasis will be on drawing connections between OHP theory and OHP practice and at the relationship between individual and organizational health and well-being. This class should be of interest to students interested in industrial/organizational psychology, social psychology, health psychology, clinical psychology, human factors, public health, preventive medicine, and industrial engineering.
Instructor(s): H. Roberts Fox
Area: Social and Behavioral Sciences.

This course is designed to address the increasing gap in our knowledge on sex differences in the brain and cognitive abilities and how hormones play a pivotal role. Dean's Teaching Fellowship. Recommended Course Background: AS.200.101 or AS.020.151
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.401. Careers in Psychology - Freshmen.
An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.
Instructor(s): J. Halberda
Area: Social and Behavioral Sciences.

An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.
Instructor(s): J. Halberda
Area: Social and Behavioral Sciences.

An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.
Instructor(s): J. Halberda
Area: Social and Behavioral Sciences.

An introduction to the varied career paths offered across the field of psychology, hosting a diverse representation of speakers from various Johns Hopkins institutions and the local Baltimore community.
Instructor(s): J. Halberda
Area: Social and Behavioral Sciences.

AS.200.501. Psychological Research - Freshmen.
S/U grading only.
Instructor(s): Staff.

AS.200.502. Psychology Research-Freshmen.
Instructor(s): Staff.

AS.200.503. Psychological Research - Sophomores.
S/U grading only
Instructor(s): Staff.

AS.200.504. Psychology Research-Sophomores.
Grading Satisfactory/ Unsatisfactory only.
Instructor(s): Staff.
AS.200.505. Psych Readings - Fr.
Instructor(s): Staff.

Instructor(s): Staff.

Instructor(s): Staff.

AS.200.509. Internship-Psychology.
S/U grading only.
Instructor(s): Staff.

AS.200.510. Psychology Internship.
Grading Satisfactory/ Unsatisfactory only.
Instructor(s): Staff.

S/U grading only.
Instructor(s): Staff.

AS.200.512. Psychology Research-Juniors.
Grading Satisfactory/ Unsatisfactory only.
Instructor(s): Staff.

AS.200.513. Psychological Research - Seniors.
The student chooses some research problem with the advice and approval of a faculty member. S/U grading only.
Instructor(s): Staff.

AS.200.514. Psychology Research-Seniors.
Instructor(s): Staff.

AS.200.517. Psych Readings - Srs.
Instructor(s): Staff.

AS.200.519. Seniors Honors Research.
Seniors working on the honors thesis enroll with the approval of the undergraduate coordinator.
Instructor(s): Staff.

AS.200.520. Seniors Honors Research.
Instructor(s): Staff.

AS.200.538. Indep Study - Sophomores.
Instructor(s): Staff.

AS.200.539. Indep Study - Juniors.
Instructor(s): Staff.

AS.200.540. Independent Study-Seniors.
Instructor(s): Staff.

Instructor(s): Staff.

Instructor(s): Staff.

AS.200.570. Independent Study.
Instructor(s): L. Raifman; S. Drigotas.

AS.200.572. Research-Intersession.
Instructor(s): A. Shelton; H. Egeth; P. Holland; S. Drigotas.

AS.200.574. Psychology Internship.
Instructor(s): H. Egeth; S. Drigotas.

AS.200.595. Internship.
Instructor(s): Staff.

AS.200.597. Psychology Research.
Instructor(s): Staff.

AS.200.599. Independent Study.
Instructor(s): Staff.

This is a journal club examining recent literature in the field related to the hippocampus and the medial temporal lobe memory system. Discussions are heavily based on animal models and theoretical accounts of the hippocampus' role in learning and memory. Graduate students only.
Instructor(s): J. Knierim; M. Yassa
Area: Natural Sciences, Social and Behavioral Sciences.

AS.200.605. Topics in Attention and Cognition.

AS.200.606. The Semantics & Psychology.

Graduate course designed to address the increasing gap in our knowledge on sex differences in the brain and cognitive abilities, and how hormones play a pivotal role. Advanced undergraduates may attend with permission.

This graduate seminar will survey recent theory and research concerning the functional organization of prefrontal cortex for working memory, decision making, and cognitive control. Graduate students only.

An introduction to the fundamental principles of cognitive and physiological psychology. Required course of first-year graduate students. Graduate students only.
Instructor(s): L. Feigenson
Area: Natural Sciences, Social and Behavioral Sciences.

Graduate students only or permission required.
Instructor(s): K. Blacker.

Graduate student only.
Instructor(s): K. Blacker.

AS.200.616. Thought and Perception.
This year's topic: Temporal Experience. Do we perceive time? If so, through what sense(s)? How long is the conscious “now”? Does the temporal order of our perceptions mirror the temporal order of what we perceive? Must the experience of a temporal duration itself be extended in time? What is the relation between the experience of time (for example, the experience of time’s passage) and memory? Does our experience of time accurately represent temporal features of reality, or is it actually illusory? How does attending to time’s passage affect its perceived rate of passage (and what is it to attend to time’s passage)? We will explore these and other questions through an examination of both psychological and philosophical work. [This course meets jointly with Professor Gross’s AS.150.476]
Instructor(s): J. Flombaum; S. Gross.

Often, languages are described as sets of expressions. But in acquiring a language, a child acquires a procedure that generates expressions. If Linguistic expressions pair pronunciations with mental representations, then one task shared by linguists and psychology is to specify the forms of these representations. This seminar explores this relationship in detail.
AS.200.627. Graduate Seminar: Memory.
Instructor(s): S. Courtney-Faruqee.

Instructor(s): A. Shelton.

AS.200.632. Topics: Spatial Cognition.
Graduate students only.
Instructor(s): A. Shelton.

AS.200.640. Review of Recent Literature in Biopsychology.
Instructor’s approval required.
Instructor(s): G. Ball.

Current biological, behavioral, and cognitive research and theory concerning the motivation of behavior are examined. Both human and non-human animal research is reviewed. Topics include the role of genetics, arousal, biological regulatory systems, incentives, expectancies, attributions, social processes and self-actualization in the general of behavior. Course will meet with AS.200.343.
Instructor(s): H. Petri.

This two-semester course will provide an overview of clinical, neuropsychological, imaging and neuropathological approaches to the study of cognitive systems altered in aging, AD and other neurodegenerative disorders. It will consider research using animal models as well as human subjects and clinical populations. The course is intended for graduate students and is open to advanced undergraduates only with permission of the professor.
Instructor(s): M. Albert; M. Gallagher.

AS.200.649. Aging, Cognition, and Neurodegenerative Disorders II.
Second part of a two-semester course. Course will provide an overview of clinical, neuropsychological, imaging and neuropathological approaches to the study of cognitive systems altered in aging, AD and other neurodegenerative disorders. It will consider research using animal models as well as human subjects and clinical populations. The course is intended for graduate students and is open to advanced undergraduates only with permission of the professor. Predoctoral and Postdoctoral students from A&S, SPH and SOM students participating in the NIA Training Program on Age-Related, Cognitive and Neuropsychiatric Disorders are required to take this course; meets concurrently with PH.330.802(01)
Instructor(s): M. Albert; M. Gallagher.

AS.200.654. Psychological & Brain Sciences Core Topics A.
This course is designed to introduce students to core topics in psychological and brain sciences. Students will read seminal and contemporary papers in topics that cover the breadth of the field. Graduate students in Psychological & Brain Sciences.
Instructor(s): L. Feigenson.

AS.200.655. Psychological & Brain Sciences Core Topics B.
This course is designed to introduce students to core topics in psychological and brain sciences. Students will read seminal and contemporary papers in topics that cover the breadth of the field. Graduate Students in Psychological & Brain Sciences.
Instructor(s): L. Feigenson.

AS.200.661. Topics in Psychological & Brain Sciences.
An introduction to postdoctoral activities (e.g., grant applications, journal article submission, meeting presentations, the politics of psychology and American science) for Ph.D. candidates in psychology.
Instructor(s): L. Feigenson.

AS.200.662. Psychological and Brain Sciences: Career Development.
Instructor(s): S. Courtney-Faruqee.

How do children acquire knowledge about the world? In this seminar course, we will explore how children understand the world, looking at concepts of objects, number, space, and other people. Students will read both empirical and theoretical writing on these topics and complete writing assignments. Classes will primarily be discussion-based.
Instructor(s): M. Kibbe.

This seminar will cover advanced topics in vision from the perspectives of several disciplines. Topics include human visual psychophysics, perception and cognition, and computational vision. Graduate students only. Cross-listed with Neuroscience.
Instructor(s): H. Egeth; J. Flombaum; J. Halberda.

Instructor(s): S. Courtney-Faruqee.

A cross-disciplinary investigation of space representation and navigation in a broad range of animal species. Topics will include sonar orientation, landmark use, the role of dead reckoning, spatial memory, long-distance migration, and map-making. Contact instructor for enrollment approval.
Instructor(s): C. Moss.

AS.200.701. Graduate Seminar: fMRI.
Instructor(s): Staff.

AS.200.801. Research Seminar: Learning and Memory.
This laboratory meeting is for graduate students studying learning and memory mechanisms, alterations with age or neurologic disease, and advanced neuroimaging methods. Meetings will focus on experimental design, presentation of data, analytical techniques. Undergraduates allowed to add the course with permission as Satisfactory/Unsatisfactory only. Recommended Course Background: AS.200.370 or AS.200.141 or AS.080.305/AS.080.306 or AS.020.306.
Instructor(s): M. Yassa.

AS.200.804. Topics in Neurocognitive Aging.
This seminar will cover advanced topics in neurocognitive aging. Topics will include animal models of memory loss in normal aging and in Alzheimer’s disease (AD), including both behavioral and neurobiological findings. Special attention will be given to the relation between such findings and the effects of aging and AD on memory and the brain in man. Similar comparative analysis in other cognitive domains (e.g. attentional processes) will also be considered.
Instructor(s): M. Gallagher.

AS.200.805. Topics in Attention and Cognition.
Instructor(s): J. Flombaum.
Guided independent readings. The class is designed as a seminar including discussion of primary research articles of cognitive aging. Specific topics include human imaging and animal models of memory, aging, and neurodegenerative disease.
Instructor(s): R. Haberman.

AS.200.810. Research in Psychology.
Students plan and execute original research under guidance of advisers. Results are usually prepared in a form suitable for publication. Graduate students only.
Instructor(s): S. Courtney-Faruqee; Staff.

Instructor(s): H. Egeth.

Instructor(s): L. Feigenson.

Instructor(s): J. Halberda.

Instructor(s): P. Holland.

Instructor(s): L. Feigenson.

Instructor(s): V. Stuphorn.

Instructor(s): J. Halberda.

Guided independent readings and research in special fields. Graduate Students only.
Instructor(s): Staff.

Graduate students only.
Instructor(s): F. Madison; G. Ball.

Graduate students only.
Instructor(s): E. Fortune.

Graduate students only.
Instructor(s): C. Moss; M. Gallagher; P. Holland; P. Janak.

Graduate Students Only
Instructor(s): M. Bedny.

Graduate only.
Instructor(s): S. Yantis.

Graduate Students Only
Instructor(s): S. Mysore.

AS.200.830. Readings in Psychology.
Graduate students only.
Instructor(s): J. Flombaum; J. Halberda.

Graduate Students Only
Instructor(s): C. Moss.

Graduate Students Only.
Instructor(s): P. Janak.

Graduate students only. Permission Required.
Instructor(s): S. Courtney-Faruqee.

Instructor(s): S. Courtney-Faruqee.

AS.200.848. Current Advances in Psychological and Brain Sciences.
Introduces advanced research topics to graduate students (as well as faculty) through a series of speakers and discussions.
Instructor(s): J. Flombaum.

AS.200.849. Teaching Practicum.
All candidates are required to obtain special experience in various aspects of undergraduate teaching. Graduate students only.
Instructor(s): Staff.

AS.200.850. Advanced Teaching Practicum.
Instructor(s): J. Halberda; L. Feigenson.

AS.200.899. Psychology Internship/Practicum.
The Ph.D. program in Psychological & Brain Sciences trains students in psychological science through general and advanced seminars in the various subdisciplines of psychology and by active engagement in research. Registration in this course will be accompanied by the student's participation in an internship/practicum experience.
Instructor(s): L. Feigenson.

Cross Listed Courses

Cognitive Science

AS.050.102. Language and Mind. 3 Credits.
Introductory course dealing with theory, methods, and current research topics in the study of language as a component of the mind. What is to “know” a language: components of linguistic knowledge (phonetics, phonology, morphology, syntax, semantics) and the course of language acquisition. How linguistic knowledge is put to use: language and the brain and linguistic processing in various domains. This course is restricted to freshmen and sophomores. Juniors and seniors must seek instructor approval to enroll. Cross-listed with Neuroscience and Psychology.
Instructor(s): A. Omaki
Area: Natural Sciences, Social and Behavioral Sciences.

AS.050.204. Visual Cognition.
Vision is central to our daily interactions with the world: we can effortlessly navigate through a city, comprehend fast movie trailers, and find a friend in a crowd. While we take the visual experience for granted, visual perception involves a series of complicated cognitive processes beyond just opening our eyes. The goal of this course is to provide an introduction to visual cognition, including existing theoretical frameworks and recent research findings. We will explore questions such as: How do we see the stable world when our eyes are constantly moving? What is the relationship between seeing and knowing? Do Infants see the world the same way as adults do? What are the neural mechanisms underlying visual perception?
Instructor(s): S. Park
Area: Natural Sciences, Social and Behavioral Sciences.
This course is an advanced seminar and research practicum course. It will provide the opportunity to learn about fMRI methods used in the field of vision science and for students to have hands-on experience to develop, design and analyze a research study on topics in the cognitive neuroscience field of high-level vision. In the first part of the course students will read recent fMRI journal papers and learn about common fMRI designs and analysis methods; in the second part of the course students will conduct a research study as a group to address a research question developed from readings. Students are expected to write a paper in a journal article format at the end of the course and to present their results in front of the class. Research topics will vary but with special focus on topics in object, scene and space recognition. Cross-listed with Neuroscience and Psychology, instructor's permission required.
Instructor(s): S. Park
Area: Natural Sciences, Social and Behavioral Sciences.

Vision is central to our daily interactions with the world: we can effortlessly navigate through a city, comprehend fast movie trailers, and find a friend in a crowd. While we take the visual experience for granted, visual perception involves a series of complicated cognitive processes beyond just opening our eyes. The goal of this course is to introduce students to the field of visual cognition, including existing theoretical frameworks and recent research findings. We will explore questions such as: How do we see the visual world? Do we see and remember correctly what’s in the physical world? How many items can we keep track of and remember at a time? How is the visual system structured and what are the neural mechanisms underlying visual perception? Meets with AS.050.619.
Prerequisites: AS.200.101 OR AS.050.101 OR AS.080.203 OR AS.050.203
Instructor(s): S. Park
Area: Natural Sciences, Social and Behavioral Sciences.

This is a survey course in developmental psychology, designed for individuals with some basic background in psychology or cognitive science, but little or none in development. The course is strongly theoretically oriented, with emphasis on issues of nature, nurture, and development. We will consider theoretical issues in developmental psychology as well as relevant empirical evidence. The principle focus will be early development, i.e., from conception through middle childhood. The course is organized topically, covering biological and prenatal development, perceptual and cognitive development, the nature and development of intelligence, and language learning. Also listed as AS.050.639. Cross-listed with Neuroscience. Instructor’s approval required.
Instructor(s): J. Yarmolinskaya
Area: Natural Sciences, Social and Behavioral Sciences.

Instructor’s permission required. (Also offered as AS.050.312.)
Instructor(s): S. Park
Area: Natural Sciences, Social and Behavioral Sciences.

Neuroscience
This course investigates numerous types of brain injuries and explores the responses of the nervous system to these injuries. The course’s primary focus is the cellular and molecular mechanisms of brain injury and the recovery of function. Discussions of traumatic brain injury, stroke, spinal cord, and tumors, using historical and recent journal articles, will facilitate students’ understanding of the current state of the brain injury field. Cross-listed with Psychological and Brain Sciences and Behavioral Biology.
Prerequisites: ( AS.080.305 AND AS.080.306) OR (AS.020.312 OR AS.020.306) OR (200.141 and 020.306) OR Permission of Instructor
Instructor(s): L. Gorman
Area: Natural Sciences.

Sociology
AS.230.302. Class Stratification & Personality.
230.302 (S) CLASS, STRATIFICATION, AND PERSONALITY (3) Kohn Limit 30 Juniors/Seniors only or instructor’s consent An intensive examination of the research literature, much of it based on survey research carried out by the instructor and his international collaborators, on the relationships of social class and social stratification with personality. The course will examine the links between people’s positions in the class structure and the stratification hierarchy of their society and their more proximate conditions of life, particularly their job conditions, and how these conditions, in turn, affect (and are affected by) such basic dimensions of personality as intellectual flexibility, self-directedness of orientation, and feelings of well-being or distress. The research has been conducted principally in the United States, Japan, Poland when it was socialist, Poland and Ukraine during their transitions from socialism to nascent capitalism, and (in the instructor’s current research) China during its very different transformation. Cross-listed with Psychological & Brain Sciences
Instructor(s): M. Kohn
Area: Social and Behavioral Sciences.

Behavioral Biology
This course will examine the historical and current theories of sexual orientation and sexual variation development by examining the biological, psychological and social contributing factors that influence the development of sexual orientations and variations along with treatment and modification of problematic sexual behaviors. Limited to Juniors and Seniors with PBS, Neuroscience, Public Health, Behavioral Biology, and Biology majors, or Juniors and Seniors with PBS or Women’s Studies minors.
Prerequisites: Students may enroll in both AS.200.204 and AS.290.420, but cannot do so in the same semester.
Instructor(s): A. Jarema; C. Kraft
Area: Social and Behavioral Sciences.

Public Health Studies
Public Health combines a prevention orientation with a population perspective in pursuit of better health for all members of society. Public health professionals deal with critical large-scale issues such as access to health care; chronic disease control; mapping, predicting, and containing outbreaks of infectious disease; as well as researching factors that contribute to health outcomes such as gender, poverty, and
education. Public Health has close ties with medicine through research, clinical practice, and formulating policy.

The Public Health Studies Program offers undergraduates a major that links them to the world of public health through core courses taken on the Homewood campus, as well as electives taken at the Johns Hopkins Bloomberg School of Public Health (JHSPH).

Core course work at Homewood includes Fundamentals of Epidemiology, Environment and Your Health, Fundamentals of Health Policy and Management, Biostatistics, Social and Behavioral Health, as well as a year of Biology and Calculus I. Students will select additional public health coursework from a range of options that include the natural sciences, health economics, medical anthropology, disparities in health and access to health care, the history of science and medicine, and demography. The major is flexible and easily adapted to further course work in the natural sciences and historically about two-thirds of Public Health Studies majors complete the premedical core curriculum.

Public Health Studies majors also complete the Public Health Applied Experience as part of their undergraduate degree requirements. This involves a supervised, hands-on experience working with public health professionals. The goal of the applied experience requirement is to ensure that students have practical public health exposure in a clinical, research, or community setting. Find more information at http://krieger.jhu.edu/publichealth/academics/AE-Main.

The Johns Hopkins Bloomberg School of Public Health is the oldest and largest school of public health in the United States. Although its primary function is as a graduate school, seniors majoring in public health studies take a semester’s worth of courses there in fulfilling their B.A. degree requirements. Many students get involved in ongoing research projects at JHSPH such as developing malaria vaccine, investigating hospital patient safety protocols or assessing the links between poverty and poor health.

Available course work at JHSPH includes the following areas: health education, environmental health sciences, epidemiology, health finance and management, health policy, human genetics, immunology and infectious diseases, international health, maternal and child health, mental health, nutrition, occupational medicine/health protection and practice, population studies, toxicology, and tropical medicine, among others.

An honors option is available to Public Health Studies seniors with a major GPA of 3.3. Public Health Honors students work in a research capacity under the supervision of a JHU faculty member and with the guidance of the Director of the Public Health Studies program. Students register for 280.495 Honors in Public Health Seminar in the fall and 280.499 in the spring. Interested students should discuss their plans with the Director of the Public Health Studies program in the spring of their junior year.

Many Public Health Studies students have pursued international public health internships and study abroad opportunities both during the academic year and over the summer. In addition to a wide array of general options available through the JHU Office of Study Abroad, the PHS program has established two public-health specific annual programs: Intersession (3 1/2 weeks) in Uganda and Summer (7 weeks) in South Africa. Each includes both academic and applied components and allows students to earn graded JHU credits which can be used toward the Public Health Studies major. The Uganda program compares health issues in urban and rural settings, while the South Africa program closely investigates the impact of the HIV epidemic on prevention measures and healthcare delivery in that country. For more information, go to krieger.jhu.edu/publichealth/academics/study-abroad/

The Public Health Studies office is located in the 3505 North Charles Building second floor, adjacent to the Homewood campus. Public Health Studies advisors may be consulted about the various courses, careers, and graduate programs in public health on a walk-in basis or by appointment. Information can also be obtained by emailing phstudies@jhu.edu or at http://krieger.jhu.edu/publichealth.

Bachelor of Arts/Masters Program

The Bachelor of Arts/Master of Health Sciences (BA/MHS) and Bachelor of Arts/Master of Sciences in Public Health (BA/MSPH) programs are a coordinated academic collaboration between the Krieger School of Arts and Sciences and the Johns Hopkins Bloomberg School of Public Health. It enables talented and committed Public Health Studies Program majors to complete a BA and master’s degree from the School of Public Health in five to six years.

The Department of Environmental Health Sciences, Department of Epidemiology and Department of Mental Health will consider JHU undergraduates majoring in Public Health Studies for admission to the BA/MHS program. The Department of Environmental Health Sciences also offers a BA/MSPH in Occupational and Environmental Hygiene. The Department of Health Policy and Management offers a BA/MSPH in Health Policy.

Public Health Studies students apply for early admission during their junior year. Admitted students must complete the BA degree before formally enrolling in the graduate school, but up to 16 of the public health credits earned inter-divisionally toward the BA may also apply toward the MHS or MSPH degree. In addition, students in this program will receive co-advising from both schools to optimize their academic experience. Find more information at http://krieger.jhu.edu/publichealth/academics/.

Public Health Studies Program Advisory Board

The Public Health Studies Program Advisory Board reviews the progress and status of the Public Health Studies Program. Members provide advice and guidance on issues that are vital to a successful program, such as faculty appointments, curriculum reviews, utilization of university resources, and new funding opportunities.

One designated Public Health Studies Alumni serves a 2-year term on the committee.

Board Members

Krieger School of Arts and Sciences

Joel Schildbach; Vice Dean for Undergraduate Education; Professor (Biology)
Richard Cone; Professor (Biophysics); Advisory Board Chair
Steven David; Professor (Political Science)
Andy Cherlin; Professor (Sociology); Benjamin H. Griswold III Professor of Public Policy
Adam Sheingate; Associate Professor (Political Science)
Johns Hopkins Bloomberg School of Public Health

Stephen Gange; Senior Associate Dean for Academic Affairs; Professor (Epidemiology)
Marie Diener-West; Abbey-Merrell Professor of Biostatistics; Chair, Master of Public Health Program
John Groopman; Anna M. Baetjer Professor in Environmental Health Sciences
Ellen MacKenzie; Fred and Julie Soper Professor in Health Policy and Management
James Yager; Edyth H. Schoenrich Professor in Preventive Medicine; Professor; Deputy Chair (Environmental Health Sciences)
Scott Zeger; Professor (Biostatistics); Professor (Epidemiology)

Requirements for the B.A. Degree

Also see Requirements for a Bachelor’s Degree (p. 20).

All major requirements must be taken for a letter grade. Course taken satisfactory/unsatisfactory do not apply towards the major with some exceptions for the applied experience requirement. Major requirements are as follows:

Courses at Homewood

<table>
<thead>

or AS.280.375 | Cultural Factor Of Public Health |

Three public health courses at the 200-400 level offered on the Homewood campus 9

Ten credits of courses at the Bloomberg School of Public Health * 10

Applied clinical or community-based experience ** 0-3

Total Credits 55-59

* Requirements at JHSPH
Fifteen (15) units of courses are taken at the Johns Hopkins Bloomberg School of Public Health in the student’s fourth year. This is equivalent to 10 Homewood credits. Within the 15, students must create an 8 unit focus in one particular area, topic, or department. Other courses may be taken in any department. These courses may not be independent research/special study, taken S/U or online.

** Applied Experience
Public health studies majors will complete one (1) approved applied clinical or community-based experience. A minimum of 80 hours of applied work is required along with a synthesizing assignment. Additional information about this requirement is available here (http://krieger.jhu.edu/publichealth/academics/AE-Main).

Honors in Public Health Studies
An honors option is available to Public Health Studies seniors with a major GPA of 3.3. Public Health Honors students work in a research capacity under the supervision of a JHU faculty member and with the guidance of the Director of the Public Health Studies program. Students register for AS.280.495 Honors in Public Health - Seminar in the fall and AS.280.499 Honors in Public Health in the spring. Interested students should discuss their plans with the Director of the Public Health Studies program in the spring of their junior year.

For current faculty and contact information go to http://krieger.jhu.edu/publichealth/directory/

Faculty
Program Director
Kelly Gebo
M.D., M.P.H.; Professor (Medicine, Epidemiology, Public Health Studies).

Associate Director
Mieka Smart
DrPH.; Lecturer (Public Health Studies); Academic Advisor.

Assistant Director
Lisa Folda
M.H.S.; Lecturer (Public Health Studies); Academic Advisor.

Academic Advisor
Joseph Balabis
M.P.H; Academic Advisor (Public Health Studies).

Faculty
Stanley Becker
Professor (Population, Family, and Reproductive Health).

Peter Beilenson
Associate (Public Health Studies).

David Bishai
Professor (Population, Family, and Reproductive Health).
Lee Bone
Associate Professor (Health, Behavior, and Society).
Joseph Bressler
Professor (Environmental Health Sciences).
Lawrence Cheskin
Associate Professor (Health, Behavior, and Society).
Carolyn Furr-Holden
Associate Professor (Mental Health).
Leah Jager
Assistant Scientist (Biostatistics).
Thomas LaVeist
Professor (Health Policy and Management).
Philip Leaf
Professor (Mental Health).
Darcy Phelan-Emrick
Assistant Scientist (Epidemiology).
Jennifer Schrack
Assistant Professor (Epidemiology).
Donald Steinwachs
Professor (Health Policy and Management).
Margaret Taub
Assistant Scientist (Biostatistics).
Michael Trush
Professor (Environmental Health Sciences).
Peter Winch
Professor (International Health).
Scott Zeger
Professor (Biostatistics and Epidemiology).
Barry Zirkin
Professor (Biochemistry and Molecular Biology).

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

AS.280.100. Public Health in Film and Media.
This course uses film to explore and question the cultural landscape of public health in today's society. Public health is a richly diverse field that reaches not only into many areas of daily life, but into our cultural imagination as well. The purpose of this class is to examine how public health matters such as epidemic disease, access to health care, health and the law, bioethics, neglected tropical diseases and other topics are portrayed in feature films and documentaries. Each week students will view and discuss a film or documentary that addresses a public health issue. Freshmen Only. S/U Grading Only.
Instructor(s): M. Smart
Area: Social and Behavioral Sciences.

An overview of the major concepts and themes in Public Health utilizing the social and natural science disciplines in populations world-wide.
Instructor(s): M. Alexander
Area: Social and Behavioral Sciences.

AS.280.103. Public Health, Policy and Politics: A Primer.
Combining basic tenets of public health with real-life examples of public health practice in Baltimore, the course will provide an introduction to the field of public health. Throughout the course a major effort will be made to expose students to the wide array of opportunities that are available to those pursuing a career in public health.
Instructor(s): P. Beilenson
Area: Social and Behavioral Sciences.

This course will introduce students to the intricate mechanisms behind institutional food service. Students will be given a background of Hopkins' commitment to source more local, ecologically sound, fair, and humane food, and how this fits into the broader context of the growing farm-to-institution movement. Tours and discussions with producers, dining managers, and food service workers will highlight different perspectives on these trends, and their roles in creating a healthier food system.
Area: Social and Behavioral Sciences.

AS.280.105. JUMP: Pathway to Success.
This course for sophomores provides important aspects of medicine including interviewing skills, historical and environmental factors affecting health, and team work in a health care system. Students will have an opportunity to practice simulated medicine at the Johns Hopkins School of Medicine's Simulation Center and through the CPR training office. A key part of the course is also having a variety of physicians from different specialty areas share their journeys to medicine, why they love medicine, and be available for questions. There will be faculty speaker at the end of the class on almost every day. Lastly, to simulate patient interviewing, student teams will interview and video record current Hopkins medical students. Similar to a patient history, students will have to generate a medical student oral history about their pathway to medicine. Final oral histories are presented the last day of class.
Instructor(s): D. Teraguchi
Area: Social and Behavioral Sciences.

This course introduces first-year students to the connections between undergraduate education and the pursuit of medicine and other health related careers. Each class will focus on a specific content area related to the pathway to medicine such as professionalism, teamwork, public health, biomedical research, and communication. Because the course is located at the Johns Hopkins Medical Institutions campus (East Baltimore), medical and graduate students will play a vital role in the course. In the last hour of class, medical students will share their research or activities, which are particularly meaningful to them and insights from their undergraduate experiences that prepared them for the rigors and intensity of medical school. By the end of the course, students will be exposed to variety of components of medicine and perspectives on the life at Hopkins Medicine. JUMP Freshmen Only.
Instructor(s): D. Teraguchi.
AS.280.110. Evidence in Epidemiology and Popular Culture. 3 Credits.
The past year, we have witnessed a broad range of controversial issues: from Ebola to anti-vaxers; protests in Ferguson and New York; the legalization of marijuana and Obamacare. Often the theories of health that experts develop and promote don’t resonate with the public they are intended to serve. Often times, different people interpret the same piece of evidence in very different ways. This course will teach students how to think critically about theories of health and disease and to develop communication skills to talk about public health in everyday conversation.
Instructor(s): A. Buttress
Area: Humanities, Social and Behavioral Sciences.

Freshmen Seminar: Should overweight individuals pay more for health insurance like many smokers do? When is it appropriate to quarantine people during an infectious disease outbreak? Do we owe citizens universal access to quality, affordable health care? We will explore these questions, among others, through the lens of public health ethics.
Freshmen Only.
Instructor(s): J. Leider
Area: Social and Behavioral Sciences.

AS.280.120. Lectures on Public Health and Wellbeing in Baltimore.
An introduction to Urban Health with Baltimore as a case study: wellbeing, nutrition, education, violence and city-wide geographic variation. Lectures by JH Faculty, local government/service providers and advocates.
Instructor(s): P. Leaf
Area: Social and Behavioral Sciences.

AS.280.121. Chemical Karma: From Pollution to Disease.
This course follows several pollutants from their industrial sources to their human health outcomes, and teaches how to rigorously/systematically search for and synthesize concepts in environmental health literature. Term paper. E²SHI Fellowships.
Instructor(s): M. Gribble
Area: Natural Sciences.

Please note, class will meet Saturday, Jan. 24 in the event of inclement weather. This course is for freshmen ONLY. This course looks closely at the environment of Baltimore City’s complex food systems and what it would take to improve these systems to assure widespread access to nutritious, adequate, and affordable food. Students will gain hands-on experience through visiting a supermarket, a corner store, and an emergency food distribution center. The in-class sessions are structured primarily as discussion seminars based around the readings and trips, supplemented with some lectures and guest lectures.
Prerequisites: Students may enroll in one B’More course only. AS.371.189 AND AS.270.119 AND AS.270.118 AND AS.060.153 AND AS.060.126 AND AS.100.197 AND AS.300.100 AND AS.360.176 AND AS.220.116 AND AS.230.114 AND AS.220.190 AND AS.220.194
Area: Social and Behavioral Sciences.

AS.280.207. I Have My Public Health Degree, So Now What???.
The goal of the course is to introduce students to and enthuse them about the vast array of public health practice careers, as well as foster individual career growth and development. Case studies will be presented and discussed to highlight a range of public health professional roles and responsibilities, as well as the skills and competencies required for effective public health practice. THE COURSE WILL INCLUDE TWO ALL DAY FIELD TRIPS TO PUBLIC HEALTH AGENCIES, NON-PROFITS, PRIVATE SECTOR, AND COMMUNITY BASED ORGANIZATIONS IN D.C. AND BALTIMORE SCHEDULED FOR JAN 7 & 8. A mandatory trip meeting and resume workshop will be held in early December in the Career Center Library, Garland Hall, 3rd floor. Course/trip attendees made by faculty selection and applications will be due to the JHU Career Center on November 14 by noon.
Instructor(s): B. Resnick; M. Gourdine
Area: Social and Behavioral Sciences.

AS.280.208. Sexually Transmitted Infections - An Exercise in Public Health.
This course introduces students to an overview of sexually transmitted infections (STIs) with a focus on upstream intervention by applying the Public Health problem solving paradigm. To simulate the real world, students are divided into small groups to tackle a STI problem in the community and demonstrate the mastery of public health concepts by successfully collaborating on a final paper with a descriptive analysis of an STI, its magnitude and determinants, exploration of the different intervention strategies and a defense of the intervention of choice.
Instructor(s): K. Mok
Area: Natural Sciences, Social and Behavioral Sciences.

Intersession Abroad Program. The course examines Childhood, Health and Disease in Uganda.
Instructor(s): M. Smart
Area: Social and Behavioral Sciences.

AS.280.211. Health Care, Housing and Homelessness.
Homelessness is bad for one’s health, and demonstrates deep social ills and policy failures. This course introduces issues fundamental to the modern phenomena of homelessness in the United States - and the connection between disparate health and desperate inequality. Through presentations and discussions with community experts - including people who have experienced homelessness - we will examine the causes of homelessness, as well as strategies for addressing the immediate health needs of homeless individuals and changing the social structures responsible for creating it.
Area: Social and Behavioral Sciences.

Infectious disease outbreaks are relatively common occurrences and outbreak investigations are a fundamental aspect of public health. The purpose of this course is to introduce students to the science of outbreak investigations and to provide an opportunity to apply these principles and basic epidemiological concepts in discussing recent outbreaks. To simulate a real world experience, students will be placed in the role of investigators during classroom discussions.
Instructor(s): K. Griffith
Area: Natural Sciences, Social and Behavioral Sciences.
How do U.S. military activities affect global and domestic public health? The course will explore the perspective that specific policies governing U.S. military activities exert broad influences on the public’s health, both in peace and war, and that in better understanding these influences, students will be positioned to recognize their significance in various public health settings, including international health, drug and vaccine development, and in the provision of mental healthcare to U.S. veterans.
Instructor(s): R. Nevin
Area: Social and Behavioral Sciences.

This course focuses on the importance of immunizations for child health. Students learn about vaccine-preventable illnesses that affect children; disease-tracking in Baltimore; and, strategies for getting child illness rates under control. Local immunization initiatives will be discussed, including Baltimore City’s model immunization program which made history in 1996 when it increased child immunization coverage to 99 in just 3 months. Through lectures, discussions and field trips, we explore methods and strategies that have helped Maryland maintain one of the top immunization coverage rates in the nation.
Instructor(s): J. Lam
Area: Natural Sciences, Social and Behavioral Sciences.

This course will begin by exposing students to a variety of theories of behavior change - why and how we do it, and why we often don't. From there they will apply this knowledge to, part of a semester-long group project, develop a health communication campaign designed to encourage changing a behavior among their peers. They will practice the skills necessary to analyze a problem, develop a campaign strategy, create persuasive materials, and implement and monitor that campaign. Some elements of impact evaluation will also be covered in this course.
Sophomores Only. Recommended Course Background: AS.280.101
Instructor(s): L. Folda
Area: Social and Behavioral Sciences.

This course looks historically at the relationship of public health to animal agriculture. We will track the co-evolution of the two disciplines over 200 years, with a focus on North America. Progressing through the changes animal agriculture underwent in this time span, students will use readings, film and radio to understand how public health was involved in these changes, and how they led to the present entanglement over sustainability, animal welfare, overgrazing, and bacon.
Instructor(s): J. DeBruicker
Area: Natural Sciences, Social and Behavioral Sciences.

This course examines bullying and aggression among school-aged youth from a public health perspective. We will explore the prevalence of bullying, theories about its etiology, and recent prevention efforts.
Instructor(s): J. Duong
Area: Social and Behavioral Sciences.

Health in Complex Humanitarian Emergencies (CHE) introduces students to the fundamentals of humanitarian response. This course explores a range of topics including: gender and vulnerable populations, war and health, refugees and internally displaced persons (IDPs), infectious diseases, water, sanitation and hygiene (WASH), risk communications, and the emerging field of digital humanitarianism. This course also examines the unique challenges of global climate change, health systems reconstruction in Haiti, and the Ebola outbreak in West Africa. All topics are presented with respect to their relation to complex humanitarian emergencies, and students are provided the opportunity to learn new skills and apply them to the complex issues of humanitarian response.
Instructor(s): J. Freeman
Area: Social and Behavioral Sciences.

AS.280.219. Breaking in Baltimore: HIV and AIDS.
Breaking in Baltimore is a week-long immersion experience where students explore social justice issues by engaging greater Baltimore through direct service and educational sessions. The HIV/AIDS program explores Baltimore’s healthcare infrastructure and the challenges facing diagnosed and vulnerable Baltimoreans. Students will participate in classroom sessions as well as service learning projects in greater Baltimore with local agencies. Student participation begins at noon on Saturday the 17th, through noon on the 23rd, and participate full-time, including some evening programming. Must apply through Center For Social Concern x6-4777. Application due Early November. Fee: Approx. $125
Instructor(s): A. Neyenhouse
Area: Social and Behavioral Sciences.

AS.280.220. Baltimore and The Wire: A focus on major urban issues.
Playing off the themes raised in the HBO series "The Wire", this course will provide an introduction to major issues confronting Baltimore and other American urban centers through a series of lectures by policy makers in the region.
Instructor(s): P. Beilenson
Area: Social and Behavioral Sciences.

AS.280.221. The Sciences Behind HIV: Is eradication imminent?.
Students will obtain a fundamental understanding of HIV biology, including a review of its origin, routes of infection, host defenses and viral evasion strategies, and HIV treatment. Special focus will be on the evaluation of HIV prevention strategies including vaccines and microbicides. Recommended Course Background: one year of general biology, AS.020.151, AP Biology, or equivalent. This is a Public Health Teaching Prize Course.
Area: Natural Sciences.
**AS.280.223. Health and the Internet.**
This course will examine how the internet and web based applications influence individual and societal health. Health information is one of the most searched for subjects online, yet despite the proliferation of health related sites, there is still a need for quality, accurate and useable information. Blogs and online communities can bring patients together and aid in treatment and recovery. However, many Web 2.0 applications such as social networking sites, wikis and mobile technology that have the potential to increase interactivity and collaboration have yet to reach their full potential in healthcare delivery and promotion. Indeed, as the internet and new technologies hold great promise, there are also pitfalls such as spread of inaccurate or potentially dangerous information. This course will provide an overview of how the internet has changed health care and how new technologies will continue to influence our health.
Instructor(s): M. Massey
Area: Humanities, Social and Behavioral Sciences.

**AS.280.224. Health, Homelessness & Social Justice.**
Homelessness is bad for one’s health, and its existence, persistence, and growth demonstrate deep policy failures and social ills. This course examines issues fundamental to the modern phenomena of homelessness in the U.S. - and the connection between disparate health and desperate inequality. There are ethical values and dimensions to the decisions we make about health policy - and public policy generally. Life, liberty, the pursuit of happiness, equality, justice, community, democracy, human rights, and human flourishing; there are many values that we might prioritize – both individually and collectively – as we develop and assess programs, policies, and systems. In this course, we will consider these and other values together with issues of health and homelessness. We will also examine tools of policy analysis and political action, and how those committed to changing the world can use those tools to engage that system critically.
Instructor(s): A. Schneider
Area: Social and Behavioral Sciences.

**AS.280.225. Population, Health and Development.**
This course will cover the major world population changes in the past century as well as the contemporary situation and projections for this century. Topics include rapid population growth, the historical and continuing decline of death and birth rates, contraceptive methods as well as family planning and child survival programs, population aging, urbanization, population and the environment and the demographic effects of HIV/AIDS.
Prerequisites: Students who have taken AS.230.225 may not take AS.280.225.
Instructor(s): S. Becker
Area: Social and Behavioral Sciences.

**AS.280.226. Mini-Term: Urban Environments and Public Health.**
Introduction to physical and social environmental systems issues affecting the health of several marginalized populations (e.g. immigrants, impoverished and homeless). The course will primarily use Baltimore as the field for experiential learning, and will incorporate cross-cultural discussions, a variety of readings, and guest lecturers from Hopkins faculty and industry experts. Course will meet for two weeks: from July 7th through 18th.
Instructor(s): A. Rule
Area: Social and Behavioral Sciences.

**AS.280.227. Medical Geography.**
This week long seminar-style course will explore the question of “Why place matters?” through lectures, readings and in-class discussion of geographic processes that influence individual- and community-level health status. Case study examples will be drawn from both local and global contexts. Students will engage in how to apply the geographic perspective to current and emerging global health issues.
Instructor(s): K. Shelley
Area: Social and Behavioral Sciences.

**AS.280.230. Public Health, Sexual Orientation, and Gender Identity.**
In recent years, lesbian, gay, bisexual, transgender(LGBT) health issues have become important public health concerns. This course will focus on key issues in LGBT health, including the health consequences of homophobia and heterosexism, racial and ethnic minorities and LGBT health, globalization, healthcare systems and services. Specific health topics to be addressed include mental health, substance use, violence, sexually transmitted infections, and access to health care. During this course, students will develop a greater understanding of health disparities among LGBT populations.
Instructor(s): T. Poteat
Area: Humanities, Social and Behavioral Sciences.

**AS.280.302. GIS as a Public Health Tool.**
This course provides an introduction to Geographic Information Systems (GIS) and presents its utility in the various fields of public health such as Epidemiology, Environmental Health and International Health. Provides exposure to GIS as a tool for describing the magnitude of health problems and for supporting health decision making. Course topics include a historical overview of the intersection between geography and public health; current epidemiological use of GIS; and, GIS applications in identifying public health problems such as the current Ebola outbreak. This course is ideal for students who desire exposure to the vast utility of GIS as it applies to public health.
Instructor(s): J. Ferguson
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

**AS.280.303. Responding to Disasters: From Earthquakes to Ebola.**
Responding to Disasters: from Earthquakes to Ebola introduces students to the fundamentals of humanitarian and disaster response. The course is divided into four topic areas: (1) fundamentals of humanitarian emergencies, (2) methods in humanitarian emergency settings, (3) refugee health, and (4) emerging issues in humanitarian response.
Instructor(s): J. Freeman
Area: Social and Behavioral Sciences.

**AS.280.304. Transforming Disease: HIV/AIDS and the production of chronic illness.**
Drawing primarily on public health, anthropology, and sociology literature, the course critically examines debates surrounding the production of chronic illness, and resulting contestations as practices, laws, and policy are transformed.
Instructor(s): M. Philbin
Area: Social and Behavioral Sciences.

**AS.280.310. Nutrition, Behavior, and Mental Health.**
What’s the relation between food and mood? This course will journey through topics as diverse as micronutrients, caffeine, and eating behaviors to seek nutrition’s connection to behavior and mental health. Recommended Course Background: AS.280.345 and/or AS.280.350
Area: Natural Sciences, Social and Behavioral Sciences.
How do doctors decide what to prescribe? How do clinical studies, elected officials, drug companies, personal beliefs, and insurance companies influence those decisions? This will not be on your MCATs. Recommended Course Background: course in Introductory Statistics or Biostatistics. Deans Teaching Fellowship Course.
Instructor(s): A. Turnbull
Area: Social and Behavioral Sciences.

This writing intensive course will encourage students to consider what counts as evidence among public health professionals as well as popular audiences. Using case studies from the field of epidemiology, now emblematic of the field, students will learn about historical changes in theories of population health and disease. Through a series of writing assignments, students will interrogate the formal structure of scientific arguments and gain practice in synthesizing and communicating complex ideas to a lay audience. Juniors/Seniors Only
Prerequisites: Prerequisite/Corequisite: AS.280.350
Instructor(s): A. Buttress
Area: Humanities, Social and Behavioral Sciences.

AS.280.313. The Germ Theory in Literature.
The Germ Theory in Literature is a writing course for science and public health majors, and for writing majors interested in science and public health. We examine the use of germs in popular literature, from 1900 to the present (with works by Paul de Kruif, Sinclair Lewis, Milton Silverman, Berton Roueché, Richard Preston, Laurie Garrett and John Barry). Students examine what happens to science when it is popularized in mainstream literature, and learn to write essays and opinion pieces using crisp, clear and purposeful prose. This course includes a writing workshop.
Instructor(s): K. Masterson
Area: Humanities.

Nutrition is a fundamental component of human health and a challenging science, with individual and societal factors that span the country and the world. The primary objective of this course is to provide a fundamental understanding of human nutrition and its role in public health by addressing multiple components including the core micro- and macro- nutrients, and food choices and their implications for personal health. The secondary objective is to examine many of today's nutrition controversies, both scientific and societal. Accordingly, this course will encourage students to think about nutrition and its critical contribution to public health on individual, societal, and global levels. A fundamental knowledge of biology and/or anatomy and physiology is recommended.
Instructor(s): B. Ha; J. Scharack; Z. Chowdhury
Area: Social and Behavioral Sciences.

This course explores an array of questions related to nutrition, food access, socioeconomic and demographic factors that affects individuals, communities, and public policy. Students will seek answers through field trips, guest lectures, and discussion seminars. Deans Teaching Fellowship Course.
Instructor(s): S. Lee
Area: Social and Behavioral Sciences.

The course provides an in-depth overview of current challenges related to water, sanitation, and hygiene (WASH) in the developing world with an emphasis on the links between WASH and epidemiology, climate change, population, gender, equity, and policy. Juniors and seniors Only.
Area: Natural Sciences, Social and Behavioral Sciences.

Seminar combines lectures from AS.280.120 with additional readings and discussion to more deeply address urban health issues. If you register for this course you do NOT register for AS.280.120. Course is open to Sophomores and Juniors only, or by instructor's permission.
Instructor(s): P. Leaf
Area: Social and Behavioral Sciences.

AS.280.325. Public Health in South Africa.
This course provides an in-depth overview of Public Health in South Africa, including material on the political climate, health care services, and the impact of the HIV/AIDS epidemic. Course is taught in Cape Town, South Africa.
Instructor(s): L. Folda
Area: Social and Behavioral Sciences.

AS.280.326. Community-Based Learning in South Africa.
3 Credit course taught in Cape Town, South Africa. This course may be used to satisfy the Public Health Applied Experience requirement. Students will participate in a community-based service learning program with a local NGO in Cape Town.
Instructor(s): L. Folda
Area: Social and Behavioral Sciences.

AS.280.329. The Good, the Bad and the Ugly: Scientific Literature.
This course covers how to conduct a literature review, and interpret and evaluate scientific literature that focuses on public health. In addition, this course will provide students with fundamental skills of writing a scientific manuscript. Skills obtained in this course will prepare students for advanced-level senior year classes at Bloomberg and other graduate institutions.
Prerequisites: AS.280.350;AS.280.345
Instructor(s): R. Thorpe
Area: Social and Behavioral Sciences.

AS.280.335. The Environment and Your Health.
This course surveys the basic concepts underlying environmental health sciences (toxicology, exposure assessment, risk assessment), current public health issues (hazardous waste, water- and food-borne diseases), and emerging global health threats (global warming, built environment, ozone depletion, sustainability). Public Health Studies, Global Environmental Change and Stability, and Earth and Planetary Science majors have 1st priority for enrollment. Your enrollment may be withdrawn at the discretion of the instructor if you are not a GECS, PHS, or EPS major.
Prerequisites: (Students may not have taken AS.270.320)
Instructor(s): J. Bressler; M. Trush
Area: Natural Sciences.

Through lectures and small group discussions, students will develop a framework for analyzing health care policy problems and gain familiarity with current issues including managed care, Medicare and the uninsured.
Instructor(s): D. Steinwachs
Area: Social and Behavioral Sciences.
AS.280.345. Public Health Biostatistics.
Using problem-based learning focusing on public health topics, students learn to describe & summarize data, make inferences regarding population parameters, & test hypotheses. Recommended Course Background: Four years of high school math.
Prerequisites: Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR AS.280.314 OR AS.280.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430
Instructor(s): L. Jager; M. Taub
Area: Quantitative and Mathematical Sciences.

AS.280.346. Advanced Biostatistics Laboratory.
As a complementary course to 280.345, Public Health Biostatistics, this course teaches R programming skills necessary for conducting independent data analyses, beyond those presented in the main course. No programming experience is necessary, but a willingness to learn independently and work with other students is indispensable.
Prerequisites: Corequisite: AS.280.345
Corequisites: AS.280.345
Instructor(s): L. Jager; M. Taub
Area: Quantitative and Mathematical Sciences.

AS.280.347. Health Data Analysis Practicum.
Students will learn to formulate precise scientific and policy questions, design exploratory and confirmatory statistical analyses to address the questions, conduct appropriate analyses using the statistical package R, and communicate their findings through graphical and tabular displays that are presented in writing and in person. The course will be run seminar style in which students conduct data analysis to present to one another in one meeting per week. Evaluation will be through class participation and a final project in which students will analyze their own data set to address a question of their choice.
Instructor(s): S. Zeger
Area: Quantitative and Mathematical Sciences.

A practical introduction to epidemiology focusing on the principles and methods of examining the distribution and determinants of disease morbidity and mortality in human populations. Juniors and seniors only.
Instructor(s): D. Phelan-Emrick; I. Saldanha
Area: Quantitative and Mathematical Sciences.

This course explores the theory and practice of changing the health behaviors of individuals, and the public health and medical impact of doing so. Theoretical concepts are integrated with practical clinical applications, especially in the areas of diet and fitness. Skill building in persuasive, health-related communication will be included in smaller group discussions.
Instructor(s): L. Cheskin
Area: Social and Behavioral Sciences.

This course covers the influence of culture on public health, health policy, management and practice. It also provides background on disparities in health in the US with a particular focus on race, place, and poverty. Guest speakers include healthcare providers, managers, and policy-makers.
Instructor(s): C. Furr-Holden; T. Laveist
Area: Social and Behavioral Sciences.

Global health addresses the staggering global disparities in health status, drawing on epidemiology, demography, anthropology, economics, international relations and other disciplines. We review patterns of mortality, morbidity and disability in low and middle income countries, starting with malnutrition, infectious diseases and reproductive health, and continuing to an emerging agenda including mental health, injury prevention, surgical care, chronic diseases, and health impacts of climate change. Gender, health systems and health workforce challenges, and career trajectories in global health are also discussed. Recommended course background: Minimum of one prior course in Public Health.
Instructor(s): P. Winch
Area: Social and Behavioral Sciences.

AS.280.399. Community Based Learning - Practicum Community Health Care.
This course is designed to expose students to urban health with focus on Baltimore City through lectures, class discussions, and experiential learning. Students will select a community-based organization (CBO) according to their expressed interests and schedule in order to complete 45 hours of service based learning. Grades are based on participation, completion of service learning project, presentation, and papers. Open to Senior and Junior Public Health Studies majors only. Others by permission of instructor.
Instructor(s): J. Balabis; L. Bone
Area: Social and Behavioral Sciences.

AS.280.401. Alcohol, Media & Health.
Students will critically examine the public health impact of alcohol marketing and assess the consequences of the resulting change in patterns of alcohol use. Gordis Teaching Fellowship course. Public Health Majors only or permission required.
Instructor(s): S. Cukier
Area: Social and Behavioral Sciences.

AS.280.402. HIV, Behavior and Society.
This class will examine the behaviors associated with the HIV epidemic. We will explore the importance of behavior and context that affect the transmission, prevention, and treatment of HIV. Gordis Teaching Fellowship course. Public Health Majors only or permission required.
Instructor(s): C. Sun
Area: Social and Behavioral Sciences.

This course provides an introduction to the public health implications of intimate partner violence and the spectrum of activities used to understand and combat it - from measurement to intervention. This course will cover a variety of topics, focusing on both research and programming, including: qualitative and quantitative research methods, individual- and community-level interventions, ethical challenges, and populations of interest. Gordis Teaching Fellowship course. Public Health Majors only or permission required.
Instructor(s): A. Robinson
Area: Social and Behavioral Sciences.
AS.280.404. Immunity and Infectious Diseases of Public Health Importance.
Provides an overview of innate and adaptive immunity as they relate to the control of infection and the development of treatment and vaccination strategies for pathogens of public health significance. Gordis Teaching Fellowship course.
Prerequisites: AS.020.151 AND AS.020.152 or AP Biology
Instructor(s): J. Craig
Area: Natural Sciences.

This course explores the links between public health and human rights, applies human rights frameworks to public health policies, and explains why the human rights have been called “The conscience of public health.” Gordis Teaching Fellowship course. Public Health Majors only or permission required.
Instructor(s): W. Davis
Area: Social and Behavioral Sciences.

How does U.S. military policy impact global and national public health? Do U.S. military missions promoted as humanitarian assistance, such as those in Africa and Afghanistan, compromise global development and independent humanitarian action programs? Did the CIA’s covert use of a vaccination program in Pakistan as cover for intelligence gathering threaten the success of global immunization campaigns? How have vaccines and drugs developed for U.S. military use benefited global public health? These topics and much more will be the focus in this seminar that explores consequences within conflict zones and the developing world, and among military personnel and veterans. Gordis Teaching Fellowship course. Juniors and Seniors Public Health Studies majors only.
Instructor(s): R. Nevin
Area: Social and Behavioral Sciences.

This course will introduce students to the public health component of preparedness and response to common emergencies, including the public health implications of such situations and the role of public health agencies and practitioners. The course will employ an all-hazard perspective, including emerging infections, natural disasters, and terrorism. Students will understand the public health community’s role in preparing for and responding to disasters through case studies, discussion, debate, and material related to the national public health preparedness infrastructure. Juniors and seniors Public Health Studies majors only. Gordis Teaching Fellowship course. Recommended Course Background: AS.280.335
Instructor(s): N. Errett
Area: Social and Behavioral Sciences.

Examines the causes, consequences, and prevention of violence committed by or against young people through a public health lens. Interrupts prevailing notions about crime and punishment and shifts the discourse to encompass an ecological and developmental understanding of the problem. Media representations and other case studies of youth violence, including mass shootings, child soldiers in armed conflict, interpersonal violence, bullying, suicide, and gang violence, provide the basis for in-class, interactive analysis applying current theories. Introduces effective prevention strategies, underscoring the important role of youth leadership and advocacy to prevent violence. Juniors and seniors Public Health Studies majors only.
Gordis Teaching Fellowship course. Recommended Course Background: AS.280.350
Instructor(s): J. Bottiani
Area: Social and Behavioral Sciences.

AS.280.409. Health Systems Challenges from Chronic Diseases in Low and Middle Income Countries.
This course provides a multidimensional health systems approach to chronic diseases, presently the largest population health burden in low and middle income countries. Learning tools include patient interviews, in-class debates, and country case studies. Recommended course background: AS.280.350: Fundamentals of Epidemiology. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): M. Socal
Area: Social and Behavioral Sciences.

Through a series of historical case studies we will explore the changing ideas and assumptions that have shaped our struggles to understand and improve health in the United States. Juniors and Seniors Public Health Studies majors only. Gordis Teaching Fellowship course. Recommended Course Background: AS.280.350
Instructor(s): A. Buttress
Area: Humanities, Social and Behavioral Sciences.

This course will critically examine the impact of place of residence on health outcomes, and on racial/ethnic health disparities. This will be accomplished by examining different definitions and levels of “place”, and assessing the impact of each on various health outcomes and racial/ethnic disparities. The role of “place” will be examined in the development of interventions targeting racial/ethnic health disparities. Juniors and seniors Public Health Studies majors only. Gordis Teaching Fellowship course.
Instructor(s): C. Bell
Area: Social and Behavioral Sciences.
Students will gain an understanding of the epidemiology of HIV/AIDS that will serve as basis for illustrating modern epidemiologic theory, methods, and practice. Topics will include a review of the natural history and pathogenesis of HIV/AIDS, the spread and current geography of the disease, contemporaneous prevention strategies, and the impact of antiretroviral therapies at the individual and population level. Throughout, a focus on the methods and mindset of epidemiologic enquiry will be emphasized. This will include how epidemiological approaches for characterizing populations, measurements, and inference can be used to build the evidence for public health action. Students will learn through critical analysis and discussion of the peer-reviewed literature coupled with evaluations using short quizzes and a final group presentation. Gordis Teaching Fellowship course.
Recommended Course Background: AS.280.345
Prerequisites: Prerequisite/Corequisite: AS.280.350
Instructor(s): P. Rebeiro
Area: Natural Sciences, Social and Behavioral Sciences.

AS.280.413. Information Communication Technology (e/mHealth) for Health Systems Strengthening.
This course explores the emerging landscape of information and communication technology in public health, such as e/mHealth, through concepts and frameworks of health systems research with a focus on low and middle income countries (LMICs). It is designed to comprehensively address various aspects of e/mHealth including policy aspects of health systems governance, community aspects of health service delivery, economic aspects of the healthcare market, technological aspects of health information infrastructure, and individual aspects of self-monitoring/management. Multidisciplinary approaches will be encouraged to understand complex public health challenges and to suggest creative yet feasible solutions in low resource settings. Successful e/mHealth use cases across countries with various health system contexts will be introduced and discussed. The course is intended for undergraduate students interested in how information and communication technology is likely to affect health care in the future. Gordis Teaching Fellowship course open to Junior and Senior Public Health Majors only.
Instructor(s): Y. Jo
Area: Social and Behavioral Sciences.

AS.280.414. Leading Health Care Organizations.
This seminar course is designed for students who seek an understanding of how to manage health care organizations including management processes, organizational structures, types of governance models and management issues of health care delivery systems. This course is designed to provide participants with an understanding of leadership and organizational behavior within health care organizations (HCOs). In this course, students will become skilled at identifying the forces that challenge the effective management of HCOs at multiple levels – individual, group and organization. Moreover, they will become skilled at developing and analyzing efforts to improve HCOs’ performance. Through case studies, readings, in-class exercises and class discussions, participants will learn analytic frameworks, concepts, tools and skills necessary for leading and management organizational learning, innovation and overall performance improvement in health care organizations. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): K. Hayes
Area: Social and Behavioral Sciences.

AS.280.415. Comparative Health Systems and Health Reform.
The course explores the structural components of modern health care systems through a comparative approach. Students will develop a toolkit for analyzing how the financing, payment, and organization of health service provision determine system performance. Student teams will analyze a health system component and develop health reform recommendations for advancing the often-competing goals of improved population health, financial protection, and public satisfaction. They will also learn how to enhance the political feasibility of technically rigorous reforms through rational design and political stakeholder analysis. Theoretical frameworks utilized by international aid organizations and think tanks will be supplemented by case studies, hands-on class activities, and team projects to encourage active student learning. Gordis Teaching Fellowship course open to Junior and Senior Public Health Majors only.
Instructor(s): N. Done
Area: Social and Behavioral Sciences.

AS.280.416. Nutrition and Immunology in Chronic Disease.
This course provides an overview of basic immunology and nutrition through the review of published chronic disease research. By careful reading and critique of published literature, students will learn to interpret scientific studies on nutrition and chronic disease. This course will cover a variety of globally important chronic diseases such as type II diabetes, heart disease and cancer. Course sessions will include lectures on the basics of nutrition and immunology, seminar sessions to critically evaluate published research findings and group presentations. Recommended prerequisite: Introductory Biology. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): J. Fontes
Area: Natural Sciences.

This course will serve as an introduction to mental health in humanitarian emergencies. The course focuses both on mental health disorders (PTSD, anxiety, depression and substance abuse) and well-being (functionality, self-esteem, hope, and pro-social behavior). Assessment of mental health in humanitarian emergencies will include identification of risk factors and protective factors that impact mental health disorders and promote well-being. Coursework will include exploration of ways gender, age, political climate, environmental factors, and social and cultural norms impact mental health. Furthermore, the course will consider development of mental health interventions for specific cultural contexts and evaluation of the effectiveness of interventions in meeting mental health needs in the short and long-term. Class sessions will be built around case studies from various countries and include contexts of natural disasters, armed conflict and complex emergencies. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): M. Cherewick
Area: Social and Behavioral Sciences.
**AS.280.418. Introduction to Public Health Genomics.**
Advances in genomic medicine and technology have presented both opportunities and challenges for public health. Through lectures and case studies, the first half of the course will provide an historical overview and raise contemporary issues related to genomics at the individual, public and policy level. In the second half of the course, students will critically analyze psychosocial, behavioral, ethical and legal issues arising from increasingly widespread access to genetic technologies and information. Topics will cover the use of routine testing (prenatal testing, newborn screening and predictive testing for adult-onset conditions) and emerging technologies capable of whole genome sequencing, direct-to-consumer marketing of various kinds of genetic testing, pharmacogenomics and personalized medicine. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): Y. Guan
Area: Social and Behavioral Sciences.

**AS.280.419. Introduction to Practical Data Analysis in Medicine and Public Health.**
The course is designed to introduce undergraduate public health majors to the methodology of data analysis, such as how to apply previously learned statistical methods in the performance of data analysis in medical and public health research. This course is unique in that it focuses on all parts of the data analysis process, from formulating a research question to synthesizing the results. While the emphasis is placed on developing and implementing various methods of data analysis, the course will also address interpreting and evaluating the strengths and limitations of existing data analyses. Students’ understanding will be solidified through small in-class activities that explore the data analysis process and evaluations of data analyses in the scientific literature, culminating in an independent data analysis project relevant to their own areas of expertise for the purpose of incorporating knowledge gained from the course into their research. Gordis Teaching Fellowship course open to sophomore, junior, and seniors who have taken AS.280.345: Public Health Biostatistics.
Prerequisites: **AS.280.345**
Instructor(s): T. Usher
Area: Quantitative and Mathematical Sciences.

**AS.280.420. Global Food and Nutrition Security.**
This course examines food insecurity in low and middle income countries from a public health nutrition perspective. Students will explore food insecurity as a complex phenomenon linked to important issues in global development and public health. Recommended prior course, either Issues in International Development or Global Health Principles & Practices. Gordis Teaching Fellowship course open to junior and seniors only.
Instructor(s): B. Caswell
Area: Social and Behavioral Sciences.

**AS.280.421. Telling Public Health Stories through Maps.**
Maps play an increasingly central role in conceptualizing, investigating, and communicating many types of public health concerns. This semester-long course is intended for undergraduate students in their junior or senior year who are familiar with epidemiology and biostatistics. This course will develop the skills needed to create and manipulate spatial information for public health research and communication. The course also prepares students to critically evaluate spatial data and to identify the common pitfalls of map-making. Through a blend of lectures, student seminars, and lab exercises, students will examine and appreciate the history of map-making, its current uses in public health, and future directions of spatial analysis. This course involves active student participation during discussions, short responses to the readings, and culminates in an independent spatial analysis project involving Geographic Information Systems (GIS) software. Basic knowledge of biostatistics and epidemiology are recommended prerequisites. Juniors/Seniors Only. Gordis Teaching Fellowship course
Instructor(s): B. Davis
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

**AS.280.422. Health Equity and Disparities: Addressing Complex Global Health Challenges.**
In this course, students will be supported and challenged to develop a personal understanding of and perspective on global health equity and disparities, and acquire a toolbox of frameworks and strategies to use in addressing them. Students will have the opportunity to be exposed to numerous examples and case studies to gain experience in assessing and addressing issues of equity in the complex, real-life problems such as those they will be facing as public health professionals. Students will review major historical and contemporary global and national initiatives to address equity issues in the health sector, including global declarations and reports as well as policies and programs that have been developed to achieve improvements in health equity in specific contexts. Application of this historical and practical knowledge and their own perspectives to new and complex situations will be fostered throughout the course. Basic knowledge of biostatistics and epidemiology and courses on global health or international public health issues recommended pre-requisites. Juniors/Seniors Only. Gordis Teaching Fellowship course
Instructor(s): M. Schleiff
Area: Social and Behavioral Sciences.

**AS.280.423. Data Visualization for Individualized Health.**
This course will explore how biostatistics and data visualization can be used to improve patient care and health outcomes. Students will learn and apply key concepts of effective data visualization to applications in individualized medicine. Teams of students will work with clinician-partners of the Hopkins Individualized Health Initiative (http://hopkinsinhealth.jhu.edu) to produce interactive web applications (http://shiny.rstudio.com) that support clinical decision-making by communicating a patient’s health state, prognosis, or expected treatment outcomes. R programming experience (AS.280.419, AS.280.346, or R programming course in coursera (https://coursera.org/course/rprog)) is necessary before the start of this course.
Prerequisites: Prereq: **AS.280.345**
Instructor(s): R. Coley
Area: Quantitative and Mathematical Sciences.
AS.280.424. The Quest for Effective Universal Health Coverage in Low and Middle Income Countries.
This course examines the movement to achieve effective universal health coverage with a particular focus on LMICs. It provides foundational grounding on health systems thinking to understand the key components of effective UHC and accordingly analyzes country cases to demonstrate lessons from health reforms in five LMICs.
Instructor(s): A. Bhadelia
Area: Social and Behavioral Sciences.

An elective for upper-level public health studies students with a strong biology background that reviews the basics of immunology and cancer biology, and then delves into how treatments at the interface are sparking a paradigm shift in how we understand and treat cancer. Special interest will be taken in the public health repercussions of this change in thinking and treatment. Students apply this knowledge by analyzing topics of current and potential immunotherapies such as cancer vaccinations, adoptive cell transfer therapies, immune checkpoint inhibitors, and more. Course format will be a combination of lecture and active learning activities such as facilitated discussions, case study analysis, and role-plays of system actions. Juniors/Seniors only.
Prerequisites: AS.020.151 OR AS.020.152 OR AS.020.243 OR AS.020.123 OR AP Biology
Instructor(s): J. Gordy
Area: Natural Sciences.

This course introduces undergraduate PHS students to ethical issue of obesity prevention in public health, and how these issues have influenced the success or failure of past and current intervention efforts. Students explore the multiple perspectives of each issue, and use an ethical framework to learn how to address the ethical challenges associated with the development of obesity intervention programs and policy. Juniors/Seniors only.
Instructor(s): L. Redmond
Area: Social and Behavioral Sciences.

Science communication is challenging. Experts are seldom trained to translate jargon in everyday language. In this course students will expand their knowledge of the biology basics of several public health issues, develop the critical thinking needed to assess health science reporting, and practice science communication skills.
Prerequisites: Prereq: AS.020.151 OR AS.020.152 OR AS.020.243 OR AS.020.123 OR AP Biology.
Instructor(s): N. Martin
Area: Humanities, Natural Sciences.

AS.280.495. Honors in Public Health - Seminar.
Using lectures, oral presentations, and writing assignments, this seminar is designed to assist Public Health Studies majors in writing a senior thesis. Students will formulate their topics, develop research skills, and address issues of professional ethics. Participating in this seminar is required for students pursuing honors in Public Health Studies. Permission Required.
Instructor(s): J. Schrack; K. Gebo
Area: Social and Behavioral Sciences.

A research methods seminar to prepare students doing honors in Public Health Studies. Permission Required.
Instructor(s): J. Schrack; K. Gebo
Area: Social and Behavioral Sciences.

AS.280.500. Applied Experience-PH.
This is a supervised, hands-on experience working with public health professionals. Students will complete 80 hours of applied work and will submit a synthesizing assignment at the end of the term. Please contact your PHS Advisor for complete details. Permission Required. Public Health Majors Only.
Instructor(s): J. Balabis; L. Folda; M. Smart.

Permission Required. Public Health majors only
Instructor(s): J. Balabis; K. Gebo; L. Folda; M. Smart.

Permission Required. S/U only.
Instructor(s): J. Balabis; L. Folda; M. Smart.

Instructor(s): K. Gebo; M. Smart.

Permission Required.
Instructor(s): K. Gebo; M. Smart.

Public Health majors only. Permission Required.
Instructor(s): L. Folda; M. Smart; R. Shingles; Staff.

Consult the public health studies adviser for procedure. Permission Required.
Instructor(s): J. Balabis; K. Gebo; L. Folda; M. Smart.

Instructor(s): K. Gebo; M. Smart.

Restricted to public health studies majors. Consult the public health studies adviser for procedure. Permission Required.
Instructor(s): K. Gebo; M. Smart.

AS.280.519. Public Health Practice.
Specialized training course/experience for students who have been selected to become members of the PEEPs (Preventative Education and Empowerment for Peers), a peer education group based out of the Center for Health Education and Wellness (CHEW). The experience will focus on knowledge, skill and application of college health issues including: health promotion theory, body image, sexual health, alcohol and other drugs, and stress management. Permission Required. S/U Only.
Instructor(s): B. Schubert.
AS.280.520. Public Health Practice.
This course is a specialized training course/experience for students who have been selected to become members of PEEPs (Preventative Education and Empowerment for Peers), a peer education group based out of the Center for Health and Wellness (CHEW). The experience will focus on knowledge, skill and application of college health issues including: health promotion theory, body image, sexual health, alcohol and other drugs, and stress management. Permission Required. S/U only.
Instructor(s): B. Schubert.

AS.280.530. Community Based Learning - Advanced Practicum in Community Health.
This course is designed to enable students who have already been volunteering in a community health placement either through 280.399 or an Applied Experience to build on this experience in the spring semester. Students eligible to enroll in this course will have previously completed a semester-long volunteering experience and have already made arrangements with that site to continue to volunteer for a minimum of 60 hours in spring 2014 semester. All students meet as a group every other Monday from 5:00-6:30 pm, starting January 27, 2014. By that meeting all students will be expected to have confirmed with their placement sites that they will be continuing. Class time will be used for reflections, training exercises, oral presentations, and group projects. Attendance at the first session is mandatory and registration forms will be completed at this time. Instructor Permission Required.
Instructor(s): J. Goodyear; L. Bone.

AS.280.570. Internship-Public Health.
Instructor(s): J. Balabis; K. Gebo; L. Folda; M. Smart.

Instructor(s): K. Gebo; M. Smart.

Instructor(s): K. Gebo; M. Smart.

Instructor(s): J. Balabis; M. Smart.

AS.280.590. Internship-Summer.
Instructor(s): J. Goodyear; K. Gebo; L. Folda; M. Smart.

AS.280.596. Independent Study-Summer.
Instructor(s): J. Goodyear; L. Folda; M. Smart.

Instructor(s): G. Ball; J. Goodyear; K. Gebo; R. Pearlman.

Instructor(s): B. Morgan; J. Goodyear; K. Gebo; T. Schroer.

Cross Listed Courses

Anthropology
Metaphors of health and illness; individual and social. The body in pain and the body politic. Ethnographies of historical memory vis-à-vis medicine, epidemics, sacredness, shamanism, terror, humanitarianism, truth and reconciliation.
Instructor(s): J. Obarrio
Area: Humanities, Social and Behavioral Sciences.

The course critically examines the techniques, practices, and experiences of global health policies and programs worldwide, and the effects they have on individuals, families, communities, and states.
Dean's Teaching Fellowship Course
Instructor(s): L. Reynolds
Area: Humanities, Social and Behavioral Sciences.

Area: Humanities, Social and Behavioral Sciences.

AS.070.327. Poverty's Life: Anthropology of Health & Economy.
Medicine, economics, and ethics have profoundly shaped debates on poverty. This course analyzes these debates and tracks the relationships between body, economy, and the everyday. How can anthropological reasoning and methods inform approaches to health and economic scarcity and insecurity?
Instructor(s): C. Han
Area: Humanities, Social and Behavioral Sciences.

AS.070.329. Care and Affliction in the Everyday.
How are illness, suffering, and potentials for well-being shaped through our everyday relations? In this seminar, we will explore how relations of care make and unmake lives in contexts of inequality and precariousness. We examine how a multiplicity of social ties, from kinship to neighborhood networks, articulates with institutional margins, and mediates violence, scarcity, and material realities of disease and illness. Cross-listed with Public Health Studies
Area: Humanities, Social and Behavioral Sciences.

History
AS.100.333. Global Public Health Since World War II.
Globalization has dramatically reshaped the world economy, providing great advantages to some but leaving poor nations to struggle with hunger, disease and death on a daily basis. This course explores the impact of globalization on public health in the developed and the developing nations since 1945. Cross-listed with Public Health Studies
Instructor(s): B. Morgan; L. Galambos
Area: Humanities, Social and Behavioral Sciences.

AS.100.411. Readings in the History of Public Health in the 20th and 21st Centuries.
The students will read major and some minor works in the history of global public health and will each develop their own concept of how and why the major institutions, professions, and practices associated with public health have evolved over the past long century. To help the students focus on their ideas, they will write three essays on particular aspects of the history.
Instructor(s): L. Galambos
Area: Humanities, Social and Behavioral Sciences.

History of Science Technology
AS.140.105. History of Medicine.
Course provides an overview of the medical traditions of six ancient cultures; the development of Greek and Islamic traditions in Europe; and the reform and displacement of the Classical traditions during the Scientific Revolution.
Instructor(s): G. Pomata; M. Hanson
Area: Humanities, Social and Behavioral Sciences.
AS.140.106. History of Modern Medicine.
The history of Western medicine from the Enlightenment to the present, with emphasis on ideas, science, practices, practitioners, and institutions, and the relationship of these to the broad social context. Instructor(s): J. Greene
Area: Humanities, Social and Behavioral Sciences.

AS.140.146. History of Public Health in East Asia.
This course examines the history of disease, epidemics, and public health responses in East Asia from the 17th-20th centuries. This public health history emphasizes the interactions, connections, and comparisons among China, Japan, Korea, and Taiwan. Instructor(s): M. Hanson
Area: Humanities, Social and Behavioral Sciences.

AS.140.304. Medicine for and by Women in Early Modern Europe.
This course will examine women’s role in early modern European medicine through the reading of early modern medical texts written for or by women. The course is meant for students interested in women’s history, the history of medicine, European history. Instructor(s): G. Pomata
Area: Humanities, Social and Behavioral Sciences.

Explores historical and current problems relating to the environment and human health, with emphasis on the Chesapeake region and Baltimore. Students write research papers. Instructor(s): S. Kingsland
Area: Humanities, Social and Behavioral Sciences.

Philosophy

AS.150.219. Introduction to Bioethics.
Introduction to a wide range of moral issues arising in the biomedical fields, e.g. physician-assisted suicide, human cloning, abortion, surrogacy, and human subjects research. Cross-listed with Public Health Studies. Instructor(s): H. Bok
Area: Humanities, Social and Behavioral Sciences.

Economics

AS.180.252. Economics of Discrimination.
This course examines labor market discrimination by gender, race and ethnicity in the United States. What does the empirical evidence show, and how can we explain it? How much of the difference in observed outcomes is driven by differences in productivity characteristics and how much is due to discrimination? How have economists theorized about discrimination and what methodologies can be employed to test those theories? What has been the impact of public policy in this area; how do large corporations and educational institutions respond; and what can we learn from landmark lawsuits? The course will reinforce skills relevant to all fields of applied economics, including critical evaluation of the theoretical and empirical literature, the reasoned application of statistical techniques, and analysis of current policy issues.
Prerequisites: AS.180.102
Instructor(s): B. Morgan
Area: Social and Behavioral Sciences.

Application of economic concepts and analysis to the health services system. Review of empirical studies of demand for health services, behavior of providers, and relationship of health services to population health levels. Discussion of current policy issues relating to financing and resource allocation.
Prerequisites: AS.180.102
Instructor(s): D. Bishai
Area: Social and Behavioral Sciences.

AS.180.390. Health Economics & Developing Countries.
Prerequisites: AS.180.301
Instructor(s): M. Gersovitz
Area: Social and Behavioral Sciences.

Political Science

AS.190.354. Politics of Health Policy.
Traces the evolution of the American Health care system, emphasis on the political forces that shape public and private provision of health care in the United States.
Instructor(s): P. Longman
Area: Social and Behavioral Sciences.

Public Policy

AS.195.477. Intro To Urban Policy.
Perm. Req’d. 195.477 & 195.478 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Area: Social and Behavioral Sciences.

195.478 & 195.477 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman.

German Romance Languages Literatures

AS.211.416. Visual Languages in Medical Knowledge.
This interdisciplinary course, co-taught by professor Veena Das (Anthropology) and Research professor and filmmaker Bernadette Wegenstein (German and Romance Languages and Literatures) will track the mediation of images in the making of medical knowledge and show how sensory knowledge is incorporated or transformed in the process. Co-listed with 214.616 and 070.416
Instructor(s): B. Wegenstein; V. Das
Area: Humanities.
AS.214.616. Visual Languages in Medical Knowledge.
This interdisciplinary course, co-taught by professor Veena Das (Anthropology) and Research professor and filmmaker Bernadette Wegenstein (German and Romance Languages and Literatures) will track the mediation of images in the making of medical knowledge and show how sensory knowledge is incorporated or transformed in the process. Co-listed with 211.416 and 070.416
Instructor(s): B. Wegenstein; V. Das
Area: Humanities.

Writing Seminars
AS.220.309. Writing Healthy Baltimore.
Students will explore public health issues in Baltimore and then write about them first in short pieces, and then in longer, polished works. The framework will be the mayor’s Healthy Baltimore 2015 initiative - launched in 2011 to address the city’s top-10 public health problems, including obesity, smoking, drug and alcohol abuse, STIDs, cancer, and environmental health hazards. Students will study the initiative and its historical context; examine data sets; explore where and how the initiative intersects with public health practitioners and advocacy groups at the neighborhood level; and write what they learn in different formats, including essays, breaking news, and substance analysis. Students will then “workshop” each other’s papers.
Instructor(s): K. Masterson
Area: Humanities.

Sociology
AS.230.150. Issues in International Development.
Why do billions of people continue to suffer from poverty? Who is most likely to change this situation, what strategies should they follow, what kinds of institutions should they put into place, and what kinds of obstacles stand in the way? This course will introduce the main theoretical perspectives, debates, and themes in the field of international development since the mid-20th century. It has three sections. The first section focuses on debates about the optimal conditions and strategies for generating economic growth and on the relationship between growth, inequality, and human welfare. The second section presents micro-level assessments of various development interventions. The third section considers the role of civil society and political movements in shaping development and social change in the 21st century. Freshmen and sophomores only.
Instructor(s): M. Levien
Area: Social and Behavioral Sciences.

This course will cover the major world population changes in the past century as well as the contemporary situation and projections for this century. Topics include rapid population growth, the historical and continuing decline of death and birth rates, contraceptive methods as well as family planning and child survival programs, population aging, urbanization, population and the environment and the demographic effects of HIV/AIDS.
Instructor(s): S. Becker
Area: Social and Behavioral Sciences.

This course introduces students to medical sociology, which is the application of the sociological perspective to health and health care. Major topics include stress, social epidemiology, and the social organization of health care.
Instructor(s): E. Agree
Area: Social and Behavioral Sciences.

Earth Planetary Sciences
AS.270.107. Introduction to Sustainability.
Will introduce interactions between global environment and humans, discuss meaning of sustainability, and introduce use of tools to attain sustainability such as policy, law, communication, marketing, research, advocacy, international treaties.
Instructor(s): C. Parker
Area: Natural Sciences.

This course explores the distribution and abundance of organisms and their interactions. Topics include dynamics and regulation of populations, population interactions (competition, predation, mutualism, parasitism, herbivory), biodiversity, organization of equilibrium and non-equilibrium communities, energy flow, and nutrient cycles in ecosystems. Field trip included. Permission of instructor.
Prerequisites: AS.270.103 or permission of instructor
Instructor(s): K. Slaevets
Area: Natural Sciences.

This course will investigate the policy and scientific debate over global warming. It will review the current state of scientific knowledge about climate change, examine the potential impacts and implications of climate change, explore our options for responding to climate change, and discuss the present political debate over global warming.
Prerequisites: AS.270.103 or permission
Instructor(s): B. Zaitchik
Area: Natural Sciences.

AS.271.107. Introduction to Sustainability.
Will introduce interactions between global environment and humans, discuss meaning of sustainability, and introduce use of tools to attain sustainability such as policy, law, communication, marketing, research, advocacy, international treaties.
Instructor(s): C. Parker
Area: Natural Sciences.

Prereq: 270.103 or permission of instructor. This course will investigate the policy and scientific debate over global warming. It will review the current state of scientific knowledge about climate change, examine the potential impacts and implications of climate change, explore our options for responding to climate change, and discuss the present political debate over global warming.
Instructor(s): B. Zaitchik; D. Waugh
Area: Natural Sciences.
Interdepartmental

With the creation of President Barack Obama’s Task Force on Childhood Obesity, there is finally a national focus on the importance of childhood nutrition. First Lady Michelle Obama spearheads the “Let’s Move!” initiative, dedicated to the goal of eradicating childhood obesity through an emphasis on diet and physical activity. This class will tackle the issue of food, nutrition and health from the ground up; looking at multiple behavioral, cultural, and environmental factors that influence what and why we eat. We will also look at how our food systems and eating habits impact the health of individuals, communities, our country, and the world. In this two week session students will have a variety of experiences including trips to a Baltimore City urban farm, the Maryland Food Bank, farmer’s markets, one of Baltimore’s traditional public markets, and a sustainably-sourced restaurant (the famed Woodberry Kitchen). Students will hear a variety of guest speakers from the academic and government sectors.
Instructor(s): A. Khamrahs; N. Budd
Area: Social and Behavioral Sciences.

AS.360.121. Discover Hopkins Health Studies.

Center for Africana Studies

AS.362.325. The Role of “Place” in Racial Ethnic Health Disparities.
This course will introduce students to racial/ethnic health disparities, the need to examine the role of “place”, give different definitions of “place”, how the characteristics of where people live affect an individual’s health, and how this leads to racial/ethnic health disparities. The course will first examine large-scale measures of place, then down to smaller scale measures. Students will discuss various theories generally associated with racial/ethnic health disparities, as well as, the extension of “place” theories to this topic. Students will apply this knowledge through various assignments and activities about racial/ethnic health disparities of interest. These activities include class discussions, group assignments and development of interventions and solution-focused policy recommendations. This course is being offered for sophomores, juniors and seniors who have completed a statistic course or who have received permission from the instructor.
Prerequisites: Students may receive credit for AS.280.411 or AS.362.325, but not both.
Instructor(s): C. Bell
Area: Humanities.

AS.362.371. The Public Health Crisis in Africa. 3 Credits.
This course examines the historical and current public health crises in Africa. Topics covered include infectious diseases and viral outbreaks, water and food access, sanitation, education, behavioral health, gender equality, health care and health care access, as well as the link between culture, economics and health. Introduction to Epidemiology is recommended but not required.
Instructor(s): C. Furr-Holden
Area: Humanities, Social and Behavioral Sciences.

Geography Environmental Engineering

EN.570.108. Introduction Environmental Engineering.
Overview of environmental engineering including water/air quality issues, water supply/ wastewater treatment, hazardous/solid waste management, pollution prevention, global environmental issues, public health considerations/environmental laws, regulations and ethics.Cross listed with Public Health Studies.
Instructor(s): H. Alavi
Area: Engineering.

Entrepreneurship and Management

So many big and seemingly intractable problems inhibit progress and diminish quality of life especially in and around urban communities. Surely there are ways to begin to tackle some of these problems, if we approach them from a multi-disciplinary perspective. This course provides that opportunity as students, who work primarily in teams, apply theory and ingenuity to investigate problems, propose solutions or invent devices that address some of these problems. Class time is spent in lecture, discussion, and applied community projects to master content. Time will be spent participating on teams and working in community organizations in addition to class.
Area: Social and Behavioral Sciences.

Social Policy

Social policy is the study of policy solutions to the problems of education, inequality, poverty, crime, and other issues faced by society’s families and children. It is an interdisciplinary field to which the disciplines of economics, sociology, and political science contribute in equal measure. It is a basic-science field with a strong applied-research focus that can prepare students for careers in government, nonprofits, and the private sector. Students who undertake the social policy minor will work with faculty who are experts in the study of poverty, the labor market, social demography, family structure, educational inequality, political participation, organizational dynamics, and health and welfare policy. They will be strongly grounded in social science training and will apply that training to real-world applications and policies. In the minor, students will be motivated to think about how knowledge translates into policy solutions, making this an appropriate specialization for young people who plan to attend law school, programs in public health, or graduate school in the constituent social science field.

Requirements of the Minor

A social policy minor is offered jointly by the Departments of Economics, Political Science, and Sociology. To complete the minor, students must take an introductory course, Introduction to Social Policy and Inequality: Baltimore and Beyond; a 300-level social policy elective in one of the three departments; an intensive semester in either Baltimore or Washington; and a senior capstone course to be taken after the intensive semester is completed. The preferred sequence is for students to take the introductory course in their sophomore year, the elective in the fall of their junior year, the intensive semester in Washington or Baltimore in the spring of their junior year, and the capstone course in their senior year. However, modifications in the sequence will be considered. The intensive semester in Washington or Baltimore will involve course work focusing on urban and national social policy problems coupled with an internship in a governmental agency or non-governmental organization that is involved with some
aspect of social policy, or as a research assistant to a faculty member conducting research on social policy. The capstone course will involve discussion and research among students who have completed the intensive semester and is intended to build up experiences in that semester.

Enrollment in the intensive semester will be limited to 30 students and requires application and admission. The social policy minor is grounded in the three disciplines and priority will be given to students who are majoring in economics, political science, or sociology, but other students who are not majors and who have taken a large number of social science courses will be considered.

A list of electives to be used to fulfill the 300-level social policy elective for the intensive semester programs is available on their website (http://krieger.jhu.edu/socialpolicy).

Students interested in the minor should speak to an advisor in the Economics, Political Science, or Sociology departments.

All courses must be taken for a letter grade and a grade of C- or better must be earned in all minor requirements.

Nicholas Papageorge  
Assistant Professor (Economics).

Daniel Schlozman  
Assistant Professor (Political Science).

**Senior Lecturer**

Barbara Morgan

### Sociology

The Department of Sociology concentrates on two broad areas at the graduate and undergraduate levels: Global social change, which focuses on cross-national, comparative research; and social inequality, which primarily focuses on family, education, work, race, gender, policy, and immigration.

These concentrations trace back to the department’s founding in 1959 by renowned American sociologist James Coleman. The department has since earned a reputation as one of most selective, personalized sociology departments in the U.S. Currently home to 17 faculty members including 2 Bloomberg Distinguished Professors, 36 graduate students, and roughly 50 undergraduates, the department offers a uniquely intimate scholarly atmosphere in which faculty and students interact and collaborate frequently.

Scholars in the department share a wide variety of interests and interdisciplinary partnerships. Students are given flexible parameters for their study, and several faculty members have been honored with joint appointments in other Johns Hopkins schools and divisions. The department shares a unique relationship with the Bloomberg School of Public Health, which offers faculty and students access to first-rate collaborations in fields such as population and demography, mental health and mental hygiene, and healthcare organization. The department is also proudly partnered with the Department of Applied Mathematics and Statistics and is committed to building and maintaining strong foundations in quantitative research methods.

### Major in Sociology

A major in sociology offers undergraduates a variety of post-graduation opportunities. Graduates from the department have found positions in financial institutions, education, non-governmental organizations focusing on international development, research departments of major corporations, and local government social service agencies. Others continue to graduate school in sociology, public health, law, urban planning, and education. A major in sociology can also be combined with the pre-medical course sequence, resulting in a medical school candidate who is well versed in the hard science of the human body and the social science of the human experience. For more details, please visit http://soc.jhu.edu/undergraduate/.

### Requirements for a B.A. Degree

(Also see Requirements for a Bachelor’s Degree (p. 20).)

The required courses for a major in sociology provide students with a fundamental understanding of sociological theory, methods, and social statistics. Beyond these core requirements, elective courses are offered on a range of important sociological themes, including gender and family, social structure and personality, education, race and ethnicity, immigration, political sociology, international development, and the evolution of a world social system.

Global Social Change and Development Track

The Global Social Change and Development (GSCD) Track (http://krieger.jhu.edu/arrighi/undergraduate/gscd) is geared towards students interested in understanding critical issues surrounding contemporary processes of globalization and international development. The track provides students with a sophisticated set of research and critical-thinking skills, prepares students for twenty-first century professions and helps them to become thoughtful global citizens. Ultimately, students pursuing the Global Social Change and Development track will receive a double major in both International Studies and Sociology.

### Sociology Electives

<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Three non-sociology courses at any level carrying a social and behavioral sciences area designator in at least two other departments or programs</td>
<td>9</td>
</tr>
</tbody>
</table>

* One elective course may be fulfilled by combining 1 or 2 credit courses for a total of at least 3 credits. All other elective courses must be at least 3 credit courses. Up to two of the six sociology electives and one of the three other social science electives may be independent study or independent research courses (at least 3 credits) supervised by Hopkins faculty. Only one course taken in the summer at JHU may apply towards the sociology electives.

All courses must be taken for a letter grade and a grade of C or better is required.

Foreign language study is strongly encouraged for majors, especially those considering graduate or professional study.

### Senior Honors Program

The senior year Honors Program affords highly motivated and qualified students the opportunity to pursue, with faculty guidance, a research project of their own design. The Honors Program culminates in an honors thesis; a substantial work of original scholarship. Prerequisites and requirements for the program are as follows:

- All the requirements of a traditional major in sociology.
- Minimum 3.5 GPA in all sociology core curriculum courses.
- Declaration of intention to enroll in Senior Honors Program to faculty advisor by the end of the junior year.
- At least two 300-level courses in sociology by the end of the junior year.
- Completion and faculty approval of honors thesis.

For more information on the Senior Honors Program, contact your faculty advisor.

### Social Policy Minor

The Social Policy minor (p. 769) brings an interdisciplinary focus to the many social problems facing a city such as Baltimore and the nation as a whole, and encourages the search for policy solutions to those problems.

### Global Social Change and Development Track

The Global Social Change and Development (GSCD) Track (http://krieger.jhu.edu/arrighi/undergraduate/gscd) is geared towards students interested in understanding critical issues surrounding contemporary processes of globalization and international development. The track provides students with a sophisticated set of research and critical-thinking skills, prepares students for twenty-first century professions and helps them to become thoughtful global citizens. Ultimately, students pursuing the Global Social Change and Development track will receive a double major in both International Studies and Sociology.

### Alpha Kappa Delta (AKD) Honor Society

In spring 2006, the Sociology department was awarded a chapter of the AKD sociology honor society. The chapter welcomed eleven new initiates that year, two faculty members, two new graduate students, and seven undergraduates.

AKD is an open, democratic, international society of scholars dedicated to the ideal of Athropon Katamanthanein Diakonesein or “to investigate humanity for the purpose of service.” AKD seeks to acknowledge and promote excellence in scholarship in the study of sociology, the research of social problems, and other social and intellectual activities that will lead to improvement of the human condition.

AKD was founded at the University of Southern California in 1920 and affiliated with the Association of College Honor Societies in 1967. There are more than 97,000 lifetime members and over 600 chapters of the Society. These are persons with academic records showing excellence in sociology.

Initiates receive a chapter pin, a certificate of membership, and a membership activation form. Members who submit completed activation forms receive a one-year subscription to Sociological Inquiry, the official journal of the Society, the Alpha Kappa Delta Newsletter, election materials, and other services. In addition, the Society sponsors student paper contests, provides honoraria for initiation speakers, provides funds for student travel to regional sociological meetings, funds research symposia, sponsors a distinguished lecture series at the Annual Meeting of the American Sociological Association, and contributes annually to the ASA Minority Scholarship Fund. AKD members wear AKD honor cords at graduation ceremonies. AKD chapters are important in the academic, professional, and social lives of student and faculty members. They provide opportunities for initiating and sharing activities in keeping with the purposes of the Society. Our local chapter affords the opportunity for faculty, graduate students, and undergraduate students to interact informally and to plan together events to enrich the intellectual and social life of the Department.

To be eligible for membership, majors must have at least junior year standing, an overall GPA of at least 3.0, a sociology GPA of at least 3.5, and have taken at least four courses in sociology.

Election to Alpha Kappa Delta is without regard to race, creed, or national origin. For more information, interested students should contact the AKD Faculty Chapter Representatives: Meredith Greif (mgreif1@jhu.edu) & Katrina McDonald (kmcdon@jhu.edu).

### James S. Coleman Award

This award was established by the Department of Sociology in 1994 in honor of Dr. James S. Coleman, first chair of the department. The award is for outstanding academic achievement by a senior majoring in sociology and is presented at graduation.

The department's primary educational goal is to train first-class sociology Ph.D.'s. The sociology graduate experience at Johns Hopkins is best characterized as a research apprenticeship – a careful blend of formal instruction, faculty-directed individual study, and supervised
as well as self-initiated research. The department’s small size and specific concentrations yield a personalized course of study and close relationships with faculty members and fellow graduate students. The social climate is informal, and the mix of students and faculty, drawn from a wide variety of geographic and social backgrounds, constitutes a rewarding intellectual community. For more details, please visit http://soc.jhu.edu/graduate/.

Admissions

Applicants must submit an application fee, personal statement, GRE scores, all college transcripts, at least two (preferably three) letters of recommendation, and a sample of written work. International applicants must also submit a TOEFL score and a financial statement (FS-1G Form: Graduate International Student Notification [F-1]/-1). Applicants should have a broad background in social science, especially sociology, economics, and psychology. Training in mathematics is encouraged. The department gives greatest weight to an applicant’s demonstrated ability and past performance. For more details, please visit http://soc.jhu.edu/graduate/admissions/.

Requirements for the Ph.D. Degree

Core Curriculum

</tbody>
</table>

* This fall semester course is taken during the first year. Faculty presentations introduce students to the substantive interests, research and professional background of the sociology faculty. It is graded pass/fail.

To count toward degree requirements, core curriculum courses other than the Trial Paper Research series of courses must be passed with a grade of B- or higher. After the core course requirement is satisfied, additional methods courses from the list above may be used to fulfill the nine-elective course requirement.

Electives

In addition to the core curriculum, graduate students must enroll in nine additional graduate-level courses, up to four of which may be taken outside of the department. All must be passed with a grade of B- or higher. While students are free to select these courses, the department strongly recommends that they be taken from diverse fields of specializations so as to maximize the breadth of exposure to core areas of sociology and other disciplines.

Teaching Assistantships

As part of their preparation for future academic work, graduate students are required to register for AS.230.811 Teaching Assistantship and serve as a teaching assistant for at least one semester.

Foreign Language

One of the requirements for the Ph.D. degree in sociology at Johns Hopkins University is a reading knowledge of a language other than English, and no student is exempt from this requirement. For a language to be eligible the student must show that

1. a body of social scientific literature exists in the language, or
2. the student must use this language to carry out dissertation field work or archival research for the dissertation.

The language test will evaluate comprehension of a social science document. Students are encouraged to complete the language requirement as soon as possible, but no later than the end of their third year.

Residence

A minimum of two consecutive semesters of full-time residence is mandatory for all degrees. However, at least six semesters of full-time residence is recommended by the department for completion of the core curriculum, electives, and completion of a research apprenticeship and a trial research paper. By the end of the fourth year in the program, the student is expected to have written a dissertation proposal and have defended it successfully before the appropriate examining committees.

Research Apprenticeship

AS.230.801 and AS.230.804

Students are required to develop practical research expertise through professional-level participation (data analysis, literature searches/reviews, non-routine data processing or coding, preparation and refinement of research instruments, and data/file management). This requirement is fulfilled by satisfactorily completing a Research Apprenticeship, which is required during the student’s first year of full-time graduate study in the department. The standard for certification is substantial research accomplishment as judged by the faculty supervisor.

Trial Research Paper

The Trial Research Paper (TRP) affords students the experience of planning and executing a research project that leads to a scholarly paper. The TRP is expected to be a serious, complete work of scholarship, suitable for conference presentation or journal submission. By the end of the fall semester of their second year, students should invite a faculty sponsor to supervise the design and execution of the TRP project. A TRP proposal must be approved by the faculty sponsor by the end of the spring semester of the second year. By the end of the fall semester of the third year, the faculty sponsor must approve a draft of the paper which will then be reviewed by another department faculty member. The faculty sponsor, at her or his discretion, may extend this deadline to the end of the intersession period following the fall semester. The faculty reviewer will evaluate the paper and, if necessary, recommend revisions that should be made before the paper is certified. The faculty sponsor will determine required revisions and
must certify a final TRP by the end of the spring semester of the third year.

Dissertation
The student must propose and conduct original research presented in a dissertation suitable for publication. The department administers an oral examination which must be passed before the student is allowed to defend before a university board. The dissertation must then be defended either at a Graduate Board preliminary oral examination, based on the dissertation proposal, or at a Graduate Board final oral examination, based on the completed dissertation.

Special Programs
The department offers two special programs that coordinate activities in its two areas of concentration. Doctoral students may affiliate with one or both of these programs at their discretion. These programs function as fields of doctoral specialization within the Department of Sociology.

Program on Global Social Change (PGSC)
This concentration of graduate study focuses on cross-national, comparative research and long-term, world-scale social change. The goal of the program is to give students knowledge of the various theoretical perspectives in these areas, experience in data collection and analysis, and expertise in one or more substantive fields.

The program does not focus on a particular geographic area, although faculty members have conducted extensive research on Latin America, Africa, Asia, the Middle East, and Eastern and Southeastern Europe. Instead of a geographical approach, the emphasis is on issues of development and social change that cut across different countries and world regions. Examples are globalization and regionalization, labor and development, city systems and urban primacy, social movements and revolutions, state violence, migration and labor force formation, family structure and change, social structure and personality, and national and international stratification. Students enroll in a sequence of courses and seminars and participate actively in ongoing faculty projects dealing with one or more of the above issues.

In addition, the interdisciplinary character of graduate education at Johns Hopkins offers students ample opportunity to enroll in courses or collaborate in research of faculty in other departments. Faculty associates of the program include distinguished scholars in anthropology, economics, geography, history, political science, and public health.

A graduate concentration is not required of Ph.D. students.

Program on Social Inequality (PSI)
This concentration of graduate study focuses on the causes and consequences of social inequality, the social processes that sustain it, and how social policies can reduce it. These questions are addressed in terms of class, gender, race, ethnicity, and immigration status/citizenship.

The program is designed to train students in the sociological analysis of social inequality among individuals and groups. This training includes course work in areas such as social stratification, the sociology of the family, the sociology of education, sociology of immigration, social structure and personality, social policy, and research design and methods. Students in the PSI program enroll in a sequence of courses and seminars and participate actively in ongoing faculty projects dealing with one or more of the above issues.

In addition, the interdisciplinary character of graduate education at Johns Hopkins offers students ample opportunity to enroll in courses or collaborate in research with faculty in other departments. Faculty associates of the program include distinguished scholars in anthropology, economics, geography, history, political science, and public health.

A graduate concentration is not required of Ph.D. students.

Joint Program: Doctorate in Sociology and Master’s in Applied Mathematics and Statistics
The Department of Sociology, Krieger School of Arts and Sciences, and the Department of Applied Mathematics and Statistics, Whiting School of Engineering, announce a joint program leading to a Ph.D. in Sociology and an M.A. or M.S.E. in Applied Mathematics and Statistics. The purpose of the joint program is to offer Sociology doctoral students an opportunity to acquire advanced statistical knowledge and applied research skills.

The joint program requirements include all the Ph.D. requirements in Sociology and the specially designed requirements for an M.A. or M.S.E. in Applied Mathematics and Statistics. For Sociology Ph.D. requirements, see the Sociology Ph.D. Students Handbook. Applied Mathematics and Statistics courses may substitute for AS.230.600 Introduction to Social Statistics and AS.230.604. Two options for fulfilling the requirements are available for an M.A. or M.S.E. in Applied Mathematics and Statistics. For both options, students are required to meet the Applied Mathematics and Statistics department’s computing requirement (fulfilled through EN.550.413 Applied Statistics and Data Analysis), the purpose of which is to ensure that students are able to effectively use computers to solve mathematical problems.

Note: All Joint Program students are required to complete Responsible Conduct of Research (RCR) training, which is in addition to the HIPPA training required for the sociology Ph.D.

For more information, please visit http://soc.jhu.edu/graduate/jointprogram/.

Facilities
Each resident graduate student is provided office or desk space to conduct his or her studies and research. In addition, the department has a computer lab with a network of computers and printers for graduate student use. Close working relationships exist with the Center for Social Organization of Schools and the Institute for Policy Studies, which provide excellent opportunities for research training.

Financial Aid
The department strives to provide five years of financial aid for all students who are in good academic standing. Eligibility for financial aid in the fifth year ordinarily requires successful oral defense of the dissertation proposal by May 31, following their fourth year in the Ph.D. program.

The department has a number of assistantships that are awarded each year to graduate students in the Ph.D. program. Opportunities are also available for graduate students to work as salaried research assistants.
with members of the Sociology faculty and staff at associated research centers.

For current faculty and contact information go to http://soc.jhu.edu/directoryindex/faculty/

Faculty
Chair
Beverly J. Silver
Historical capitalism, comparative and world-historical research methods, global inequality and development, labor and social movements.

Professors
Andrew J. Cherlin
Benjamin H Griswold III Professor of Public Policy; sociology of the family, demography, social policy.

Kathryn Edin
Bloomberg Distinguished Professor; poverty, inequality, social policy.

Lingxin Hao
Sociology of the family, public policy, immigration, social inequality, sociology of education, quantitative methodology.

Stephen L Morgan
Bloomberg Distinguished Professor; education, inequality, demography, and methodology.

Associate Professors
Rina Agarwala
International development, gender, labor, migration, globalization, India.

Joel Andreas
Post 1949 Chinese society, transitions to and from socialism, industrial democracy, education and class reproduction.

Stefanie A. DeLuca
Sociology of education, sociology of neighborhoods, life course studies.

Ho-Fung Hung
Global political economy, contentious politics, nationalism, and social theory.

Katrina Bell McDonald
Sociology of the family, gender/ethnic identity, race and social class.

Assistant Professors
Julia Burdick-Will
Urban sociology, education, stratification.

Ryan Calder
Economic sociology, political sociology, political economy, Middle East, Southeast Asia, Globalization, finance, Islamic banking, Islamic jurisprudence.

Meredith Greif
Race, urban sociology, and health in developing countries.

Michael Levien
Political and developmental sociology.

Professors Emeriti
Karl L. Alexander
Academy Professor in The Academy at JHU/KSAS, sociology of education, social stratification

Melvin L. Kohn
Academy Professor in The Academy at JHU/KSAS; social structure and personality, cross-national comparative analysis, social class and stratification, sociology and social psychology of work.

Joint Appointments
David M. Altschuler
Adjunct Associate Professor (Institute for Policy Studies) Bloomberg School of Public Health; de-institutionalization and community-based services, delinquency and criminal justice, voluntary organizations and philanthropy, social policy.

Stanley Becker
Professor, Bloomberg School of Public Health; demography.

Joyce Epstein
Research Professor, School of Education (Center for Social Organization of Schools); sociology of education, evaluation research, social psychology.

Kelly Gebo
Adjunct Assistant Professor, School of Medicine; medical sociology and mental health.

Gail Geller
Professor, School of Medicine; ethical, social and cultural implications of genetic advances in the adult, pediatric and family contexts.

Thomas A. LaVeist
Professor, Bloomberg School of Public Health; medical sociology, mortality, health services, aging.

Vicente Navarro
Professor, Bloomberg School of Public Health; health and social policy, international health, health care policy.

Katherine Smith
Associate Professor, Bloomberg School of Public Health; social determinants of health behavior.

Marc Stein
Assistant Professor, School of Education; neighborhoods, school choice, academic achievement.

Research Professor/Lecturers
Emily Agree
Research Professor; gerontology demography.

Magda von der Heydt
Senior Lecturer (Latin American Studies Program); socio-economic history of Latin America, developmental processes.

Huei-ying Kuo
Senior Lecturer/Assistant Research Scientist; Chinese diasporic business networks, Japanese and British imperialism, as well as Chinese nationalism in East and Southeast Asia.

Sydney van Morgan
**Courses**

**AS.230.101. Introduction Sociology.**
Introduces students to basic sociological concepts and perspectives, and applies them to a variety of topics including family, work, and the dynamics of class, gender, and racial/ethnic inequalities in the United States and globally.
Instructor(s): A. Cherlin
Area: Social and Behavioral Sciences.

**AS.230.109. Freshman Seminar: Hot Topics in Education.**
This course examines current school reform initiatives and the controversies surrounding them through a sociological lens. Freshmen Only
Instructor(s): J. Burdick-Will
Area: Social and Behavioral Sciences.

**AS.230.113. Politics and Development of Baltimore.**
This course will examine the development of Baltimore and its impact in the 21st century through the complex role of economic, political, and social dynamics. We will address the relationship between development and politics and the impact this has on the social and economic conditions of Baltimore from the development of the Great Parks to the redevelopment of Downtown and East Baltimore.
Instructor(s): D. Pasciuti
Area: Social and Behavioral Sciences.

**AS.230.116. B'More: Studying Innovation and Change Through Charm City.**
Please note, class will meet Saturday, Jan. 24 in the event of inclement weather. This course is for freshmen ONLY. Ideas that changed the world originated from Baltimore. We will examine the innovations rooted in B'More and discuss how they were born, how they spread, and how they succeeded or failed. Our in-class activities will provide general insight into how entrepreneurs and activists promote change. Our field trips will inform class conversations about technological and cultural innovations along with the societal and economic consequences of those changes.
Prerequisites: Students may enroll in one B'More course only.
AS.371.189 AND AS.270.119 AND AS.270.118 AND AS.060.153 AND AS.060.126 AND AS.100.197 AND AS.300.100 AND AS.360.176 AND AS.220.116 AND AS.280.205 AND AS.220.190 AND AS.220.194
Area: Social and Behavioral Sciences.

**AS.230.123. Trust and Altruism: Existence and Forms in Theory and Practice.**
Trust is often cited as necessary to the successful functioning of small groups, formal organizations, and democratic society. Altruism is a concept that is debated regarding its very existence - whether there is a sociological, biological, or other basis for saying it exists. Through interdisciplinary readings - primarily from sociology but also evolutionary biology, psychology, and philosophy - we will consider theories of trust and altruism, as well as claims about other mechanisms that can secure mutually beneficial cooperation. Case studies from families, education, neighborhood ecology, and on-line communities are featured. Freshmen only.
Instructor(s): S. Plank
Area: Social and Behavioral Sciences.

**AS.230.127. Freshmen Seminar: Social Interaction.**
This course introduces students to ways of seeing social interaction, from mundane acts like conversation and riding the bus to extraordinary events like riots, escape panics and battlefield atrocities. The course will employ a “hands on” approach in which students will DO and not just read about sociology. Locations in and around campus will serve as laboratories to observe (and instigate) interactions for analysis. Freshman Only.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences.

**AS.230.129. Extreme Poverty in the United States.**
Is it possible that there is a level of poverty in the United States so deep that no one even knew it existed - until now? New research from Edin and Shaefer (2015) makes this case. Join a Hopkins’ graduate student on Edin and Shaefer’s team to dig into this exciting and controversial work. Particular focus will be given to possible public policy responses and qualitative research design challenges when studying hard-to-reach populations.
Instructor(s): R. Francis
Area: Social and Behavioral Sciences.

**AS.230.137. Special Opportunities in Undergraduate Learning: Exploring Baltimore: An Introduction to Urban Studies.**
Through an exploration of urban topics, this course will introduce students to data collection and analysis methods used in the social sciences. Students will discuss relevant research published by Johns Hopkins faculty in urban studies. Students will also gain an introduction to their adopted home, Baltimore, by collecting data and conducting field observations in different neighborhoods.
Instructor(s): M. Reese.

**AS.230.138. Be More Organic, Be More Local.**
Urban farming is the practice of cultivating, processing and distributing food in or around a city, proponents argue that it improves access to fresh produce and improves community cohesion. Baltimore is an exciting case study for different types of urban farm operations. Through academic literature, field trips to winter farms and discussions with farmers and residents, students will explore the potentials of urban farming and community building in Baltimore.
Instructor(s): W. Chen
Area: Social and Behavioral Sciences.
AS.230.142. Integrating Spaces.
Diversity has rapidly increased in the US with Census 2010 reporting more integrated areas than the previous 40 years. What does integration mean, where is it occurring, and why? This course will examine the process of integration occurring in neighborhoods and schools. We will explore what drives integration and unpack its consequences. Students will identify integrated schools or neighborhoods in the Baltimore/Washington area to research as case studies of the social process of integration.
Instructor(s): S. Warkentien
Area: Social and Behavioral Sciences.

AS.230.147. Introduction to Islam and Islamicate Societies since 1800.
This course is an introduction to contemporary Islam and Muslim societies from approximately 1800 to the present. Key themes will include the colonial encounter, state formation and reform, revolution, Islamic revival, and globalization. Reflecting Islam’s status as a world religion, the course will touch on developments around the Muslim-majority world and in the West.
Instructor(s): R. Calder
Area: Social and Behavioral Sciences.

AS.230.150. Issues in International Development.
Why do billions of people continue to suffer from poverty? Who is most likely to change this situation, what strategies should they follow, what kinds of institutions should they put into place, and what kinds of obstacles stand in the way? This course will introduce the main theoretical perspectives, debates, and themes in the field of international development since the mid-20th century. It has three sections. The first section focuses on debates about the optimal conditions and strategies for generating economic growth and on the relationship between growth, inequality, and human welfare. The second section presents micro-level assessments of various development interventions. The third section considers the role of civil society and political movements in shaping development and social change in the 21st century. Freshmen and sophomores only.
Instructor(s): M. Levien
Area: Social and Behavioral Sciences.

AS.230.152. Housing and Schools: The Social Contexts of Inequality.
Where families live is still a major determinant of the quality of children’s schools, and this connection between residential location and educational opportunity plays a significant role in the perpetuation of social inequality. This course will examine recent research in housing and education to develop a critical understanding of the role of social inequality, public policy, and individual choices in shaping housing and school opportunities for families. The course will focus on the intersection of residential and educational choices, by examining housing and school interventions across a host of American cities, with a particular focus on how these issues operate in our own city of Baltimore at the end of the semester.
Instructor(s): A. Rhodes
Area: Social and Behavioral Sciences.

Significant gaps in academic achievement persist among students from different socioeconomic groups and have actually widened over the past fifty years. Through a sociological lens, we will identify the sources of these gaps and consider recent intervention efforts to narrow them. Students will use multiple data sources to explore the causes of underachievement in one Baltimore neighborhood and will design a targeted intervention to improve the academic outcomes of students in that neighborhood.
Instructor(s): B. Condliffe
Area: Social and Behavioral Sciences.

AS.230.165. Sociology of Mental Illness.
What we now consider mental illness has historically been seen as everything from demon possession to a gift of rare insight. Using sociological theories of symbolic interaction, social construction, and intersectionality, we will consider how culture, privilege, disadvantage, and context affect definition, diagnosis, and treatment. This class will employ fiction and film as well as empirical studies and theory in the exploration of the social meanings of mental illness.
Instructor(s): C. Cross-Barnet
Area: Social and Behavioral Sciences.

This interdisciplinary course applies theories of economic sociology to examine the effects of Chinese overseas migration on modern world economy from the sixteenth century to the contemporary era. It examines the contribution of overseas Chinese to the development of capitalism in the following junctures: the East-West economic integration in the pre-modern era, China’s modern transformation after the Opium War (1839-1842), the making of US national economy in the early twentieth century, as well as the postwar economic miracles in the Pacific Rim, among others. Special Note: Fulfills History requirement for GSCD track students.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

AS.230.175. Chinese Revolutions.
This course introduces the origins, operation and impacts of five major revolutions in modern China between 1850 and 1950. These include the Taiping Rebellion, the republican revolutions, federalist and southern automatic movements, labor strikes as well as peasant rebellions. It draws on the existing historiography that examines China’s transition from an empire to a republic, impacts of western and Japanese influences to China, as well as the continuity and change of Chinese social organizations. Cross list with International Studies and East Asian Studies. Fulfills IS History requirement.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

An overview of the criminal justice system including court watching and riding with a police officer (optional). Class includes guest visits, field trips, and term projects.
Instructor(s): S. Harris
Area: Social and Behavioral Sciences.

The purpose of this course is to provide a sound introduction to the overall process of research and the specific research methods most frequently used by sociologists and other social scientists. Required for Sociology majors and IS GSCD track students.
Instructor(s): L. Hao
Area: Social and Behavioral Sciences.
AS.230.205. Introduction to Social Statistics.
This course will introduce students to the application of statistical techniques commonly used in sociological analysis. Topics include measures of central tendency and dispersion, probability theory, confidence intervals, chi-square, anova, and regression analysis. Hands-on computer experience with statistical software and analysis of data from various fields of social research. Special Note: Required for IS GSCD track students.
Prerequisites: Statistics Sequence restriction: students who have completed any of these courses may not register:
EN.550.211 OR EN.550.230 OR EN.550.112 OR EN.550.310 OR
EN.550.311 OR EN.550.413 OR EN.550.420 OR EN.550.420 OR
EN.550.420 OR EN.560.435 OR AS.280.345 OR AS.200.314 OR
AS.200.315; Statistics Sequence Restriction: Students who have completed EN.550.111 OR EN.550.113 may not enroll.
Instructor(s): D. Pasciuti
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.230.208. Introduction to Race and Ethnicity.
This course offers an historical overview of race and ethnicity in American society, and the processes that have led to ethnic and racial boundaries. We explore the social dynamics of racial/ethnic hostility and racial/ethnic protest movements. In addition, we examine how race and ethnicity have been used to justify segregation, domination and genocide, but also to create a sense of community, shared responsibility and belonging. Cross-listed with Africana Studies
Instructor(s): K. McDonald
Area: Social and Behavioral Sciences.

Piketty’s Capital in the Twenty-First Century is a lengthy (700 pages) but accessible synthesis of the author’s rigorous research on income inequality. This research has informed social scientists and politicians as well as social movements such as Occupy. Yet Piketty’s theories of the causes of rising inequality and his proposed solutions have been controversial. In this course, we will read and critically assess this major work.
Instructor(s): D. Thompson
Area: Social and Behavioral Sciences.

AS.230.211. Women and Work.
This class will examine American women and work over the past century and will assess how power, work, and gender are connected. It will also consider the ways in which class and race relate to working women. We will look at how women and men divide time between family and work; explanations for the gender differences in employment, occupation choice, and earnings; gender and low-wage work; and how policy affects the experience of working women.
Instructor(s): E. Talbert
Area: Social and Behavioral Sciences.

AS.230.213. Social Theory.
This course provides an introduction to classical sociological theories (with an emphasis on Marx, Weber, and Durkheim). Contemporary theoretical perspectives on social inequality, conflict, and social change are also explored. Emphasis is placed on understanding the theoretical constructs as well as applying them in the analysis of current social issues. Special Note: Required for IS GSCD track students.
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

This course examines the topics of Chinese overseas migration after the long sixteenth century. It investigates the following themes: First, the making of Chinese maritime frontier in the longterm trade and migration across the South China Sea and beyond; Second, economic functions of Chinese overseas networks in the East-West integration from the early modern era to the ongoing wave of globalization; Third, politics of identity and heritage in Chinese overseas communities. Course may not be taken by students that previously took AS.230.166.
Prerequisites: Course may not be taken by students that previously took AS.230.166.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

This course introduces students to issues of global social change, with a particular focus on the challenges of international development and the contemporary globalization process. Specific themes include world income inequality and global poverty, the rise of supranational organizations (e.g. WTO and EU) and their relations with sovereign states, anti-globalization activism, the rise of China and India in the global economy, and the origins as well as consequences of the current global economic crisis, among others. Lectures will be aided by documentary films and other multi-media materials. Special Note: Fulfills Economics requirement for IS GSCD track students only. Formerly offered as AS.230.353. Students who took AS.230.353 cannot take AS.230.221.
Prerequisites: Students who took AS.230.353 cannot take AS.230.221.
Instructor(s): H. Hung
Area: Social and Behavioral Sciences.

AS.230.223. Housing and Homelessness in the United States.
This course will examine the role of housing, or the absence thereof, in shaping quality of life. It will explore the consequences of the places in which we live and how we are housed. Consideration will be given to overcrowding, affordability, accessibility, and past and existing housing policies and their influence on society. Special attention will be given to the problem of homelessness.
Instructor(s): M. Greif
Area: Social and Behavioral Sciences.

This course will cover the major world population changes in the past century as well as the contemporary situation and projections for this century. Topics include rapid population growth, the historical and continuing decline of death and birth rates, contraceptive methods as well as family planning and child survival programs, population aging, urbanization, population and the environment and the demographic effects of HIV/AIDS
Instructor(s): S. Becker
Area: Social and Behavioral Sciences.
AS.230.228. Colonialism in Asia and Its Contested Legacies.
This seminar examines the theories and historiography of colonialism in Asia, with special focus on the development of British Straits Settlements and Hong Kong as well as Japanese Taiwan. We will review the competing discourses about the impact of colonial dominations in these areas from the 1800s to the present-day. In the beginning of the era, the British built up the economic linkage between Hong Kong and Penang, Malacca as well as Singapore to sustain its dominance throughout the “Far East.” In the middle of the period, the expanding Japanese empire developed Taiwan as a footnote to compete with the British interests in South China and Southeast Asia. Hong Kong and the Straits Settlements, especially Singapore, became the contested terrain where two colonial powers vied for their influences in the region. The competition was not only about trade, but about the construction of a new East Asian regional order after the end of the Chinese hegemony. In the end of the period, the intervention of the US power in postwar Asia facilitated the retreat of the colonial establishments, British and Japanese ones included. The course that compares the colonial establishments and discourses on colonial legacies among the three areas points out that colonialism constituted an inalienable part of Asian history. Cross listed International Studies (CP) and East Asian Studies. Fulfills History requirement for IS GSCD track students only.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

AS.230.237. Sociology and Film.
Do films merely mirror society, or do they in fact shape societal experience? This class will investigate these questions through a filmic analysis of sociological issues. We will consider both narrative and documentary films and use them to engage in sociological questions of class, race, and gender. We will discuss what the historical and current trends in film making and film subject say about society, and how these trends may in turn influence society.
Instructor(s): E. Talbert
Area: Humanities, Social and Behavioral Sciences.

Race and ethnicity have played a prominent role in American society and continue to do so, as demonstrated by interracial and interethnic gaps in economic and educational achievement, residence, political power, family structure, crime, and health. Using a sociological framework, we will explore the historical significance of race and its development as a social construction, assess the causes and consequences of intergroup inequalities and explore potential solutions.
Instructor(s): M. Greif
Area: Social and Behavioral Sciences.

AS.230.244. Race and Ethnicity in American Society.
In the US and other industrialized countries, problems of income inequality and poverty have taken a sharp turn for the worst in recent years. The purpose of the course is to give students an opportunity to learn about the causes of this increasing inequality and poverty in US cities like Baltimore, and to explore the potential for public policies to rectify these problems. Students will read about the main theoretical and empirical perspectives on the issues; examine the relationship between inequality and class, gender and race; study the history and present shape of social policy in the US; and explore the consequences of particular initiatives for the status of the urban poor.
Instructor(s): A. Livingstone
Area: Social and Behavioral Sciences.

Interaction in small groups or in face-to-face situations (“microsociology”) is the sole focus of this course. Wherever possible, a “hands on” approach in which students do sociology and not just learn about others’ efforts is utilized. This will include field observations of public and semi-public spaces, recording and analyzing small group interaction, and participating in SIMSOC, an intense interactive simulation of society. Major conceptual approaches include symbolic interactionism, ethnomethodology and interaction ritual. Students that previously took AS.230.127 may not take this course.
Prerequisites: Students that previously took 230.127 may not take this course.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences.

This course will explore what it means to be male or female through academic writings, fiction, and film. It will examine how genders are defined by individuals, cultures, and institutions, and how those meanings shape everyday life for men and women. Power, inequality, and intersections with race-ethnicity, class, and sexuality will be a primary focus. Theories of gender addressed will include those related to masculinity, social psychology, feminism, and intersectionality. Though the course will primarily consider the United States, gender in other countries and cultures will also be addressed. Cross-listed with WGS.
Instructor(s): K. McDonald
Area: Social and Behavioral Sciences.

This course explores the interaction between political power and social forces in macro-comparative and international perspectives, focusing on how political institutions (such as states, political parties, and international governing bodies) are shaped by actions of different social groups (such as classes, ethnic groups, social movements), and vice versa. The class will cover the historical emergence of sovereign nation-state as the most salient political organization across the world, as well as its evolution into the form as we know it today. The class will also discuss the array of challenges that modern nation-states are facing under globalization and restructuring of world order following the end of Cold War. Cross-listed with Political Science.
Instructor(s): H. Hung
Area: Social and Behavioral Sciences.

This course will introduce students to a range of digital technologies that are critical for conducting social scientific research in the 21st century. Students will develop competency in the use of computer programs for statistical analysis, database management, the creation of maps and timelines, and the presentation of research reports. The research tools and technologies will be taught using examples from ongoing social science faculty research projects at Johns Hopkins on global inequality and international development. Required for GSCD track students.
Instructor(s): S. Upadhyay
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.
AS.230.275. Revolution, Reform and Social Inequality in China.
This course explores various aspects of social inequality in China during the Mao Zedong and the post-Mao reform eras. We will examine inequality within villages, the rural/urban divide, urban inequality, education and health policies, and gender and ethnic inequality. Each of these issue areas will be tackled analytically, but the aim is also to understand what it was/is like to live in China during and after the Mao era. Formerly offered as AS.230.321.
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

This course examines the transnational connections among merchants and migrants in the waters of East and Southeast Asia from a historical and comparative perspective. We will explore how diplomatic ties, long-distance trade and migration contributed to the making of cosmopolitan cities such as Quanzhou (Zayton), Malacca, Fort Zeelandia (Formosa), Batavia, Manila, Singapore and Hong Kong in the region from the tenth century onwards. The course will close with an examination of how the transnational connections are relevant to understand inter-state competition in Asia’s long twentieth century. Key subjects to be introduced include tribute trade system, trading diasporas, Euro-Chinese co-colonialism, pan-Asianism, as well as history and historiography of maritime silk road.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

AS.230.293. Immigration in the United States.
This course examines patterns and consequences of immigration at the national, state, and local level. Special attention will be given to changing racial and ethnic relations in American gateway cities, immigrants’ economic and cultural assimilation, the plight of the second generation, the importance of immigration policy in shaping the experiences of migrant groups, and public opinion on immigration.
Instructor(s): M. Greif
Area: Social and Behavioral Sciences.

AS.230.302. Class Stratification & Personality.
230.302 (S) CLASS, STRATIFICATION, AND PERSONALITY (3) Kohn Limit 30 Juniors/Seniors only or instructor’s consent An intensive examination of the research literature, much of it based on survey research carried out by the instructor and his international collaborators, on the relationships of social class and social stratification with personality. The course will examine the links between people’s positions in the class structure and the stratification hierarchy of their society and their more proximate conditions of life, particularly their job conditions, and how these conditions, in turn, affect (and are affected by) such basic dimensions of personality as intellectual flexibility, self-directedness of orientation, and feelings of well-being or distress. The research has been conducted principally in the United States, Japan, Poland when it was socialist, Poland and Ukraine during their transitions from socialism to nascent capitalism, and (in the instructor’s current research) China during its very different transformation. Cross-listed with Psychological & Brain Sciences
Instructor(s): M. Kohn
Area: Social and Behavioral Sciences.

We will ask: “How do arrangements of tasks, rewards, roles, and opportunities in schools affect student learning, behavior, and sense of attachment?” and “In what ways are social control processes in schools related to the demands and dynamics of other institutions, particularly the family and the labor market?” Before addressing these questions, we will define social organization and social control, and describe the forms (both intended and unintended) they take in schools.
Instructor(s): S. Plank
Area: Social and Behavioral Sciences.

AS.230.309. Segregation & Social Inequality.
This course presents an in-depth study of racial and ethnic residential segregation and its relationship to social inequality. Through various theoretical perspectives, students will explore the history and contemporary patterns of residential segregation in the United States. In doing so, students will learn about the persons, organizations, and social phenomena that contribute to neighborhood segregation, such as homeowner associations, federal and local governments, developers, as well as differences between groups in racial preferences and socioeconomic status. Through lectures, readings, discussions, and films, students will gain insight into the causes of segregation, as well as its social, economic, and demographic consequences. Cross listed with the Center for Africana Studies.
Instructor(s): P. Bennett
Area: Social and Behavioral Sciences.

While students may already be personally familiar with the subject matter, the course examines the sociological and psychological dimensions of this demographically dense period known as the transition to adulthood. Emphasizes life course theories of human development through readings of empirical work on adolescence, the transition to college, early employment and early family formation. Attention is paid to the ways class; gender; race and nationality influence the pathways, choices and outcomes of young people. A Statistics/ Sociology background is helpful, but not required.
Instructor(s): S. Deluca
Area: Social and Behavioral Sciences.

AS.230.312. Education & Society.
This course analyzes educational systems as social institutions and organizations. It gives particular attention to the often taken-for-granted ways that we structure learning in schools and their consequences for social inequality. To these ends, the course will examine classical institutional and organizational theory in sociology and evaluate these theories in their application to historical process of educational formation and the contemporary organization of K-12 schooling in the US.
Instructor(s): J. Burdick-Will
Area: Social and Behavioral Sciences.
Is a neighborhood just a grouping of individuals living in the same place, or do neighborhoods have collective meanings and impacts on children and families? We will capitalize on research methodologies used to define and describe neighborhoods and their effects on economic and educational outcomes. These include case studies, census data, surveys, quasi/experimental data. Focus is on how research measures neighborhood effects and incorporates community level processes into models of social causation (e.g., social capital/control, community efficacy, civic engagement). Also examined: patterns in residential mobility, segregation, and preferences within black and white populations; development of housing policy in the U.S.; programs to determine how neighborhoods affect issues of social importance. Statistics and public policy background is helpful but not required. Instructor(s): S. Deluca
Area: Social and Behavioral Sciences.

AS.230.316. African American Family.
This course is an examination of sociological theories and studies of African-American families and an overview of the major issues confronting African-American family life. The contemporary conditions of black families are explored, as well as the historical events that have influenced the family patterns we currently observe. Special attention will be given to social policies that have evolved as a result of the prominence of any one perspective at a given point in time. Instructor(s): K. McDonald
Area: Social and Behavioral Sciences.

This course surveys sociological theories and research on immigration to the U.S. Theoretical approaches include theories of international migration, economic sociology, immigration, and assimilation. Research topics include the impact of U.S. immigration laws and policies on immigrant inflows and stocks, self-selection of immigrants, the impact of immigration on the native-born population and the U.S. labor market and economy, and the adaptation of the first and second generations. Instructor(s): L. Hao
Area: Social and Behavioral Sciences.

AS.230.318. State and Society in Modern India.
This course examines the complex, at times conflicting, relationship that has emerged between Indian seats of power from above and Indian expressions of society from below. Attention will be placed on the period between 1947 to the present. Instructor(s): R. Agarwala
Area: Social and Behavioral Sciences.

This course provides “hands on” research experience applying sociological research tools and a sociological perspective to problems of substance. Quantitative methods will be emphasized, as applied to census data, survey data and/or archival data. Students will design and carry out a research project and write a research report. Juniors and seniors only. Sophomores require instructor’s permission. Recommended Course Background: AS.230.205, AS.230.202
Instructor(s): J. Burdick-Will
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.230.323. Qualitative Research Practicum.
This course provides “hands on” research experience applying sociological research tools and a sociological perspective to problems of substance. Qualitative observational and/or interviewing methods will be emphasized. Students will design and carry out a research project and write a research report. This course fulfills the “research practicum” requirement for the Sociology major. Instructor(s): K. McDonald
Area: Social and Behavioral Sciences.

AS.230.325. Global Social Change and Development Practicum.
This course provides “hands on” research experience in the field of global social change and development. Students will participate in a collaborative research project analyzing the causes and consequences of the recent upsurge of protest around the world in comparison with previous historical waves of social unrest. The course fulfills the “research practicum” requirement for Sociology majors and is required for the GSCD track.
Prerequisites: Prereq: AS.230.265 and permission of Instructor.
Instructor(s): B. Silver
Area: Social and Behavioral Sciences.

AS.230.332. Race, Racism & Racial Privilege.
This course will examine the concepts of race, racism, racial privilege in contemporary America, and the West in general. Examples from other countries will be integrated as well. Historical contexts such as the colonialism, the Civil War and Reconstruction, the Civil Rights movement, and the post Civil Rights era will help to provide an understanding of the social, political, economic, and cultural forces processes that have constructed and shaped the concepts of race and the racialized subject over time. Instructor(s): K. McDonald
Area: Social and Behavioral Sciences.

This course examines social changes in China since the beginning of the People’s Republic (1949) through the lenses of family, gender and sexuality. The first half of the course focuses on understanding family institutions, women’s status, gender relations and sexualities in connection with major historical transitions between 1949 and the present. The second half includes readings and discussions around several thematic topics regarding family, gender and sexuality in contemporary China in the broader context of politics, economy, and social norms.
Instructor(s): Y. Dong
Area: Social and Behavioral Sciences.

The rising tide of global religious fundamentalism in the last three decades has challenged the basic tenets of all theories of progress, and attracted significant popular and scholarly attention. This course combines theoretical material with comparative analyses of selective case studies to investigate and question the basic dichotomies that underlie our understanding of religious fundamentalism: cultural versus political, Western versus non-Western, modern versus anti-modern, and reactionary versus revolutionary.
Instructor(s): L. Bushra
Area: Social and Behavioral Sciences.
This course introduces students to medical sociology, which is the application of the sociological perspective to health and health care. Major topics include stress, social epidemiology, and the social organization of health care.
Instructor(s): E. Agree
Area: Social and Behavioral Sciences.

AS.230.343. Political Sociology of Latin America.
This course provides an overview of Latin America through its historical, economic, social, and political dimensions. Emphasis will be given to the analysis of social structures: class, race and ethnicity, and the contemporary social movements. The course begins with an overview of the pre-Columbian civilizations and colonial legacies that gave rise to the multiethnic societies and the ethnic conflicts which characterize contemporary Latin America.Cross-listed with Program in Latin American Studies and International Studies (CP)
Instructor(s): M. von der Heydt-Coca
Area: Social and Behavioral Sciences.

This class examines the social and health consequences of systemic transformations in China, including collapse of the urban work-unit system, resurgence of infectious disease, and implementation of the One-Child Policy. Dean’s Teaching Fellowship; Cross listed with East Asian Studies, Public Health and International Studies.
Instructor(s): R. Core
Area: Social and Behavioral Sciences.

This course will offer an overview of Latin America’s economic reality as an intertwined process of economic and political domestic factors within the constraints of the world economy. Latin American development will be analyzed from a historical perspective. The first half of the semester will focus on the analysis of the economic developmental patterns starting in the middle of the 19thcentury to the populist era in the middle of the 20thcentury. In the second half of the semester, we will analyze in depth the contemporary neoliberal approach to development. Globalization is the force that drives economic, social and political processes in Latin America. The course will include case studies as well the social conflicts generated by the increasing polarization of the society. Students will be exposed to important sociological theories.
Instructor(s): M. von der Heydt-Coca
Area: Social and Behavioral Sciences.

AS.230.347. Quantitative Data Management with SAS.
This course provides an introduction to SAS, one of the most popular statistical programming packages in social research, economics, public health, and business. Topics to be covered include importing data, recoding variables, conditional processing, merging datasets, and producing descriptive statistics. Students must have a lap-top computer and purchase a student version of SAS through JHU IT.
Instructor(s): D. Thompson
Area: Quantitative and Mathematical Sciences.

A Community Based Learning (CBL) course organized through the Center for Social Concern, we will collaborate with Housing Our Neighbors (HON) http://www.honbaltimore.org, a local organization comprised of people experiencing homelessness, allies and advocates promoting the human right to housing to examine and engage the vacant housing crisis in Baltimore. Students will be expected to participate in organizing and community sessions as well as ongoing research into the Baltimore vacant property market and ultimately seek to transform housing into a right for all people.
Instructor(s): D. Pasciuti
Area: Social and Behavioral Sciences.

This course is a survey of contemporary social movements in sub-Saharan Africa. The course will begin with an introduction to social movement theory. Subsequent weeks will each focus on a different type of movement (e.g. independence movements, labor movements, women’s movements, environmental movements, etc.) The limited coverage of African issues in the US media tends to focus on either catastrophes or on development projects that are driven by international NGOs and the governments of northern countries. Through this course, students will gain a clear understanding of the broad range of actions that African civil society is using to address social problems throughout the continent. Materials used will include academic analysis of movements, writings by movement participants themselves, and films. The course will also introduce students to the most widely used social movement theories. Because these theories have been largely developed by social scientists in northern countries, the students will be asked to assess their applicability to African movements. Through this critical application of social theory, students will investigate the specific possibilities and constraints facing social and political actors in contemporary Africa. Cross listed with Dean’s Teaching Fellowship, International Studies (CP) and Africana Studies.
Instructor(s): B. Scully
Area: Social and Behavioral Sciences.

AS.230.357. Baltimore as an Urban Laboratory.
This course uses the city of Baltimore as a lens through which to explore issues of urban inequality. We will focus on Baltimore’s history of racial segregation and concentrated poverty, and its effect on the social and economic well-being of the city and its residents, with attention to education, employment, health and crime. Students will learn how to employ Census data, GIS approaches, and sociological research to inform questions about population change, inequality and the distribution of resources across the city and metropolitan region. Students will also work on one or more policy relevant studies based in Baltimore, including: a project on abandoned and vacant housing, a desegregation intervention, and a longitudinal study of inner city youth. Finally, students will become familiar with Baltimore City’s programs and policy approaches to addressing the city’s most pressing problems, and will design innovative and effective and innovative solutions as part of their course assignments. Enrollment restricted to Social Policy minors only.
Prerequisites: Students that took AS.360.357 may not take AS.230.357
Instructor(s): S. Deluca
Area: Social and Behavioral Sciences.
This research seminar will be run as a collective research working group in which we will carry-out a research project on the waves of social unrest around the world from the 19th century to present. The research project seeks to shed light on the recent (post-2008) global upsurge of labor and social unrest -- from the Arab Spring to Occupy Wall Street, from the anti-austerity movements roiling Europe to the wave of workers’ protests taking place in China (including the factories where Ipods, Ipads and Iphones are assembled) -- by comparing it with analogous historical periods since the early nineteenth century. We will document the spread and characteristics of this global wave as well as exploring its causes and consequences. The course will be devoted to the (i) theoretical discussions about major historical waves of social protest and labor unrest in the world, (ii) methodological discussions regarding data collection procedures using digital archives of historical newspapers (including reliability studies), (iii) data-coding, and (iv) substantive analysis of major waves of social protest. This course is suitable for students who are interested in deepening their understanding of the dynamics of global social protest as well as in deepening their experience with hands-on research on a topic of contemporary social and political relevance.
Prerequisites: AS.230.265 OR AS.230.325 OR permission of the instructor.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences.

AS.230.361. Class and Culture.
This course examines the intersection of social class and culture—both the popular culture of movies, TV, music, etc, and “culture” in the anthropological sense as the shared way of life of a people. The course is divided into three main sections: 1) concepts of class, culture and the ways in which they interact; 2) cultures of each major class within American society, beginning with the “Old” and “New Money” classes, the “New Class” of intelligentsia, the much-invoked Middle Classes, the shrinking Working Class, and continuing through the poverty-stricken Lower Classes; 3) issues of cultural consumption and production and their role in reproducing the class structure.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences.

This course focuses on the relationship between international migration and development. The course first introduces theories of international migration, immigrant integration, and international development. Building on this foundation, we then examine how immigrants interact with their homeland and how sending country governments tap their diaspora to improve development outcomes. Cross-listed with International Studies (CP, IR). Fulfills Economics requirement for IS GSCD track students only.
Instructor(s): L. Hao; R. Agarwala
Area: Social and Behavioral Sciences.

The “grabbing” of land and natural resources has, in recent years, generated widespread political conflict across the Global South and put dispossession on the agenda of academics and policy-makers. Nevertheless, compared to other social relations—such as labor exploitation—dispossession has not been central to social scientific understandings of capitalism, the state, “development,” or politics. In this class, we will collectively explore the nascent field that we might call the sociology of dispossession. We will begin with existing theoretical approaches to the problem, and then proceed to challenge, reconstrcut or supplant those theories as we consider a wide range of historical examples of dispossession—including the English enclosures, colonial plunder, large dams, mining, water privatization, Special Economic Zones, transnational agricultural investments, conservation projects, and climate-induced displacement. Students will write weekly reading responses and a final paper.
Instructor(s): M. Levien
Area: Social and Behavioral Sciences.

This course provides a framework for understanding and analyzing different forms of ethnic violence including ethnic riots, ethnic wars, and genocides around the world. Beginning with foundational texts on defining ethnic groups, we will examine causes and dynamics of ethnic mobilization and violence from different disciplines and perspectives. Throughout the course, we will explore texts that treat key themes in studies of ethnic violence including globalization, economic development, inequality, dismantling of the developmental state, migration, state formation and failure, conflict resolution, and democratization; focusing on various cases of ethnic violence in different regions including Eastern Europe, Basque Region, Turkey, Sudan, India, Sri Lanka, China, and historical cases like Northern Ireland. Fulfills Non-Western History (NWHIST) requirement for IS GSCD students only.
Instructor(s): S. Kumral
Area: Social and Behavioral Sciences.

This course offers a broad survey of urban development in the United States by examining both the intended and unintended consequences of urban planning. Using a comparative-historical framework, issues of power, conflict, representation, participation, and planning within urban development and the American city will be addressed and critiqued with specific reference to Baltimore. Cross listed with International Studies (AP). Fulfills History requirement for IS GSCD track students only.
Instructor(s): D. Pasciuti
Area: Social and Behavioral Sciences.
AS.230.367. Islamic Finance.
Today, Islamic finance is a global industry comprising nearly $2 trillion in assets, with hubs from Kuala Lumpur to Dubai to London. But half a century ago, nothing called “Islamic finance” existed. So where did Islamic finance come from? Why is it growing so fast? And what does it mean for finance to be Islamic? We discuss the ban on riba in the Quran and hadith, finance in early and medieval Islamic societies, petrodollars and the birth of Islamic banking in the 1970s, the rise of Islamic capital markets since 2000, contemporary shariah-compliant financial structures, and the constitution of piety through financial practice.
Instructor(s): R. Calder
Area: Social and Behavioral Sciences.

AS.230.369. Sociology in Economic Life.
This course discusses how geopolitics, technology as well as social differentiation (such as race, class and gender) shape the structure of economic actions. Special attention will be paid to patterns of state-business relationship, labor processes, migrant economy, globalization and international division of labor.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

AS.230.371. Sociology of Rock. 3 Credits.
This course examines the history and dynamics of rock music using key concepts and perspectives from sociology. The course is divided into four sections, each of which examines the phenomenon of rock music from a different analytical perspective. The first section on the origins of rock looks at the confluence of developments in post-war America, especially in terms of race, class and generational change, which produced this new musical form. The second section, “Rock as Cultural Production,” looks at all aspects of the rock “field,” not just artists and audiences but record labels, stores, DJ’s and radio stations, the music press and journalists, performance venues. The third section examines rock as a force for social change and protest from the 1960s until present, and the final section examines the performative aspects of rock as a kind of “interaction ritual” with its own microsociological dynamics.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences
Writing Intensive.

This class introduces popular resistance in post-1978 China, examining its socioeconomic, political, and cultural background, various types of protests by multiple social groups, and outcomes of protests. Cross listed with Dean’s Teaching Fellowship.
Instructor(s): Y. Li
Area: Social and Behavioral Sciences.

AS.230.373. Urban Sociology.
This course will explore the growth and development of urban areas, and how cities create, influence, and perpetuate social and economic inequalities. It will explore how the community environment shapes social interactions, identities, and attitudes. Specific topics will include urban poverty, residential segregation, housing, crime, and health.
Instructor(s): M. Greif
Area: Social and Behavioral Sciences.

AS.230.374. Poverty and Public Policy.
This course examines the causes and consequences of U.S. urban poverty, its implications for health and wellbeing, and explores strategies for addressing it. We cover the major theoretical explanations scholars have advanced to explain the persistence of urban poverty including labor markets, residential segregation, welfare policy, family structure, and the criminal justice system. Within each topic area, students are introduced to a range of interventions aimed at alleviating urban poverty. Students will conduct a formal policy analysis of 20 pages and participate in a mock congressional hearing. Enrollment restricted to Social Policy minors only.
Prerequisites: Students that took AS.360.372 may not take AS.230.374.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.

AS.230.375. Nations, States, and Boundaries.
This course explores the historical origins and development of the modern global political order based on sovereign nation-states, the crisis of this order through the twentieth century, as well as the unraveling of this order at the turn of the twenty-first century. We will focus on how dominant political organizations in the changing world order (such as states, political parties, and transnational governing bodies) have been shaped by different social forces (such as classes and ethnic groups) and vice versa. Topics covered include rise and fall of modern nationalism, formation of regional and global governing structures, “civilizational” turn of global politics, waves of separatism and redrawing of nation’s boundaries after the Cold War, politics of immigration and citizenship, among others.
Instructor(s): H. Hung
Area: Social and Behavioral Sciences.

This course addresses two primary questions: What social elements influence the varieties of religious belief, organization and action? What are the consequences of these forms of religious expression for both individuals and for society? In addition to readings and exams, students will also attend two different religious services over the course of the semester.
Instructor(s): T. Nelson
Area: Social and Behavioral Sciences.

This seminar examines the theories and historiography of colonialism and anti-colonial movements. It focuses on the establishment of the colonial division of labor, comparative colonialism, identity formation, and nationalism as well as anti-colonial movement.
Instructor(s): H. Kuo
Area: Social and Behavioral Sciences.

Seminar for Sociology students writing senior honors theses and conducting pre-approved independent research projects. Sociology majors only. Permission of instructor.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.
This course examines the causes and consequences of U.S. poverty and explores strategies for addressing it, with some comparisons to other rich nations. We cover the major theoretical explanations scholars have advanced to explain the persistence of poverty and inequality including labor markets, residential segregation, welfare policy, family structure, and the criminal justice system. Within each topic area, students are introduced to contemporary policy approaches aimed at alleviating poverty, and evaluations of these approaches.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.

AS.230.381. Sociology of the Middle East and North Africa.
This course takes a sociological approach to the contemporary Middle East and North Africa. Topics include urbanization and demographic change; rentier welfare states and the global political economy of oil; women in higher education and the labor force; the 2011 Arab Spring; conflict in Syria, Libya, and Yemen; Amazigh (Berber) identity in northwest Africa; Israel-Palestine; “Dubai, Inc.” and the sociology of migrant labor; neoliberal Islamic politics in Turkey; cinema and everyday life in Iran; conservative monarchy in Morocco and Saudi Arabia; and the role of the United States in the MENA region. Students will give presentations, write memos, and submit two papers. One aim of the course is to turn students into clear, polished academic writers and thinkers.
Instructor(s): R. Calder
Area: Social and Behavioral Sciences.

This course will join an existing survey of the Housing Court in Baltimore City by the Public Justice Center (PJC) of Maryland to examine the role and process of evictions in the Baltimore civil litigation system. The course will examine the history of housing in Baltimore and the changing role of the courts in housing rights and law from the mid-20th century to the present. Working with the PJC’s Human Right to Housing Project, students will be expected to participate in the survey collection process by attending Rent Court and participating in the data collection process, followed by cleaning and analysis of the data. Counts as American Politics/Sociology of the United States for GSCD Track.
Prerequisites: AS.230.205 AND AS.230.265 or permission of instructor
Instructor(s): D. Pasciuti
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.230.384. Global Urbanism: Planet of Slums or World Cities?.
Cities are at the forefront of a range of global governance challenges. This course will address the relationship between development and the political and economic structure of the world economy in the built environment of the city. By drawing upon both classical texts about cities (do they still work for us, what can they account for) and on a diverse literature on cities and slums, we will focus our attention to the contemporary challenges faced in cities both in the more developed and in the developing world. Through a variety of disciplinary perspectives we will try to understand the underlying social and economic changes and the profound transformations under way throughout the global urban world. Fulfills IR or CP requirement for International Studies students and Political Sociology (IR or CP) for GSCD track. (Formerly AS.191.349)
Instructor(s): D. Pasciuti
Area: Social and Behavioral Sciences.

AS.230.385. Schooling, Racial Inequality and Public Policy in America.
After examining alternative explanations for why individuals obtain different amounts and types of educational training, the course focuses on how an individual’s family background and race affect his or her trajectory through the educational system. The course covers the specific challenges that have confronted urban schooling in America since the 1960s, including the classic literature on the effects of school and community resources on student achievement as well as the development and later evaluation of school desegregation policies. The course also considers case studies of current policy debates in the US, such as housing segregation and school resegregation, voucher programs for school choice, and the motivation for and consequences of the establishment of state-mandated testing requirements. Throughout the course, emphasis is placed upon the alternative modes of inquiry and writing which opposing scholars, policymakers, and journalists use to address these contentious topics.
Instructor(s): A. Cherlin
Area: Social and Behavioral Sciences.

Sociological perspectives on contemporary family life, including marriage and divorce, cohabitation, single parenthood, same sex partnerships, children’s wellbeing, balancing work and family responsibilities, domestic violence, and government policy toward families.
Instructor(s): S. Morgan
Area: Social and Behavioral Sciences.

AS.230.391. Theories of International Development.
This course will cover major theoretical approaches to the study of development. We will begin with foundational political economic texts (including those of Adam Smith, Karl Marx, and Karl Polanyi). After setting the historical context of decolonization, we will then proceed to cover major theoretical approaches to the study of development in the past sixty years, including: modernization theory, dependency and world systems analysis, state-centered approaches, neo-institutionalism, the capabilities approach, political-economy, post-development, feminism, the Washington consensus, social capital, experimental economics, and contemporary sociological reconstructions of Marx, Smith and Polanyi. Cross listed with International Studies (IR); fulfills IS Economics requirement for GSCD track students only.
Instructor(s): M. Levien
Area: Social and Behavioral Sciences.
AS.230.395. Contemporary Social Theory.
This course will examine how major social theorists of the 20th century advanced upon the “classical” social theories of Marx, Weber, and Durkheim. As they grappled with the historical events and social concerns of the 20th century—the Russian revolution and its degeneration into Stalinism, the failure of communist movements in the West, the rise and fall of fascism and Nazism, the consolidation of capitalist democracies and welfare states, the emergence of anti-colonial movements in the “Third World,” and the persistence of race, gender and sexuality as forms of domination—social theorists provided novel answers to classical questions of social theory: 1) what is the structure of modern society, how does it change, and how is it reproduced?; 2) what is the relation between social structures and ideas, knowledge, and subjectivity?; and 3) what are the conditions of possibility for human freedom? Theorists to be covered include Antonio Gramsci, W.E.B. Du Bois, Georg Lukacs, Talcott Parsons, Herbert Marcuse, Jurgen Habermas, Louis Althusser, Pierre Bourdieu, Michel Foucault, Nancy Fraser, Patricia Hill Collins, Judith Butler, and Henri Lefebvre. In addition to understanding and comparing the theories, we will try to use them to understand contemporary societies.
Instructor(s): M. Levien
Area: Social and Behavioral Sciences.

This seminar surveys texts that treat key problems of political sociology including the rise of the modern state, the relationship between political and economic power, the origins and nature of liberal democracy, the nation-state and nationalism, states and war, states and welfare, sources of authority, ideology and political contention, social movements, and social revolutions. Fulfills Comparative Politics for International Studies.
Prerequisites: AS.230.213
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

This course reviews the evolution of the literature on economic development over the past half-century and evaluates its strengths and weaknesses in light of developmental experiences in Africa, Asia and Latin America. Course lectures are by Dr. Brian Van Arkadie, an economist with decades of experience in the international development field including as a consultant for the World Bank, the United Nations Development Program and to numerous governments ranging from Tanzania and Uganda to Egypt and Vietnam.
Instructor(s): B. Silver; B. Van Arkadie
Area: Social and Behavioral Sciences.

Research-oriented course on the dynamics of labor and social movements from global and comparative-historical perspective.
Prerequisites: AS.230.265 AND AS.230.325
Instructor(s): S. Karatasli
Area: Social and Behavioral Sciences.

In this course we will examine contemporary Chinese society, looking at economic development, rural transformation, urbanization and migration, labor relations, changes in class structure and family organization, health care, environmental problems, governance, and popular protest. The course is designed for both graduate and undergraduate students. Undergraduates must have already completed a course about China at Hopkins. Cross-listed with East Asian Studies.
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

AS.230.435. The China Boom.
This course addresses the origins, global impacts, and demise of China’s economic ascendency as a world economic and political powerhouse at the turn of the twenty-first century. The course will cover the historical origins of the China boom and impacts of the boom on global political economic order. It will also address the social-political imbalances within China that contribute to the global financial crisis and recent slowdown of the Chinese economy. Particular topics include late imperial and Maoist legacies’ relation to contemporary economic growth, stages of China’s capitalist development, China’s outward investment in the developing world, formation and limits of US-China economic symbiosis, and China’s participation in global governance, among others.
Instructor(s): H. Hung
Area: Social and Behavioral Sciences.

This course examines stratification in the modern world economy from the 16th century to today, covering classical and contemporary theoretical perspectives and empirical studies on the hierarchical structure of the capitalist world economy (including Baranko Milanovic, Thomas Piketty, Andre Gunder Frank, Giovanni Arrighi, Christopher Chase-Dunn, P. Korzeniewicz and T. Moran, W. W. Rostow). Students will be expected to recreate and extend these empirical studies and engage in a quantitative discussion of theories of global inequality and development. In doing so, we will discuss how methodological choices, research designs, choice of indicators and inequality measures affect the outcomes and conclusions of this research. Using this theoretical and empirical background, the course will engage key questions on the contemporary and historical conditions of world inequality such as, has world income inequality been increasing or decreasing over time? Do we see stability or change in the hierarchical structure of the capitalist world economy? What are the consequences for contemporary rise of China and recent global financial meltdown for world income inequality? What will stratification in the world economy look like in the 21st century? Counts as IR/Global Sociology or Economics/Economic Sociology for GSCD Track.
Prerequisites: AS.230.150 AND AS.230.265 or permission of instructor
Instructor(s): D. Pasciuti; S. Karatasli
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.230.508. Internship.
Instructor(s): A. Cherlin; H. Hung; L. Hao; M. Levien; S. Morgan.

AS.230.509. Independent Study.
Instructor(s): P. Bennett.

AS.230.570. Internship-Intersession.

Instructor(s): A. Cherlin; K. McDonald.

AS.230.599. Independent Study.
Instructor(s): Staff.

AS.230.600. Introduction to Social Statistics.
This course will introduce students to the application of statistical techniques commonly used in sociological analysis. Topics include measures of central tendency and dispersion, probability theory, confidence intervals, chi-square, anova, and regression analysis. Hands-on computer experience with statistical software and analysis of data from various fields of social research.
Instructor(s): D. Pasciuti
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

AS.230.602. Theories of Society.
Intensive readings from classical theorists (including Marx, Weber, and Durkheim) form the core of this course. Emphasis is placed on exploring the utility of social theory for formulating important sociological questions and conceptualizing social research.
Instructor(s): J. Andreas.

AS.230.603. Contemporary Social Theory.
This course will explore several important traditions in contemporary social theory, including structural-functionalism, micro-interactionism, exchange and rational choice, post-structuralism, discourse and narrative analysis, and efforts by recent theorists to extend, synthesize, supplement, and revise Marx and Weber’s explanations of inequality, group conflict, and macro-level social change, including world systems analysis.
Instructor(s): M. Levien.

A seminar in multiple regression (least squares and alternative estimation procedures) with a focus on sociological problems and software applications. Extensions to hierarchical linear models will be included. Graduate students should have completed AS.230.600 or the equivalent. Undergraduates only admitted with instructor's permission, and AS.230.205 or equivalent. Recommended Course Background: AS.230.205, AS.230.600 or equivalent.
Instructor(s): J. Burdick-Will.

AS.230.605. Categorical Data Analysis.
This course provides the students with a set of statistical tools to understand and interpret social science research dealing with categorical dependent variables and to prepare students to apply these models in their own research. The models covered in the course include logit, probit, Poisson, and log-linear models, as well as multi-level models of categorical dependent variables.
Instructor(s): L. Hao
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

This is an intensive reading seminar on working class formation from a comparative, historical and global perspective, including theoretical and empirical (case study) readings on changes over time in labor process, labor markets, and labor movements. We will build on a range of local case studies to establish spatial and temporal patterns, and discuss the connections between these global patterns and the dynamics of historical capitalism.
Instructor(s): B. Silver.

AS.230.608. Proseminar In Sociology.
Individual one-hour presentations by faculty members will introduce students to the faculty’s substantive interests and research styles.
Instructor(s): B. Silver.

Advanced seminar for PhD students who are preparing their dissertation proposals or writing their dissertations. Sociology graduate students only.
Instructor(s): L. Hao.

AS.230.611. World-Historical Sociology.
In this seminar we will read key texts in comparative sociology. The topics covered are cross-national sociology, comparative national development, comparing world-systems, the modern world-system, globalization, and social movements.
Instructor(s): H. Hung.

AS.230.612. Seminar on Social Inequality.
This seminar attempts a broad survey of sociological theorizing and research on social stratification and the role of social institutions in generating and mitigating inequality.
Instructor(s): K. Edin; S. Deluca.

A discussion-oriented seminar focused on major recent writings on the family, in both the developed and developing nations.
Instructor(s): A. Cherlin.

Instructor(s): A. Cherlin.

AS.230.616. Researching Race, Class, & Gender.
This advanced graduate seminar is designed to help graduate students sort out whether they are headed for careers as race, gender, or class specialists. We will review major sociological work in these sub-fields and work to determine what common elements of these publications makes them a stand out in the discipline. Then students will be asked to craft projects of their own.
Instructor(s): K. McDonald.

In-depth reading and discussion of theories and research on immigration to the U.S. theoretical issues include international migration, immigration, and assimilation. Research topics include: the impact of U.S. immigration laws on immigrant inflows and stocks, self-selection of immigrants, the impact of immigration on the native-born population, and the adaptation of the first and second generations. The course focuses on immigration since 1965 and its related controversies and debates.
Instructor(s): L. Hao.
AS.230.623. Causal Inference. This course introduces strategies for estimating causal effects from a counterfactual perspective, uniting the potential outcome model with causal graph methodology. After an examination of the primary features of the counterfactual perspective and criteria for causal effect identification, the course will consider data analysis techniques such as matching, regression from a potential outcome perspective, inverse probability of treatment weighting, instrumental variable estimators of local average treatment effects, and estimation via exhaustive mechanisms. Instructor(s): S. Morgan.

AS.230.624. Educational Inequality and Social Context. This course engages students in the study of educational inequality through in depth readings on poverty, culture, the family, neighborhoods and public policy. Instructor(s): S. Deluca.

AS.230.625. Seminar on International Development. This seminar offers a graduate level introduction to the theoretically guided study of national development. The first part of the course analyzes the development theories that dominated the first four decades of the development effort. The second half of the course examines more recent perspectives that have attempted to fill the intellectual void left by the demise of the development paradigm. Throughout the seminar, discussions and readings will focus on the intellectual history of the development theories. What are the relevant questions to ask and what are the appropriate units of analysis for the study of social and political change? What forces have propelled transformations across the world? What explanatory power do the theories hold for our future? Instructor(s): R. Agarwala.

AS.230.633. 21st Century Capitalism. TBD Instructor(s): B. Silver; C. Nealon.

AS.230.634. 21st Century Capitalism II. Permission of instructor required. Instructor(s): B. Silver; C. Nealon.

AS.230.635. PGSC Research Seminar. Working seminar focusing on new research in the field of comparative and world-historical sociology. Sociology graduate students or permission of instructor. Instructor(s): R. Calder.

AS.230.636. Research Designs for Causal Inference and Mixed Methods. This course is designed to help students think critically, theoretically, and empirically about issues in design of sociological research that aims to answer causal questions and incorporate mixed methods approaches. Specifically, we will focus on: 1) Understanding causal inference and the objectives of social science; 2) Learning the types of validity in research designs; 3) Becoming familiar with the elements of experimental research design, such as treatment, observation and assignment; 4) Comparing and contrasting experimental and quasi-experimental designs and their applications for the study of social processes and social problems; 5) Understanding designs that employ mixed methods to answer questions of social and policy importance. The course will give a general overview of the challenges of causal inference, but we will focus on research in a few specific areas, such as education and urban sociology, for the sake of consistent, coherent examples. Sociology/Statistics background is helpful, but not required. Instructor(s): S. Deluca.

AS.230.638. 21st Century Capitalism IV. Instructor(s): B. Silver; C. Nealon.

AS.230.640. Field Methods for Studying Urban Poverty. This course is designed to help students understand the important theoretical and empirical considerations required to design, collect and analyze sociological data in urban settings. Emphasis will be given to the practical aspects of fieldwork and data collection, as well as the benefits and challenges of mixed methods research designs. The significance of research for public policy will also be highlighted. The workload for each semester will vary, usually tackling one or more of the following aspects of conducting research in urban settings: moving from theoretical puzzles to research questions; designing interview guides; designing human subjects/IRB protocols; preparing logistics for fieldwork; interview training; actual interviewing in the field; writing field notes; analyzing data from interviews; writing papers from qualitative data; blending GIS, qualitative and quantitative data to answer questions. Admission is granted by permission from instructor only. Instructor(s): S. Deluca.

AS.230.641. Urban Youth and Inequality. Popular television shows and news media cast stark images of urban youth that range widely from notorious “corner boys” and controversial teen moms, to the celebrated examples of those writers, athletes and artists who beat the impossible odds of their backgrounds. This course takes a more systematic look at this population, with a sociological focus on the demography and social processes that characterize the transition to adulthood for disadvantaged youth growing up in America’s cities. We will also examine the role of family, neighborhood, schools and peers in affecting the transition from high school to work and college, early family formation, and participation in risky behavior. Previous and contemporary policy approaches to addressing inequality among these young adults will also be explored. Instructor(s): S. Deluca.

AS.230.642. Advanced Topics in Education Research. Instructor(s): S. Plank.

AS.230.643. Sociological Analysis. An intensive analysis of a wide range of sociological studies, designed to acquaint the student with how sociologists deal with important theoretical issues, using a variety of methods and sources of data. Particular attention will be paid to the logical coherence of the studies and to the fit between data and interpretation. Instructor(s): H. Hung Area: Social and Behavioral Sciences.

AS.230.645. PSI Research Seminar. Seminar focusing on new research in the study of social inequality, with an emphasis on education, neighborhoods, race, family dynamics, health and social policy. Sociology graduate students or permission of instructor. Instructor(s): S. Deluca.
AS.230.647. Agrarian Change.
This course will explore questions related to historical and contemporary trajectories of agrarian change. It begins with classical theoretical debates on the distinctiveness of peasants and their prospects under capitalism. It will then turn to major themes of agrarian change in the twentieth century: modes of production, class polarization and differentiation, peasant wars, moral economies, everyday resistance, collectivization and decollectivization, food regimes, and depeasanization. It will conclude with new themes in agrarian change, with a particular emphasis on contemporary forms of land dispossession and repossession. The course will be structured as a reading-intensive research seminar.
Instructor(s): M. Levien.

AS.230.649. Qualitative Research Methods: Domestic and International Fieldwork.
This course discusses the conceptualization of qualitative research involving fieldwork, and the collecting, analyzing, and reporting of sociological field data in both domestic and international settings. Data collection techniques such as intensive interviewing, participant-observation, document analysis, and ethnography are included. The course also covers the logic of qualitative inquiry, choosing research sites and cases, engaging archival sources, judging the validity and reliability of data, and software-based data analysis.
Instructor(s): K. McDonald; R. Pasciuti
Area: Social and Behavioral Sciences.

AS.230.650. Macro-Comparative Research.
The course examines methods of studying long-term, large-scale social change. Both qualitative and quantitative methods are covered.
Instructor(s): B. Silver.

AS.230.651. Political Sociology.
This seminar surveys key problems of political sociology including the rise of the modern state, the origins and nature of liberal democracy, the relationship between political and economic power, the nation-state model and nationalism, ideology and political contention, collective identity, and collective action.
Instructor(s): J. Andreas
Area: Social and Behavioral Sciences.

This course presents an in-depth study of racial and ethnic residential segregation and its relationship to social inequality. Through various theoretical perspectives, students will explore the history and contemporary patterns of residential segregation in the United States. In doing so, students will learn about the persons, organizations, and social phenomena that contribute to neighborhood segregation, such as homeowner associations, federal and local governments, developers, as well as differences between groups in racial preferences and socioeconomic status. Through both classics in urban sociology and contemporary works, students will gain insight into the causes of segregation, as well as its social, economic, and demographic consequences.
Instructor(s): P. Bennett.

AS.230.685. TRP PROPOSAL SEMINAR.
This seminar includes all members of the second year cohort of sociology graduate students. Class meetings will provide feedback and guidance as students develop proposals for their Trial Research Papers. The course will also include a series of professional developments seminars. For Sociology PhD students only.
Instructor(s): A. Cherlin.

AS.230.690. TRP PRESENTATION SEMINAR.
This seminar includes all members of the third year cohort of sociology graduate students. Class meetings will provide feedback and guidance as students revise the final drafts of their Trial Research Papers. For Sociology PhD students only.
Instructor(s): A. Cherlin.

This course is for graduate students in the PhD program in Sociology to obtain graduate credit for work off campus that provides training and the development of skills in teaching and/or research. Before the practicum is begun, the graduate student must identify a sponsoring faculty member or seek permission from the student's faculty advisor. The faculty member or adviser must sign a form that certifies that graduate credit will be granted, verifies the nature of the work to be performed by the student and explains how the practicum helps to fulfill the degree requirement. Once completed, the sponsoring faculty member or adviser submits a grade of pass or fail for the student. This course may be used for Curricular Practical Training (CPT).
Instructor(s): Staff.

Cross Listed Courses
Political Science
AS.190.653. Organizations.
Graduate students only. “Organizations are the fundamental building blocks of economic, social and political life. This course will examine how different disciplines (sociology, economics, political science) approach the problem of explaining how organizations operate, as well as exploring the structure and development of a very wide range of organizations (firms, interest groups, charitable foundations, universities, militaries, bureaucracies, international organizations, and professions).
Instructor(s): S. Teles
Area: Social and Behavioral Sciences.

This class explores the relationship between two central concepts of International Relations: violence and world order. Some broad questions we will attempt to answer include: What is the role of violence in maintaining or producing certain world orders, both contemporary and historical? How do blatant and more hidden forms of violence work together to foreclose certain possibilities for social, political, and economic existence? How do different logics of violence produce hierarchies of gender, race, citizenship and class? What violence pasts and/or presents are concealed by contemporary ways of thinking about world order? We will explore diverse literatures from International Relations and political theory that addresses these questions. Readings will include contemporary work from International Relations theory as well as Franz Fanon, Michel Foucault, Judith Butler, Achille Mbembe and others. Assignments will include several analytic essays. Cross-listed with Sociology.
Instructor(s): L. Wilcox
Area: Social and Behavioral Sciences.

AS.191.349. Global Urbanism: Planet of Slums or World Cities.
This course will address the relationship between development and the political and economic structure of the world economy in the built environment of the city. By drawing upon both classical texts about cities (do they still work for us, what can they account for) and on a diverse literature on cities and slums, we will focus our attention to the contemporary challenges faced in cities both in the more developed and in the developing world. Through a variety of disciplinary perspectives we will try to understand the underlying social and economic changes and the profound transformations under way throughout the global urban world.
Instructor(s): D. Pasciuti.

Public Policy
AS.195.477. Intro To Urban Policy.
Perm. Req’d. 195.477 & 195.478 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Area: Social and Behavioral Sciences.

195.478 & 195.477 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman.

East Asian Studies
AS.310.204. Rural Development in Asia.
We will examine the transformation of the Asian countryside from the beginning of the twentieth century up until the present by looking at agrarian structure, economic and social development, collectivization and decollectivization, rural industrialization, agribusiness, sustainable agriculture, and rural unrest. Course materials combine theoretical readings with empirical case studies. While theoretical readings examine global processes involving Asia and elsewhere, case studies cover several Asian countries, with an emphasis on China and India.
Instructor(s): B. Gurel
Area: Humanities, Social and Behavioral Sciences.
A dramatic rise of popular protests in China today has spurred lively discussions about the causes, dynamics, and impact of these protests. This course will provide students with an opportunity to understand these issues by discussing the social, institutional and cultural background of protests, major forms of protest, social groups involved, government responses, and social implications of various kinds of protests. The first part of the course will explore significant socio-economic changes since 1978 and the effects of these changes on China’s social structure and stratification. This part will also examine changes in governance and political systems in the reform era and review important theories of contentious politics. The second part will examine protests by distinct social groups, including peasants, workers, homeowners, and ethnic minority groups, pro-democratic activists, among others. This part will identify similarities and differences in the demands and actions of different groups, introduce the major forms of popular resistance, and explore how the state deals with them accordingly. The course will conclude with discussion of the outcomes of social protests in China and make a cross-national comparison between protests in China and other authoritarian states. By taking China as an example, this course will enhance students’ knowledge about forms of popular contention and government responses in an authoritarian regime as well as help students develop analytical and critical thinking skills with regard to contentious politics.
Instructor(s): Y. Li
Area: Social and Behavioral Sciences.

Interdepartmental
This course will introduce students to basic concepts in economics, political science and sociology relevant to the study of social problems and the programs designed to remedy them. It will address the many inequalities in access to education and health care, unequal treatment in the criminal justice system, disparities in income and wealth, and differential access to political power. The focus will be on designing effective policies at the national and local level to address these pressing issues. This course is open to all students, but will be required for the new Social Policy Minor. The course is also recommended for students who are interested in law school, medical school, programs in public health, and graduate school in related social science fields. Cross list with Sociology, Economics and Political Science. Freshman, Sophomore and Juniors only.
Instructor(s): B. Morgan; D. Schlozman; K. Edin
Area: Social and Behavioral Sciences.

AS.360.372. Poverty and Public Policy.
This course examines the causes and consequences of U.S. urban poverty, its implications for health and wellbeing, and explores strategies for addressing it. We cover the major theoretical explanations scholars have advanced to explain the persistence of urban poverty including labor markets, residential segregation, welfare policy, family structure, and the criminal justice system. Within each topic area, students are introduced to a range of interventions aimed at alleviating urban poverty. Students will conduct a formal policy analysis of 20 pages and participate in a mock congressional hearing. Permission of instructor required.
Instructor(s): K. Edin
Area: Social and Behavioral Sciences.

This course analyzes the distinctive US welfare state in historical and comparative perspective. We begin with a survey of the policy context, an historical overview from the poorhouses through the Great Society, and a tour of welfare states across the rich democracies. We then survey developments – and explain the actual workings of policy – across jobs, education, welfare, pensions, and health care. We explore the institutional and political factors behind their divergent trajectories through conservative revival and the age of Obama. Students will write a seminar paper exploring policy development over time in a program or area of their choosing. Enrollment restricted to Social Policy minors only.
Instructor(s): D. Schlozman
Area: Social and Behavioral Sciences.

This course is designed for students who have completed either the Baltimore or Washington intensive semesters of the Social Policy Minor. The students will make presentations and pursue joint projects based on what they have learned during the intensive semesters concerning key social policy issues.
Instructor(s): A. Cherlin
Area: Social and Behavioral Sciences.

Program in Latin American Studies
The course examines a new wave of development theories and projects that have emerged in Latin America in response to changes such as the empowerment of indigenous movements, the rise of China, the contestation of U.S. hegemony and the current global crisis. Theoretical questions are examined in light of real case studies and reports from the United Nations. Cross-listed with Sociology
Instructor(s): F. Filomeno
Area: Humanities, Social and Behavioral Sciences.

Center for Africana Studies
AS.362.111. Introduction to Africana Studies.
Introduction to Africana Studies is designed to introduce you to the core concepts, theories, and thinkers of the black diaspora by means of a “keyword” approach. Each week we will focus on one keyword and the way it both shapes and is shaped by the African diaspora from the Trans-Atlantic Slave Trade to the middle of the twentieth century. I argue that much of the modern project, the assembly of institutions, ideas, interests, and identities, is a product of the brutal encounter between Europe, the Americas, and Africa. It is my hope that by the end of this course we will know more about how this encounter helped to construct modernity, and we will also know a bit more about how this encounter helped shape responses to it.
Instructor(s): L. Spence
Area: Humanities, Social and Behavioral Sciences.
Program in Museums and Society

Do museums have a social responsibility? What roles should they play in their communities? Should they be agents of social change or social justice? This course explores the ways in which museums engage with local communities. Students work in partnership with a specific museum to develop an original and fundable proposal as a response to protests in Baltimore in the wake of the death of Freddie Gray. Field trips and guest speakers will be a key feature of the course. M&S practicum course. CBL course. Cross-listed with Sociology.

Instructor(s): E. Maloney

Area: Humanities.

Space Science and Engineering

This minor is open to all students in the Whiting School of Engineering and the Krieger School of Arts and Sciences who have the prerequisites for the required courses. The objective of the Minor is to prepare students for a career in Space Science and Space Engineering, either directly as an entering professional in industry, government laboratories and other organizations or as a student in a graduate program. The educational goal of the Minor is to enable students to:

- Apply their understanding and mastery of the fundamental scientific, engineering, and mathematical principles obtained through their major subject of study to space science and space engineering.
- Develop an understanding and capacity for interdisciplinary approaches to technical activities.
- Improve their ability to work in multidisciplinary teams, which are typical in space and other complex technical activities, through interdisciplinary education and internship(s) or equivalent experience(s).

Minor in Space Science and Engineering

Requirements for the Minor:

- A Proposal and Course Plan, which must be approved by your adviser for the minor (hereafter referred to as the “Adviser”). The proposal must discuss a theme that unites the individual elements of the program (courses and internship(s)) into an intellectual whole.
- Five courses in Science and Engineering. One course is specified (AS.171.321 Introduction to Space, Science, and Technology) and the remaining four are chosen through your Proposal and Course Plan, which must be approved prior to taking the courses by the Adviser. All courses must be taken for a grade rather than satisfactory/unsatisfactory. A grade of C- or better is required. Courses that are named as requirements for the student’s major may not be used. However, courses that are not named, but satisfy an elective requirement for the major, may be used.
- An internship or equivalent experience in the field of space science and engineering is required. This must have prior approval from the Adviser.
- A brief report on the internship or equivalent experience to the Adviser.

For a detailed explanation of the minor and its requirements, including sample programs of study, please visit the Student Handbook for the Minor in Space Science and Engineering (http://krieger.jhu.edu/pa-intranet/academic-resources/student-handbook-for-the-minor-in-space-science-and-engineering).

Study of Women, Gender, and Sexuality

The Program for the Study of Women, Gender, and Sexuality (WGS) promotes interdisciplinary scholarship on women, gender, sexuality, and related issues. The program coordinates a wide array of course offerings for both undergraduate and graduate students. It incorporates non-Western intellectual traditions where gender and sexuality are discussed in relation to class, ethnicity, and race in everyday life, political organization, and situations of violent conflict. The program also provides opportunities for intellectual exchange across disciplines by sponsoring lectures, symposia, seminars, and workshops for faculty and students alike. Through both interdisciplinary and specialized courses, students are encouraged to develop critical and comparative approaches to the study of gender and associated topics; race, class, and violence being among them.

Courses in the program are taught by prominent faculty members from many disciplines and are cross-listed through a variety of departments. New courses are added each year. Recent offerings have included Feminist and Queer Theory, The Poetics and Politics of Sex, and seminars that incorporate non-Western perspectives on religion and sexuality. WGS also offers community-based learning, where students combine volunteer work in a local social service agency with a seminar that explores the connections between social justice and academic inquiry. Each of these courses is offered on a regular basis. Together, they form the basis of a flexible minor. More generally, the minor—which is open to students from any department—aims to help integrate work undertaken across a broad range of offerings in the humanities, sciences, and social sciences.

Minor

The requirements for the minor consist of six one-semester courses chosen from the core offerings and the offerings cross-listed with the Program for the Study of Women, Gender, and Sexuality.

Details about minor requirements include:

- Two core courses are required. In the recent past, the core courses have been Introduction to the Study of Women, Gender, and Sexuality, Feminist and Queer Theory, Gender and Health, The Poetics and Politics of Sex, Religion and Gender or Sexuality, and the community-based learning course Working for Social Justice in Contemporary Urban Space.
- Only two introductory 100- or 200-level courses may be counted toward the minor.
- With approval, students may elect to apply two semesters of independent study to fulfill the minor requirements.
- Students electing to minor in the Program for the Study of Women, Gender, and Sexuality may declare their intention to the program at any time, but they are encouraged to seek advice about course selection early in their academic careers.
- Students must earn a C- or better in all minor requirements and courses may not be taken satisfactory/unsatisfactory.

Aaron Goodfellow
Visiting Assistant Professor (Anthropology).

Assistant Professor
Clara Han
M.D., Ph.D., Assistant Professor (Anthropology).

Professor
Christopher Nealon
Ph.D., Professor (English).

Theatre Arts and Studies

The program offers a comprehensive approach to the arts of acting, directing, playwriting, and theatre history, along with the fundamentals of technical direction, play production, play analysis, and theatre management.

For those students who intend to prepare for a career in the theatre, the courses offered are taught exclusively by established professionals with experience on Broadway, in the best of regional theatres, and in many countries of the world.

For those students not focused on a career in theatre arts, the courses offer a broader perspective, an understanding of societal traditions and culture, and an appreciation for the arts, whether theatrical, literary, musical, or visual. Students pursuing careers in medicine, engineering, law, international relations, science, and others have been challenged and enriched by the school’s courses in theatre arts.

For those who seek careers in the arts, the acting and directing workshops, playwriting courses, and independent study opportunities provide rigorous training in acting and other theatre crafts, as well as an appreciation for and an understanding of the history of dramatic arts, its cultural significance, and the industries it has produced.

Located in the program’s home, the historic Merrick Barn, The Johns Hopkins University Theatre provides a vehicle for the fulfillment of student lab requirements. The University Theatre produces several plays each year in the John Astin Theatre and occasionally in the Meyerhoff Auditorium at the Baltimore Museum of Art, which adjoins the Homewood campus. Classes are also held in the Barn.

Theatre Arts and Studies Minor

All courses for the minor here must be taken for letter grades and receive a grade of C- or higher. Courses taken at another institution
may not apply towards the minor without permission of the Director of Undergraduate Studies.

AS.225.100 Introduction to Theatre 3
or AS.225.300 Contemporary Theatre & Film
AS.225.301 Acting & Directing Workshop I 3
AS.225.302 Acting & Directing Workshop II 3
AS.220.105 Fiction Poetry Writing I 3
One theatre history course: 3
One drama course in other program * 3
One additional theatre course ** 3
Total Credits 21

* Courses are identified by the POS-Tag THEA-DRAMA. Alternatively, another theatre history course from within the program (not counted towards another requirement) may apply towards this requirement with permission of the director of undergraduate studies.

** This course may be an acting, theatre production, playwriting, or theatre history course.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

AS.225.100. Introduction to Theatre.
An introduction to the drama: how and why the theatre came into being; its role in human history; and how changing social structures in different regions and epochs have shaped different kinds of theatre, plays and performance. Also: how theatre "works" for us and on us, and the major plays of world drama.
Instructor(s): J. Martin
Area: Humanities.

Effective performance in musical theatre demands a committed analysis of the musical and dramatic values of the song and the libretto from which it springs, in order to develop a fresh, organic interpretation. This course will provide you with the training to both analyze and interpret musical theatre scenes and songs and to make the most of them in performance. Instructor Permission Only.
Instructor(s): M. Denithorne
Area: Humanities.

AS.225.300. Contemporary Theatre & Film.
An introduction to the performing arts, including an overview of theatre history, acting styles and the interaction of art and society. A personal view from inside.
Instructor(s): J. Astin
Area: Humanities.

AS.225.301. Acting & Directing Workshop I.
An introduction to the fundamentals of acting through exercises, improvisation, and work on scenes from established plays and Shakespearean sonnets, based on the teachings of Stanislavsky, Greet, Boleslavsky, Michael Chekhov, Clurman, and Meisner. This course also includes a brief survey of major playwrights. Plays will be read, analyzed, and employed in scene work. Interested students should attend the section of their choice on August 27th. By permission only, approval required.
Instructor(s): J. Astin
Area: Humanities.

AS.225.302. Acting & Directing Workshop II.
The Sanford Meisner repetition exercises are explored in detail. They form the basis of Workshop II. The Uta Hagen exercises are also pursued. As in Workshop I, the principal classroom activities will consist of scene work, exercises, lectures, and discussion. Some rehearsal will also take place during school hours. It is expected that substantial out-of-class time be spent on rehearsals and exercises. Recommended Course Background: AS.225.301
Instructor(s): J. Astin
Area: Humanities.

AS.225.303. Acting & Directing Workshop III.
Special attention is given to the development of spontaneity and emotional freedom using the principles of Workshops I and II. Hands on work with John Astin's "The Process" and the second Silverberg workbook are employed, along with the Uta Hagen text. Boleslavsky and Michael Chekhov are introduced. The Clurman, Meisner, Stanislavsky and Strasberg approaches are included. Substantial out of class time is required. Recommended Course Background: Two acting courses.
Instructor(s): J. Astin
Area: Humanities.

Faculty

Director
John Astin
Visiting Professor (Dramatic Arts), Writing Seminars: acting, directing, theatre history, production and management.

Decker Professor in the Humanities, Writing Seminars
John T. Irwin
Decker Professor in the Humanities, Writing Seminars: criticism and poetry in the theatre.

Professors
Richard A. Macksey
Professor, The Humanities Center, History of Science and Technology: theatre history and criticism.

Ronald Walters
Professor, History: American cultural and social history.

Visiting Instructors
Margaret (Peg) Denithorne
Instructor: acting, directing, theatre history.

James Glossman
Instructor: directing, acting, theatre management, theatre history.

Joseph Martin
Instructor: theatre history, dramaturgy.

William Roche
Instructor: technical direction, theatre crafts, theatre management.

For current faculty and contact information go to http://krieger.jhu.edu/theatre-arts/directory
Workshop IV is an advanced class for actors who have gained some control over their instruments and are ready for character work and full performances. Work will be co-ordinated with productions in which the actor performs and in which the directors direct. Play analysis, characterization, fullness of performance, diction, accents, and other elements of building a performance are covered. Permission only, signature required. Recommended Course Background: AS.225.302, AS.225.303
Instructor(s): M. Denithorne  
Area: Humanities.

AS.225.305. New York City Theatre Intensive.
**[Open to All Majors]** January 5-10, 2016, students will attend Broadway, Off-Broadway and off-off Broadway plays and musicals in New York City, including Book of Mormon, Fun Home, Noises Off and many more. The class will meet before and after each performance (occasionally meeting one of the artists). Each student will keep a journal to be collected at the end of the class. Lodging is available or you can commute from your NJ/NY/CT location. Students must apply to be accepted to this class and pay a non-refundable deposit. The application can be found on the Course Listings page of the Study in the USA Intersession site: http://pages.jh.edu/intersession/studyusa/index.html.  
Instructor(s): M. Denithorne  
Area: Humanities.

Fundamentals of mounting, casting and staging the play; various theories of directing; students must commit to a practical lab. It is understood that students have a working familiarity with acting fundamentals.  
Instructor(s): J. Astin; J. Glossman  
Area: Humanities.

AS.225.308. Shakespeare in Performance.
The techniques and craft of following a Shakespearean text directly into character and action. Students will work with a selection of Shakespeare's plays --- TWELFTH NIGHT; CYMBELINE; and KING LEAR --- in exploring specific ways in which the power of the lines can be translated dynamically and immediately into vocal and physical performance. This course can be repeated for credit, because it covers different topics. (Some background in the acting sequence is encouraged).  
Instructor(s): J. Glossman  
Area: Humanities.

AS.225.310. Stagecraft.
A hands-on approach to the technical and theoretical elements of production. Meets in the Merrick Barn Scene Shop. Permission Required.  
Instructor(s): W. Roche  
Area: Humanities.

AS.225.311. Scene Study.
Classes and scenes tailored to the needs of the actors. Some rehearsal will take place during school hours. It is expected that substantial out-of-class time be spent on rehearsals and exercises.  
Prerequisites: AS.225.301  
Instructor(s): J. Astin  
Area: Humanities.

AS.225.312. Acting Workshop: Chekhov and O'Neill.
Using the plays of Anton Chekhov and Eugene O'Neill, the acting fundamentals from the Workshops are applied in both preparation and scene work as the student employs the basics in order to build a character for the stage. Play analysis is included. Recommended Course Background: At least one acting workshop.  
Instructor(s): J. Astin  
Area: Humanities.

AS.225.313. The Story of Theatre - an Introduction to Drama and Performance.
An exploration of World Theatre from the Greeks to modern times, including the major playwrights and their plays, performance styles throughout the ages, and the surrounding social and cultural contexts.  
Instructor(s): J. Martin  
Area: Humanities.

An introduction to Technical Direction including pre-production and production with an overview of materials, tools, rigging and safety, together with design and its implementation.  
Instructor(s): J. Astin; W. Roche  
Area: Humanities.

AS.225.315. Scene Study 2.
Classes and scenes tailored to the needs of the actors. Some rehearsal will take place during school hours. It is expected that substantial out-of-class time be spent on rehearsals and exercises.  
Instructor(s): J. Astin  
Area: Humanities.

This course is designed to help students deepen their appreciation and understanding of the accomplishments of American Women Playwrights of the 20th and 21st Centuries. Students will explore the growth, development and impact of women writers in the first half of the century, the second half of the century and the women playwrights of today.  
Area: Humanities.

AS.225.319. Performance II.
The student is given specific acting assignments, and develops them as special projects for public performance under the direct supervision of the instructor. A professional level of performance is the goal. Audition Req’d. Out of class rehearsal time required. Check at the Barn (6-0618). Auditions TBA.  
Instructor(s): J. Astin  
Area: Humanities.

AS.225.320. Performance.
The student is given specific acting assignments, and develops them as special projects for public performance under the direct supervision of the instructor. A professional level performance is the goal. Audition Required. Out of class rehearsal time required. Permission only, signature required.  
Instructor(s): M. Denithorne  
Area: Humanities.
AS.225.321. The Lab - The Actor/Director/Playwright Lab.
Student actors, directors, and playwrights will explore their respective crafts with emphasis on process and individual artistic growth. Participants in the class will also collaborate on the creation of new material for the stage. Recommended Course Background: one course in Acting, Directing, or Playwriting.
Instructor(s): M. Denithorne
Area: Humanities.

AS.225.323. Design for the Stage.
The fundamentals of stage design, with an emphasis on process, including script analysis, research, conceptualization, and implementation, from the first reading of the play to opening night, along with an overview of theatre architecture from the Greeks to the current day and into our imagined future.
Instructor(s): W. Roche
Area: Humanities.

AS.225.324. Adaptation for the Stage.
For aspiring playwrights, dramaturgs, and literary translators, this course is a workshop opportunity in learning to adapt both dramatic and non-dramatic works into fresh versions for the stage. Students with ability in foreign languages and literatures are encouraged to explore translation of drama as well as adaptation of foreign language fiction in English. Fiction, classical dramas, folk and fairy tales, independent interviews, or versions of plays from foreign languages are covered.
Instructor(s): J. Martin
Area: Humanities.

AS.225.328. The Existential Drama: Philosophy and Theatre of the Absurd.
Existentialism, a powerful movement in modern drama and theatre, has had a profound influence on contemporary political thought, ethics, and psychology, and has transformed our very notion of how to stage a play. Selected readings and lectures on the philosophy of Kierkegaard, Nietzsche, Camus and Sartre -- and discussion of works for the stage by Sartre, Ionesco, Genet, Beckett, Albee, Pinter, Athol Fugard (with Nkani & Nshone), Heiner Müller and the late plays of Caryl Churchill. Opportunities for projects on Dürrenmatt, Frisch, Havel, Witkiewicz, and Mrozek.
Instructor(s): J. Martin
Area: Humanities.

Musical Theatre is a unique form of theatrical expression that requires special skills of its actors and directors. In this course, students will study the form and structure of musicals as they apply to acting and directing. Students will direct and perform musical numbers as well as book scenes from classic and contemporary American musicals.
Instructor(s): J. Astin; M. Denithorne
Area: Humanities.

A seminar and workshop in playwriting with Dr. Joe Martin, playwright and dramaturge. Student writers, developing their plays, will learn how to open up to the creative process, “brainstorm,” refine their work, and shape it toward an act of artistic communication. Writer’s techniques, such as attending to plot or “story,” delineation of character, creating effective “dialog,” even overcoming “writer’s block,” will be addressed. This course is designed to be complementary to - not a replacement for - playwriting classes in the Writing Seminars.
Instructor(s): J. Martin.

AS.225.331. Acting Styles and the “Viewpoints”.
This course is designed for acting students who have already completed one or both of the first levels in acting or the first level in directing. Uses the cutting edge approach to enhanced physicality and presence in acting - The Viewpoints, originally developed by Anne Bogart and Tina Landau. The second half of the course involves work on scenes from Commedia delle‘Arte to modern absurdist plays.
Instructor(s): J. Martin
Area: Humanities.

AS.225.332. Acting and Directing Workshop IV.
Workshop IV is an advanced class for actors who have gained some control over their instruments and are ready for character work and full performances. Work will be co-ordinated with productions in which the actor performs and in which the directors direct. Play analysis, characterization, fullness of performance, diction, accents, and other elements of building a performance are covered.
Prerequisites: AS.225.302 OR AS.225.303
Instructor(s): J. Astin
Area: Humanities.

Innovative modern playwrights and have gone beyond the boundaries of the living room, the kitchen and the front porch to explore the interaction of the human mind and human passions with the drama of the cosmos. Few elements of science remain unexplored by theatre, be it medicine, particle physics, astronomy, mathematics or chemistry. These unique plays often require experiments with new forms of theatre, and a new way of writing for theatre. We will examine prominent works for theatre which engage with science, including: The Life of Galileo (Brecht, astronomy), Copenhagen (Frayn, physics), Arcadia (Stoppard, mathematics), Semmelweis (Bjorneboe, medicine), The Man who Mistook His Wife for a Hat (Sachs/Brook, neuroscience); Einstein’s Dreams (Lightman et al). The course will include lectures, informal readings (together) of scenes to inform discussions of the works; final small group presentations; one short paper and a choice of a final essay or research paper.
Instructor(s): J. Martin
Area: Humanities, Natural Sciences.

Designed to impart a deepened appreciation and understanding of today’s theatre by surveying the major playwrights, historical movements, and theatre practices of the 20th century. The course also seeks to help students understand theatre’s relationship to the societal and political power structure of each era and to introduce students to great dynamic literature in its intended form, which is performance.
Instructor(s): J. Astin; M. Denithorne
Area: Humanities.

An exploration of the imagination and the senses using basic techniques of improvisation: exercises, conflict resolution, ensemble building, and theatre games. Texts: Spolin, Johnstone, LaBan and Feldencreis. Open to all students.
Instructor(s): M. Denithorne
Area: Humanities.

Permission only.
Instructor(s): J. Astin; J. Glossman; J. Martin.

Instructor(s): J. Astin; J. Glossman; J. Martin; M. Denithorne.
AS.225.520. Projects in Theater.
Special projects created for and tailored to the individual theatre student. Enrollment limited. Permission Required.
Instructor(s): J. Astin.

AS.225.590. Summer Internship in Theatre.
Instructor(s): J. Astin.

AS.225.599. Independent Study.
Instructor(s): J. Astin.

Cross Listed Courses

German Romance Languages Literatures

AS.211.312. Acting French: learning about French language and culture through theater.
Performing a play in a foreign language not only improves language skills, but develops the ability to express oneself through the body and to communicate both efficiently and elegantly. Using excerpts from popular French stage plays by Camus, Sartre, Feydeau, Ionesco, Pagnol and Rostand among others, this course aims to help students to 1) improve French pronunciation, intonation, syntax, and vocabulary; 2) appreciate and understand linguistic nuance and socio-cultural practices; 3) learn fundamentals of acting that carry over into everyday communication, from body language and vocal projection to the expression of emotion and improvisation. Students will view filmed representations of select plays as well as present an end-of-semester staging. Recommended course background: AS.210.301.
Instructor(s): K. Cook-Gailloud; M. Alhinho
Area: Humanities.

AS.211.346. 20th Century French Theater and Performance.
Taught in English. In this course, we will survey the themes and techniques that marked the theory and practice of theater in France in the 20th century. As we make our way from the early century avant-garde movements such as Futurism and Surrealism to Antonin Artaud’s Theater of Cruelty, from the Theater of the Absurd and mid-century existentialists to the post-1968 turn to collective authorship, our goal will be twofold: First, we will examine the prominent plays of the era as literary products, generated from within specific socio-political contexts. Second, we will attempt to re-construct their three-dimensional lives in performance, how they looked, sounded and felt to those watching. In addition, we will examine how French theater went from being a playwright-centered institution to a director-centered one, and how acting styles transitioned from psychological realism to a focus on the human body. Course materials will include plays, theoretical texts on the theater, as well as directors’ manifestos, rehearsal notes, set and costume designs and filmed recordings of theatrical events. Cross-listed with Theatre Arts and Studies. THIS COURSE CAN COUNT EITHER AS A 212 (LITERATURE--AS.212.346) OR AS A 211 (CULTURE) COURSE FOR THE FRENCH MAJOR AND MINORS.
Instructor(s): E. Fisek
Area: Humanities.

Humanities Center

AS.300.113. Freshmen Seminar: Drama and Gender in Shakespeare's England.
In this seminar we will read male and female authored plays and discuss how they reflect contemporary social expectations in Tudor and Stuart England. Authors include William Shakespeare; Mary Sidney, Countess of Pembroke; Christopher Marlowe; Elizabeth Cary; Ben Jonson; and Mary Sidney, Lady Wroth.
Instructor(s): E. Patton
Area: Humanities.

AS.300.133. Freshmen Seminar: Women of Epic Fame in Literature and Drama, 800 BCE-1650 CE.
From Homer’s Odyssey to Shakespeare’s Antony and Cleopatra, powerful women who achieve their ends by working from within the system are often overlooked or not fully explored. Our readings and discussions will foreground these women of fiction, while we also consider the social conditions of their living contemporaries. Readings will include: Homer’s Odyssey (Penelope); Virgil’s Aenead (Dido); Dante’s Inferno (Beatrice); Milton’s Paradise Lost (Eve), and several accounts of Cleopatra in plays by Shakespeare and his contemporary women writers. Cross listed with Theater Arts, Writing Seminars, and WGS.
Instructor(s): E. Patton
Area: Humanities.

AS.300.353. Present Mirth: Stages of Comedy.
A comparative survey of presentational comedies from Aristophanes to Beckett on stage and screen, with some attention to to to the vexed question of theories of comedy (no laughing matter).
Instructor(s): O. Mehrgan; R. Macksey
Area: Humanities.
AS.300.363. Reading Judith Shakespeare: poetry and drama by women writers in Elizabethan England (ca 1558-1650).
Virginia Woolf’s account of the thwarted career of Shakespeare’s hypothetical sister, Judith (in A Room of One’s Own) frames our reading of plays and poetry by Shakespeare and contemporary women writers, including Isabella Whitney, Elizabeth Cary, Mary Sidney, Aemelia Lanyer, Mary Wroth, and others. Students will create fictional biographies of “Judith Shakespeare” and her literary accomplishments. Cross listed with English, Theater Arts, Writing Seminars, and WGS.
Instructor(s): E. Patton
Area: Humanities.

Writing Seminars

The Writing Seminars exists to help students combine imaginative writing with scholarship in the general context of the humanities.

Requirements for a B.A. degree

(Also see Requirements for a Bachelor’s Degree (https://e-nextcatalog.jhu.edu/undergrad-students/academic-policies/requirements-for-a-bachelors-degree))

AS.220.105 Fiction Poetry Writing I and AS.220.106 Fiction Poetry Writing II are prerequisite courses required for all majors and others who want to take advanced courses in writing. Majors must receive a grade of C- or better in all courses required for the major and no major requirements may be taken satisfactory/unsatisfactory.

AS.220.105 Fiction Poetry Writing I 3
AS.220.106 Fiction Poetry Writing II 3
Four courses of English literature. * 12
Two courses in philosophy. It is recommended that one course be a Philosophy Department introductory course. 6
Two courses in history. Majors are encouraged to take one history survey course in the History Department. May include one course from History of Art or from History of Science and Technology. 6
AS.220.200 Introduction to Fiction 3
AS.220.201 Introduction to Poetry Writing 3
One fiction course at the 300-400 level. 3
One poetry course at the 300-400 level. 3
One advanced writing workshop. 3
Three elective courses at the 200-400 level within the department. 9
Foreign language proficiency through the second semester of the intermediate level is required. *

* Expository Writing may not apply towards the English literature requirement.

Honors

A GPA of 3.5 or better in all major requirements is required to earn honors in the major.

The Writing Seminars offers a Master of Fine Arts (M.F.A.) in fiction and poetry. Students admitted to the M.F.A. program enroll in two years of course work and produce a substantial manuscript in the form of a novel or collection of fiction or poetry. M.F.A. candidates are chosen on the basis of a manuscript, college transcripts, GRE scores, and appropriate letters of recommendation that testify to the student’s ability and willingness to undertake serious study in the literary arts. Since all students receive financial aid in the form of full tuition and a teaching assistantship, applicants must be able to demonstrate aptitude for college teaching.

The program requires two full years of residency in Baltimore. Students enroll each semester in two courses: a writing workshop in poetry or fiction and a second course in craft or literature taught within the department. At the end of the first year, students present a portfolio of revised work for faculty review. Successful completion of this work is a requirement for continuation in the second year.

The M.F.A. degree in The Writing Seminars is designed for students committed to the study and practice of literary writing at the highest level of accomplishment. Approximately four poets and four fiction writers will be admitted annually. Our pedagogy emphasizes genre-informed discussions, faculty conferences, independent readings, and interactions with visiting writers. Culminating in a book-length thesis, this immersion in literary study is designed to inculcate the habits and skills necessary for a productive writer’s life.

Students applying to the M.F.A. program should have a bachelor’s degree. All must demonstrate competence in a foreign language at the college level.

Courses

The course will introduce students to the role of storytelling in medicine through a variety of essays, short stories and documentaries, from Susan Sontag’s Illness as Metaphor to Atul Gawande’s Complications to Terry Wrong’s Hopkins. In addition to studying these narratives, students will produce their own written works and meet guest writers from the local medical community. Throughout, the course will provide students with valuable practice in critical analysis and reasoning, skills that are tested on entrance exams such as the MCAT.
Instructor(s): E. Parker
Area: Humanities.

AS.220.105. Fiction Poetry Writing I.
A course in realist fiction and traditional verse, with readings in Eudora Welty, Vladimir Nabokov, Henry James; George Orwell, Beryl Markham and Truman Capote. Students compose short stories and essays with attention to literary models. AS.220.105 can be substituted for AS.220.108.
Instructor(s): Staff
Area: Humanities.

AS.220.106. Fiction Poetry Writing II.
The second half of IFP, a course in counter-traditional antirealist fiction and free verse (Emily Dickinson, Virginia Woolf, Elizabeth Bishop, Franz Kafka, Italo Calvino, and William Carlos Williams). This course is a prerequisite for most upper level courses.
Prerequisites: AS.220.105
Instructor(s): Staff
Area: Humanities.

AS.220.108. Introduction to Fiction & Nonfiction.
A course in realist fiction and nonfiction, with readings by Eudora Welty, Vladimir Nabokov, Henry James; George Orwell, Beryl Markham and Truman Capote. Students compose short stories and essays with attention to literary models. AS.220.105 can be substituted for AS.220.108.
Instructor(s): J. Cavanaugh-Simpson
Area: Humanities.

AS.220.112. The Problems with Myth: Mythology in 20th Century Literature.
This course examines how and why important 20th century writers reinterpreted ancient myths to explore modern themes of ennui, violence, and the absurd hero. We begin with classical authors then jump to those of the 20th century: for example, Louise Glück, James Joyce, Albert Camus, and Eugene O’Neill. In addition to reading literature and essays, students write original poems and sketches in order to understand how mythic narratives continue to satisfy the modern voice.
Instructor(s): R. Oh
Area: Humanities.

AS.220.118. Plagues and Pandemics in Literature.
All plagues seem to begin in mystery: What is happening? Why? Who can we blame? What needs to change? How we react to these questions in the midst of a mass disaster has fascinated writers for centuries. Looking to literature, this class will examine pandemics ranging from the Black Death to Influenza to HIV/AIDS. We will also discuss vampires, zombies, and laboratory experiments gone disastrously wrong. Students will write their own poems and short stories.
Instructor(s): P. Kirkpatrick.

AS.220.121. Writing for Children: Craft and Charm.
This course will critically examine modern and contemporary children’s literature as models from which students will produce writing for children. We will investigate why the most successful children’s books are the most difficult to restrict to that category, through a focus on literary merit and analysis, interplay of word and image, treatment of adult subjects, and author histories. Students will write creatively in response to topics including: picture books; children’s poetry; Harold Bloom on the Junior Canon; fantasy blockbusters and “high/low” literature; magic, fairytales, and Disneyification; and gender divisions in middle grade works. Prerequisite: AS.220.105.
Instructor(s): C. Sender
Area: Humanities.
AS.220.123. **B'More: Baltimore in Fiction, Film, TV.**
Please note, class will meet Saturday, Jan. 24 in the event of inclement weather. This course is for freshmen ONLY. Baltimore has long inspired a diverse group of writers & filmmakers. Students will gain access to the creative soul of the city by reading works by F. Scott Fitzgerald, Russell Baker, and Anne Tyler; watching films by Barry Levinson and John Waters, and viewing episodes of The Wire. They will also take a literary walking tour of Mount Vernon, and meet with local writers and filmmakers. Finally, students will write their own Baltimore-inspired stories and scripts. "IFP 1 not a prerequisite, but preferred". **Prerequisites:** AS.360.108 AND AS.270.119 AND AS.371.189 AND AS.060.153 AND AS.060.126 AND AS.100.197 AND AS.300.100 AND AS.360.176 AND AS.220.116 AND AS.280.205 AND AS.230.216 AND AS.220.190 AND AS.220.194
**Area:** Humanities.

AS.220.125. **Short Fiction of David Foster Wallace.**
In this course we will explore David Foster Wallace’s shorter fiction with an eye towards the philosophical questions raised therein: How can we be authentic when the self is a social construct? How do we escape solipsism while remaining aware of our helpless subjectivity? How do we feel empathy while acknowledging irony? Is it impossible to escape the self, or is that just me? **Recommended Course Background:** AS.220.105
**Instructor(s):** E. Levitz
**Area:** Humanities.

AS.220.126. **Serious Nonsense: Light & Comic Poetry.**
This course will provide a guided tour of some of the funniest poems ever written in the English language. Genres covered will include light verse, satire, parody, absurdism (nonsense), and others. Lessons will explore the serious side of comic poetry and vice versa. Students will have the opportunity to write their own comic verse in the genres discussed. **Prerequisite:** AS.220.105
**Instructor(s):** A. Allen
**Area:** Humanities.

AS.220.127. **Music and Narrative.**
In today’s fast-paced, literate society, it is easy to forget that storytelling began as an oral tradition—an early music. We will explore, in broad strokes, the relationship between musical compositions and written stories, the ways in which composers/songwriters and authors alike build into their creations the elements of a story—setting, voice, character, conflict. Our canon will include everything from Thriller to Beethoven’s 3rd, Gluck to Gladiator, Cather to Carver. Work load includes weekly readings, one major creative writing assignment, and the completion of a critical essay. **Recommended Course Background:** AS.220.105
**Instructor(s):** A. Creighton
**Area:** Humanities.

AS.220.131. **Place, Identity, & Memory in Poetry.**
This course focuses on poetry that deals with the ways in which place and memory inform a poet’s identity. For centuries, poets have explored the individual’s relationship with place, linking spaces to specific memories or experiences in an attempt to articulate how our environment defines us. Students will read a wide selection of poems that deal with “place”—from WB Yeats’ exploration of Roman ruins, to Anthony Hecht’s reflections on his childhood in New York City. Students will write and workshop their own poems weekly. This course will culminate in a final portfolio of the student’s poetry.
**Instructor(s):** K. Parr
**Area:** Humanities.
AS.220.137. You Can't Make This Stuff Up.
Topics for this course will be autobiographical in nature. We will be considering our personal experiences and striving to articulate how those experiences relate to the larger world. The work will be both creative and analytical, as we look closely at examples of the personal narrative, and carefully revise and reconsider our own methods of autobiography. The content for the course will consist of personal essays, comics, movies, and podcasts. We will consider work by Joan Didion, James Baldwin, David Foster Wallace, Allie Brosh, Jafar Panahi, and more. IFP1 not a prerequisite, but preferred.
Instructor(s): N. McNamara
Area: Humanities.

AS.220.138. Make 'Em Laugh.
The quickest way to kill a joke is to explain it. So how do we learn to be funny? In this class, we’ll explore techniques in humor writing. Whether poking holes in accepted absurdities or helping us laugh at death, humor makes us smile and think. Each week, we’ll focus on a different type of humor—dark comedy, satire, etc.—through stories, nonfiction, criticism, and author interviews. Students will write imitations and original work.
Area: Humanities.

A study of poems that embody Wordsworth’s idea of poetry as the spontaneous overflow of powerful feelings. This course will focus on examples of formal excess that arise in poems of ecstasy and despair. Students will read selections from John Donne, Gerard Manley Hopkins, and John Berryman’s schizophrenic Dream Songs, among other poets, paying particular attention to how each writer celebrates and affirms poetic conventions precisely by excessively deviating from proper poetic norms.
Instructor(s): M. Morton
Area: Humanities.

AS.220.142. Seriously Funny: Writing Humor Poetry.
This course will examine both light verse and how humor can enrich serious subjects in poetry. We will explore many subjects, from bad love to aesthetic experiences. Principal readings will range from classic exemplars such as Shakespeare, Dryden, and Eliot to selections from American poets since 1950, as represented in the anthology "Seriously Funny: Poems about Love, Death, Religion, Art, Politics, Sex, and Everything Else." Students will be required to write several seriously funny poems of their own. Fun is mandatory.
Instructor(s): S. Greer
Area: Humanities.

The origins of the modern short story owe much to old-fashioned ghost stories—tales of wicked, benevolent, or eerily indifferent spirits. In this course we’ll read a range of ghost stories, discuss what makes them so compelling, and then try to write some ghost stories of our own. We’ll look at classic tales as well as more recent incarnations of the genre.
Instructor(s): N. Washatka
Area: Humanities.

AS.220.144. Metamorphosed.
From ancient Greek mythology to the recent explosion in vampires and werewolves, stories of metamorphosis have not merely captured the human imagination but have also asked us to consider what, essentially, makes us human. Whether undergoing punishment or willfully bringing about their own change, the afflicted must adapt or face rejection, exile, death; thus we begin to see connections to stories of real-world displacement and psychological trauma. But don’t be fooled: in the midst of the drama, stories of metamorphosis are, ironically, often buoyed by mischievousness, humor, and cunning a playfulness that make them only more complex. Ovid, Franz Kafka, Guy Endore, Anne Sexton, and many more; novels, stories, poetry, film; and, for a limited time only, one week exclusively on werewolves. Not for the faint of heart.
Instructor(s): A. Creighton
Area: Humanities.

AS.220.145. Otherworldliness in Contemporary Lit.
In this course, students will examine invocations of fairy tales, Biblical and historical mythologies, and magical realism in modern and contemporary literature, with a focus on short fiction and reference to poetry, novels, and plays. Students will write and workshop their own short pieces in response to class discussion. Selections will be drawn from the works of Karen Russell, George Saunders, Jeannette Winterson, Gabriel Garcia Marquez, Amy Hempel, Louise Erdrich, Nathan Englander, Carol Ann Duffy, and Tony Kushner, among others.
Instructor(s): C. Sender
Area: Humanities.

AS.220.146. Introduction to Science Writing.
Science writing is science written in plain English and told as a story. Students research, write, edit others, rewrite. They also analyze published stories for structure, substance, accessibility, and clarity.
Area: Humanities.

AS.220.147. Writing About Family.
Write what you know! This course gives students the opportunity to write and workshop a short story, a poem, and the first pages of a memoir, isolating the joyful, humorous, and painful moments that define family life. Class discussions will explore the subject and treatment of family in fiction, poetry, and memoir by writers including Junot Díaz, Alice Munro, Marilynne Robinson, Robert Lowell, Louise Gluck, Natasha Trethewey, Joan Didion, Maxine Hong Kingston, and Tobias Wolff.
Area: Humanities.

Flannery O'Connor once said “Anybody who has survived his childhood has enough information about life to last him the rest of his days.” Fiction is a carefully hewn combination of memory and imagination, and while it is impossible to know how much of the literary canon is sourced in autobiography, the truism holds firm: people write what they know. In this course, we will focus on modern and contemporary autobiographical fiction, looking closely at source, creative process, craft, and style, in order to answer the essential question, How does a writer successfully roll fact into fiction? Students will complete writing activities and participate in discussions and workshops. They will produce either an autobiographical story, or the first chapter of a longer work. Novels: Portrait of the Artist as a Young Man, Joyce; The Bell Jar, Plath; The Lover, Duras. Stories by Hemingway, Updike, Munro, O’Brien, Casey.
Area: Humanities.
AS.220.150. Steal This Book.
From Spike Lee to The Clash, art can wield immense influence on our worldview. This class will explore the intersection of social critique and American literature. Class texts will also include a range of pertinent films, documentaries, and popular music. We’ll examine the social utility of art and how artists use their craft to make a statement. Classwork includes Blackboard posts on current events, weekly creative writing assignments, and a final portfolio of creative work.
Area: Humanities.

This class will focus on poetry’s relationship to time and the visual. Students will read a body of poetry and criticism (by Walter Benjamin, Susan Sontag, Penelope Pelizzon, et al.) looking at how the descriptive nature of lyric poetry is fundamentally related to photography -- more closely related to photography, in fact, than poetry is to painting or sculpture. In addition to bringing a worthwhile discussion of the readings to each class, students will submit one original poem and one original photo each week for credit. *IFP 1 preferred.
Area: Humanities.

A study of confessionalism in American poetry. M.L Rosenthal first described Robert Lowell’s poetry as "confessional" in his 1959 review of Life Studies. But what does “confessional” mean? Is intimacy related to poetic voice or subject matter? This course will ask these and other questions, focusing on the work of Sylvia Plath, Anne Sexton, John Berryman, and Lowell. The course will also include a weekly workshop of students’ poems inspired by the readings. IFP 1 recommended, but not required.

A close study of expatriate authors featured in Woody Allen’s popular film Midnight in Paris, which students will view to begin the course. Students will examine texts by Ernest Hemingway, F. Scott Fitzgerald, Zelda Fitzgerald, Gertrude Stein, and T.S. Eliot, among others. After careful reading and discussion of the assigned works, students will pen their own creative “forgeries,”’ mimicking the styles of studied authors. As a capstone project, students will visit the Baltimore Museum of Art’s Cone Collection to study associated works of visual art, and will ultimately write a creative response to a chosen painting.

AS.220.156. Next Week On... : The History and Evolution ofSerialized Narratives.
This course will explore the development of serialized narratives across several mediums including the novel, the graphic novel, and television. Authors may include Henry James, Sherwood Anderson, Alan Moore and Art Spiegelman. Students will write in-class sketches and three stories. This course will utilized and build upon the ideas and skills presented in IFP1. Introduction to Fiction and Poetry 1
Area: Humanities.

As the saying goes, great writers steal. In this class, we will read and analyze stories and novels that seem to be “stolen” from others—for example, Lorrie Moore’s “Referential” and Nabokov’s “Signs and Symbols.” We will consider questions like: what is influence? What does a writer gain by rewriting a classic, and what do readers gain by reading it? Students will analyze “copycat” works and write their own.
Area: Humanities.

AS.220.158. Leaping Poetry: The Art of Surprise and Surrealism.
A study of poetry that leaps between the conscious and unconscious. Robert Bly’s 1972 anthology, "Leaping Poetry" sought to rejuvenate Western poetry by looking towards the energetic writing of world poets. Students will read the work of Cesar Vallejo, Pablo Neruda, Rainier Maria Rilke, and others in order to understand what makes poetry "leap". Students will respond to the readings by writing and workshops poetry of their own.

AS.220.159. Poetry and Imitation.
This will be an intensive course for the beginning poet. Students will write in a variety of modes, including elegy and satire, and engage with poetry from before Shakespeare to the present day. Emphasis will be placed on imitation; as T.S. Eliot put it, "immature poets imitate, mature poets steal". Poems will be read with an eye for the metaphorical and rhetorical elements that make them work, and students will be encouraged to apply those newfound techniques in their own writing.
Area: Humanities.

AS.220.161. Story in Fiction and Film.
Examine the two primary forms of storytelling in our society: film and fiction. This course will closely examine the writing of Tom Perrotta and Cormac McCarthy, as well as film and television adaptations of their literary works. Students will adapt a film or television show into a work of fiction. Recommended Course Background: AS.220.105
Area: Humanities.

AS.220.162. The Stories We Tell Kids: On Children’s Literature.
The Stories We Tell Kids: On Children’s Literature. This intersession course will consider canonical works of children’s literature - from the Brothers Grimm and Hans Christian Andersen to Laura Ingalls Wilder and Maurice Sendak - alongside contemporary examples of the young adult genre, like Suzanne Collins’s “Hunger Games” trilogy. We will discuss the impact of illustration, recent trends in children’s literature, and the publishing process.
Area: Humanities.

AS.220.165. Writing Unreality: Fantastical Fiction.
While fiction is by definition not “real,” some modes of fiction present deliberate departures from the world as we know it. This class will examine fantastical and non-realist writing, including surrealistic and magic realist stories, as well as works with fairy-tale and folklore influences, and stories with elements of the uncanny or supernatural.

This course will provide a guided tour of some of the funniest poems ever written in English. Genres covered will include light verse, satire, parody, absurdism (“nonsense”), and others. We’ll explore the serious side of comic poetry and vice versa. Students will have the opportunity to write their own comic verse in the genres discussed.
Instructor(s): A. Allen
Area: Humanities.
Worth a (Hundred) Thousand Words: From Flash Fiction to the Novel. In this course, students will explore the tenets of flash fiction, the short story, the novella, and the novel. We will write samples (or segments) of each genre. We will compare and contrast each in terms of craft, reader expectation, and opportunity for experimentation. Readings drawn from Amy Hempel, Lydia Davis, Kurt Vonnegut, J.D. Salinger, Grace Paley, Sherman Alexie, Junot Diaz, and Ernest Hemingway, among others. Instructor(s): C. Sender Area: Humanities.

A study of the spontaneous and art-obsessed poetry known as The New York School. Students will read selected poems by Frank O'Hara, John Ashbery, and Kenneth Koch. A workshop will be held each week in which students will incorporate devices from the week’s reading into their own poetry. The New York School’s influence on contemporary poets will also be emphasized. Instructor(s): C. Ernst.

AS.220.171. Humor and Poetry.
In this class we’ll take humor seriously by reading (and writing) poems that aren’t so serious. We’ll read poems by W.H. Auden, Wendy Cope, May Swenson, Anthony Hecht, and others. We’ll ask questions: how does humor work differently from direct statement? What are the different ways a writer can be ironic? Students will write poems in a variety of forms and styles, and learn to describe the specific style of a comic writer. They’ll also read scholarly work on humor, including passages from Daniel Dennett’s Inside Jokes and Rachel Giora’s On Our Mind. We’ll explore how poetry and humor allow us to say so much with so few words. Instructor(s): J. Frantz Area: Humanities.

We all use figurative language, such as metaphor, simile, and irony. But what does it mean for language to be figurative, and how does this affect its meaning? This course will approach these questions from the angle of poetry. We’ll ask further questions like: how do some poets use metaphor differently from others? What does Shakespeare mean when he says “my love is as a fever”? We’ll read passages from different critics on metaphor, including several from Lakoff and Turner’s More than Cool Reason: A Field Guide to Poetic Metaphor and Denis Donoghue’s Metaphor. Students will write poems with specific metaphorical requirements; they’ll learn to use conceits (metaphors that govern an entire poem); they’ll learn to use conventional metaphors; most importantly, they’ll learn to think critically about why certain metaphors work and certain ones don’t. Instructor(s): J. Frantz.

AS.220.183. Introduction to Dramatic Writing: Film.
An examination of the screenplays as a literary text and blue-print for production. Professional screenplays will be critically analyzed, with focus on character, dialogue, plot development, conflict, pacing, dramatic foreshadowing, the element of surprise, text and subtext, and visual story-telling. Students will learn professional screenplay format and write a short script. Instructor(s): M. Lapadula Area: Humanities.

AS.220.186. The American Poem.
This course will examine the broad family tree of American poetry, from Whitman and Dickinson to the present day. We will focus on several poets of the 20th century as exemplars of major trends and/or instigators of change over the last hundred years, and we will seek to chart their influences. Through our own poems and essays, we will enter into a conversation with the myriad voices that have composed the poem in America. Instructor(s): S. Lackaye Area: Humanities.

AS.220.188. Fitzgeralnds in Baltimore.
Zelda Fitzgerald received psychiatric treatment in Baltimore from 1932-1936. As part of her therapy, she wrote a novel that analyzed the deterioration of her marriage to F. Scott Fitzgerald. We’ll examine Zelda’s depiction of the Fitzgeralnds marriage in Save Me the Waltz and Scott’s subsequent counter-depiction in Tender is the Night, both written in Baltimore. Scott felt partly responsible for Zelda’s mental instability, because of his intense scrutiny of their marriage in his two previous novels. And yet, Scott did not hesitate to dissect their marriage a third time. To compensate both for his callous refusal and his helpless inability to cure Zelda, Scott depicts his fictional double (a psychiatrist/husband) curing Zelda’s fictional double (a patient/wife). How does Scott explore the ethics of balancing professional and personal commitments? Why does Zelda analogize her fictional double to Oedipus in Sophocle’s Theban Plays? Prerequisite: AS.220.105. Instructor(s): J. Rockefeller V Area: Humanities.

AS.220.190. B’More: How to Be Scary: Ghost stories and the Art of Giving Chills.
Students explore Baltimore through a variety of media that tell stories-writing, movies, radio shows, photography, and more. The course will include short stories by Laura Lippman, Edgar Allen Poe, and Ann Tyler, David Simon’s “The Wire” and films by John Waters, photography by Aubrey Bodine, class trips and guest speakers. Students will also try their hand at journalism, documentary, and other creative avenues of storytelling. Prerequisites: Students may enroll in one B’More course only. AS.371.189 AND AS.270.119 AND AS.270.118 AND AS.060.153 AND AS.060.126 AND AS.100.197 AND AS.300.100 AND AS.360.176 AND AS.280.205 AND AS.230.116 AND AS.220.194 Instructor(s): L. Reding Area: Humanities.

Through readings, movies, and trips in Baltimore, we’ll explore the genre of travel writing and do some of our own. We’ll read and view The Motorcycle Diaries and Into the Wild, explore the Inner Harbor, among other neighborhoods, and write our own collaborative travelogue. The Water Taxi Diaries will include both our observations and our imagined experiences, from Hons to pirates. Prerequisites: Students may enroll in one B’More course only. AS.371.189 AND AS.270.119 AND AS.270.118 AND AS.060.153 AND AS.060.126 AND AS.100.197 AND AS.300.100 AND AS.360.176 AND AS.220.116 AND AS.280.205 AND AS.230.116 AND AS.220.190 Instructor(s): R. Parson Area: Humanities.
AS.220.195. Fitzgerald’s Short Stories.
An examination of F. Scott Fitzgerald’s major short stories in the 1920s and 1930s. We’ll analyze Fitzgerald’s commitment to exploring the tension between two opposing intellectual movements: literary naturalism (which championed the primacy of environmental determinism) and literary realism (which championed the primacy of free will). We’ll trace Fitzgerald’s mercurial loyalty to each movement: his abandonment of one school of thought for the other, from one year to the next. In “May Day” he even embraced both movements equally —testimony to his belief that “the test of a first-rate intelligence is the ability to hold two opposed ideas in mind at the same time and still retain the ability to function”. Did Fitzgerald ultimately advocate one school of thought over the other? Or, did he intend simply to stage the debate between them?
Instructor(s): J. Rockefeller V
Area: Humanities.

This class will explore different ways of responding poetically to visual art (painting, photographs, film) and will examine ekphrastic poems alongside the artwork that inspired them. We will examine the possibilities as well as the challenges associated with this sort of writing. Coursework will include in-class writing exercises, take-home assignments, and weekly workshops. A portfolio of original poems will be due at the end of the course.
Instructor(s): C. Wahmanholm
Area: Humanities.

AS.220.200. Introduction to Fiction.
Study in the reading and writing of short narrative with focus on basic technique: subject, narrative voice, character, sense of an ending, etc. Students will write weekly sketches, present story analyses in class, and workshop one finished story. Selected parallel readings from such models of the form as Henry James, Anton Chekov, James Joyce, John Cheever, Alice Munro, and others. Permission Required. (Formerly AS.220.191.)
Prerequisites: AS.220.105 AND AS.220.106
Instructor(s): R. Mitchell; T. Davies
Area: Humanities.

AS.220.201. Introduction to Poetry Writing.
A study of the fundamentals and strategies of poetry writing. This course combines analysis and discussion of traditional models of poetry with workshop critiques of student poems and student conferences with the instructor. Permission Required. (Formerly AS.220.141)
Prerequisites: AS.220.105 AND AS.220.106
Instructor(s): A. Allen; D. Yezzi; M. Salter
Area: Humanities.

A first course in nonfiction writing, emphasizing how facts can be woven into narrative forms to portray verifiable, rather than imagined, people and events. Students read and discuss model works, then write frequent papers to refine their own style. (Formerly AS.220.145.)
Instructor(s): W. Biddle
Area: Humanities.

AS.220.204. Introduction to Dramatic Writing: Film.
Screenwriting workshop. This course will look at the screenplay as both a literary text and blueprint for production. Several classic screenplays will be analyzed. Students will then embark on their own scripts. We will intensively focus on character development, creating “believable” cinematic dialogue, plot development, conflict, pacing, dramatic foreshadowing, the element of surprise, text and subtext, and visual story-telling. Several classic films will be analyzed and discussed (PSYCHO, CHINATOWN, BLADE RUNNER). Students will learn professional screenplay format and write an 8-12 page screenplay that will be read in class and critiqued.
Instructor(s): M. Lapadula
Area: Humanities.

AS.220.205. Introduction to Dramatic Writing: Plays.
Instructor(s): M. Lapadula
Area: Humanities.

AS.220.206. Writing About Science I.
This course is designed to teach students the skills of daily science news reporting. The focus is on turning complex scientific information into lively prose for the general public. Lectures will cover such topics as how to compose news “ledes,” how to get great quotes, how to find stories, and how best to interact with researchers and outside experts. Scientists from Johns Hopkins, University of Maryland, and other local institutions will present their latest research to the class. Students will ask questions, as journalists would, at a news conference. Students will convert these talks into news stories, which will be critiqued in class. As a final project, students will be asked to write a daily news story of their own devising. Please note that a brief writing test is required for this course. To schedule this test, please contact the instructor at dgrimm5@jhu.edu.
Instructor(s): D. Grimm
Area: Humanities.

Poetic Symbols: Past and Future. In this course we will trace the lineages of familiar poetic symbols, or tropes, that have occurred centrally and with regularity in literary history. We will investigate how they evolve with time and reveal changing styles and sensibilities from author to author and age to age. That’s the past. The future is the next poem you will write as the assignment for each of the symbols we read.
Recommended Course background: AS.220.105
Instructor(s): G. Williamson
Area: Humanities.

Using the political and economic milieu of science and technology as a context for our writing, we will study how social factors such as government, money, secrecy, and ethics affect the conduct and public presentation of scientific and medical research. Controversies from 20th century history as well as current events will be discussed. Writing assignments to satisfy the W requirement will consist of short papers derived from classroom topics.
Instructor(s): W. Biddle
Area: Humanities.
**AS.220.211. Journalism for Writers.**
Learn reporting through analysis of famous and infamous work by contemporary journalists such as Janet Malcolm, Michael Finkel, Sarah Corbett and Seymour Hersch. Students will use readings to understand concepts central to news and feature writing, including libel, fair use, balanced reporting, and appropriate sourcing. They will then head out to find and write their own stories about local issues using best practices learned in class. Sarah Harrison Smith is a former managing editor of the New York Times Magazine and the author of “The Fact Checker’s Bible.”
Instructor(s): S. Smith
Area: Humanities.

**AS.220.303. Intermediate Dramatic Writing: Plays.**
Intensive workshop development of one play by each student. Repeatable for credit with permission of instructor. Permission Required.
Prerequisites: Prerequisite AS.220.205
Instructor(s): M. Lapadula
Area: Humanities.

**AS.220.309. Writing Healthy Baltimore.**
Students will explore public health issues in Baltimore and then write about them first in short pieces, and then in longer, polished works. The framework will be the mayor’s Healthy Baltimore 2015 initiative – launched in 2011 to address the city’s top-10 public health problems, including obesity, smoking, drug and alcohol abuse, STDS, cancer, and environmental health hazards. Students will study the initiative and its historical context; examine data sets; explore where and how the initiative intersects with public health practitioners and advocacy groups at the neighborhood level; and write what they learn in different formats, including essays, breaking news, and substance analysis. Students will then “workshop” each other’s papers.
Instructor(s): K. Masterson
Area: Humanities.

**AS.220.310. Intermediate Fiction: Nature Writing.**
Our central text will be Thoreau’s “Walden”. Most of our readings will be American, though we will read excerpts from Lucretius and Darwin. We will examine various ways in which the natural world has been depicted in nonfiction, fiction, and poetry. Students will write critical papers on nature writers as well as to do creative nature writing of their own. Our authors may include: Emerson, Rachel Carson, Loren Eiseley, John Updike, Robert Frost, Donald Culross Peattie.
Instructor(s): B. Leithauser
Area: Humanities.

**AS.220.311. Intermediate Fiction: Point of View.**
A consideration of not just the obvious point-of-view choices writers face - first person or third? one perspective or many? - but also questions of reliability and distance. Reading may include Chekhov, Faulkner, Nabokov, Munro, Diaz, and others. Students will write and workshop their own short stories.
Area: Humanities.

**AS.220.312. Intermediate Fiction: Detail and Description.**
An intermediate workshop focusing on the question of how to make fictional worlds feel real. We’ll read 19th, 20th, and 21st century short fiction by authors such as Anton Chekhov, Jhumpa Lahiri, Junot Diaz, and Alice Munro, focusing particularly on how authors make the lives on the page feel three-dimensional. Students will write stories and exercises, including exercises that involve exploring Baltimore in order to observe and write about the city in which we live. Recommend Course Background: Students need to have completed a 200-level Writing Seminars course.
Prerequisites: Prereqs: AS.220.105 AND AS.220.106
Instructor(s): AS.220.312
Area: Humanities.

**AS.220.315. Intermediate Poetry: Sound Effects.**
This course explores the crucial role sound plays in the power of poetry, from early roots in oral traditions to contemporary contexts. Through readings, discussion, academic reflection, and creative exercises, participants will explore a range of sound techniques in their own poems and in the poems of others.
Instructor(s): AS.220.315
Area: Humanities.

**AS.220.316. Seminar: Opinion Writing.**
The study of exposition and argument in literary prose, with exposure to journalistic practices. Instructor will assign topics on which students write essays and subsequently discuss in class and critique for style, grammar, coherence, and effectiveness. Permission required.
Instructor(s): AS.220.316
Area: Humanities.

**AS.220.317. Writing about Science II.**
Skills taught will include how to construct a long-form narrative, how to create profiles, and how to maintain reader interest throughout. Class speakers will include award-winning science journalists from New York to DC, who will share the secrets of their craft. The primary writing assignment will be a 3,000-word feature piece that is pitched, reported, and workshopped throughout the course of the class. "Writing About Science I" (formerly Becoming a Science Journalist) is recommended as a prerequisite for this course. Students who have not taken this course will need to complete a short writing test and obtain the permission of the instructor to enroll.
Instructor(s): AS.220.317
Area: Humanities.

**AS.220.318. Intermediate Fiction: Voice.**
This workshop will focus intensely on student writing, and on reading stories with a strong narrative voice, the kinds of stories in which the reader can hear the narrator speaking, where the voice gets stuck in the reader’s mind, where the story feels like an invasion of the narrator’s private thoughts, or is a retelling of the tale for some invisible public, or is the quiet, clear prose of a diarist, journaling into the void.
Instructor(s): AS.220.318
Area: Humanities.
An intermediate fiction workshop focusing on the question of place. We’ll read 19th, 20th, and 21st century short fiction (including some set in Baltimore) in which setting strongly affects plot. While we’ll talk about each story holistically, we’ll also spend time discussing how authors make the physical world feel three-dimensional, and how place can lean on–even change–what happens in a story. Students will write stories and exercises, including exercises that involve exploring Baltimore in order to observe and write about the city in which we live.
Instructor(s): K. Noel
Area: Humanities.

The study of plot, with questions, both practical and theoretical, inevitably raised by the short story form. Readings in Chekhov, James, O’Connor, Cheever, Joyce, and Hemingway.
Instructor(s): T. Davies
Area: Humanities.

a study of fictional persons in works by Fitzgerald, Joyce, W.C. Williams, and Rilke. Students write sketches and compose at least one complete story.
Instructor(s): A. McDermott
Area: Humanities.

Readings in the first hundred years of the short story in the Western tradition. Authors include Hoffmann, Kleist, Pushkin, Gogol, Turgenev, Maupassant, James, Chekhov, and Wharton. Numerous pastiches will be assigned.
Instructor(s): T. Davies
Area: Humanities.

A look at some non-realistic methods, in stories and novels, for dealing with the “real world.” Students will write one page exercises and short stories Recommended Course Background: Students need to have completed a 200-level Writing Seminars class.
Prerequisites: Prereqs: AS.220.105 AND AS.220.106
Instructor(s): T. Davies
Area: Humanities.

A course in fiction writing that utilizes a wiki environment. Students will write and maintain multiple fictional data sets, read and edit other students’ work in the same, and coordinate and interlink their sets with the goal of creating a collaborative web-based fiction.
Prerequisites: AS.220.200
Area: Humanities.

AS.220.337. Intermediate Dramatic Writing: Film.
An intensive workshop focusing on methodology: enhancing original characterization, plot development, conflict, story, pacing, dramatic foreshadowing, the element of surprise, text and subtext, act structure, and visual storytelling. Each student is expected to present sections of his/her "screenplay-in-progress" to the class for discussion. The screenplay Chinatown will be used as a basic text.
Area: Humanities.
A consideration of a variety of poetic forms and conventions, analysis
and discussion of characteristic approaches, with a balance of workshop
of student poems. Admission requires completion of Introduction to
Poetry. Permission Required.
Instructor(s): G. Williamson
Area: Humanities.

AS.220.378. Intermediate Poetry: Poetic Forms II.
The course builds on the information and techniques encountered
in Poetic Forms I, and uses them in reading and imitating a range of
contemporary poets. Permission required.
Instructor(s): G. Williamson
Area: Humanities.

This course, which begins with careful textual study, offers students
the opportunity to experience Shakespeare's language as a spoken
expression, marked by rhythm, sound, rhetoric, and emotion. By
working with (and ultimately committing to memory) sonnets, speeches,
and scenes, students will deepen their understanding of Shakespeare's
art, through performance and brief critical writings. Recommended
Course Background: Need to have completed a 200-level Writing
Seminars' class.
Instructor(s): D. Yezzi
Area: Humanities.

Emphasis in writing scenes—the building blocks of fiction-units of
action, units of dialogue. Readings will include the stories of Chekhov,
Cheever, Hemingway, and Carver. Recommended Course Background:
AS.220.200
Area: Humanities.

AS.220.382. Intermediate Poetry: Narrative Strategies in Poetry
Writing.
Before a poem is anything else, it is the hint, implication, outline, or raw
matter of a story, that fundamental human-making shape of expression.
Story-writing is learned behavior and its alternative approaches are
the makers of form and vision, of communication that is worth re-
experiencing, or not. In this course we consider how poets have written
narratives and how today's poets continue to do so. We will read one
book of poems by each of eight contemporary poets who will visit the
class, including Pulitzer Prize winners Claudia Emerson and Stephen
Dunn, and discuss narrative strategies with these poets. Students
will then write a poem "imitating" each visitor and we will workshop
the poems on next class meeting after the visit. There will also be
short response papers and a final essay (or examination—the student's
choice).
Instructor(s): D. Smith
Area: Humanities.

We will look at modern American novellas. Authors will include: Henry
James, Edith Wharton, Katherine Anne Porter, John Updike, Steven
Milhauser, Truman Capote, Elizabeth Spencer. Frequent short writing
assignments, to be discussed in workshop.
Instructor(s): B. Leithauser
Area: Humanities.

Autobiography.
The class will read and discuss classic autobiographical texts by
Benjamin Franklin, Frederick Douglass, Henry Thoreau, Henry Adams,
Gertrude Stein, Malcolm X, and others. Students will write and workshop
their own life stories of substantial length.
Instructor(s): W. Biddle
Area: Humanities.

Scientists, engineers and physicians create and define risks. The public
perceives these risks and decides what is acceptable. We will study the
psychology and politics of risk communication between experts and
laymen.
Instructor(s): W. Biddle
Area: Humanities.

A workshop course with readings and writing assignments that
emphasize the artistic value of the outward gaze. Students will keep a
daily journal of observations, and over the semester will develop those
observations into at least 10 new poems. Course readings will include
work by Rainer Maria Rilke, Elizabeth Bishop, and Theodore Roethke.
Permission Required.
Instructor(s): J. Arthur
Area: Humanities.

This course will explore the dramatic mode of poetry, from the plays of
the Greeks and Shakespeare to the lyric poems of Hardy, Yeats, Frost,
Brooks, Hecht, and others. Weekly writing assignments, suggested by
the readings, will include character monologues, dialogue, conflict, and
other aspects of the dramatic lyric. Student poems will be discussed in a
workshop format.
Instructor(s): D. Yezzi
Area: Humanities.

Performing Fiction & Poetry: An Acting Workshop for Writers. This
hands-on performance workshop, combining literary and theatrical
practice, will look closely at what makes a performance or reading
compelling, clear, and resonant. Through textual analysis, vocal
technique, and group discussion, students will create a pliant
and powerful reading style to best serve their work. The course
includes regular writing assignments in poetry and fiction and weekly
performance and group discussion.
Instructor(s): D. Yezzi.

AS.220.392. Intermediate Poetry: Tall Tales and Short on
Narrative Poetry.
Tall Tales and Short: On Narrative Poetry. Many of the most resonant
and influential stories in history have been told in verse—The Illiad,
The Aeneid, Beowulf, The Divine Comedy, The Prelude. This course will
examine narrative poems—from Homer to the present, both long and
short—with an eye toward how they function formally and generically.
Students will adapt an array age-old storytelling techniques for their
own poems. There will be weekly writing assignments in poetry and
group discussion of student writing.
Instructor(s): D. Yezzi
Area: Humanities.
An exploration of poetic process as ongoing discourse within and across generations. Readings, writing assignments, and in-class workshop of student poems will encourage and enable course participants to join the conversation themselves.
Instructor(s): D. Malech
Area: Humanities.

What is a lyric poem in the 21st Century? What causes such a thing? What does it sound like? What is it good for? Who writes them? We will. By reading lyric poems written over the last 500 years in English, and by writing our own original work we will find some answers to these questions. This class will have a special emphasis on Free Verse and the particular challenges and joys of such a poem. This workshop aims to generate new work and to cultivate skills necessary for a writer. Permission Required.

Many of the finest modern and contemporary poets were also groundbreaking dramatists, including Goethe, Yeats, Eliot, Millay, Cummings, Brecht, and Walcott. Taking these writers’ poetic dramas as models, students will explore the elements of playwriting - plot, character, rhythm, etc. - in order to create original dramatic works. Speeches, scenes, and short plays will be read aloud in class and considered in a workshop setting.
Instructor(s): D. Yezzi
Area: Humanities.

AS.220.400. Advanced Poetry Workshop.
The capstone course in poetry writing. Consideration of various poetic models in discussion, some assigned writing, primarily workshop of student poems. Students will usually complete a “collection” of up to 15 poems. Permission Required. (Formerly AS.220.396.)
Instructor(s): A. Motion
Area: Humanities.

AS.220.401. Advanced Fiction Workshop.
The capstone course in writing fiction, primarily devoted to workshop of student stories. Some assignments, some discussion of literary models, two or three completed student stories with revisions. Completion of Intermediate Fiction is required for admission. Permission Required. (Formerly AS.220.355)
Instructor(s): J. McGarry; R. Puchner
Area: Humanities.

Readings in Contemporary Poetry. Confession, place, myth and image are the four compass points of American poetry best embodied in the work of James Wright. With the work of Wright at the center of the compass, we will read the Selected Poems of four major living poets and discover how these directions and forces play out over the course of a career. Permission required.
Instructor(s): S. Scafidi
Area: Humanities.

Students read six novels by Hammett, Chandler, Cain, Burnett, and Woolrich and view seven films made from these novels by Huston, Hawks, Wilder, Dmytryk, Richards, Walsh, and Farrow. Cross-listed with Film and Media Studies.
Area: Humanities.

An examination of the fiction of three American modernist masters in the context of the early 20th century movement in the verbal and visual arts. Not a workshop course.
Instructor(s): J. Irwin
Area: Humanities.

A study of technique and strategy in the poetry of Emily Dickinson, Marianne Moore, Elizabeth Bishop, and Amy Clampitt. Not a workshop course.
Instructor(s): M. Salter
Area: Humanities.

Between sex and death the body has a varied wild life in American poetry. In a survey of contemporary work this seminar will consider the life of the body, its relationship to the imagination and the kaleidoscopic world of the senses. Reading erotic poems, elegies, poems of sickness and health, and of age and youth, we will find an intimate politics of the body. Students will read and respond critically to American poems written over the last forty years.
Instructor(s): S. Scafidi
Area: Humanities.

An examination of the poetry of Eliot, Crane and Stevens in the context of the modernist movement in the verbal and visual arts. Not a workshop course. Juniors and seniors majors are given preference.
Instructor(s): J. Irwin
Area: Humanities.

AS.220.416. Readings in Fiction: Five from the Fifties.
We will examine five American writers who were emerging or thriving in the middle of the 20th century: John Cheever, Flannery O’Connor, Peter Taylor, John Updike, and Vladimir Nabokov. We will read short stories by all five, as well as the following novels: O’Connor’s Wise Blood, Updike’s Of the Farm, Nabokov’s Lolita and Pale Fire.
Instructor(s): B. Leithauer
Area: Humanities.

Classes will be devoted to writing and collective editing of factual work of significant length and ambition, including essays, journalistic reports, histories, and biographies. Instructor permission required.
Instructor(s): W. Biddle
Area: Humanities.

AS.220.418. Readings in Fiction: The Novella.
Registration Restrictions: Permission required. Twentieth-century novellas, with a new author and book each week. The course asks: What can and has been accomplished by American fiction writers in fewer than 150 pages?
Area: Humanities.

The central concern of this course is to read, study, think about, and discuss several novels and short story collections, paying special attention to the voice and structural techniques these authors have invented to create compelling works.
Instructor(s): M. Klam
Area: Humanities.
AS.220.422. Readings in Fiction: Women Behaving Badly!
This course will focus on fiction that centers around a profoundly flawed female protagonist, an antitheroine. Why is it that we love some of these women in spite of their wrongdoing? How do we connect to a character who is acting in ways that we would never hope to act? And how is it that bad behavior is often perceived as sexy? Are evil women any less or more evil than their male counterparts? Students will read 8 books with villainesses whose crimes range from poor parenting to serial killing. One final paper (10-20 pages) will be due at the end of the semester on a topic of the student’s choosing, relating to one or more of the protagonists from the reading list.
Area: Humanities.

AS.220.423. Readings in Fiction: Castaways in Literature.
Our primary text will be Defoe’s Robinson Crusoe. We will read spin-offs of Robinson Crusoe (Muriel Spark’s Robinson, J. M. Coetzee’s Foe, Elizabeth Bishop’s “Crusoe in England”) as well as Golding’s Lord of the Flies and Sylvia Townsend Warner’s Mr. Fortune’s Maggot. Selections from Homer, Swift, and Byron. We will conclude with Shakespeare’s The Tempest. (Leithauser)
Instructor(s): B. Leithauser
Area: Humanities.

AS.220.424. Science as Narrative.
Class reads the writings of scientists to explore what their words would have meant to them and their readers. Discussion will focus on the shifting scientific/cultural context throughout history. Authors include Aristotle, Copernicus, Galileo, Descartes, Newton, Darwin, Freud, Einstein, Heisenberg, Bohr, Crick and Watson.
Instructor(s): R. Panek
Area: Humanities.

A study of the short story cycle as a literary form. Authors may include Joyce, Schulz, Anderson, Welty, Calvino, Munro, Erdrich, Diaz and others.
Instructor(s): R. Puchner
Area: Humanities.

A close study of the writing that Auden, Isherwood, Spender, and MacNeice produced during the 1930s against the backdrop of the Great Depression, the Spanish Civil War, and the rise of Nazism. This is not a workshop course, but students will have the opportunity to respond artistically as well as analytically to the course readings.
Instructor(s): J. Arthur

A study of the novella as a literary form. Authors may include Melville, Turgenev, Tolstoy, Chekhov, Kafka, James, Wharton, Baldwin, Porter, Rufo, Smiley, and others.
Instructor(s): B. Leithauser
Area: Humanities.

We will read the major long and short stories of Chekhov, along with selected letters written in the full course of his lifetime. Juniors and Seniors only.
Prerequisites: AS.220.105 AND AS.220.106 AND AS.220.200 AND 300 level Intermediate Fiction
Instructor(s): J. McGarry
Area: Humanities.

A close study of twentieth- and twenty-first-century Irish poetry. Course readings will include work by W.B. Yeats, Austin Clarke, Michael Longley, Seamus Heaney, Eiléan Ní Chuilleanáin, Eavan Boland, Ciaran Carson, and others. This is not a workshop course, but students will have the opportunity to respond artistically as well as analytically to the course readings.
Instructor(s): J. Arthur
Area: Humanities.

Lives of the Poets: Hecht, Merrill, Sexton, Plath. “The intellect of man is forced to choose / perfection of the life, or of the work,” wrote Yeats. This course examines important intersections between the life and the work in the poems and memoirs of four, biographically interconnected poets. Poems treating subjects of depression and mental illness (Hecht, Sexton, Plath), the terror of war (Hecht), the depredations of disease (Merrill), and suicide (Sexton, Plath), find their sources in these poets fascinating—and, to varying degrees, troubled—lives.
Instructor(s): D. Yezzi
Area: Humanities.

This course will trace the development of the short story beginning with its tentative emergence from the shadow of the novel, through the early commercial period triggered by the invention of inexpensive newsprint, and to its full maturation at the turn of the 20th century. Works by E. T. A. Hoffmann, Heinrich Von Kleist, Alexander Pushkin, Nikolai Gogol, Ivan Turgenev, Guy de Maupassant, Henry James, Anton Chekhov, and Edith Wharton.
Instructor(s): T. Davies
Area: Humanities.

AS.220.432. Readings in Fiction: Innovators of the Short Story.
In this class, we’ll look at particularly influential writers who’ve had a lasting effect on the form of the short story, reshaping it through their own idiosyncratic vision. Authors may include Hawthorne, Kafka, Chekhov, Babel, Joyce, Borges, O’Connor, Welty, Barthelemy, Paley, and Munro.
Instructor(s): R. Puchner
Area: Humanities.

This course examines important intersections between the life and the work in the poems and memoirs of four, biographically interconnected poets. Poems treating subjects of depression and mental illness (Hecht, Sexton, Plath), the terror of war (Hecht), the depredations of disease (Merrill), and suicide (Sexton, Plath), find their sources in these poets fascinating—and, to varying degrees, troubled—lives.
Instructor(s): D. Yezzi
Area: Humanities.

AS.220.434. Readings in Poetry: The Mind in Motion: The Rhetoric of Poetry. 3 Credits.
This course examines how argument and formal thought shape poetry. Through class discussion about readings ranging from Donne to Dickinson to contemporary poets, and through critical and creative exercises, students will explore poems that reveal not only feeling and observation, but also the architecture of the analytical mind at work.
Instructor(s): D. Malech
Area: Humanities.

AS.220.435. Readings in Poetry: The Romance Tradition. 3 Credits.
A writer’s survey of the medieval romance and of the subsequent poetry that it inspired. Course readings will include Sir Gawain and the Green Knight, The Death of King Arthur, and romances by Chretien de Troyes, as well as poetry by Spenser, Tennyson, and Robert Browning. This is a workshop course, but students will have the opportunity to respond artistically as well as analytically to the course readings.
Instructor(s): J. Arthur
Area: Humanities.
AS.220.436. Readings in Fiction: A Writer’s Journal. 3 Credits.
We will study the role journals play in the work of Virginia Woolf, Franz Kafka, Rainer Maria Rilke, and Anton Chekov. Readings include novels, stories, and diaries.
Instructor(s): J. McGarry
Area: Humanities.

AS.220.437. Creating the Poetry Chapbook.
Students will build on previous work in the major by completing a project of sustained length, depth, and cohesion (25-35 pages) in their final semester. The course will include independent creative and critical work, peer review and discussion, and meetings with the instructor. Application only; Advanced Poetry prerequisite.
Prerequisites: AS.220.400
Instructor(s): D. Malech
Area: Humanities.

In this Community-Based Learning course, students will explore poetry of social and political engagement in partnership with high-school age writers from Writers in Baltimore Schools. Participants will put learning into practice by organizing community conversation, reflection, and collaboration. Participation in some events outside of class time will be required.
Instructor(s): D. Malech
Area: Humanities.

Caribbean history is reflected in the literature of emigration and collapse of empire. We’ll study novels by Naipaul, Rhys, and other 20th century authors.
Instructor(s): W. Biddle
Area: Humanities.

Ordinarily no more than one independent study course may be counted among the eight Writing Seminars courses presented for graduation.

Instructor(s): D. Yezzi; G. Williamson; Staff.

AS.220.505. Writing Seminars Internship.
Instructor(s): Staff.

AS.220.506. Writing Seminars Internship.
Instructor(s): Staff.

Permission Required.
Instructor(s): Staff.

Department Permission Required.

AS.220.509. Practicing Journalism Internship.
This internship is given in conjunction with local media and must be taken on a satisfactory/unsatisfactory basis. It covers many aspects of the operation of a metropolitan newspaper or magazine or TV station. Permission Required. Satisfactory/ Unsatisfactory only.
Instructor(s): M. Klam; Staff; T. Davies; W. Biddle.

AS.220.510. Practicing Journalism.
Permission Required.
Instructor(s): T. Davies
Area: Humanities.

AS.220.513. Teaching Writing.
Permission Required.
Instructor(s): Staff
Area: Humanities.

AS.220.570. Independent Study-Intersession.
Instructor(s): G. Williamson; Staff; T. Davies.

AS.220.572. Practicing Journalism Internship.
Instructor(s): T. Davies; W. Biddle.

AS.220.592. Internship-Summer.
Instructor(s): Staff.

AS.220.594. Practicing Journalism Internship.
Instructor(s): D. Basford; J. Arthur; J. McGarry; T. Davies; W. Biddle.

AS.220.596. Teach Writing-Internship.
Instructor(s): S. Dixon.

AS.220.598. Independent Study.
Instructor(s): G. Blake; G. Williamson; J. McGarry; Staff; T. Davies.

The central concern of this course is to read, study, think about, and discuss several novels and short story collections, paying special attention to the voice and structural techniques these authors have invented to create compelling works. Restricted to Graduate Students.
Instructor(s): M. Klam
Area: Humanities.

We will examine a number of classic and contemporary coming-of-age novels. Students will compose their own: an original work of fiction that may well described as such.
Area: Humanities.

AS.220.610. Readings in Fiction: Alternatives to Realism.
Instructor(s): A. McDermott.

AS.220.611. Writing about Science.
A seminar in the writing of factual prose about scientific matters, whether for the general reader or for professional scientists as audience. Weekly writing, editing, and reading assignments. Permission required.
Instructor(s): A. Finkbeiner.

AS.220.614. Graduate - Science Workshop.
Intensive seminar, at a professional level, in writing factual prose about science for the general reader. Students find, research, and structure their own stories. Weekly writing, editing. Permission required.

AS.220.619. Graduate Poetic Forms I.

AS.220.623. Fiction Workshop.
Discussion and critique of fiction manuscripts by students enrolled in the M.F.A. program. Some assignments possible.
Instructor(s): J. McGarry.

AS.220.624. Graduate Fiction Workshop.
Discussion and critique of fiction manuscripts by students enrolled in the MFA program. Some assignments possible.
Instructor(s): A. McDermott.

AS.220.625. Poetry Workshop.
Discussion and critique of poetry manuscripts by students enrolled in the M.F.A. program. Some assignments possible.
Instructor(s): M. Salter.
AS.220.626. Graduate Poetry Workshop.
Discussion and critique of poetry manuscripts by students enrolled in the MFA program. Some assignments possible.
Instructor(s): G. Williamson.

A study of American poetry written after 1945 with discussion of aesthetic movements, events, historical and contextual, and the character of evolution and practices in poetic structures. Readings vary.
Instructor(s): D. Smith
Area: Humanities.

We will read all--or most--of Chekhov's short stories, his "notebook," as well as the letters that have been translated into English.

A study of three major poets (English, Irish, American) who each introduced signature tones, techniques, and themes in modern poetry. Some other figures, such as Louise Bogan and the World War I poets, may be discussed.
Instructor(s): M. Salter.

A course in the poetry of the 14th-century alliterative revival in which students will read and study Middle English works such as Patience, Cleanness, Pearl, Gawain and the Green Knight, and Piers Plowman. Graduate students only.
Instructor(s): J. Irwin
Area: Humanities.

AS.220.645. Graduate Readings in Fiction: Castaways in Literature.
Our primary text will be Defoe's Robinson Crusoe. We will read spin-offs of Robinson Crusoe (Muriel Spark's Robinson, J. M. Coetzees Foe, Elizabeth Bishop's "Crusoe in England") as well as Golding's Lord of the Flies and Sylvia Townsend Warner's Mr. Fortune's Maggot. Selections from Homer, Swift, and Byron. We will conclude with Shakespeare's The Tempest. Graduate students only.
Instructor(s): B. Leithauser
Area: Humanities.

AS.220.646. Graduate Readings in Fiction and Poetry.
A graduate course designed to develop both close reading and genre study, and to support the teaching of Introduction to Fiction and Poetry (IFP) I and II. Readings in selected works of American, English, and European poetry and short fiction. Course required by all graduate students in fiction and poetry.
Instructor(s): D. Yeazzi; M. Klam
Area: Humanities.

A practical study of prosody rooted in the formalist tradition and continuing into theories of free verse. Readings include essays by Ezra Pound, William Carlos Williams, T.S. Eliot, Charles Olson, and Denise Levertov. This is not a workshop course, but students will have the opportunity to respond artistically as well as analytically to the course readings. Graduate students only.
Instructor(s): J. Arthur
Area: Humanities.

AS.220.648. Forms: The Longer Poem as Anthology.
A study of form through three poets especially concerned with formal variety as a complement to, and manifestation of, theme and voice. Readings will include book-length works by George Herbert (The Temple); Auden (The Sea and the Mirror); Schnackenberg (The Throne of Labdacus).
Instructor(s): M. Salter
Area: Humanities.

This course focuses on three poets whose individual relationships with form, inspiration, and innovation continue to shed light on the poetic process.
Area: Humanities.

Based on a close reading of major texts, this course will look at the ways in which Romantic and port-Romantic British poetry deals with the passage of time, how it creates elegiac structures, and how it records various kinds of loss: the loss of self, the loss of traditional consolations (especially in terms of the environment), and the threatened loss of poetry itself. Students will be encouraged to respond creatively, as well as critically. Restricted to graduate students in the MFA program.
Instructor(s): A. Motion
Area: Humanities.

AS.220.651. Readings in Fiction: Five from the Fifties.
We will examine five American writers who were emerging or thriving in the middle of the 20th century: John Cheever, Bernard Malamud, Vladimir Nabokov, Jean Stafford, John Updike. We will read short stories by all five, as well as the following novels: Malamud's The Assistant, Nabokov's Lolita and Pale Fire. Restricted to graduate students in the MFA program.
Instructor(s): B. Leithauser
Area: Humanities.

This course will look at the way poets have responded to the environment, from the early Romantic period to the present day. In the process, it will study and show how the role of the natural world in poetry has changed from being a cause for celebration and a mirror for self-scrutiny, into a way of continuing these things while also expressing anxiety about the effects of global warming any other dangers to the health of the planet. Poets included in the discussion will include Wordsworth, Clare, Hopkins, Frost, Auden, Hughes and Heaney.
Instructor(s): A. Motion
Area: Humanities.

Which books do writers often foist on other writers, telling them "You have to read this"? In this course, we'll look at books that have yet to find much popular appeal, but which writers often speak about in reverential tones. Authors may include James Salter, Paula Fox, Dezso Kosztolanyi, J.L. Carr, Juan Rulfo, Tom Drury, Christina Stead, Evan S. Connell, Leonard Gardner, Joy Williams, and Penelope Fitzgerald.
Instructor(s): R. Puchner
Area: Humanities.

AS.220.800. Independent Study.
Instructor(s): Staff.

Instructor(s): Staff.
Cross Listed Courses

**Film and Media Studies**

**AS.061.205. Introduction to Dramatic Writing: Film.**
In this course we will explore the basic principles of visual storytelling in narrative film as they apply to the design and execution of a screenplay. During the course of the semester, each student will work on different writing exercises while they search for their specific story and the best way to approach it. We will study different narrative tools and methods of screenwriting by analyzing films to ascertain how they work or fail to do so at script level. Through in-class critiques, group discussions and one-on-one sessions, students will apply these techniques to their own work as they undergo the process of designing, breaking down, outlining and writing a screenplay for a short film. In-class analysis and debate on the strengths and challenges posed by the students' work will help shape the thematic emphasis of the second half of the course.
Instructor(s): R. Buso-garcia
Area: Humanities.

**AS.061.315. Screenwriting By Genre.**
Story design for the screenplay with special attention to the genres of comedy, horror, melodrama, and adventure. Regular workshops, short written exercises, and a longer final project.
Prerequisites: AS.061.313 or AS.220.342 or instructor's permission
Instructor(s): L. Bucknell
Area: Humanities.

**AS.061.371. Unrealities: The Fantastic in Film & Fiction.**
The fantastic, the absurd, the blackly comic in films by Cocteau, Hitchcock, and others; and in the short fiction of Barthelme, Cortázar, Hrabal, and others. Several short creative exercises and a longer final project.
Instructor(s): L. Bucknell
Area: Humanities.

**AS.061.373. Intermediate Dramatic Writing: Film.**
This course will explore different approaches towards understanding the fabric of story as it pertains to film. Students will be exposed to key challenges in conceiving, structuring and executing a compelling, memorable and vibrant feature-length screenplay. By studying key examples, we will discuss possible solutions to these issues. In every class, students will share their work in progress and will help each other find approaches or solutions to their specific challenges and issues. We will analyze films with screenplays that effectively play with the form to create lasting, thought-provoking and affecting stories. Through in-class critiques, group discussions and one-on-one sessions, students will apply new tools and approaches to their own work as they undergo the process of designing, breaking down, outlining and writing a full step outline, a beat sheet and the first ten pages of a feature length screenplay. As the semester progresses, in-class analysis and debate on the strengths and challenges posed by the students' work will shape the thematic emphasis of each class.
Prerequisites: AS.220.204 OR AS.061.205
Instructor(s): R. Buso-garcia
Area: Humanities.

**AS.061.376. Arts and Culture Journalism: Interactive Media, Online Publishing.**
Students will participate in the ongoing creation of BmoreArt.com, an online arts and culture publication that serves the Baltimore community. In conjunction with visiting professionals, students will investigate the Baltimore cultural community and create different types of editorial content using interactive media including film, video, sound, and writing. Students will produce creative content utilizing their individual areas of expertise - such as visual art, art history, music, literary arts, film, and theater - while working together as a professional organization. A strong emphasis will be placed on the student’s collaborative participation and creative experimentation. Students with differing backgrounds in media will approach this project from unique perspectives, which will be valued and cultivated. Students with previous experience in journalism are welcome. An introductory writing or film course is suggested as a prerequisite.
Instructor(s): C. Ober
Area: Humanities.

**AS.061.404. Advanced Dramatic Writing: Film.**
Intensive workshop course where students will write both a first draft and a full revision of a feature length screenplay. Classes will be designed and centered on the specific challenges of the students' works-in-progress, with an emphasis on exploring and discussing different narrative approaches and solutions that will enhance their writing and revision processes. Select films will be screened and analyzed as they pertain to the students' scripts. Students will aim to have a polished draft of their screenplay to be submitted to industry-recognized screenwriting labs at the end of the semester.
Prerequisites: AS.061.373 or AS.220.337
Instructor(s): R. Buso-garcia

**Anthropology**

**AS.070.203. Healing: Politics and Poetics.**
Metaphors of health and illness; individual and social. The body in pain and the body politic. Ethnographies of historical memory vis-à-vis medicine, epidemics, sacredness, shamanism, terror, humanitarianism, truth and reconciliation.
Instructor(s): J. Obarrio
Area: Humanities, Social and Behavioral Sciences.

**AS.070.306. Healing: Politics and Poetics.**
Area: Humanities, Social and Behavioral Sciences.

**AS.070.337. Digital Media, Democracy, and Control.**
This course examines how digital technologies enable new publics that circumvent state and social controls as well as how they are mobilized to confirm existing racial, gendered, and political hierarchies.
Area: Humanities, Social and Behavioral Sciences.
German Romance Languages Literatures

AS.211.472. Barbers and countesses: conflict and change in the Figaro trilogy from the age of Mozart to the 20th century.

2016 marks the bicentennial of Rossini’s irreverent masterwork The Barber of Seville, which premiered in Rome in February 1816. Thirty years earlier, in 1786, Mozart’s The Marriage of Figaro had opened in Vienna. The two operas, based on the first two plays of Beaumarchais’ controversial “Figaro trilogy”, stage conflicts of class and gender, challenging the assumptions of the aristocracy as well as the ludicrous pretensions of the raising bourgeoisie. The same themes inform the post-modern portrayal of the past in John Corigliano’s The Ghosts of Versailles (1991), which ideally completes the musical afterlife of the trilogy. By studying how the plays were adapted to the opera stage within their different cultural and historical contexts, the course will explore the representation of the ideological, social, and political turmoil that, eventually, culminated in the French Revolution. The course will also include field trips and screenings of movies such as Stanley Kubrick’s Barry Lyndon (1975) and Milos Forman’s Amadeus (1984). This course may be used to satisfy major requirements in both the French and Italian majors.

Instructor(s): E. Refini
Area: Humanities.

This course will not aim at drawing the exhaustive literary landscape of French Middle Ages, neither will it be a Comparative Literature or History class. It may be considered a gateway to French Medieval literature, given that the Modern Fantasy has obviously improved the last decades, the latter being built as a rewriting of Medieval themes and Western European folklore. Looking at texts originally written in Old French, including prose and poetry, but also at the French Medieval iconography, we will try to understand the old roots of the Modern and so popular (but sacrificing) Fantasy Literature. Basic French will be required.

Instructor(s): M. Alhinho
Area: Humanities.

AS.213.309. Walter Benjamin and His World.

All readings and class discussions in English. This course will provide an introduction to the thought, writing, and world of Walter Benjamin—one of the most interesting and influential German writers of the early 20th century. Although he died in exile having published only a single book in his lifetime, in the past three decades his ideas and preoccupations have changed the way we think about Cultural Studies, Media Studies, Literary Studies, German thought, Jewish mysticism, and the philosophy of history. We will be examining some of his major writings in tandem with precursors such as Charles Baudelaire and Louis Aragon; contemporaries such as Theodor Adorno and Gershom Scholem; and the legacy of his work among contemporary theorists, critics, and artists.

Area: Humanities.

Are all Jews funny, or only the ones from New York? This course will be an advanced-undergraduate examination of literary, theatrical, cinematic, and televised representations of Jewish culture focusing on the construction of cultural discourse through comedy. Taking as a point of departure Sigmund Freud’s Jokes and Their Relation to the Unconscious, we will consider the joke as a mode of narration and cultural coding with specific resonances for the Jewish encounter with modernity. Among the topics to be addressed in this course will be the origins of modern Jewish humor in traditional modes of storytelling and study; the problems of anxiety and otherness articulated and neutralized through humor; the significance of Jews in creating popular culture through the mass media (particularly though not exclusively in the United States) as well as the role of these mediums in transmitting and translating Jewish references to the general culture; the status of the Yiddish language as a vehicle for satire and a vehicle of resistance between tradition and modernity; the uses and abuses of Jewish stereotypes and the relationship of Jewish humor to anti-Semitism; the connections between Jewish humor and other modes of minority discourse; and the question of translation of Jewish humor both from Yiddish into other languages and from the Jewish “in-group” to a “post-ethnic” audience. Authors and performers to be examined will include Avrom Goldfaden, Sholem Aleichem, Franz Kafka, Dzigan and Szumacher, Lenny Bruce, the Marx Brothers, Mel Brooks, Phillip Roth, Woody Allen, Larry David, Sarah Silverman, and the Coen Brothers. All readings and discussions conducted in English.

Instructor(s): M. Caplan
Area: Humanities.

AS.213.361. The Holocaust in Film and Literature.

How has the Holocaust been represented in literature and film? Are there special challenges posed by genocide to the traditions of visual and literary representation? Where does the Holocaust fit in to the array of concerns that the visual arts and literature express? And where do art and literature fit in to the commemoration of communal tragedy and the working through of individual trauma entailed by thinking about and representing the Holocaust? These questions will guide our consideration of a range of texts — nonfiction, novels, poetry — in Yiddish, German, English, French and other languages (including works by Elie Wiesel, Primo Levi, and Isaac Bashevis Singer), as well as films from French documentaries to Hollywood blockbusters (including films by Alain Resnais, Claude Lanzmann, and Quentin Tarantino). All readings in English.

Instructor(s): S. Spinner
Area: Humanities.
AS.213.387. Major City, Minor Literature? Berlin in German-Jewish and Yiddish Literature. 3 Credits.
Between the two World Wars, a period of intense artistic and intellectual vitality, Berlin was an international center for theater, visual arts, and literature. Many important Yiddish-language writers were drawn to Berlin and, together with their German-language counterparts, produced a body of literature that explores issues of modernity and identity. By comparing works in Yiddish and German, we will learn about inter-War Berlin’s cultural diversity and richness, while also gaining insight into the particular issues of writing about Jewish identity in the 1920s, and the implications of writing in a minor language (Yiddish).
We will read works by authors including Joseph Roth and Alfred Döblin in German, and Moyshe Kuliak and David Bergelson in Yiddish. All texts will be in translation. Some questions we will explore include: • What is a minority/minor language or literature? • How did German and Yiddish interact in cultural and social spheres? • Can texts in different languages comprise a single body of literature? • What did it mean to be German and what did it mean to be Jewish? • Are assimilation and hybridity useful concepts? • Is there such a thing as Jewish modernism?
• How did literature of the period respond to the rise of the Nazi party and the intensification of antisemitism?
Instructor(s): S. Spinner
Area: Humanities.

AS.214.479. Dante Visits the Afterlife: The Divine Comedy.
Dante’s Divina commeda is the greatest long poem of the Middle Ages; some say the greatest poem of all time. We will study the Commedia critically to find: (1) What it reveals about the worldview of late-medieval Europe; (2) how it works as poetry; (3) its relation to the intellectual cultures of pagan antiquity and Latin (Catholic) Christianity; (4) its presentation of political and social issues; (5) its influence on intellectual history, in Italy and elsewhere; (6) the challenges it presents to modern readers and translators; (7) what it reveals about Dante’s understanding of cosmology, world history and culture. We will read and discuss the Commedia in English, but students will be expected to familiarize themselves with key Italian terms and concepts. Students taking section 02 (for 4 credits) will spend an additional hour working in Italian at a time to be mutually decided upon by students and professor.
Instructor(s): W. Stephens
Area: Humanities.

The first objective of the course is to train students in close reading and analysis of literary texts. The second objective is to read prose and poetry by some of the canonical texts in the Latin American tradition written by women. Taught in English.
Instructor(s): S. Castro-Klaren
Area: Humanities.

This course will deal with close readings of Borges ficciones and critical essays in order to determine how his thinking on the problem of writing and thinking is fictionalized in his stories.
Instructor(s): S. Castro-Klaren
Area: Humanities.

This course will focus on the art of writing poetry, the art of reading poetry and the poetics of each of the poets whose work is the textual matter of the course.
Instructor(s): S. Castro-Klaren
Area: Humanities.

AS.216.300. Contemporary Israeli Poetry.
This course examines the works of major Israeli poets such as Yehuda Amichai, Nathan Zach, Dalia Rabikovitch, Erez Biton, Roni Somek, Dan Pagis, Yona Wollach, Yair Horwitz, Maya Bejerano, and Yitzhak Laor. Against the background of the poetry of these famous poets we will study recent developments and trends in Israeli poetry, including less known figures such as Mois Benarroch, Shva Salhoov and Almog Behar. Through close reading of the poems, the course will trace the unique style and aesthetic of each poet, and will aim at presenting a wide picture of contemporary Hebrew poetry.
Prerequisites: Students may receive credit for AS.216.300 or AS.300.413, but not both.
Instructor(s): N. Stahl
Area: Humanities.

AS.216.342. The Holocaust in Israeli Society and Culture.
This course examines the role of the Holocaust in Israeli society and culture. We will study the emergence of the discourse of the Holocaust in Israel and its development throughout the years. Through focusing on literary, artistic and cinematic responses to the Holocaust, we will analyze the impact of its memory on the nation, its politics and its self-perception.
Instructor(s): N. Stahl
Area: Humanities.

AS.216.370. Israel Through Prose.
This course examines representations of various aspects of Israeli society and culture in contemporary Israeli prose. The course will follow both a thematic and chronological path in order to study the ways in which Israeli prose reflects political, ideological, social and cultural aspects of contemporary Israel. In this context, we will read works by several major authors such as: Agnon, Shabtai, Kahanah-Carmon, Oz, Kenaz, Yehoshua, Grossman, Castel-Bloom, Matalon, Laor, Kashua and Hoffmann. Students who sign up for section 2 will work an additional hour in Hebrew with Professor Cohen at a time mutually agreed upon by the professor and the students enrolled. –Carmon, Oz, Kenaz, Yehoshua, Grossman, Castel-Bloom, Matalon, Laor, Kashua and Hoffmann.
Instructor(s): N. Stahl; Z. Cohen
Area: Humanities.

AS.216.373. War in Israeli Arts and Culture. 3 Credits.
In this course we will study the various representations of what functions as one of Israel’s most unifying and yet dividing forces: war. By analyzing literary and cinematic works as well as visual art and popular culture we will attempt to understand the role of war in shaping Israeli society, culture and politics. Topics such as commemoration and mourning, dissent and protest, trauma and memory and the changing image of the soldier will stand at the center of the course. Students with a knowledge of Hebrew wishing to do extra work in Hebrew should enroll in section 2 and the fourth hour will be scheduled at a time convenient to the enrollees and instructor.
Instructor(s): N. Stahl; Z. Cohen
Area: Humanities.
AS.216.398. Zionism: Literature, Film, Thought.
This course studies the relation between Israeli culture and Zionism. Based on a close reading of both literary and non-literary Zionist texts, we will explore the thematic, social and political aspects of the Zionist movement. The course focuses on primary sources and its main goal is to familiarize students with the history of Zionism and its influence on Israeli culture. In the last part of the semester we will investigate the different meanings of Post-Zionism through contemporary literary and non-literary texts as well as recent Israeli films. Students wishing to do additional work in Hebrew should enroll in section 2 where students will meet for an additional hour at a time TBD and will earn 4 credits for the course.
Prerequisites: Students may receive credit for AS.216.398 or AS.300.398, but not both.
Instructor(s): N. Stahl; Z. Cohen
Area: Humanities.

AS.216.412. The Divine in Literature and Cinema.
This course studies various issues concerning literary and cinematic representations of the divine. We will investigate theoretical, theological, generic and aesthetic aspects of the topic and will familiarize ourselves with the general problem of the relation between religion, literature and cinema. Among the topics to be discussed are, negative theology in literature and film, theodicy and anti-theodicy, the question of religion and literary modernism, providence and narratology in the modern novel and in contemporary cinema.

This course studies literary and cinematic representations of the apocalypse. We will investigate theoretical, theological, generic and aesthetic aspects of the topic and seek to trace the narrative dynamics as well as literary and cinematic means of apocalyptic representations. We will discuss works from various periods, languages, cultures and religions. Among the issues to be discussed are: what is the apocalypse, war and the apocalypse, the Holocaust as apocalypse, Biblical apocalypse, post-apocalyptic works, the apocalypse in popular culture, realism, anti-realism and the apocalypse.
Instructor(s): N. Stahl
Area: Humanities.

AS.216.612. The Divine in Literature and Cinema.
This course studies various issues concerning literary and cinematic representations of the divine. We will investigate theoretical, theological, generic and aesthetic aspects of the topic and will familiarize ourselves with the general problem of the relation between religion, literature and cinema. Among the topics to be discussed are, negative theology in literature and film, theodicy and anti-theodicy, the question of religion and literary modernism, providence and narratology in the modern novel and in contemporary cinema.
Instructor(s): N. Stahl.

Theatre Arts Studies

AS.225.324. Adaptation for the Stage.
For aspiring playwrights, dramaturgs, and literary translators, this course is a workshop opportunity in learning to adapt both dramatic and non-dramatic works into fresh versions for the stage. Students with ability in foreign languages and literatures are encouraged to explore translation of drama as well as adaptation of foreign language fiction in English. Fiction, classical dramas, folk and fairy tales, independent interviews, or versions of plays from foreign languages are covered.
Instructor(s): J. Martin
Area: Humanities.

A seminar and workshop in playwriting with Dr. Joe Martin, playwright and dramaturge. Student writers, developing their plays, will learn how to open up to the creative process, “brainstorm,” refine their work, and shape it toward an act of artistic communication. Writer’s techniques, such as attending to plot or “story,” delineation of character, creating effective “dialog,” even overcoming “writer’s block,” will be addressed. This course is designed to be complementary to – not a replacement for – playwriting classes in the Writing Seminars.
Instructor(s): J. Martin.

Humanities Center

AS.300.113. Freshmen Seminar: Drama and Gender in Shakespeare’s England.
In this seminar we will read male and female authored plays and discuss how they reflect contemporary social expectations in Tudor and Stuart England. Authors include William Shakespeare; Mary Sidney, Countess of Pembroke; Christopher Marlowe; Elizabeth Cary; Ben Jonson; and Mary Sidney, Lady Wroth.
Instructor(s): E. Patton
Area: Humanities.

AS.300.133. Freshmen Seminar: Women of Epic Fame in Literature and Drama, 800 BCE-1650 CE.
From Homer’s Odyssey to Shakespeare’s Antony and Cleopatra, powerful women who achieve their ends by working from within the system are often overlooked or not fully explored. Our readings and discussions will foreground these women of fiction, while we also consider the social conditions of their living contemporaries. Readings will include: Homer’s Odyssey (Penelope); Virgil’s Aenead (Dido); Dante’s Inferno (Beatrice); Milton’s Paradise Lost (Eve), and several accounts of Cleopatra in plays by Shakespeare and his contemporary women writers. Cross listed with Theater Arts, Writing Seminars, and WGS.
Instructor(s): E. Patton
Area: Humanities.

AS.300.139. Introduction to Intellectual History.
This course offers a conceptual and historical introduction to Intellectual History. What makes the “history of ideas” different from the history of other objects? What, if anything, distinguishes the history of ideas from the history of philosophy? What is it exactly that we call “ideas”? In what sense do they have a history? These are examples of the kind of questions addressed in the course.
Instructor(s): P. Marrati; S. Carmel
Area: Humanities.

AS.300.143. Introduction to Comparative Literature.
This course offers an introduction to the history, theory, and praxis of comparative literature. We will read texts from some of the founding figures of the discipline and look at the most recent debates in the field, including translation studies, literary theory, and world literature, among others. Particular attention will be given to the methodologies and problems of studying literatures in different linguistic traditions and the relation between literature and other areas of thought and culture, such as philosophy, art history, and psychoanalysis. Case studies in comparative approaches to literature will provide concrete examples to our discussions.
Instructor(s): L. Lisi
Area: Humanities.
AS.300.356. From Literature to Film - the case of Israeli Cinema.
This course explores the differences and similarities between two artistic mediums: literature and cinema. Our case study will be the interesting transformation of Hebrew fiction into Israeli films--a dominant phenomenon in Israeli cinema since its very beginning. Our main framework will be narrative theories, but we will also consider the specific historical, ideological and geo-political aspects involved in this transformation. By comparing the two artistic modes and studying the transformation of 5 literary works into films, students will become familiar with the history of modern Hebrew literature, contemporary Israeli cinema, and the relationship between these two artistic mediums. Cross-listed with Jewish Studies, Film and Media Studies, and Writing Seminars
Instructor(s): N. Stahl
Area: Humanities.

AS.300.363. Reading Judith Shakespeare: poetry and drama by women writers in Elizabethan England (ca 1558-1650).
Virginia Woolf’s account of the thwarted career of Shakespeare’s hypothetical sister, Judith (in A Room of One’s Own) frames our reading of plays and poetry by Shakespeare and contemporary women writers, including Isabella Whitney, Elizabeth Cary, Mary Sidney, Aemelia Lanyer, Mary Wroth, and others. Students will create fictional biographies of “Judith Shakespeare” and her literary accomplishments. Cross listed with English, Theater Arts, Writing Seminars, and WGS.
Instructor(s): E. Patton
Area: Humanities.

AS.300.413. Israeli poetry.
This course examines the works of major Israeli poets such as Yehuda Amichai, Nathan Zach, David Avidan, Dalia Rabikovitch, Yona Wollach, Maya Bejerano, and Yitzhak Laor. These works will be read against the background of the poetry of previous literary generations of writers such as H.N Bialik, Avraham Shlonsky, Natan Alterman and Lea Goldberg in an attempt to uncover changes in style, themes and aesthetic. Through close reading of the poems, the course traces the unique style and aesthetic of each poet, and aims at presenting a wide picture of contemporary Hebrew poetry. Class will be conducted in English and texts will be read in both English translation and the Hebrew original. Open for both Hebrew and non-Hebrew speakers. Students may receive credit for AS.216.300 or AS.300.413, but not both.
Prerequisites: Students may receive credit for AS.216.300 or AS.300.413, but not both.
Instructor(s): N. Stahl.

East Asian Studies

This course aims to introduce students to a variety of literary texts featuring romantic love from the 9th to the mid-20th centuries in China. The target materials cover a wide range of literary products from Bo Juyi’s court poem to the modern Shanghai novella by the woman writer Zhang Ailing (Eileen Chang). As we read romance in a variety of narrative forms such as fiction, drama, and poetry, we will examine changing ideas about marriage, love, sexuality, family, emotion, and morality within the literary discourse as well as in society. Thus, students are expected to connect various literary texts about romance to their socio-historical, literary, and political surroundings. At the same time, we will discuss the shifting significance of romance for writers and reading public and consider how literary texts formed ideas about romance in society. The course is organized chronologically and thematically. Reading assignments are all in English.
Instructor(s): F. Joo
Area: Humanities.

Interdepartmental

AS.360.133. Freshman Seminar: Great Books at Hopkins.
Students attend lectures by an interdepartmental group of Hopkins faculty and meet for discussion in smaller seminar groups; each of these seminars is led by one of the course faculty. In lectures, panels, multimedia presentations, and curatorial sessions among the University’s rare book holdings, we will explore some of the greatest works of the literary and philosophical traditions in Europe and the Americas. Close reading and intensive writing instruction are hallmarks of this course; authors for Fall 2015 include Homer, Thucydides, Dante, Milton, Diderot, Shelley, Nietzsche, Nabokov, and Douglass.
Instructor(s): E. Patton; E. Russo; R. Bett; S. Achinstein; W. Stephens
Area: Humanities.

Program in Latin American Studies

AS.361.316. Caribbean Writing in Shakespeare, V. S. Naipaul, and Alejo Carpentier.
Readings and polemics concerned with Shakespeare’s play The Tempest (1610-1611) and its postcolonial afterlives; V. S. Naipaul’s novel A House for Mr. Biswas (1961); and Alejo Carpentier’s El siglo de las luces (1962). The socio historical and political contexts of each work and authorship will be considered in depth in terms of dominant notions of writing in current critical theory. Cross-listed with GRLL, English, and Writing Seminars.
Instructor(s): E. Gonzalez
Area: Humanities, Social and Behavioral Sciences.

Center for Africana Studies

AS.362.304. Reading and Writing Black Poetry.
This course is an exploration of twentieth and twenty-first century black poetry and poetics. Readings include Paul Laurence Dunbar, Langston Hughes, Gwendolyn Brooks, Amiri Baraka, Sonia Sanchez, Nikki Giovanni, Lucille Clifton, Rita Dove, Natasha Trethewey, Terrance Hayes, Claudia Rankine, and Danez Smith. Texts will be mined for theme as well as formal technique as a basis for poetic experimentation.
Instructor(s): A. Gunn
Area: Humanities.

Whiting School of Engineering

Engineering education at Johns Hopkins began with the establishment of an engineering school in 1913. Throughout its history, the Whiting School has maintained close ties with the Krieger School of Arts and Sciences, which has led pioneering education and research since the Faculty of Philosophy was assembled in 1876. The Whiting School of Engineering provides its students with an education and research environment that fosters a lifetime ability to create and apply new knowledge and to contribute to their professions.

The Whiting School offers 10 ABET-accredited programs in engineering leading to the Bachelor of Science degree: biomedical engineering, chemical and biomolecular engineering, civil engineering, computer engineering, computer science, electrical engineering, engineering mechanics, environmental engineering, materials science and engineering, and mechanical engineering. The school also offers B.S. and B.A. degrees in applied mathematics & statistics as well as B.A. degrees in biomedical engineering, computer science, general engineering, and geography.

Our commitment to advanced study and research yields outstanding programs that lead to masters and doctoral degrees. In the descriptions that follow, each department lists its faculty and their research,
research facilities, graduate programs, and the elementary and advanced courses they offer. More details can be obtained from the departmental websites, through the Whiting School homepage at http://engineering.jhu.edu.

## Applied Mathematics and Statistics

The Department of Applied Mathematics and Statistics is devoted to the study and development of mathematical disciplines especially oriented to the complex problems of modern society. A broad undergraduate and graduate curriculum emphasizes several branches of applied mathematics: **Probability**, the mathematical representation and modeling of uncertainty; **Statistics**, the analysis and interpretation of data; **Operations Research**, the design, analysis, and improvement of actual operations and processes; **Optimization**, the determination of best or optimal decisions; **Discrete Mathematics**, the study of finite structures, arrangements, and relations; and **Scientific Computation**, which includes all aspects of numerical computing in support of the sciences.

**Probability and Statistics** is treated in the curriculum as a single general area, dealing in a unified way with theory and methodology for probabilistic representation of chance phenomena, applications of stochastic modeling to physical and social sciences, formulation of statistical models, fitting of statistical models to data, and interpretation of data. **Operations Research and Optimization** represents a second general area, dealing in unified fashion with the application of optimization theory, mathematical programming, computer modeling, stochastic modeling, and game theory to planning and policy problems such as scheduling, allocation of resources, and facility location. **Discrete Mathematics** includes the traditional themes of graph theory and combinatorics, as well as newer topics arising from modern technological and theoretical developments. The fourth general area, **Computational and Applied Mathematics**, covers topics pertaining to computing, numerical analysis, advanced matrix analysis, and mathematical modeling. **Financial Mathematics** addresses applications by making use of applied mathematics techniques and models from many of the above-mentioned areas.

In its fundamental role of representing applied mathematics at Johns Hopkins University, the Department of Applied Mathematics and Statistics is complemented by the Department of Mathematics, with its differing emphasis. Located in the School of Engineering, the Department of Applied Mathematics and Statistics fulfills a special integrative role, stemming in part from the affinity of engineers and scientists and cooperation with other scientists.

The department's degree programs include foundational and introductory course work drawing from all areas of the curriculum, along with specialized course work in areas such as probability, statistics, operations research, and optimization. Students, in consultation with their advisors, may develop challenging individual programs. The department emphasizes mathematical reasoning, mathematical modeling, abstraction from the particular, and innovative application all in a problem-oriented setting. The aim is to prepare graduates for professional careers in the mathematical sciences and related areas, in academic institutions as well as in governmental, industrial, and research organizations.

The undergraduate major in applied mathematics and statistics leads to the B.A. and B.S. degrees. The graduate program leads to the M.A., M.S.E., and Ph.D. degrees. In addition, under a combined bachelor’s/master’s program, exceptionally able undergraduates may be admitted early to simultaneous graduate work.

## Facilities

The department is located in Whitehead Hall. Office space and liberal access to computing facilities are provided to resident graduate students. A Reading/Commons Room provides the opportunity for informal discussions among faculty and graduate students. The university’s Milton S. Eisenhower Library maintains an excellent collection of literature in the mathematical sciences, including all of the important current journals.

The undergraduate major in applied mathematics and statistics may serve as preparation for employment as an applied mathematician, for graduate study in applied mathematics or related areas, or as a general quantitative training for a career in business, medicine, or other fields. An undergraduate major in applied mathematics and statistics takes an individually tailored program of courses within the department and in the Department of Mathematics (calculus, and perhaps further courses such as differential equations, analysis, complex variables, topology, and modern algebra) and electives in science and engineering. By suitable choice of electives, heavy concentration in a specific field of engineering is possible.

In order to develop a sound program suited to individual needs and interests, the student should consult regularly with the faculty advisor. Additional advisory information, including information about the areas of focus described below, may be obtained from the department office.

With the advice and consent of the faculty advisor, each student constructs an individualized program meeting the requirements below. A written copy of the program should be on file with the faculty advisor, with whom it can be revised and updated from time to time.

## Bachelor’s Degrees

Departmental majors can earn either the B.A. or the B.S. degree by meeting the general university requirements and the general requirements of the School of Engineering (see Requirements for a Bachelor’s Degree at http://e-catalog.jhu.edu/undergrad-students/academic-policies/requirements-for-a-bachelors-degree), including Writing Requirement, in this catalog), and the departmental requirements.

All courses used to meet the following departmental requirements must be taken for a letter grade and passed with grade of C- or higher:

### 1. Calculus I, II, and III

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.106</td>
<td>Calculus I</td>
<td></td>
</tr>
<tr>
<td>&amp; AS.110.107</td>
<td>Calculus II (For Biological and Social Science)</td>
<td>(can be used to satisfy the Calculus I and II requirements.)</td>
</tr>
<tr>
<td>or AS.110.108</td>
<td>Calculus I</td>
<td></td>
</tr>
<tr>
<td>&amp; AS.110.109</td>
<td>Calculus II (For Physical Sciences and Engineering)</td>
<td></td>
</tr>
</tbody>
</table>
AS.110.202 Calculus III (satisfies the Calculus III requirements. Advanced placement is acceptable as well) or AS.110.211 Honors Multivariable Calculus

2. Linear Algebra and Differential Equations

Two courses in linear algebra and differential equations. These two courses must, collectively, touch both areas. There are two ways to meet this two-course requirement:

Option A
Choose one of the following for Linear Algebra:

- AS.110.201 Linear Algebra 4
- AS.110.212 Honors Linear Algebra 4

Choose one of the following for Differential Equations:

- AS.110.302 Diff Equations/Applic 4
- AS.110.417 Partial Diff Equations 4
- EN.550.386 Scientific Computing: Differential Equations 4
- EN.550.391 Dynamical Systems 4

Option B
EN.550.291 Linear Algebra and Differential Equations 4

Plus an additional course in linear algebra or differential equations chosen from among the following:

- EN.550.385 Scientific Computing: Linear Algebra 4
- EN.550.386 Scientific Computing: Differential Equations 4
- EN.550.391 Dynamical Systems 4
- EN.550.692 Matrix Analysis and Linear Algebra 4
- AS.110.417 Partial Diff Equations 4

Choose one of the following (or one of the courses approved to meet the the Master’s/PhD Computing Requirement):

- AS.171.426 Practical Scientific Analysis of Big Data 0-3
- AS.250.205 Introduction to Computing 4
- EN.500.200 Computing for Engineers and Scientists 4
- EN.510.202 Computation and Programming for Materials Scientists and Engineers 4
- EN.530.371 Quantitative Applications in Mechanical Engineering 4
- EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers 4
- EN.550.281 Computing in Applied Mathematics 4
- EN.550.383 Scientific Computing with Python 4
- EN.550.385 Scientific Computing: Linear Algebra 4
- EN.550.386 Scientific Computing: Differential Equations 4
- EN.550.400 Mathematical Modeling and Consulting 4
- EN.550.413 Applied Statistics and Data Analysis 4
- EN.550.415 Practical Scientific Analysis of Big Data 4
- EN.550.433 Monte Carlo Methods 4
- EN.550.436 Data Mining 4
- EN.550.443 Financial Computing in C++ 4
- EN.550.450 Computational Molecular Medicine 4

or EN.550.487 Numerical Methods for Financial Mathematics 4
or EN.550.493 Mathematical Image Analysis 4
or EN.560.220 Civil Engineering Analysis 4
or EN.570.210 Computation/Math Modeling 4
or EN.580.200 Introduction to Scientific Computing in BME using Python, Matlab, and R 4
or EN.580.223 Models and Simulations 4
or EN.600.475 Introduction to Machine Learning 4

4. Discrete Mathematics

Choose one of the following:

- EN.550.171 Discrete Mathematics 4
- EN.550.371 Cryptology and Coding 4
- EN.550.471 Combinatorial Analysis 4
- EN.550.472 Graph Theory 4

5. Probability and Statistics

EN.550.420 Introduction to Probability 4
EN.550.430 Introduction to Statistics 4

6. Optimization

EN.550.361 Introduction to Optimization 4

7. Completion of an area of Focus, chosen from the list below.

Two additional courses are to be taken in the area of focus, distinct from those used to satisfy requirements 5 and 6.

8. Courses coded Quantitative Studies totaling 40 credits of which at least 18 credits must be in courses numbered 300 or higher. (Courses used to meet the requirements above may be counted toward this total.)

9. For the B.S. degree, at least 12 credits coded Natural Sciences

Laboratory courses that accompany Natural Science courses may be used in reaching this total. (Courses used to meet the requirements above may be counted toward this total.)

Area of Focus

Two additional courses are to be taken in the area of focus.

Probability and Statistics

Choose two of the following: 7-8

- AS.110.405 Analysis I 4
- EN.550.400 Mathematical Modeling and Consulting 4
- EN.550.413 Applied Statistics and Data Analysis 4
- EN.550.426 Introduction to Stochastic Processes 4
or EN.550.427 Stochastic Processes and Applications to Finance 4
- EN.550.433 Monte Carlo Methods 4
- EN.550.436 Data Mining 4
- EN.550.439 Time Series Analysis 4

Scientific Computing

Choose two of the following: 7-8

- EN.550.385 Scientific Computing: Linear Algebra 4
- EN.550.386 Scientific Computing: Differential Equations 4
- EN.550.433 Monte Carlo Methods 4

Optimization and Operations Research
Choose two of the following: 8
- EN.550.362 Introduction to Optimization II
- EN.550.400 Mathematical Modeling and Consulting
- EN.550.453 Mathematical Game Theory
- EN.550.463 Network Models in Operations Research

**Discrete Mathematics**

Choose two of the following: 8
- AS.110.401 Advanced Algebra I
- EN.550.371 Cryptology and Coding
- EN.550.463 Network Models in Operations Research
- EN.550.471 Combinatorial Analysis
- EN.550.472 Graph Theory

**Financial Mathematics**

Choose two of the following: 8
- EN.550.427 Stochastic Processes and Applications to Finance
- EN.550.442 Investment Science
- EN.550.444 Introduction to Financial Derivatives
- EN.550.445 Interest Rate and Credit Derivatives

* Neither the pair of EN.550.385-EN.550.386 nor EN.550.386-EN.550.388 allowed in fulfillment of the area of focus.

Requirements 1–9 together constitute a minimal core program, allowing maximum flexibility in planning degree programs. Students often are able to complete a second major during a four-year program or to proceed to the department’s combined bachelor’s/master’s degree program.

It is highly recommended that students develop a coherent program of study (see below) or at least take additional departmental courses, in order to establish a broad foundation for a career as an applied mathematician. Of particular importance are additional courses in optimization (EN.550.362 Introduction to Optimization II), stochastic processes (EN.550.426 Introduction to Stochastic Processes), and scientific computing (EN.550.385 Scientific Computing: Linear Algebra, EN.550.386 Scientific Computing: Differential Equations), and investment science (EN.550.442 Investment Science). Students planning to continue to graduate school in an applied mathematics program are encouraged to consider taking one or more graduate-level courses in probability (EN.550.620 Probability Theory I, EN.550.621 Probability Theory II), statistics (EN.550.631 Statistical Theory I, EN.550.632 Statistical Theory II, optimization (EN.550.661 Foundations of Optimization, EN.550.662 Optimization Algorithms), combinatorics (EN.550.671 Combinatorial Analysis), graph theory (EN.550.672 Graph Theory), numerical analysis (EN.550.681 Numerical Analysis), or matrix analysis (EN.550.692 Matrix Analysis and Linear Algebra).

**Honors**

The Department of Applied Mathematics and Statistics awards departmental honors based on a number of factors, including performance in coursework, research experiences, teaching, and service. If a student completes a senior thesis (EN.550.501 Senior Thesis) and also earns a GPA of 3.5 or higher in Applied Mathematics and Statistics courses, then the student will automatically be awarded departmental honors.

**Minor in Applied Mathematics and Statistics**

The minor in applied mathematics and statistics should be attractive to students majoring in a variety of disciplines, in both the School of Engineering and the School of Arts and Sciences. The minor provides formal recognition of the depth and strength of a student’s quantitative knowledge beyond the minimal requirements of his/her major.

The requirements of the minor in applied mathematics and statistics are the following:

- Completion of an approved program of study containing at least 18 credits in courses coded Quantitative Studies. The first two courses in calculus (AS.110.106 Calculus I-AS.110.107 Calculus II (For Biological and Social Science) or AS.110.108 Calculus I-AS.110.109 Calculus II (For Physical Sciences and Engineering) or their equivalents) may not be used to fulfill this requirement.
- Among the courses comprising the 18 Q credits, there must be:
  - (a) at least four courses in the Department of Applied Mathematics and Statistics (each of these must be a 3- or 4-credit course); and
  - (b) at least three 3- or 4-credit courses coded Q at the 300-level or above, of which at least two must be in the Department of Applied Mathematics and Statistics; and
  - (c) an approved semester course based on a high-level computer language chosen from the list below or one of the courses approved to meet the AMS Master’s/PhD Computing Requirement (http://engineering.jhu.edu/ams/courses-approved-meet-ams-mastersph-d-computing-requirement).

- AS.171.426 Practical Scientific Analysis of Big Data
- or AS.250.205 Introduction to Computing
- or EN.500.200 Computing for Engineers and Scientists
- or EN.510.202 Computation and Programming for Materials Scientists and Engineers
- or EN.530.371 Quantitative Applications in Mechanical Engineering
- or EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers
- or EN.550.281 Computing in Applied Mathematics
- or EN.550.383 Scientific Computing with Python
- or EN.550.385 Scientific Computing: Linear Algebra
- or EN.550.386 Scientific Computing: Differential Equations
- or EN.550.388 Scientific Computing: Differential Equations in Vector Spaces
- or EN.550.400 Mathematical Modeling and Consulting
- or EN.550.413 Applied Statistics and Data Analysis
- or EN.550.415 Practical Scientific Analysis of Big Data
- or EN.550.433 Monte Carlo Methods
- or EN.550.436 Data Mining
- or EN.550.443 Financial Computing in C++
- or EN.550.450 Computational Molecular Medicine
- or EN.550.487 Numerical Methods for Financial Mathematics
- or EN.550.493 Mathematical Image Analysis
- or EN.560.220 Civil Engineering Analysis
- or EN.570.210 Computation/Math Modeling
- or EN.580.200 Introduction to Scientific Computing in BME using Python, Matlab, and R
or the master of science in engineering (M.S.E.) degree in applied mathematics and statistics. Students may work toward either the master of arts (M.A.) degree or the master of science (M.S.) degree.

Requirements for the Master's Degree in Applied Mathematics and Statistics

Students must show that he/she has the basic intellectual capacity and has acquired the skills necessary to complete the program successfully within a reasonable period of time. A faculty committee evaluates each applicant’s credentials; there are no rigid requirements.

Prospective applicants should submit transcripts of previous academic work, letters of recommendation from persons qualified to evaluate the applicant’s academic performance and potential for graduate study, a statement of purpose describing anticipated professional goals, and Graduate Record Examination (GRE) scores. Foreign students must submit scores from the Test of English as a Foreign Language (TOEFL) or International English Language Testing System (IELTS).

Most applicants have undergraduate majors in quantitative fields such as mathematics, statistics, engineering, or a field in the physical sciences, but any major is permitted. Regardless of the major, completion of a program in undergraduate mathematics at least through advanced calculus and linear algebra is essential to begin the normal graduate program.

Requirements for the Master’s Degree in Applied Mathematics and Statistics

Students may work toward either the master of arts (M.A.) degree or the master of science (M.S.) degree in applied mathematics and statistics, or the master of science in engineering (M.S.E.) degree in financial mathematics (described in the next section). All master’s degrees in applied mathematics and statistics ordinarily require a minimum of two semesters of registration as a full-time resident graduate student.

To obtain departmental certification for the master’s degree, the student must:

- Complete satisfactorily at least eight one-semester courses of graduate work in a coherent program approved by the faculty advisor. Some 400-level and all 600-level or higher courses in the Applied Mathematics and Statistics Department (with the exception of seminar and research courses) are “graduate level” for the purpose of meeting the Master’s degree requirements. For courses used toward the degree, all grades must be C or higher, at most two grades can be below a B-, and the overall average grade point average in these courses must be at least 3.0.

- Meet one of the following two options:
  - (a) submit an acceptable research report based on an approved project; or
  - (b) complete satisfactorily two additional one-semester graduate courses, as approved by the faculty advisor.

- Demonstrate a working knowledge of the utilization of computers in applied mathematics and statistics.

In consultation with the faculty advisor, a candidate for the master’s degree plans a complete program of proposed course work and submits it in writing for departmental approval. This should be done early in the first semester of residence.

Doctoral students in other departments may undertake concurrently a master’s program in Applied Mathematics and Statistics. Application forms and information are available in the department office.

Requirements for the Master’s Degree in Financial Mathematics

The department offers an M.S.E. degree in Financial Mathematics. The structure of this program is summarized below. More detailed information about this program may be found on the department’s website.

Full-time students in this program are expected to attend courses for three semesters beginning in the fall semester, a summer internship after the spring semester of their first year, and return for a second fall semester.

For departmental certification for this degree, the student must complete the following courses or approved substitute courses with program approval:

Requirements for the Bachelor’s/Master’s Program

Highly motivated and exceptionally well-qualified undergraduates may apply for admission to the combined bachelor’s/master’s program in applied mathematics and statistics. Interested students should apply no later than fall semester of their senior year.

The requirements for this program consist of those for the bachelor’s and master’s programs.

Requirements for the Ph.D. Degree

The objective of the department’s Ph.D. program is to produce graduates who are broadly educated in applied mathematics and statistics and who can work at the current frontiers of their chosen specialized disciplines. The introductory phase of graduate study acquaints the student with a spectrum of topics, provides an opportunity to fill gaps in his or her background, and affords a close view of the doctoral research process and of potential research areas and advisors. Continuation to advanced study and dissertation research is based upon favorable evaluation of preparedness and potential. The progress of students is evaluated at the end of every semester. The culmination of the program is the doctoral dissertation, representing an original and significant contribution to knowledge in applied mathematics.

In addition to fulfilling the university requirement of a minimum of two consecutive semesters of registration as a full-time resident graduate student, the student must accomplish the following to obtain departmental certification for the Ph.D.:

- Pass the Introductory Examination, normally offered immediately before each semester.
- Pass the Ph.D. Candidacy Examination. This oral examination is normally taken in the third year of residency. The scope of the exam will be governed by a syllabus prepared by the student with the help of the student’s mentor or advisor.
- Pass the Graduate Board Oral Examination, normally taken in the third year of residence.

- Complete satisfactorily a one year elective course (or the equivalent) in some area of application of applied mathematics and statistics.
- Acquire teaching experience under the supervision of the faculty.
- Demonstrate a working knowledge of the utilization of computers in applied mathematics and statistics.
- Complete a program of original research and its clear exposition in a written dissertation. The dissertation must be approved by at least two faculty readers and be certified by them to be a significant contribution to knowledge and worthy of publication in scholarly journals. The candidate defends the dissertation in a public examination held under the auspices of the department.

Additional details on these items may be found on the department’s website.

Course Program

The most common way for students to gain the knowledge and skills to succeed in the Ph.D. program is through course work. In consultation with his or her advisor, each student will develop a program of proposed course work. The relevant courses for the Ph.D. are of three types: basic graduate-level courses, additional specialized courses appropriate to the student’s field of research, and an elective one year course selected to broaden the student in applied mathematics. To promote a well-rounded education and record, all full-time graduate students are expected to enroll in an appropriate number of courses for their stage in the program. Students are required to enroll in and attend EN.550.600 Department Seminar, the Applied Mathematics and Statistics Department Seminar, every semester. Grades of B- or better (or equivalent level of performance in pass/fail courses) are expected of all department Ph.D. graduate students in their course work.

Basic Courses

All students are encouraged to master basic material in:

- probability (EN.550.620), statistics (EN.550.630), and stochastic processes (EN.550.426);
- optimization (EN.550.661);
- numerical and matrix analysis (EN.550.681, EN.550.692); and
- discrete mathematics (EN.550.671, EN.550.672).

Normally, a student will have completed at least eight basic courses by the end of the fourth semester of residence.

Specialized Courses

Each student takes advanced courses appropriate to the proposed area of dissertation research, with the approval of the research advisor.

Elective Courses

A one-year graduate course (or the equivalent) in a field distinct from the student’s specialized area is required. This is a minimal requirement. Students are encouraged to take more than two semesters of elective course work, either covering one area in depth or covering two areas. Typical areas in other departments are biology, econometrics, mathematical economics, mathematical ecology, computational geometry, systems theory, health systems, mathematics, facility location, psychometrics, and physics. These courses may complement or supplement the student’s previous experience, but if a student has no previous experience in an area some elementary course work may be necessary as a prerequisite to acceptable graduate level courses. Although students are strongly encouraged to take the elective

courses outside the department, with the approval of the advisor they may be chosen within the department, provided they are 600- or 700-level courses in a field clearly distinct from the student’s specialized area.

Financial Assistance

A limited number of teaching and research assistantships providing full tuition and a competitive academic year stipend are available to qualified full-time Ph.D. candidates. Furthermore, the following special fellowships are awarded:

• The Rufus P. Isaacs Fellowship, named in honor of a late member of the faculty acclaimed for his contributions to operations research.
• The Charles and Catherine Counselman Fellowship, generously endowed by Hopkins alumnus Charles Counselman.

In addition, summer employment opportunities are often available within the university and in the Baltimore-Washington corridor.

Faculty

Chair
E. Laurent Younes
Professor: mathematical imaging, shape theory and applied differential geometry, computational probability, statistics.

Vice Dean of Education
Edward R. Scheinerman
Professor: discrete mathematics, graph theory, social networks, random methods, partially ordered sets.

Director of Undergraduate Studies
James A. Fill
Professor: probability, stochastic processes, random structures, and algorithms.

Associate Director of Undergraduate Studies
Donniell E. Fishkind
Associate Research Professor: combinatorics, graph theory, matrix analysis.

Executive Director of Financial Mathematics Master’s Program
David Audley
Senior Lecturer: financial mathematics, term structure models, fixed income derivatives, and quantitative portfolio strategies.

Professors
Gregory L. Eyink
Professor: mathematical physics, fluid mechanics, turbulence, dynamical systems, partial differential equations, nonequilibrium statistical physics, geophysics and climate.

Donald Geman
Professor: image analysis, statistical learning, bioinformatics.

Daniel Naiman
Professor and Director, Financial Mathematics Master’s Program: statistics, computational probability, bioinformatics.

Carey E. Priebe
Professor: statistics, image analysis, pattern recognition.

John C. Wierman
Professor: probability, statistics, discrete mathematics, percolation theory, stochastic processes.

Assistant Professors
Amitabh Basu
Assistant Professor: optimization, discrete and combinatorial geometry, convex analysis, operations research.

Maxim Bichuch
Assistant Professor: financial mathematics, utility optimization, market with transaction costs, counterparty risk, valuation adjustments.

Tamas Budavari
Assistant Professor: computational statistics, Bayesian inference, low-dimensional embeddings, streaming algorithms, parallel processing on GPUs, scientific databases, survey astronomy.

Nicolas Charon
Assistant Professor: shape analysis, image analysis, Riemannian and discrete geometry.

Daniel P. Robinson
Assistant Professor: optimization, numerical analysis, matrix analysis, complementarity problems.

Yanxun Xu
Assistant Professor: Bayesian statistics, cancer genomics, clinical trial design, graphical model, nonparametric Bayesian, statistical inference for big data analysis, high-throughput genomic data and proteomics data.

Research Professor
Helyette Geman
Research Professor: financial mathematics, commodities.

James C. Spall

Assistant Research Professor
Avanti Athreya
Assistant Research Professor: probability, stochastic processes.

Minh Hai Tang
Assistant Research Professor: statistical pattern recognition, high-dimensional data analysis.

Senior Lecturer
Beryl Castello
Senior Lecturer: operations research, optimization, facility location, inventory modeling.

Fred Torcaso
Senior Lecturer: stochastic processes, asymptotics, and partial differential equations.

Lecturers
Prashant Athavale
Lecturer: mathematical image processing, variational problems, multiscale analysis; bio-medical imaging

John Miller
Lecturer: financial mathematics, equity derivative trading and risk management, number theory

Joint, Part-Time and Visiting Appointments

Gregory Chirikjian
Professor: Mechanical Engineering, computational structural biology, applied mathematics, robotics.

John Goutsias
Professor: Electrical and Computer Engineering.

Benjamin F. Hobbs
Professor: Geography and Environmental Engineering, energy and environmental systems and economics.

Pablo Iglesias
Professor: Electrical and Computer Engineering.

Takeru Igusa
Professor: Civil Engineering.

S. Rao Kosaraju
Edward J. Schaefer Professor: Computer Science, design of algorithms, parallel computation, pattern matching, robotics computational geometry.

Scott Levin
Assistant Professor: Emergency Medicine, School of Medicine.

David Marchette
Lecturer: Naval Surface Warfare Center.

Michael I. Miller
Professor: Biomedical Engineering.

Jerry L. Prince
Professor: Electrical and Computer Engineering, multi-dimensional signal processing, medical imaging, computational geometry.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.550.100. Introduction to Applied Mathematics and Statistics.
A seminar-style series of lectures and assignments to acquaint the student with a range of intellectual and professional activities performed by applied mathematicians and statisticians. Problems arising in applied mathematics and statistics are presented by department faculty and outside speakers. Recommended Course Background: one semester of Calculus.
Instructor(s): E. Younes
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.103. Mathematics & Politics.
Instructor(s): M. Sedlock
Area: Quantitative and Mathematical Sciences.

EN.550.111. Statistical Analysis I.
First semester of a general survey of statistical methodology. Topics include descriptive statistics, introductory probability, conditional probability, random variables, expectation, sampling, the central limit theorem, classical and robust estimation, confidence intervals, and hypothesis testing. Case studies from psychology, epidemiology, economics and other fields serve to illustrate the underlying theory. Some use of Minitab, Excel or R, but no prior computing experience is necessary. Recommended Course Background: four years of high school mathematics. Students who may wish to undertake more than two semesters of probability and statistics should consider EN.550.420-EN.550.430.
Prerequisites: Statistics Sequence restriction: students who have completed AS.230.205 or EN.550.113 may not enroll.; Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.211 OR EN.550.230 OR EN.550.310 OR EN.550.311 OR EN.550.420 OR EN.550.430 OR EN.550.112 OR EN.550.413 OR EN.560.435 OR AS.280.345 OR AS.200.314 OR AS.200.315
Instructor(s): Z. Lubberts
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.112. Statistical Analysis II.
Second semester of a general survey of statistical methodology. Topics include two-sample hypothesis tests, analysis of variance, linear regression, correlation, analysis of categorical data, and nonparametrics. Students who may wish to undertake more than two semesters of probability and statistics should strongly consider the EN.550.420-430 sequence.
Prerequisites: Prereqs: EN.550.111 OR EN.550.113 OR AS.230.205 OR AS.280.345 OR credit for AP Statistics
Instructor(s): J. Paat
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.113. Statistics Through Case Study.
A case-study based course treating basic statistical theory and methodology. All theoretical material will be presented in the context of timely real-world case studies. Topics covered will include basic probability, random variables and their distributions, the central limit theorem and normal approximation, sampling distributions, statistical inference, confidence intervals, and hypothesis testing. Recommended Course Background: Four years of high school mathematics.
Prerequisites: This course is not open to students who have received credit for 550.111 or AP Statistics.; Statistics Sequence restriction: AS.230.205 OR EN.550.211 OR EN.550.230 OR AS.280.345 OR AS.280.345 OR AS.200.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.430 OR EN.550.413
Instructor(s): D. Athreya
Area: Engineering, Quantitative and Mathematical Sciences.

Introduction to the mathematics of finite systems. Logic; Boolean algebra; induction and recursion; sets, functions, relations, equivalence, and partially ordered sets; elementary combinatorics; modular arithmetic and the Euclidean algorithm; group theory; permutations and symmetry groups; graph theory. Selected applications. The concept of a proof and development of the ability to recognize and construct proofs are part of the course. Recommended Course Background: Four years of high school mathematics.
Instructor(s): B. Castello
Area: Quantitative and Mathematical Sciences.
EN.550.200. Computing for Engineers and Scientists.
This course introduces a variety of techniques for solving problems in engineering and science on a computer using MATLAB. Topics include structure and operation of a computer, the programming language MATLAB, computational mathematics, and elementary numerical analysis. Co-listed with EN.500.200
Prerequisites: AS.110.107 OR AS.110.109 or credit for those courses through AP Calculus.
Area: Engineering, Quantitative and Mathematical Sciences.

This is an introduction to statistics aimed at students in the life sciences. The course will provide the necessary background in probability with treatment of independence, Bayes theorem, discrete and continuous random variables and their distributions. The statistical topics covered will include sampling and sampling distributions, confidence intervals and hypothesis testing for means, comparison of populations, analysis of variance, linear regression and correlation. Analysis of data will be done using Excel.
Prerequisites: AS.110.106 OR AS.110.108; Statistics Sequence restriction: Students who have completed any of these courses may not register: EN.550.230 OR AS.280.345 OR AS.200.314 OR AS.200.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430
Instructor(s): P. Athavale
Area: Quantitative and Mathematical Sciences.

EN.550.230. Introduction to Biostatistics.
Prerequisites: Statistics Sequence restriction: Students who have completed any of these courses may not enroll: EN.550.211 OR AS.280.345 OR AS.200.314 OR AS.200.315 OR EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430
Instructor(s): K. Hernandez Cuevas
Area: Engineering, Quantitative and Mathematical Sciences.

As society’s enterprises and technologies grow more and more complex, their operation and planning rely increasingly on mathematics-based analyses. This course is an introduction to management science and the quantitative approach to decision making. Emphasis on model development and case studies, using spreadsheets or other computer software, applied to a variety of problems in manufacturing, transportation, finance, and general management.
Prerequisites: AS.110.106 or AS.110.108
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

This course is an introduction to management science and the quantitative approach to decision making. Our focus will be on the formulation and analysis of stochastic models, where some problem data may be uncertain. The covered topics may include Project Scheduling, Decision Analysis, Time Series Forecasting, Inventory Models with Stationary or Nonstationary Demand, Queuing Models, Discrete-Event Simulation, and Quality Management. We emphasize model development and case studies, using spreadsheets and other computer software. The applications we study occur in a wide variety of applications. Recommended Course Background: One semester of calculus
Prerequisites: AS.110.106 or AS.110.108
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

Prereq: Calculus I Overview of some of the more common computational platforms in which to do applied mathematics. The course will cover computing in at least three general areas: numerical linear algebra using Matlab, symbolic mathematics using Maple, and statistics using R. Students will be presented with applications, basic mathematics that underlies the problems to be solved, and computational approaches to their solution.
Instructor(s): D. Naiman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.282. A Hands-On Introduction to MATLAB.
This is an introductory course in programming MATLAB for students in the mathematical sciences. MATLAB is widely used in research and industry for numerical calculations, plotting of functions and data, and the creation of user interfaces. Short tutorial lectures will be followed by problem solving sessions. Topics emphasized will be basic programming in the MATLAB environment and the practical solution of problems in matrix calculations, differential equations, signal and image processing, and machine learning.
Prerequisites: AS.110.201 OR AS.110.212 OR EN.550.291
Instructor(s): T. Ding
Area: Quantitative and Mathematical Sciences.

EN.550.283. Introduction to R.
This is an introductory course in R for both undergraduate and graduate students. R is a programming language and software environment that provides a wide variety of statistical and graphical techniques, including linear and nonlinear modeling, classical statistical tests, time-series analysis, etc. We will discuss data structures, data entry and manipulation, graphical procedures, statistical models, and programming in R. No previous programming experience is required.
Instructor(s): T. Bosede
Area: Quantitative and Mathematical Sciences.

EN.550.284. VBA For Finance.
Excel VBA is a powerful programming environment that lurks behind the Excel program that many of us have some familiarity with. This course aims to get students up to speed with working with this tool.
Instructor(s): D. Naiman
Area: Quantitative and Mathematical Sciences.

This is an introductory course in programming python for students in the mathematical sciences. Short tutorial lectures will be followed by problem solving sessions. Topics emphasized will include linear algebra problems, ordinary differential equations and optimization. Also a particular interest will be given to practical machine learning problems (classification, regression and clustering).
Instructor(s): K. Lahouel
Area: Quantitative and Mathematical Sciences.

EN.550.291. Linear Algebra and Differential Equations.
An introduction to the basic concepts of linear algebra, matrix theory, and differential equations that are used widely in modern engineering and science. Intended for engineering and science majors whose program does not permit taking both AS.110.201 and AS.110.302.
Prerequisites: (AS.110.106 OR AS.110.108) AND (AS.110.107 OR AS.110.109)
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.
An introduction to probability and statistics at the calculus level, intended for engineering and science students planning to take only one course on the topics. Combinatorial probability, independence, conditional probability, random variables, expectation and moments, limit theory, estimation, confidence intervals, hypothesis testing, tests of means and variances, goodness-of-fit. Recommended course background: Co-requisite, Multivariable Calculus.
Prerequisites: ( AS.110.106 OR AS.110.108 ) AND ( AS.110.107 OR AS.110.109 ); Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430
Instructor(s): P. Athavale
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.311. Probability and Statistics for the Biological Sciences and Engineering.
An introduction to probability and statistics at the calculus level, intended for students in the biological sciences planning to take only one course on the topics. This course will be at the same technical level as EN.550.310. Students are encouraged to consider EN.550.420-430 instead. Combinatorial probability, independence, conditional probability, random variables, expectation and moments, limit theory, estimation, confidence intervals, hypothesis testing, tests of means and variances, and goodness-of-fit will be covered. Students cannot receive credit for both EN.550.310 and EN.550.311. Students cannot receive credit for EN.550.311 after having received credit for EN.550.420 or EN.550.430. Recommended Course Corequisite: AS.110.202
Prerequisites: ( AS.110.106 OR AS.110.108 ) AND ( AS.110.107 OR AS.110.109 ); Statistics Sequence restriction: students who have completed any of these courses may not register: EN.550.310 OR EN.560.435 OR EN.550.420 OR EN.550.430
Instructor(s): P. Athavale
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.361. Introduction to Optimization I.
Appropriate for undergraduate and graduate students without the mathematical background required for EN.550.661. An introductory survey of optimization methods, supporting mathematical theory and concepts, and application to problems of planning, design, prediction, estimation, and control in engineering, management, and science. Study of varied optimization techniques including linear programming, network-problem methods, dynamic programming, integer programming, and nonlinear programming. Appropriate for undergraduate and graduate students without the mathematical background required for EN.550.661.
Prerequisites: EN.550.361 AND ( AS.110.202 OR AS.110.211 )
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.362. Introduction to Optimization II.
An introductory survey of optimization methods, supporting mathematical theory and concepts, and application to problems of planning, design, prediction, estimation, and control in engineering, management, and science. Study of varied optimization techniques including linear programming, network-problem methods, dynamic programming, integer programming, and nonlinear programming. Appropriate for undergraduate and graduate students without the mathematical background required for EN.550.661.
Prerequisites: EN.550.361 AND ( AS.110.202 OR AS.110.211 )
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

Computing experience. A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication: How can we ensure the privacy of messages? Coding theory studies how to make communication reliable: How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow. Recommended Course Background: AS.110.204
Prerequisites: EN.550.171 AND ( EN.550.291 OR AS.110.201 )
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

In this course, we will study numerical methods, and scientific computing using the Python language. We will discuss topics in numerical analysis, such as equation solving, differential equations, interpolation, integration etc. We will also introduce image analysis techniques such as filtering, denoising, inpainting, and segmentation. We will discuss core computer language concepts, algorithms, and data-structures using Python. No previous experience with computer programming is needed.
Prerequisites: ( EN.550.291 OR AS.110.201 ) AND ( AS.110.202 OR AS.110.211 )
Instructor(s): P. Athavale
Area: Quantitative and Mathematical Sciences.

A first course on computational linear algebra and applications. Topics include floating-point arithmetic, algorithms and convergence, Gaussian elimination for linear systems, matrix decompositions (LU, Cholesky, QR), iterative methods for systems (Jacobi, Gauss-Seidel), and approximation of eigenvalues (power method, QR-algorithm). Theoretical topics such as vector spaces, inner products, norms, linear operators, matrix norms, eigenvalues, and canonical forms of matrices (Jordan, Schur) are reviewed as needed. Matlab is used to solve all numerical exercises; no previous experience with computer programming is required.
Prerequisites: ( EN.550.291 OR AS.110.201 OR AS.110.212 ) AND ( AS.110.202 OR AS.110.211 )
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.
A first course on computational differential equations and applications.
Topics include floating-point arithmetic, algorithms and convergence, root-finding (midpoint, Newton, and secant methods), numerical differentiation and integration, and numerical solution of initial value problems (Runge-Kutta, multistep, extrapolation methods, stability, implicit methods, and stiffness). Theoretical topics such as existence, uniqueness, and stability of solutions to initial-value problems, conversion of higher order/ non-autonomous equations to systems, etc., will be covered as needed. Matlab is used to solve all numerical exercises; no previous experience with computer programming is required.
Prerequisites: ( EN.550.291 OR AS.110.201 OR AS.110.212) AND ( AS.110.202 OR AS.110.211 )
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

A first course on computational differential equations in vector spaces and applications, a continuation of EN.550.385. Topics include root-finding for nonlinear systems of equations (bisection, Newton, and secant methods), numerical differentiation and integration, and numerical solution of initial-value problems (Runge-Kutta, multistep, extrapolation methods, stability, implicit methods, and stiffness) and boundary-value problems (shooting method, relaxation) for ordinary differential equations in finite-dimensional vector spaces. Theoretical topics such as existence, uniqueness, and stability of solutions to initial-value problems, conversion of higher-order/non-autonomous equations to systems, etc., will be covered as needed. Matlab is used to solve all numerical exercises.
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

Mathematical concepts and methods for describing and analyzing linear and nonlinear systems that evolve over time. Topics include boundedness, stability of fixed points and attractors, feedback, optimality, Liapounov functions, bifurcation, chaos, and catastrophes. Examples drawn from population growth, economic behavior, physical and engineering systems. The main mathematical tools are linear algebra and basic differential equations.
Prerequisites: EN.550.291 OR AS.110.201 OR AS.110.211
Instructor(s): P. Athavale
Area: Engineering, Quantitative and Mathematical Sciences.

Creating, analyzing and evaluating optimization and mathematical models using case studies. Project-oriented practice and guidance in modeling techniques, with emphasis on communication of methods and results. Applications may include transportation networks, scheduling, industrial processes, and telecommunications. Computation will be emphasized throughout using MATLAB.
Prerequisites: EN.550.361 OR EN.550.362
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.413. Applied Statistics and Data Analysis.
An introduction to basic concepts, techniques, and major computer software packages in applied statistics and data analysis. Topics include numerical descriptive statistics, observations and variables, sampling distributions, statistical inference, linear regression, multiple regression, design of experiments, nonparametric methods, and sample surveys. Real-life data sets are used in lectures and computer assignments. Intensive use of statistical packages such as S+ to analyze data.
Prerequisites: EN.550.112 or EN.550.310 or EN.550.311 or EN.550.420
Instructor(s): M. Tang
Area: Engineering, Quantitative and Mathematical Sciences.

This course explores common issues around computational analysis of massive data. We will learn about numerical inaccuracies in calculations, work with databases, and venture out into parallel computing (multi-threading and CUDA). Students will be introduced to streaming algorithms and elements of robust statistics.
Instructor(s): T. Budavari
Area: Natural Sciences, Quantitative and Mathematical Sciences.

EN.550.420. Introduction to Probability.
Probability and its applications, at the calculus level. Emphasis on techniques of application rather than on rigorous mathematical demonstration. Probability, combinatorial probability, random variables, distribution functions, important probability distributions, independence, conditional probability, moments, covariance and correlation, limit theorems. Students initiating graduate work in probability or statistics should enroll in EN.550.620. Auditors are not permitted. Students can use any of the 6th, 7th or 8th editions of the textbook. Recommended Course Background: one year of calculus; Corequisite: multivariable calculus.
Prerequisites: Prereqs: AS.110.106 OR AS.110.108 AND AS.110.107 OR AS.110.109 OR AS.110.113;Statistics Sequence restriction: students who have already completed EN.550.430 may not register
Instructor(s): F. Torcaso
Area: Engineering, Quantitative and Mathematical Sciences.

Mathematical theory of stochastic processes. Emphasis on deriving the dependence relations, statistical properties, and sample path behavior including random walks, Markov chains (both discrete and continuous time), Poisson processes, martingales, and Brownian motion. Applications that illuminate the theory. Students may not earn credit for both EN.550.426 and EN.550.427.
Prerequisites: EN.550.420 AND ( EN.550.291 OR AS.110.201 OR AS.110.212)
Instructor(s): F. Torcaso
Area: Engineering, Quantitative and Mathematical Sciences.
A development of stochastic processes with substantial emphasis on the processes, concepts, and methods useful in mathematical finance. Relevant concepts from probability theory, particularly conditional probability and conditional expectation, will be briefly reviewed. Important concepts in stochastic processes will be introduced in the simpler setting of discrete-time processes, including random walks, Markov chains, and discrete-time martingales, then used to motivate more advanced material. Most of the course will concentrate on continuous-time stochastic processes, particularly martingales, Brownian motion, diffusions, and basic tools of stochastic calculus. Examples will focus on applications in finance, economics, business, and actuarial science. Students may not receive credit for both EN.550.427 and EN.550.426.
Prerequisites: Students may not receive credit for both
EN.550.427 and EN.550.426; EN.550.420
Instructor(s): D. Athreya
Area: Quantitative and Mathematical Sciences.

EN.550.428. Stochastic Processes and Applications to Finance II.
A basic knowledge of stochastic calculus and Brownian motion is assumed. Topics include stochastic differential equations and Brownian motion is assumed. Topics include stochastic differential equations, the Feynman-Kac formula and connections to partial differential equations, changes of measure, fundamental theorems of asset pricing, martingale representations, first passage times and pricing of path-dependent options, and jump processes.
Prerequisites: EN.550.427
Instructor(s): J. Miller
Area: Quantitative and Mathematical Sciences.

EN.550.430. Introduction to Statistics.
Introduction to the basic principles of statistical reasoning and data analysis. Emphasis on techniques of application. Classical parametric estimation, hypothesis testing, and multiple decision problems; linear models, analysis of variance, and regression; nonparametric and robust procedures; decision-theoretic setting. Bayesian methods.
Prerequisites: EN.550.420 OR APPROVED ALTERNATIVE AND
( EN.550.291 OR AS.110.201 OR AS.110.212 )
Instructor(s): D. Naiman
Area: Engineering, Quantitative and Mathematical Sciences.

Denoising, segmentation, texture modeling, tracking, object recognition are challenging problems in imaging. We will present a collection of statistical models and methods in order to address these, including the E.M. algorithm, Maximum Entropy Modeling, Particle filtering, Markov Random Fields and Belief Propagation. Co-listed with EN.580.466. Some practice of Matlab or R is highly recommended.
Prerequisites: (AS.110.202 OR AS.110.211) AND (EN.550.310 OR EN.550.311 OR EN.550.420)
Instructor(s): B. Jedynak
Area: Engineering, Quantitative and Mathematical Sciences.

The objective of the course is to survey essential simulation techniques for popular stochastic models. The stochastic models may include classical time-series models, Markov chains and diffusion models. The basic simulation techniques covered will be useful in sample-generation of random variables, vectors and stochastic processes, and as advanced techniques, importance sampling, particle filtering and Bayesian computation may be discussed.
Prerequisites: EN.550.430
Instructor(s): J. Spall
Area: Engineering, Quantitative and Mathematical Sciences.

Nonparametric, or distribution-free methods for statistical data analysis design statistical decision regions under minimal assumptions on the observed data, avoiding, in particular, making the assumption that their distribution is known, or that it belongs to a specific parametric class (like Gaussian). The course will study the following topics: order statistics, rank-based methods, tests of independence, symmetry, location differences, scale differences and goodness-of-fit, permutation tests with an introduction to the problem of multiple comparisons.
Prerequisites: Prereqs: EN.550.310 OR EN.550.311 OR EN.550.430
Instructor(s): E. Younes
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.436. Data Mining.
Data mining is a relatively new term used in the academic and business world, often associated with the development and quantitative analysis of very large databases. Its definition covers a wide spectrum of analytic and information technology topics, such as machine learning, artificial intelligence, statistical modeling, and efficient database development. This course will review these broad topics, and cover specific analytic and modeling techniques such as advanced data visualization, decision trees, neural networks, nearest neighbor, clustering, logistic regression, and association rules. Although some of the mathematics underlying these techniques will be discussed, our focus will be on the application of the techniques to real data and the interpretation of results. Because use of the computer is extremely important when “mining” large amounts of data, we will make substantial use of data mining software tools to learn the techniques and analyze datasets. Recommended Course Background: EN.550.413
Prerequisites: EN.550.310 or EN.550.311 or EN.550.430
Instructor(s): T. Budavari
Area: Engineering, Quantitative and Mathematical Sciences.

Managing and analyzing big data in finance can be of ultimate challenge but of ultimate opportunity. The need for statistical tools and machine learning techniques has been gradually influencing the marketplace. This course will explore several topics of machine learning and statistical finance, while the emphasis will be the applications on market prediction, risk detection and validity of finance models. The tentative topics include traditional finance models, linear models, kernel methods (e.g. support vector machine), hidden Markov models, decision trees, dimensionality reduction (e.g. PCA, low rank approximation), conditional modeling and conditional inference, and hypothesis testing. Students will be involved in several projects (computer experiments) to exam those tools with real market data. Recommended Course Background: EN.550.428
Prerequisites: (EN.550.420 OR EN.550.620) AND (EN.550.430 OR EN.550.630)
Instructor(s): L. Chang
Area: Engineering, Quantitative and Mathematical Sciences.

Time series analysis from the frequency and time domain approaches. Descriptive techniques; regression analysis; trends, smoothing, prediction; linear systems; serial correlation; stationary processes; spectral analysis.
Prerequisites: (EN.550.310 OR EN.550.311 OR EN.550.420) AND
(AS.110.201 OR AS.110.221 OR EN.550.291)
Instructor(s): F. Torcaso
Area: Engineering, Quantitative and Mathematical Sciences.
**EN.550.441. Equity Markets and Quantitative Trading.**
This course introduces equity markets from a mathematical point of view. The properties of equities and equity-linked instruments will be described. Several quantitative trading strategies will be studied. Order execution tactics and the effect of market structure will be analyzed. Students will select a specialized aspect of the equity markets to investigate and complete a related independent project.

**Prerequisites:** EN.550.442 or instructor's permission  
Instructor(s): J. Miller  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.442. Investment Science.**
Intended for upper-level undergraduate and graduate students, this course offers a rigorous treatment of the subject of investment as a scientific discipline. Mathematics is employed as the main tool to convey the principles of investment science and their use to make investment calculations for good decision-making. Topics covered in the course include the basic theory of interest and its application to fixed-income securities, cash flow analysis and capital budgeting, mean-variance portfolio theory, and the associated capital asset pricing model, utility function theory and risk analysis, derivative securities and basic option theory, portfolio evaluation. The student is expected to be comfortable with the use of mathematics as a method of deduction and problem solving. Some familiarity with optimization is desirable but not necessary.

Instructor(s): J. Miller  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.443. Financial Computing in C++.**
The first part of course, will introduce the basic concepts of C++ including variables, functions, pointers and references, function and operator overloading and along with inheritance and polymorphism, templates and the C++ Standard Library. Basic ideas of object-oriented design will be introduced. The second part of the course will cover computational techniques for solving mathematical problems arising in finance. Numerical solution of parabolic partial differential equations for option valuation and their relation to tree methods together with a basic introduction of concepts such as convergence and stability as applied to finite difference schemes. Prerequisites EN.550.427 Stochastic Processes and Applications to Finance. No prior experience with C/C++ is required.

**Prerequisites:** EN.550.427  
Instructor(s): M. Bichuch  
Area: Quantitative and Mathematical Sciences.

**EN.550.444. Introduction to Financial Derivatives.**
This course will develop the mathematical concepts and techniques for modeling cash instruments and their hybrids and derivatives.

**Prerequisites:** AS.110.302 AND EN.550.420  
Instructor(s): D. Audley  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.445. Interest Rate and Credit Derivatives.**
Advances in corporate finance, investment practice and the capital markets have been driven by the development of a mathematically rigorous theory for financial instruments and the markets in which they trade. This course builds on the concepts, techniques, instruments and markets introduced in EN.550.444. In addition to new topics in credit enhancement and structured securities, the focus is expanded to include applications in portfolio theory and risk management, and covers some numerical and computational approaches.

**Prerequisites:** EN.550.444  
Instructor(s): D. Audley  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.446. Risk Measurement/Management in Financial Markets.**
This course applies advanced mathematical techniques to the measurement, analysis, and management of risk. The focus is on financial risk. Sources of risk for financial instruments (e.g., market risk, interest rate risk, credit risk) are analyzed; models for these risk factors are studied and the limitation, shortcomings and compensatory techniques are addressed.

**Prerequisites:** EN.550.444  
Instructor(s): D. Audley  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.447. Quantitative Portfolio Theory and Performance Analysis.**
This course focuses on modern quantitative portfolio theory, models, and analysis. Topics include intertemporal approaches to modeling and optimizing asset selection and asset allocation; benchmarks (indexes), performance assessment (including, Sharpe, Treynor and Jenson ratios) and performance attribution; immunization theorems; alpha-beta separation in management, performance measurement and attribution; Replicating Benchmark Index (RBI) strategies using cash securities / derivatives; Liability-Driven Investment (LDI); and the taxonomy and techniques of strategies for traditional management: Passive, Quasi-Passive (Indexing) Semi-Active (Immunization & Dedicated) Active (Scenario, Relative Value, Total Return and Optimization). In addition, risk management and hedging techniques are also addressed.

**Prerequisites:** Prereq: EN.550.442 OR EN.550.444  
Instructor(s): D. Audley  
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.550.448. Financial Engineering and Structured Products.**
This course focuses on structured securities and the structuring of aggregates of financial instruments into engineered solutions of problems in capital finance. Topics include the fundamentals of creating asset-backed and structured securities—including mortgage-backed securities (MBS), stripped securities, collateralized mortgage obligations (CMOs), and other asset-backed collateralized debt obligations (CDOs)—structuring and allocating cash-flows as well as enhancing credit; equity hybrids and convertible instruments; asset swaps, credit derivatives and total return swaps; assessment of structure-risk interest rate-risk and credit-risk as well as strategies for hedging these exposures; managing portfolios of structured securities; and relative value analysis (including OAS and scenario analysis).

**Instructor(s): D. Audley  
Area: Engineering, Quantitative and Mathematical Sciences.**
EN.550.449. Advanced Equity Derivatives.
This course will cover the pricing, trading and risk management of equity derivatives, with emphasis on more exotic derivatives such as path-dependent and multi-asset derivatives. The course will emphasize practical issues: students will build their own pricing and risk management tools, and gain experience simulating the dynamic hedging of a complex derivatives portfolio. Students will practice structuring and selling equity derivative products. Pricing issues such a model selection, unobservable input parameters and calibration will be discussed, and students will learn techniques to manage the often highly nonlinear and discontinuous risks associated with these products. The course will have a significant computing component: both in the classroom and as homework projects, students will use Excel, write VBA macros and write and call C++ routines in the Microsoft Windows environment (which is the most common computing environment used by the financial industry).
Prerequisites: EN.550.444
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.450. Computational Molecular Medicine.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional "omics" data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful).
Prerequisites: (EN.550.420 AND EN.550.430) OR equivalent courses in probability and statistics.
Instructor(s): D. Geman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.453. Mathematical Game Theory.
Mathematical analysis of cooperative and noncooperative games. Theory and solution methods for matrix game (two players, zero-sum payoffs, finite strategy sets), games with a continuum of strategies, N-player games, games in rule-defined form. The roles of information and memory. Selected applications to economic, recreational, and military situations. Prereq: Multivariable Calculus, probability, linear algebra.
Prerequisites: (AS.110.202 OR AS.110.211) AND (EN.550.420 AND EN.550.291 OR AS.110.201)
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

Study in depth of a special mathematical or computational area of operations research, or a particular application area. Recent topics: decision theory, mathematical finance, optimization software.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.
This course will examine the mathematical methods relevant to modeling biological phenomena, particularly dynamical systems and probability. Topics include ordinary differential equations and their simulation; stability and phase plane analysis; branching processes; Markov chains; and stochastically perturbed systems. Biological applications will be drawn from population growth, predator-prey dynamics, epidemiology, genetics, intracellular transport, and neuroscience.
Prerequisites: ( EN.550.420 OR EN.550.310 OR EN.550.311 ) AND (( EN.550.291 ) OR ( AS.110.201 AND AS.110.302 ))
Instructor(s): D. Athreya
Area: Natural Sciences, Quantitative and Mathematical Sciences.

EN.550.493. Mathematical Image Analysis.
This course gives an overview of various mathematical methods related to several problems encountered in image processing and analysis, and presents numerical schemes to address them. It will focus on problems like image denoising and deblurring, contrast enhancement, segmentation and registration. The different mathematical concepts shall be introduced during the course; they include in particular functional spaces such as Sobolev and BV, Fourier and wavelet transforms, as well as some notions from convex optimization and numerical analysis. Most of such methods will be illustrated with algorithms and simulations on discrete images, using MATLAB.
Prerequisites: linear algebra, multivariate calculus, basic programming in MATLAB. Recommended Course Background: Real analysis
Prerequisites: ( AS.110.202 OR AS.110.211 ) AND ( EN.550.291 OR AS.110.201 OR AS.110.212)
Instructor(s): N. Charon
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.500. Undergraduate Research.
Reading, research, or project work for undergraduate students. Pre-arranged individually between students and faculty.
Instructor(s): D. Fishkind; E. Scheinerman; Staff.

Instructor(s): J. Wierman.

Reading, research, or project work for undergraduate students. Pre-arranged individually between students and faculty. Recent topics and activities: percolation models, data analysis, course development assistance, and dynamical systems.
Instructor(s): F. Torcaso; Staff.

EN.550.503. Preparation for Research.
Primarily an independent study course. Readings, assignments, and discussion to prepare students for research in applied mathematics and statistics. Topics include the research process, problem-solving, mathematical writing, LaTeX, Beamer, reading mathematics, literature search, oral presentations, REU programs, and the publication process. Brief meetings to be arranged. Students are expected to spend 3 to 4 hours per week in addition to the meetings. Grading is Satisfactory/Unsatisfactory only.

Instructor Permission Required - Opportunity for students to particiate
Instructor(s): B. Castello
Area: Quantitative and Mathematical Sciences.

Instructor(s): D. Fishkind
Area: Quantitative and Mathematical Sciences.

Preparation of a substantial thesis based upon independent student research, under the pre-arranged supervision of at least one faculty member in Applied Mathematics and Statistics. Instructor permission required.
Instructor(s): D. Geman; F. Torcaso.

EN.550.517. Undergraduate Internship.
Instructor(s): Staff.

EN.550.574. Research-Intersession.
Instructor(s): D. Fishkind; E. Scheinerman; J. Fill.

EN.550.590. Internship-Summer.
Instructor(s): Staff.

EN.550.597. Research-Summer.
Instructor(s): Staff.

EN.550.599. Independent Study.
Instructor(s): D. Fishkind; E. Scheinerman; J. Fill; N. Lee.

EN.550.600. Department Seminar.
A variety of topics discussed by speakers from within and outside the university. Required of all resident department graduate students.
Instructor(s): D. Robinson.

EN.550.620. Probability Theory I.
The course objectives are to develop probabilistic reasoning and problem solving approaches, to provide a rigorous mathematical basis for probability theory, and to examine several important results in the theory of probability. Topics include axiomatic probability, independence, random variables and their distributions, expectation, integration, variance and moments, probability inequalities, and modes of convergence of random variables. The course will include introductory measure theory as needed. Students are expected to have previous study of both analysis and probability. This course is the first half of a yearlong sequence. The second semester’s course, EN.550.621 Probability Theory II, will cover classical limit theorems, characteristic functions, and conditional expectation.
Prerequisites: EN.550.420 and AS.110.405 or equivalent
Instructor(s): V. Lyzinski.

EN.550.621. Probability Theory II.
Probability at the level of measure theory, focusing on limit theory. Modes of convergence, Poisson convergence, three-series theorem, strong law of large numbers, continuity theorem, central limit theorem, Berry-Esseen theorem, infinitely divisible and stable laws.
Prerequisites: EN.550.620 OR AS.110.405
Instructor(s): J. Fill.

EN.550.622. Introduction to Stochastic Calculus.
A graduate-level class on stochastic calculus, providing a rigorous introduction on stochastic integrals and differential equations.
Prerequisites: EN.550.621
Instructor(s): M. Bichuch.
This course explores several topics and tools toward modern applications of probability and statistics in computational, cognitive, engineering, and neural sciences. The course will introduce the theoretical background for each topic, while the emphasis will be on the applications that are not often covered in the standard probability and statistics courses. The tentative topics include: Gibbs distribution and the maximum entropy with connections to large deviations and information theory; Nonparametric statistics ("learning theory") and classifications including consistency, bias/variance tradeoff, and regularization; Markov chains and their applications in MCMC computing and hidden Markov models; Graphical models and their applications; Parameter estimation, the EM algorithm and applications on image template learning. For each topic, there will be a related project assignment, which is composed of both paper work problems and computer experiments, designed to demonstrate the mathematics and the utility of the approach in the topic. Students are required to submit their own work individually.
Prerequisites: EN.550.310 OR EN.550.311 OR ( EN.550.420 AND EN.550.430)
Instructor(s): L. Chang.

EN.550.630. Statistical Theory.
The fundamentals of mathematical statistics will be covered. Topics include: distribution theory for statistics of normal samples, exponential statistical models, the sufficiency principle, least squares estimation, maximum likelihood estimation, uniform minimum variance unbiased estimation, hypothesis testing, the Neyman-Pearson lemma, likelihood ratio procedures, the general linear model, the Gauss-Markov theorem, simultaneous inference, decision theory, Bayes and minimax procedures, chi-square methods, goodness-of-fit tests, and nonparametric and robust methods.
Prerequisites: EN.550.420 or EN.550.620.
Instructor(s): C. Priebe.

EN.550.631. Statistical Theory II.
Advanced concepts and tools fundamental to research in mathematical statistics and statistical inference: asymptotic theory; optimality; various mathematical foundations.
Instructor(s): C. Priebe.

The course will cover Bayesian methods for exploratory data analysis. The emphasis will be on applied data analysis in various disciplines. We will consider a variety of topics, including introduction to Bayesian inference, prior and posterior distribution, hierarchical models, spatial models, longitudinal models, models for categorical data and missing data, model checking and selection, computational methods by Markov Chain Monte Carlo using R or Matlab. We will also cover some nonparametric Bayesian models if time allows, such as Gaussian processes and Dirichlet processes. Prerequisite: 550.630 (recommended) or 550.430
Prerequisites: EN.550.630 OR EN.550.430
Instructor(s): Y. Xu.

This course covers advanced topics in Bayesian statistical analysis beyond the introductory course. Therefore knowledge of basic Bayesian statistics is assumed (at the level of “A first course in Bayesian statistical methods”, by Peter Hoff (Springer, 2009). The models and computational methods will be introduced with emphasis on applications to real data problems. This course will cover nonparametric Bayesian models including Gaussian process, Dirichlet process (DP), Polya trees, dependent DP, Indian buffet process, etc. Recommended Course Background: EN.550.632 or permission from the instructor
Instructor(s): Y. Xu.

EN.550.635. Topics in Bioinformatics.
A “readings” course organized around research articles in the recent bioinformatics and computational biology literatures. In this term, the choice of papers will favor work on inferring phenotype from genotype, and modeling signaling networks, based on gene microarrays bearing the expression levels of thousands of transcripts, and on properties of proteins, such as predicting active sites and detecting harmful mutations. One major objective is to prepare students to comfortably read articles which involve extensive mathematical and statistical modeling as well as techniques from pattern recognition and machine learning. Most papers will be presented by the students. In addition, student expositions will be preceded by “tutorials” by the instructor on various aspects of statistical learning, modeling and prediction, such as properly estimating generalization error in cancer classification and avoiding over-fitting in learning networks of molecular interactions. Recommended Course Background: course in statistics; previous exposure to machine learning or pattern recognition
Instructor(s): D. Geman.

The focus of this roundtable-format course will be stochastic modeling as relates to system identification and maximum likelihood. The principles and algorithms being covered in this course have tremendous importance in the world at large. For example, maximum likelihood is arguably the most popular method for parameter estimation in most real-world applications. System identification is the term used in many fields to refer to the process of mathematical model building from experimental data, with a special focus on dynamical systems. The system identification process refers to several important aspects of model building, including selection of the model form (linear or nonlinear, static or dynamic, etc.), experimental design, parameter estimation, and model validation. This course will cover topics such as the maximum likelihood formulation and theory for dynamical systems, the EM (expectation-maximization) algorithm and its variants, Fisher information, common model structures, online versus offline estimation, the role of feedback in identification (i.e., open-loop versus closed-loop estimation), standard and extended Kalman filtering, and uncertainty characterization (e.g., confidence regions). Recommended Course Background: Undergraduate-level matrix theory and ordinary differential equations; graduate-level course in probability and statistics (e.g., 550.430 or equivalent; in particular, students should have prior exposure to maximum likelihood and Bayes’ rule). Prior experience in data analysis and algorithms will be helpful.
Instructor(s): J. Spall.
**EN.550.642. Investment Science-Commodities as a Unique Asset Class.**
The aims of the course are the following: 1. understand the properties of commodities and shipping as an asset class distinct from bonds and equity, 2. learn the fundamental economic results, e.g., theory of storage, established for commodities by leading figures like Keynes and Kaldor, 3. recognize the specific difficulties of the different groups, i.e., energy, metals, agricultural and shipping, 4. analyze the forward curve and its stochastic modeling, with or without seasonality, 5. discuss the pricing and hedging of options mostly traded in commodity markets, such as Asian and spread, as well as the valuation of physical assets through alternative approaches, 6. identify the different ways of investing in Commodities: Futures, ETFs, indexes, structured notes. Students should have rudimentary knowledge of financial markets.

**Prerequisites:** Rudimentary knowledge of financial markets; EN.550.420 and (AS.110.106 or AS.110.108)

**Instructor(s):** H. Geman.

**EN.550.643. Graphical Models.**
This course describes how models based on networks encoding the conditional dependency structure between random variables, also called graphical models, can be used to design multivariate probability distributions. A special focus will be made on important particular cases, like Markov Chains, Bayesian networks or Markov Random Fields. We will also discuss parametric estimation and inference problems, and issues arising when some of the variables cannot be observed.

**Prerequisites:** EN.550.420 or equivalent AND EN.550.430 or equivalent

**Instructor(s):** L. Chang.

**EN.550.646. Advanced Topics in Derivatives.**
Topics will include static arbitrage versus dynamic arbitrage, proof of Black-Scholes formula using a change of measure, the Modigliani-Miller representation of the corporation, Merton model of corporate debt valuation, Asian options’ operational use, pricing and hedging; stochastic volatility and local volatility models; elements of market microstructure and high frequency trading. Grading will be mostly based on oral presentations. The course is aimed at second year Master’s students and will not begin meetings until mid-October.

**Instructor(s):** H. Geman.

**EN.550.647. Financial Mathematics Masters Seminar.**
This course is only open to students enrolled in the MSE in Financial Mathematics program. Advanced topics chosen according to the interests of the instructor and graduate students. The course will focus on recent research articles in the financial mathematics literature.

**Instructor(s):** D. Audley.

**EN.550.648. Credit and Systemic Risk.**
Credit risk is a topic which has become of fundamental importance after the recent crisis, due to the larger number of credit quality deteriorations and default events. This course deals with mathematical modeling and valuation of credit risk. Students will be exposed to key theoretical principles (doubly stochastic intensity processes, enlargement of filtrations, risk measures), related to the construction of modern credit risk management systems. The course will analyze computational techniques for simulating default times, as well as methodologies for measuring credit losses based on probabilistic tools. We will discuss topics of currently high research interest, such as counterparty risk valuation, systemic risk, liquidity risk, and default contagion.

**Prerequisites:** (EN.550.426 OR EN.550.427) AND EN.550.620

**Instructor(s):** A. Capponi.
EN.550.653. Commodities and Commodity Markets.
The first half of this course will be devoted to energy markets, both in terms of the market itself and how to model peculiar features of this business. First we will discuss fossil fuels, including physical and financial natural gas and LNG; crude and refined petroleum commodities; and possibly coal markets. Then the focus will turn to electricity markets, including market structures; energy, capacity and ancillary services markets; characteristics of demand; power plant commitment and dispatch; the “stack” or market supply curve; characteristics of different plants and fuels; regional differences in markets; and hedging techniques from trading vanilla products all the way to complex multi-commodity structures. We will discuss renewable energy sources, their characteristics, economics, and effects on the larger market, as well as emissions markets as a way of removing pollution externalities. The first half will conclude by elaborating on risk management techniques; credit; legislation and regulation; and derivative accounting as time permits. The second half of the course will turn to shipping, metals and agricultural markets. The metal physical markets will be described, the major Exchanges presented (LME, SHFE), as well as the warehousing issues in the case of base metals. The case of precious metals will be singled out, and gold in particular; and finally uranium and rare earths. Agricultural (grains and softs) markets will be presented, together with the crucial issues of biofuels, fertilizers, water, and arable land. In all cases, there will be a large focus on the trading activities – both to hedge and to gain exposure to commodities – in spot and derivative markets. Numerous examples of forward curves will be provided, as well as volatility skews. The valuation of swaps, spread options and Asian options will be (re)derived. Students should have rudimentary knowledge of financial markets. Recommended Course Background: EN.550.420 and AS.110.106 or AS.110.108
Instructor(s): G. Schultz; H. Geman.

This course considers algorithms for solving various important nonlinear optimization problems and, in parallel, develops the supporting theory. Primary focus will be on unconstrained and bound-constrained optimization. Topics will include: necessary and sufficient optimality conditions; gradient, Newton, and quasi-Newton based line-search and trust-region methods; linear and nonlinear least-squares problems; linear and nonlinear conjugate gradient methods; stochastic optimization; optimal gradient methods; structured nonsmooth optimization, and derivative-free optimization. Special attention will be paid to the large-scale case and will include topics such as limited-memory quasi-Newton methods, projected gradient methods, and subspace accelerated two-phase methods for bound-constrained optimization. Recommended Course Background: Multivariable Calculus, Linear Algebra; Coreq: AS.110.405
Instructor(s): D. Robinson.

This course considers algorithms for solving various nonlinear constrained optimization problems and, in parallel, develops the supporting theory. Topics include: necessary and sufficient optimality conditions for constrained optimization; projected-gradient and two-phase accelerated subspace methods for bound-constrained optimization; simplex, interior-point, Bender’s decomposition, and the Dantzig-Wolfe decomposition methods for linear programming; duality theory; penalty, augmented Lagrangian, sequential quadratic programming, and interior-point methods for general nonlinear programming. In addition, we will consider the Alternating Direction Method of Multipliers (ADMM), which is applicable to a huge range of problems including sparse inverse covariance estimation, consensus, and compressed sensing.
Instructor(s): S. Arguillere.

EN.550.663. Stochastic Search & Optimization.
An introduction to stochastic search and optimization, including discrete and continuous optimization problems. Topics will include the “no free lunch” theorems, beneficial effects of injected Monte Carlo randomness, algorithms for global and local optimization problems, random search, recursive least squares, stochastic approximation, simulated annealing, evolutionary and genetic algorithms, machine (reinforcement) learning, and statistical multiple comparisons. Students should have knowledge of basic matrix algebra. Recommended Course Background: Graduate course in probability and statistics
Instructor(s): J. Spall.

Concepts and statistical techniques critical to constructing and analyzing effective simulations; emphasis on generic principles rather than specific applications. Topics include model building (bias-variance tradeoff, model selection., Fisher information), benefits and drawbacks of simulation modeling, random number generation, simulation-based optimization, discrete multiple comparisons using simulations, Markov chain Monte Carlo (MCMC), and input selection using optimal experimental design.
Instructor(s): J. Spall.

This course presents algorithms for convex optimization along with the supporting theoretical convergence results. The chosen topics covered, which are driven by big data and machine learning applications, include convex sets and functions, gradient methods (steepest descent, line searches, rates-of-convergence for weakly and strongly convex functions, Frank-Wolfe method), accelerated methods (heavy ball, Nesterov), stochastic gradient, coordinate descent, proximal and projected gradient methods, duality theory and duality-based algorithms (augmented Lagrangian, ADMM), and Newton/quasi-newton methods. Recommended Course Background: (AS.110.201 or AS.110.212 or EN.550.291) and AS.110.405
Instructor(s): D. Robinson.

The main goal of this course is to introduce students to combinatorial optimization techniques. The first part of the course will focus on combinatorial algorithms for classical problems. The next part of the course will show how polyhedral theory can be used to deal with combinatorial optimization problems in a unifying manner. Familiarity with linear programming and algorithms desirable but not strictly required. Recommended Course Background: Linear Algebra.
Instructor(s): A. Basu.
EN.550.671. Combinatorial Analysis.
An introduction concurrently with combinatorial analysis at the graduate level.
Meets concurrently with 550.471. See 550.471 for course description.
Recommended Course Background: EN.550.291 or AS.110.201
Instructor(s): E. Scheinerman.

EN.550.672. Graph Theory.
An introduction to graph theory at the graduate level. See 550.472 for course description.
Meets with EN.550.472
Prerequisites: EN.550.291 OR AS.110.201 OR AS.110.212
Instructor(s): A. Basu.

The purpose of this class is to provide an elementary knowledge of the
differential geometry of curves and surfaces, and to place this in relation with the description and characterization of 2D and 3D shapes.
Intrinsic local and semi-local descriptors, like the curvature or the second fundamental form will be introduced, with an emphasis on the invariance of these features with respect to rotations, translations, etc.
Extension of this point of view to other class of linear transformations will be given, as well as other shapes of shape descriptors, like moments or medial axes.
Recommended Course Background: Calculus III and linear algebra
Instructor(s): E. Younes
Area: Engineering, Quantitative and Mathematical Sciences.

Brief review of topics in elementary numerical analysis such as floating-point arithmetic, Gaussian elimination for linear equations, interpolation and approximation.
Core topics to be covered: numerical linear algebra including eigenvalue and linear least-squares problems, iterative algorithms for nonlinear equations and least squares problems, and convergence theory of numerical methods.
Other possible topics: sparse matrix computations, numerical solution of partial differential equations, finite element methods, and parallel algorithms.
Instructor(s): N. Charon.

This class will explore basic aspects of functional analysis, focusing mostly on normed vector spaces. This will include, in particular, the Hahn-Banach and open mapping theorems, a discussion of strong and weak topologies, the theory of compact operators, and spaces of integrable functions and Sobolev spaces, with applications to the study of some partial differential equations.
Recommended Course Background: AS.110.415/AS.110.416/AS.110.605 or EN.550.620
Prerequisites: AS.110.405 or equivalent
Instructor(s): E. Younes.

The course will provide fundamental concepts and methods that pertain the analysis of the variation of anatomical shapes extracted from medical images. It will review basic properties of the most important shape representations (landmark, curves, surfaces, images...), describe distances and discrepancy measures that allow for their comparison, and introduce nonlinear optimal control methods that underlie the Large Deformation Diffeomorphic Metric Mapping (LDDMM) family of registration algorithms.
The course will then discuss shape averaging methods and template-centered representations for the analysis of shape datasets.
Recommended Course Background: Optimization (EN.550.361 or higher) and (AS.110.202 OR AS.110.211 or higher) AND AS.110.302 or higher.
Prerequisites: ( AS.110.202 OR AS.110.211 or higher) AND ( AS.110.302 or higher)
Instructor(s): E. Younes.

EN.550.690. Neural Networks and Feedback Control Systems.
This roundtable course is an introduction to two related areas: neural networks (NNs) and control systems based on the use of feedback.
Artificial NNs are effective conceptual and computational vehicles for many important applications; feedback control is relevant to virtually all natural and human-made systems.
NNs are applied in areas such as system modeling and control, function approximation, time-series filtering/prediction/smoothing, speech/image/signal processing, and pattern recognition.
Topics to be covered for NNs include network architecture, learning algorithms, and applications.
Specific NNs discussed include perceptrons, feedforward networks with backpropagation, and recurrent networks.
This course also provides an introduction to feedback control systems, including the role of feedback in regulating systems and in achieving stability in systems.
We consider stochastic (noise) effects in feedback systems.
We also consider the interface of NNs and control by discussing how NNs are used in building modern control systems in problems where standard methods are infeasible.
Recommended Course Background: Matrix theory, differential equations, and a graduate course in probability and statistics.
Instructor(s): J. Spall.

This course is open only to AMS department master's students.
Instructor(s): D. Audley; D. Naiman.

A second course in linear algebra with emphasis on topics useful in analysis, economics, statistics, control theory, and numerical analysis.
Review of linear algebra, decomposition and factorization theorems, positive definite matrices, norms and convergence, eigenvalue location theorems, variational methods, positive and nonnegative matrices, generalized inverses.
Prerequisites: ( AS.110.202 OR AS.110.211 ) AND ( AS.110.201 OR AS.110.212 OR EN.550.291 ) AND AS.110.405
Instructor(s): D. Fishkind.

EN.550.693. Turbulence Theory.
An advanced introduction to turbulence theory for graduate students in the physical sciences, engineering and mathematics.
Both intuitive understanding and exact analysis of the fluid equations will be stressed.
Students should have previous familiarity with fluid mechanics.
Instructor(s): G. Eyink.

EN.550.694. Turbulence Theory II.
This course will continue the theoretical investigation of fluid turbulence, directly following on from EN.550.693.
Topics to be considered are turbulent vortex dynamics, Lagrangian dynamics, and special topics such as wall-bounded turbulence, free shear flows, two-dimensional and quasigeostrophic turbulence, MHD turbulence, etc.
Cross-listed with Physics
Prerequisites: EN.550.693
Instructor(s): G. Eyink.
This course will present an overview of topics in science-based parameterization, including dynamics, probability and other applied mathematical methods. These concepts will be presented in a unified format, with some emphasis on scientific computing. Specific topics include: basic probability, statistical dynamics, (moment hierarchies, Liouville/forward equations, path-integral methods), asymptotic closure (homogenization, Chapman-Enskog), closure techniques without any separation of scales (non-linear Galerkin & Weighted residuals, algebraic closures, PDF-based closures, down-scaling), uncertainty quantification (variance & other measures of uncertainty, Bayesian estimation, ensemble methods), hybrid methods.
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

his course will discuss turbulence theory relevant for planetary atmospheres and oceans (including Earth's) and astrophysical plasmas. The three basic topics will be two-dimensional & geostrophic turbulence, compressible fluid turbulence, and magnetohydrodynamic turbulence. It would be useful for students to have taken courses EN.550.693-694, but these are not formal prerequisites and material from those courses will be reviewed as required. Exact mathematical results will be developed wherever possible to inform physical theories. The course focuses on coarse-grained nonlinear dynamics, turbulent cascades, wave-turbulence interactions, scaling theories, and relevant experimental observations from satellites and spacecraft.
Instructor(s): G. Eyink.

A control system is a dynamical system on which one can act through a parameter that can be chosen freely at any point in time. In this class, we will be interested in two main problems. The first one is controllability, which studies conditions for the existence of controls allowing an initial point to be driven to any other point. The second one is optimal control, in which we will study methods to minimize a certain cost over all possible controls, possibly with endpoint constraints. Such problems have many applications in engineering: crossing a river with minimal fuel, planning trajectories of rocket engines etc. Pre-requisites: Multivariate Calculus, Linear Algebra, Differential Equations. Some familiarity with Optimization is recommended, but not mandatory.
Instructor(s): S. Arguillere.

EN.550.700. Master's Research.
Reading, research, or project work for Master's level students. Arranged individually between students and faculty.
Instructor(s): Staff.

EN.550.701. Graduate Independent Study.
Instructor(s): C. Priebe; E. Vishniac.

Recent advances in computer science, physics, and statistics have been made possible by correspondingly sharpened quantitative developments in the mathematical theory of Markov chains. Possible topics: rates of convergence to stationarity, eigenvalue techniques, Markov chain Monte Carlo, perfect simulation, self-organizing data structures, approximate counting and other applications to computer science, reversible chains, interacting particle systems.
Instructor(s): J. Fill.

EN.550.730. Topics In Statistics.
Roundtable course covers system identification and maximum likelihood for models, including EM (expectation-maximization) and variants, online versus offline estimation, role of feedback in estimation (open-loop versus closed-loop), and uncertainty bounds. Students should have an understanding of matrix theory and ordinary differential equations. Prior experience in data analysis and algorithms will be helpful. Recommended Course Background: EN.550.430; in particular, students should have prior exposure to maximum likelihood and Bayes' rule.
Instructor(s): M. Tang.

EN.550.735. Topics in Statistical Pattern Recognition.
The Dissimilarity Representation for Pattern Recognition. This course will investigate aspects of statistical inference and statistical pattern recognition associated with observing only dissimilarites between entities rather than observing feature vectors associated with the individual entities themselves. Recommended Course Background: EN.550.735
Instructor(s): M. Tang.

This course will cover various topics in financial mathematics and will be co-taught in two parts Part one (Chavez-Bedoya) will cover various aspects of portfolio optimization, and part two (Geman) will cover topics including stochastic time changes, subordination, pure jump Lévy Processes; the Lévy- Kintchine and its relationship to the Fast Fourier transform of option prices. The last part will be dedicated to general changes of probability measure in finance.
Instructor(s): H. Geman; L. Chavez-Bedoya.

Topics in Discrete Mathematics: Graphons. Just as real numbers can be defined as limits of convergent sequences of rational numbers, graphons are the limits of convergent sequences of graphs. The notion of a graphon is very recent (less than a decade old) but graphons already are playing an interesting role in pure combinatorics (extremal graph problems) and in applications/algorithms for huge networks. Active participation by students is key as we work our way through challenging ideas.
Instructor(s): E. Scheinerman.

One of the most powerful tools currently applied in combinatorics. This course covers the basic method, with applications to graph theory, combinatorics, and especially algorithm design.
Instructor(s): V. Lyzinski.
Analysis of Algorithms. This course in the probabilistic analysis of algorithms (AofA) will be accessible to any student who has had at least one course in probability and will be most beneficial to those who have had at least one probability course at the measure-theoretic level. The course will review basic topics from the theory of probability that have proved useful in AofA. It will provide introductions to more advanced AofA-relevant topics chosen from such topics as: Markov chains, branching processes, urn models, Poissonization (and de-Poissonization), various metrics on distributions, fixed-point characterizations of distributions, convergence of sequences of stochastic processes, perfect simulation using Markov chains (and otherwise), and large deviation principles. The course will interweave probability theory and applications to AofA, focusing on the fundamentally important and exceptionally rich example of limiting distributions for various ways of measuring the cost of executing the QuickSort and QuickSelect algorithms.
Instructor(s): J. Fill.

Instructor(s): Staff.

Open to students in the Financial Mathematics Master’s Program only.
Instructor(s): Y. Li.

EN.550.805. Communications Practicum.
Open to students in the Financial Mathematics Master’s Program only.
Instructor(s): J. Heiserman.

Instructor(s): C. Priebe.

Discussion of new results in the specified research area based on journal articles, research monographs and current research. Each week a participant in the seminar will present a lecture. Organized by advanced graduate students with the sponsorship of an Applied Mathematics and Statistics faculty member.
Instructor(s): A. Basu; D. Robinson.

Continuation of EN.550.692.
Instructor(s): D. Fishkind.

Cross Listed Courses

Biomedical Engineering
EN.580.694. Statistical Connectomics.
This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).
Instructor(s): J. Vogelstein
Area: Engineering.

Computer Science
EN.600.442. Modern Cryptography.
This course focuses on cryptographic algorithms, formal definitions, hardness assumptions, and proofs of security. Topics include number-theoretic problems, pseudo-randomness, block and stream ciphers, public-key cryptography, message authentication codes, and digital signatures. Recommended Course Background: EN.600.226 and a 300-level or above systems course; EN.600.271/EN.600.471 and EN.550.171 or equivalent.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

This is a second graduate level course in machine learning. It will provide a formal and an in-depth coverage of topics at the interface of statistical theory and computational sciences. We will revisit popular machine learning algorithms and understand their performance in terms of the size of the data (sample complexity), memory needed (space complexity), as well as the overall computational runtime (computation or iteration complexity). We will cover topics including nonparametric methods, kernel methods, online learning and reinforcement learning, as well as introduce students to current topics in large-scale machine-learning and randomized projections. Topics will vary from year-to-year but the general focus would be on combining methodology with theoretical and computational foundations. [Analysis or Applications] Prerequisites: EN.600.475 OR EN.600.476 OR EN.600.676 OR permission of the instructor.
Instructor(s): R. Arora.

Biomedical Engineering
www.bme.jhu.edu

Faculty and students in the Department of Biomedical Engineering have been breaking new ground in biomedical research for over 50 years, and we strive to continue this history of innovation and discovery every day. Some examples of biomedical engineering include instrumentation and systems for use in medical environments, health care delivery systems, therapeutic and prosthetic devices such as artificial organs and orthopedic implants, and the application of quantitative methods and engineering-based modeling to basic research in the biological sciences.

The Department of Biomedical Engineering offers three programs of study to prepare students to work in this area: an undergraduate program leading to a bachelor’s degree with a choice of B.S. or B.A., a master’s degree program, and a doctoral degree program.

Research in the department focuses on several general areas: biomaterials, biomedical imaging systems, biomedical sensors and instrumentation, cardiovascular systems physiology, molecular and cellular engineering physiology, systems neuroscience, theoretical and computational biology, cell and tissue engineering, and nanobiotechnology.

Facilities
The center of gravity for the Department of Biomedical Engineering is the Traylor, Ross, Miller, and Smith research buildings on the campus of the School of Medicine. This location favors a close association with other basic medical science programs and provides access to the clinical environment of one of the nation’s top-ranked hospitals. The Homewood campus houses the Whitaker Biomedical Engineering
The undergraduate program provides a strong foundation in mathematics, engineering, and science. It emphasizes preparation for advanced study in an area related to biomedical engineering and is broad enough to accommodate students who plan graduate work in biology, medicine, engineering, biophysics, physiology, or biomedical engineering.

Thus, the objective of the undergraduate program is to educate students majoring in biomedical engineering who will attain one or both of the following upon or within a few years of graduation:

- entry into graduate (M.S. or Ph.D. degree programs) or professional schools (medical, dental, veterinarian, business, public health, law)
- employment in jobs that utilize biomedical engineering or a related field.

Each student plans a curriculum suited to his or her goals with the assistance of a faculty advisor. Upon completion of the B.S. in biomedical engineering, students will demonstrate the ability to:

- apply knowledge of advanced mathematics, life sciences, natural sciences, and principles of engineering to problems at the interface of engineering, biology, and medicine and mathematically model and simulate biological systems using computers.
- design and conduct experiments, as well as analyze and interpret data; formulate hypotheses for experiments, including those on living systems; devise procedures for experiments, including those on living systems; collect and validate data using appropriate equipment; display, describe, summarize, and interpret experimental results in a lab report; relate the experimental results to previous work, including the interaction between living and non-living materials and systems; and practice lab safety.
- design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability; identify a need and define the biomedical engineering problem to be solved, determine the constraints to the problem and assess the successful likelihood for different approaches, undergo the design process of creation, synthesis, and integration and evaluate success of the design to meet the desired need.
- function on multidisciplinary teams; understand team goals and complementary roles and expertise of each team member; share opinions and viewpoints with other team members; and assume and fulfill individual responsibilities within a team.
- identify, formulate, and solve engineering problems; conceptualize the engineering problem, formulate a solution to the problem, and solve problems using experimental, mathematical and/or computational tools.
- understand professional and ethical responsibility; understand the guidelines for ethical and responsible use of human subjects and data for research; understand the guidelines for ethical and responsible use of animals for research; understand professional and ethical standards in the workplace and properly reference the work of others.
- communicate effectively; synthesize, summarize, and explain technical content in a written report; and synthesize, summarize, and explain technical content in an oral presentation.
- understand the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context; understand the contributions biomedical engineers can play in academia, industry, and government; and understand how biomedical engineering solutions are of benefit inside and outside the U.S.
- recognize the need for, and gain an ability to engage in, life-long learning; use library resources, professional journals, and Internet effectively; update technical literacy to understand contemporary issues; and recognize the need for self-assessment.
- comprehend contemporary issues; understand recent developments in biomedical engineering; understand differing viewpoints in academia, government, industry, and business; and gain the ability to search and critically evaluate scientific literature.
- use the techniques, skills, and modern engineering tools necessary for engineering practice; gain proficiency in computer simulations...
and mathematical analysis tools; create mathematical models; develop laboratory skills applied to living systems; and utilize data acquisition systems.

The program also encourages individual study and research and gives academic credit for them. Students are welcome to work in laboratories on the Homewood campus or at the Medical Institutions in East Baltimore.

**Bachelor of Science in Biomedical Engineering**

Students seeking the B.S. degree are encouraged to focus their studies on one of five subspecialties that incorporates traditional engineering disciplines and biomedical applications. See the Biomedical Engineering Undergraduate Advising Manual for specifics on focus areas, lists of recommended mathematics and engineering electives, limitations on credits for courses with overlapping material, and the design content of engineering courses.

**Requirements for the B.S. Degree**

(See also General Requirements for Departmental Majors (p. 20.).)

The B.S. degree in biomedical engineering requires 129 credits. The courses listed below must either be taken or passed by examination for advanced credit. Engineering, science, and mathematics courses may not be taken satisfactory/unsatisfactory. No more than 6 credits of engineering, science, or mathematics courses in which a grade of D was received may be counted.

**Basic Sciences (22 credits)**

**Humanities and Social Sciences (18 credits)**

These courses should form a coherent program, relevant to the student’s goals, with at least one course at the 300-level or higher. They should include:

- One course in which ethical and social issues related to technology are discussed.
- At least two semesters of writing-intensive courses.

**Biomedical Core Knowledge (35 credits)**

The program also encourages individual study and research and gives academic credit for them. Students are welcome to work in laboratories on the Homewood campus or at the Medical Institutions in East Baltimore.

**Focus Area (21 credits)**

Each student is required to take one of five Biomedical Engineering focus areas.

**Design**

Among the technical elective courses offered, at least 6 credits must come from an approved list of design options.

**Computer Programming**

Select 1 of the following courses.

*Johns Hopkins University - 2015-2016*
** Building on the foundation of this core curriculum, each student is required to take a cohesive sequence of advanced engineering encompassing one of five Biomedical Engineering focus areas. A student’s choice of focus area is made before the start of the junior year and is based on their experience with the Biomedical Engineering Core and their answers to the questions given below:

** Systems Biology **— “Do you want to focus on understanding at a fundamental level how biological systems work?”

** Sensors, Micro/Nano Systems, and Instrumentation **— “Do you want to build things that facilitate research or clinical medicine?”

** Cell/Tissue Engineering and Biomaterials **— “Do you want to create replacement cells, tissues, and organs?”

** Computational Bioengineering **— “Do you want to focus on the use of mathematical theory or computers to solve complex biological and medical problems?”

** Imaging **— “Do you want to develop new imaging technology to reveal how biological systems work or diagnose disease?”

Courses in a focus area must be taken for a total of 21 or more credits. At least 18 credits must come from the relevant upper-level engineering course list; a maximum of three credits from the non-upper-level engineering course list may count in focus area.

Among the technical elective courses offered, at least 6 credits must come from an approved list of design options. There are many combinations of courses, programs and independent study opportunities to satisfy this requirement. This is discussed in detail in the Undergraduate Handbook. Please refer to http://www.bme.jhu.edu/undergraduate/resources.htm for applicable courses designed for each focus area by faculty members with research interests appropriate to the area; all faculty members are active participants in shaping the undergraduate curriculum.

Master of Science in Engineering

The master’s degree program is designed for students who wish to pursue careers in research and development, or as a step toward Ph.D. or M.D./Ph.D. education. The program, which is designed to be completed in two years, consists of core courses, elective courses, and a thesis project. The project may be basic research in a laboratory or practical engineering related to patient monitoring or other clinical problems.

Admission and Financial Aid

Students with undergraduate degrees in engineering are eligible to apply. Exceptional students with degrees in basic sciences may also apply, but would normally have to take a number of courses to overcome deficiencies in their curriculum.

All students have the potential to receive full tuition support by obtaining a position in a research laboratory. Research assistantships are usually advertised by various laboratories in the institution to carry out specific research and development projects. Students without a research assistantship are expected to pay full tuition independently. Fellowships are also awarded to the top students in the program.

Applications for admission are due by the appointed deadline (usually in mid-January).

For more information and to apply online, go to http://www.bme.jhu.edu/graduate/mse/apply.

Requirements for the M.S.E. Degree

Each student will take a minimum of 24 credits of courses at the 400-level or higher and complete a thesis. Students fulfill the course requirement by taking two courses in the Systems Bioengineering sequence (EN.580.421, EN.580.422 or EN.580.429) and other advanced engineering, math, and science courses. Students are usually advertised by various laboratories in the institution to carry out specific research and development projects. Students are advised to make an early start toward their master’s thesis. The M.S.E. program grants partial tuition fellowship awards on the basis of academic merit. Research assistantships are usually advertised by various laboratories in the institution to carry out specific research and development projects. Fellowships are also awarded to the top students in the program.

B.S./M.S.E. Program

Students enrolled in the B.S. program in biomedical engineering may pursue a combined B.S./M.S.E. degree that can be completed in five years. Students should apply in their junior year and adhere to the published deadlines and application requirements. (The only exception is that biomedical engineering undergraduates do not need to take the GRE.) Course work should be carefully structured so as to fulfill all the requirements for the B.S. as well as the M.S.E. degree in a timely and coordinated manner. Students are advised to make an early start toward their master’s thesis. The M.S.E. program grants partial tuition fellowship awards on the basis of academic merit. Research assistantships are usually advertised by various laboratories in the institution to carry out specific research and development projects. Fellowships are also awarded to the top students in the program.

Master of Science in Engineering in Innovation and Design

The Center for Bioengineering Innovation and Design (CBID), housed in the Department of Biomedical Engineering, focuses on the design aspect of Biomedical Engineering. This exciting program gives students opportunities to design, develop, build, and test devices that solve some of the most pressing problems facing clinicians today.

The mission of CBID is to:

• Improve human health by developing medical devices that solve important clinical problems
• Educate a new generation of medical device engineers and fellows
• Facilitate technology transfer and industry collaboration

In the graduate program CBID students will learn to identify clinical needs and innovate a novel solution to solve that clinical problem. Working in teams, students work closely with engineering faculty and physicians throughout the medical institution to come up with device ideas, build prototypes, research intellectual property, learn about the regulatory process, write business plans, and present their designs to fellow students, faculty, and outside advisors.

Undergraduate students in BME can also become involved in medical device design by joining an undergraduate design team which works on solving clinical problems by designing innovative devices.

Incorporated in all the BME design curriculum is a focus on technology commercialization. All students, graduate and undergraduate, will interact with clinical and corporate sponsors and have experiences that promote the development of leadership, communications, and
marketing skills, thus helping to ensure our graduates' professional success.

The CBID M.S.E. is a one-year program lasting from May through the following May. Please see our website for more information on our programs: http://cbid.bme.jhu.edu.

Information can also be found here: http://www.bme.jhu.edu/graduate/masters-design/

**Ph.D. in Biomedical Engineering through the School of Medicine**

Biomedical Engineering has emerged as one of the most exciting interdisciplinary research fields in modern science. Biomedical engineers apply modern approaches from the experimental life sciences in conjunction with theoretical and computational methods from the disciplines of engineering, mathematics, and computer science to the solution of biomedical problems of fundamental importance. The Biomedical Engineering Graduate Program of Johns Hopkins University is designed to train engineers to work at the cutting edge of this exciting discipline.

The cornerstone of the program is our belief in the importance of in-depth training of students in both life sciences and modern engineering. In-depth training in life sciences is achieved in one of two ways. Typically, incoming Ph.D. students enroll in the first year basic sciences curriculum of the Johns Hopkins University School of Medicine. That is, they learn human biology with the medical students. This is a unique and intensive curriculum covering a broad range of topics including molecules and cells, human anatomy, immunology, physiology, and neuroscience. Students choosing this option typically devote their entire first academic year to these courses. This curriculum is an excellent way to build a broad and solid foundation in the life sciences. Alternatively, students may elect alternative life sciences curricula. These curricula have been carefully designed to provide training in areas of the life sciences that are appropriate to each of the program's research areas. This option is of particular value to students who enter the program having a strong background in the life sciences. In-depth training in engineering, mathematics, and computer science is achieved through elective courses that are taken in the second year.

All students are admitted with full fellowship. This covers tuition and provides a modest stipend for the duration of their Ph.D. Because the students are fully funded, they can choose to perform their dissertation in essentially any laboratory in the University (subject to the approval of the Program directors). A special program with the National Heart, Lung, and Blood Institute of the National Institute of Health (NIH) allows students to also choose from research laboratories at the NIH.

Students typically do research rotations during the summer before start of the first academic semester, during the first year (typically as they are taking medical school courses), and during the following summer year. They are expected to choose a research laboratory before the start of the second academic year.

Emphasis is placed on original research leading to the doctoral dissertation. The research is usually experimental in nature, and students are expected to learn biological experimentation techniques. Nevertheless, experiment or theory can be emphasized in the research as desired by the student.

**Requirements for Admission**

The School of Medicine program accepts applications for the Ph.D. program until December 15 of each year. We typically recruit students in five areas: Computational Biology, Imaging, Tissue Engineering, Neural engineering, and Molecular, Neural, and Cardiac physiology (MNCP). The program is unique in that it offers the BME student the strengths of one of the best medical schools in the world. If you wish to combine engineering with cutting edge research in medicine, this may be the program for you.

In their first year, our students have the option of taking many of the same courses as the medical students, including human anatomy, molecules and cells, and genes to society. In their second year, our students take advanced engineering courses. Therefore, students that apply to our program need to not only have a strong background in engineering and mathematics, but also sufficient background in chemistry (including organic chemistry) and biology (at least two introductory courses).

The admission process is by committee. The applicant should specify which area they are interested in and write about the kind of research they are considering. The faculty in each area vote and rank the applicants. The final pool of applicants is ranked and voted on by the entire faculty.

About one third of our incoming students are international students. A short list of these students is formed by committee and the top candidates are interviewed by phone. Like all admitted students, international students receive full financial aid as well as a monthly stipend. They too have the freedom to choose from any lab.

Applications should be complete when submitted. In order to be considered a complete application we must have:

- A completed online application form.
- **Official transcripts from each college or university attended**—Sealed, official transcripts or certified records of all university (undergraduate and graduate) study must be submitted. If you have attended more than one institution, transcripts from each must be included with your application.
- **Official Graduate Record Examination**—GRE/MCAT scores will be acceptable and can be arranged through the Office of Graduate Affairs (address provided below). The GRE code for applying to graduate programs at the Johns Hopkins School of Medicine is 5316.
  - The BME Ph.D. program does not rely heavily on the GRE exam in making admissions or financial aid decisions. Research experience, course grades, and recommendations carry more weight. However, because the GRE score is part of the application and does affect admissions decisions in some cases, foreign applicants who took the GRE in its electronic form, in a country where the electronic test is no longer offered, are advised to retake the exam in its paper form. Applications will be considered regardless of which form of the exam was taken.
- **Three letters of recommendation**—These letters should come from faculty members who are acquainted with you and your academic work. These letters should be sealed and comment on your aptitude and promise for independent research.
- **Personal Statement**—A typewritten statement (one page maximum) indicating the basis of your interest in graduate study and your career objectives. Included should be a discussion of any research experience you have had.
Applicants for admission must fulfill the following course prerequisites:

- one year of college level biology (may include quantitative biology or physiology)
- one semester of organic chemistry
- differential equations

If you are interested in applying and do not have the prerequisite courses, you may want to submit your application with an explanatory note indicating you have made or will make arrangements to take the prerequisites before you would matriculate, if your application is accepted. In the past, applicants have taken the prerequisites at their present schools, local community colleges, etc. Courses taken at any accredited college or university are acceptable.

Each applicant must have received a B.A. or B.S. degree or its equivalent prior to matriculation. A Masters degree is not required for admission to our program.

All written correspondence and supporting documents should be sent directly to:

The Office of Graduate Affairs
The Johns Hopkins School of Medicine
1830 E. Monument St., Suite 2-107
Baltimore, MD 21205-2196
410-614-3385 phone
410-614-3386 fax
grad_study@jhmi.edu

Processing

The Ph.D. Program admissions committee will not consider any application until it is complete. Once an application has been received the applicant will be notified if supporting materials are missing.

Interview

The admissions committee will review completed applications and invite applicants to come to Johns Hopkins for a personal interview with faculty. Applicants from North America must come for an interview to be considered for admission. In the case of overseas applicants, for whom such a trip is not possible, a small number of telephone interviews will be conducted. The final admissions decisions will be made from the pool of interviewed applicants. Interviews are generally conducted in March.

Acceptance

Applicants will be notified by end of March of the outcome of their application. An offer of admission from the program will include a yearly stipend, full tuition, and paid medical and dental insurance. This applies to every accepted applicant, regardless of citizenship or national origin. Those offered admission will be asked to let us know their decision as soon as possible. In any case, we must have the applicant’s decision by April 15. Applications can be found at www.hopkinsmedicine.org/graduateprograms/application.cfm.

Financial Aid

Fellowships for tuition and support stipends (regardless of citizenship or national origin) are available from the general funds of the university. U.S. citizens and Permanent Residents are eligible for support from training grants from the NIH. Students are encouraged to apply for individual fellowships from the National Science Foundation and for NRSA awards from the NIH. Only online applications for admission are accepted and must be received by December 15.

Requirements for the Ph.D. Degree

The first two years are ordinarily devoted to advanced courses in engineering science and in biomedical science. Engineering, mathematics, and other physical science courses to be taken are arranged between students and their advisors. Each student is assigned a panel of three advisors during the first two years. Eighteen credit hours of course work in engineering, mathematics, or physical sciences are required. In addition, students must complete eighteen credit hours of course work in the life sciences. Of these 36 credit hours, at least six must be at the graduate level. At least three credit hours in a course with strong engineering or mathematical theory content at the 600-level must be taken.

Summers are spent working in a biomedical laboratory to gain experience and to seek out a suitable thesis research area. By the beginning of the third year, students should start original research leading to the dissertation. Students must fulfill a modest teaching requirement during one year of their program. The remaining time is spent in thesis research. The program typically takes five to six years to complete.

The student must pass a preliminary oral examination which will be a Graduate Board examination. This is taken in the first half of the third year. The student must then conduct original research, describe it in a dissertation, and pass a final oral examination that is a defense of the dissertation. There is a minimum residency requirement of two consecutive academic years.

Integrated M.D./Ph.D. Program

Candidates for the Ph.D. in biomedical engineering who wish to apply jointly for the M.D. degree must apply directly through the School of Medicine. Although the combined programs would normally require at least seven years to execute sequentially, the combined program can ordinarily be completed in six years, with appropriate planning. Good preparation in biology and chemistry as well as mathematics, engineering, and the physical sciences is essential. Life science graduate requirements are met by the first-year program of the School of Medicine. This program is more arduous than the Ph.D. program alone, but it may have marked advantages for students interested in clinical research and applications in hospital systems and in the delivery of health care. The catalog for the School of Medicine should be consulted for admissions requirements and procedures.

Information about applying to the combined M.D.-Ph.D. program can be found at www.hopkinsmedicine.org/mdphd/admissions (http://www.hopkinsmedicine.org/mdphd/admissions). Applications submitted for consideration of the combined degree will be reviewed by the Medical School admissions committee. If the Medical School admissions committee accepts the application, it is then passed along to the Biomedical Engineering Ph.D. Program admissions committee for review. A student applying to the combined program who wishes to be considered for the straight Ph.D. program must submit a written request to have his or her application forwarded to the Biomedical Engineering Ph.D. Program office for admission consideration if his or her application is not accepted by the Medical School admissions committee.

For current faculty and contact information go to http://www.bme.jhu.edu/people/completememberlist.php
Faculty
Chair
Leslie Tung
Interim Director and Director of the Undergraduate program in Biomedical Engineering: Functional electro-physiology of cultured cardiac cell networks, cardiac arrhythmias, analysis of multicellular structure, stem cell-derived cardiac cells.

Professors
Jennifer H. Elisseeff
Jules Stein Professor: tissue engineering, biomaterials, cartilage regeneration.
Taekjip Ha
Bloomberg Distinguished Professor: single molecular engineering and biophysics, DNA/RNA nanotechnology, cell mechanics, super-resolution microscopy.
Xingde Li
Endomicroscopy technologies, nanobiophotonics and molecular imaging, early detection (cancer, cardiovascular diseases, wound healing).
Elliot McVeigh
imaging.
Michael I. Miller
Herschel and Ruth Seder Chair in Biomedical Engineering: computational anatomy, medical imaging, image understanding.
Aleksander S. Popel
Physiological flows and molecular transport, microcirculation, cell mechanics.
Steven L. Salzberg
Bloomberg Distinguished Professor: Bioinformatics and computational biology.
Lawrence P. Schramm
Spinal cord injury and regeneration, neural regulation of the circulation.
Reza Shadmehr
Director of the Biomedical Engineering PhD program: human motor control and learning in health and disease, functional imaging of the brain, human neurophysiology, computational and theoretical neuroscience.
Jeffrey H. Siewersden
Medical imaging, image-guidance, flat-panel imagers, cone-beam CT, volume imaging, MRI, image science, imaging performance, radiation therapy.
Nitish V. Thakor
Medical instrumentation, medical micro and nanotechnologies, neurological instrumentation, signal processing, and neural prosthesis.
Natalia Trayanova
Murray B. Sachs Professor: computational cardiac electrophysiology and electro-mechanics, mechanisms of arrhythmogenesis and cardiac anti-arrhythmia therapies, cardiac dyssynchrony and resynchronization, development of cardiac models from imaging modalities.
Rene Vidal
Computer vision (camera sensor networks, recognition of human activities, dynamic scene analysis, structure from motion), biomedical imaging (processing of high angular resolution diffusion imaging, registration and segmentation of diffusion MRI, segmentation and fiber tracking of cardiac MRI, interactive medical image segmentation), machine learning (generalized principal component analysis, manifold learning and clustering, classification of dynamical systems), signal processing (consensus on manifolds, distributed optimization, compressive sensing).
Xiaoqin Wang
Neurophysiology of the auditory cortex, neural mechanisms of speech perception and learning, computational neuroscience.
Raimond L. Winslow
Raj and Neera Singh Professor of Biomedical Engineering: computational cell biology, systems biology, cardiac electrophysiology.

Associate Professors
Joel S. Bader
Bioinformatics, computational biology, systems biology, synthetic biology.
Michael A. Beer
Genomics and computational molecular biology.
Jordan J. Green
Cellular engineering, nanobiotechnology, biomaterials, controlled drug delivery and gene delivery.
Rachel Karchin
Computational molecular biology, bioinformatics, genetic variation.
Scot C. Kuo
Cell motility and mechanics, nanoscale biophysics, laser-based bioinstrumentation, advanced multiphoton and confocal microscopy.
Kevin J. Yarema
Director of the Master's degree program in Biomedical Engineering: metabolic glycoengineering, glycobiology, systems biology of glycosylation, carbohydrate-based cancer drug design and delivery, cellular responses to static magnetic fields.

Assistant Professors
Angelo Homayoun All
Spinal cord injury, stem cells, electrophysiology, imaging.
Patrick Cahan
Computational biology, stem cell biology, and single cell genomics.
Vikram Chib
Decision-making, motivation, movement, neuroscience, robotics, neuroeconomics.
Harry R. Goldberg
Assistant Dean of the School of Medicine: interactive simulations, virtual classrooms.
Warren L. Grayson
Tissue engineering, stem cells, bioreactors, biomaterials and orthopaedics.
Daniel Herzka
Cardiac magnetic resonance imaging, self-navigation, open-ended imaging, fast imaging, high resolution imaging, applications of MRI in cardiac electrophysiology, kinematic imaging, and fetal imaging.

Feilim Mac Gabhann
Computational modeling of growth factor-receptor networks, personalized medicine, individualized medicine, experimental studies of interindividual variation, therapeutic cardiovascular remodeling, novel methods for data visualization and automated image analysis, computational models of virus-host interactions.

Sridevi Sarma
Closed-loop deep brain stimulation, control theory, computational neuroscience and large-scale optimization.

J. Webster Stayman
Imaging physics, 3D image reconstruction, novel imaging systems, image-guided interventions and diagnostic imaging.

Winston Timp
Epigenetics, single cell analysis, single molecule biophysics, nanotechnology, systems biology, computational biology/bioinformatics.

Joshua T. Vogelstein
Big data science, connectomics, statistical neuroscience.

Youseph Yazdi
Medical instrumentation, medical device design, translation and commercialization of medical devices, biophotonics, optical spectroscopy.

Kechen Zhang
Theoretical neuroscience, computational neuroscience, neural computation.

Professors Emeriti

Richard J. Johns
University Distinguished Service Professor: Industrial liaison.

Murray B. Sachs
University Distinguished Service Professor: Auditory neurophysiology and psychophysics.

Artin A. Shoukas
Systems analysis of circulatory systems, systems physiology.

Eric D. Young
Auditory neurophysiology, neural modeling, sensory processes.

Adjunct Associate Professors

Yuanyi Gao
Methyomics, transcriptomics and bioinformatics big data analytics and visualization.

Xiaofeng Jia
Novel application of neuro-electrophysiology for detection and restoration of peripheral nerve and spinal cord injury, basic and clinical investigations in neurological injuries and therapeutic hypothermia of brain and spinal cord after asphyxial cardiac arrest.

Research Professor

Gary Brooker
Mechanism of receptor independent hormone desensitization, mechanisms of resistance to chemotherapeutic agents, optical methods in microscopy.

Andre Levchenko
Intracellular signal transduction, cell engineering, cancer research.

Alexander A. Spector
Biosolid mechanics, cell mechanics and biophysics, membrane mechanics, mechanotransduction, molecular motors, mathematical and computational modeling.

Associate Research Professor

Robert H. Allen
Design, education, biomechanics, birth mechanics.

J. Tilak Ratnanather
Computational anatomy, biomedical imaging, numerical analysis, mathematical biology of the cochlea.

Assistant Research Professor

Soumyadippta Acharya
Director of the Master’s degree program in Bioengineering Innovation and Design: Biomedical instrumentation, medical device innovation, neuroprosthetics, brain machine interfaces, computational neuroscience.

Siakumar Ardekani
Image-based (multi-detector CT and MRI) shape and motion analysis of cardiac disease using mathematical models, analysis of brain development and aging process using diffusion MRI and deformation based morphometry.

Nicholas J. Durr
Medical imaging, biomedical optics, endoscopy, ocular diagnostics, biomicroscopy, and medical device design.

David Masica
Novel computational methods to predict the impact of (epi)genetic alterations on human disease and drug response.

J. Webster Stayman
Imaging physics, 3D image reconstruction, novel imaging systems, image-guided interventions and diagnostic imaging.

Fijoy Vadakkumpadan
Patient-specific whole-heart modeling, ex vivo image-based cardiac modeling, image-based cardiac shape analysis, computational methods for brain surface mapping.

Research Associate

Ivy Dick
Ca2+ signaling mechanisms in neuronal and cardiac systems, Ca2+ channels, electrophysiology, channelopathies.

Kideok Jin
Drug resistant cancer, metastasis, angiogenesis, drug discovery.

Manu Ben Johny
Michael Scott Osmanski
Auditory neuroscience, perception and cortical representation of complex sounds, acoustic communication, comparative and evolutionary biology of hearing.

David Sherman
Quantitative and clinical neurophysiology, EEG, seizure detection, signal processing, instrumentation.

In Hong Yang
High throughput drug screening for axonal degeneration, myelination, electrical stimulation of nerve, stem cell differentiation.

Wojciech B. Zbijewski
System modeling for optimization of X-ray CT imaging chain, integration in novel reconstruction algorithms.

Karen I. Zeller
Synthetic biology.

**Senior Lecturers**

Eileen Haase
Freshmen Modeling and Design, System Bioengineering Laboratory I and II, Cell and Tissue Engineering Laboratory, Molecules and Cells, BME Teaching Practicum.

**Lecturers**

Lawrence B. Aronhime
Senior Lecturer (Center for Leadership Education): innovation, business, technology commercialization, accounting, entrepreneurship, engineering management, business history.

Paul Fearis
Industrial design, medical device design.

Elizabeth A. Logsdon
BME Design Studio Director, Engineering Design Education, Online Learning.

**Joint, Secondary, Part-Time, and Visiting Appointments**

Mohamad E. Allaf
Associate Professor (Urology): laparoscopic and robotic surgery.

William S. Anderson
Associate Professor (Neurosurgery): cerebrospinal fluid disorders and movement disorders.

Andreas G. Andreou
Professor (Electrical and Computer Engineering): bioelectronics, integrated micro and nano devices for the life sciences, natural and synthetic sensory systems, neural computation.

Isaac N. Bankman
Assistant Professor (Applied Physics Laboratory): biomedical signal and image processing.

Ronald D. Berger
Professor (Cardiology): mechanisms of sudden cardiac death, new modalities of ablation therapy, device development, signal processing.

Dan E. Berkowitz
Professor (Anesthesiology and Critical Care Medicine): molecular mechanisms of cardiovascular deconditioning in rodent models of microgravity, vasoregulatory dysfunction associated with obesity, diabetes, the role of leptin in vasoregulatory changes.

Paul A. Bottomley
Professor (Radiology): magnetic resonance imaging and spectroscopy, medical imaging.

Henry Brem
Professor (Neurosurgery): clinical treatments for brain tumor, anti-angiogenesis therapies, computer navigation systems used during surgery, brain tumor vaccines.

Jeff W.M. Bulte
Professor (Radiology): stem cells, cell therapy, imaging, nanotechnology, in vivo diagnostics.

John A. Carrino
Associate Professor (Radiology and Radiological Science): spine imaging novel MRI techniques, health services research informatics.

Charles C. Della Santina
Associate Professor (Otolaryngology-Head and Neck Surgery): electrical stimulation of the inner ear for restoring balance function, neurophysiology, vestibular function testing.

Andrew S. Douglas
Vice Dean for Faculty for the Whiting School of Engineering, Professor (Mechanical Engineering): nonlinear solid mechanics, soft tissue mechanics, mechanics of active materials.

Andrew Ewald
Associate Professor (Cell Biology and Oncology): cellular mechanisms and molecular regulation of epithelial morphogenesis in development and cancer.

Gene Fridman
Assistant Professor (Otolaryngology-Head and Neck Surgery): novel methods and devices for neural interfacing.

Paul A. Fuchs
Professor (Otolaryngology-Head and Neck Surgery): biophysics and sensory physiology of sensory hair cells and neurons on the inner ear.

Peter L. Gehrlich
Associate Professor (Ophthalmology): microsurgical tools, angiogenesis, antiangiogenesis, viral vectors, oxidative injury as they apply to diseases of the retina and vitreous, microsurgical tools, angiogenesis, antiangiogenesis, viral vectors, oxidative injury.

Donald Geman
Professor (Applied Mathematics and Statistics): statistical learning, visual recognition, computational genomics.

John Goutsias
Professor (Electrical and Computer Engineering): complex interaction networks, biochemical reaction system modeling and analysis, computational systems biology.

Edith D. Gurewitsch
Associate Professor (Gynecology and Obstetrics): birth simulation, birth mechanics, mechanical birth injury, shoulder dystocia, obstetric brachial plexus injury, human subjects testing.

Henry R. Halperin
Professor (Cardiology): cardiovascular medicine, MR compatible devices.
Justin Hanes  
Professor (Ophthalmology): drug and gene delivery, biomaterials synthesis, particle transport through biological barriers.

Kalina Hristova  
Professor (Materials Science and Engineering): biomolecular materials, biomembranes, biosensor development, signal transduction across biological membranes.

Chao-Wei Hwang  
Assistant Professor (Cardiology): optimization of PCI and stent-based drug delivery using computational fluid dynamics, cell-based therapy for the heart and peripheral vasculature, active sensing drug delivery systems.

Pablo A. Iglesias  
Professor (Electrical and Computer Engineering): computational biology, models of cellular signal transduction, directed cell motility, cell division, control systems.

Takanari Inoue  
Associate Professor (Cell Biology): directed cell migration, tumor metastasis, primary cilia, synthetic chemical biology, technology development.

David A. Kass  
Professor (Cardiology): molecular pathophysiology of heart failure and hypertrophy, pathobiology of cardiac dysynchrony and resynchronization, cardiac stress regulation by phosphodiesterase 5, nitric oxide synthase uncoupling, structure-function of sarcomeric proteins to cardiac mechanics, heart failure with preserved ejection fraction.

A. Jay Khanna  
Professor (Orthopaedic Surgery): spine surgery, minimally invasive, musculoskeletal imaging, image guidance for surgery, MRI, biomechanics, clinical outcomes.

Konstantinos Konstantopoulos  
Professor (Chemical and Biomolecular Engineering): cell adhesion and microfluidics, nanoscale mechanics, receptor biochemistry, quantitative modeling and functional genomics.

Albert C. Lardo  
Associate Professor (Cardiology): cardiovascular MRI, cardiovascular CT, image guided therapy.

Jonathan S. Lewin  
Professor (Radiology): interventional MRI, intraoperative MRI, neuroradiology.

Hai-Quan Mao  
Professor (Materials Science and Engineering): nanomaterials, electrospinning, nanofibers, biomimetic matrix, stem cell expansion and differentiation, nerve regeneration, micellar nanoparticle, therapeutic delivery, biodegradable polymers.

W. Lowell Maughan  
Professor (Department of Medicine): left ventricular function.

Robert E. Miller  
Associate Professor (Pathology Informatics): clinical laboratory instrumentation, laboratory information systems.

Wayne Mitzner  
Professor (Environmental Health Sciences, Program in Respiratory Biology and Lung Disease): modeling lung function, lung structure-function interactions, mechanical aspects of lung disease.

Hien Nguyen  
Assistant Professor (Surgery): clinical outcomes in hernia surgery, critical care medicine, bariatric surgery and metabolic syndrome.

Carey E. Priebe  

Jerry L. Prince  
Professor (Electrical and Computer Engineering): image processing and computer vision with application to medical imaging.

Lewis H. Romer  
Professor (Anesthesiology and Critical Care Medicine, Cell Biology, and Pediatrics, and the Center for Cell Dynamics): tissue engineering the micro-vasculature, extracellular matrix as an instructive environment, biophysics and biochemistry of matrix assembly, interactions between tyrosine kinases and Rho family GTPases in cell matrix adhesion, mechanochemical coupling in cell-matrix adhesion signaling, harnessing stem and progenitor cells for microvascular restitution.

Lakshmi Santhanam  
Assistant Professor (Anesthesiology and Critical Care Medicine): molecular mechanisms of vascular stiffness.

Lew Schon  
Associate Professor (Orthopaedic Surgery): surgical delivery systems for stem cells and bioactive molecules.

Mark J. Shelhamer  
Associate Professor (Otolaryngology-Head and Neck Surgery): sensorimotor adaptation, nonlinear dynamics, vestibular and oculomotor modeling, space flight adaptation, traumatic brain injury.

Joseph M. Smith  
Adjunct Associate Professor (Biomedical Engineering): health care innovations and technologies.

Sean Sun  
Associate Professor (Mechanical Engineering): biological force generation, molecular motors, cell motility, statistical mechanics of soft condensed materials.

Benjamin M.W. Tsui  
Professor (Radiology): molecular imaging including SPECT, PET and CT, anatomical and physiological models of humans and small animals, simulation of imaging systems and processes, quantitative image reconstruction methods, image quality assessment.

Jennifer Van Eyk  
Professor (Cardiology): proteomics, mass spectrometry, cardiac disease, biomarker discovery, technology development.

Tza-Huei (Jeff) Wang  
Professor (Mechanical Engineering): BioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Clifford R. Weiss  
Assistant Professor (Radiology and Surgery): Clinical Director of the Johns Hopkins Center for Bioengineering, Innovation and Design (CBID).
Thomas B. Woolf  
Professor (Physiology): molecular dynamics calculations, membrane biophysics, computational neurosciences.

Laurent Younes  
Professor (Applied Mathematics and Statistics): statistical properties of Markov random fields, image analysis, deformation analysis-shape recognition.

Elias Zerhouni  
Professor (Radiology): imaging.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

**EN.580.104. Advanced Cardiac Imaging.**  
This course starts with cardiac anatomy and physiology, a description of cardiac diseases and their prevalence in the US, and introduces the fundamentals of image acquisition in imaging modalities used in cardiac imaging such as computerized tomography (CT), magnetic resonance imaging (MRI), echocardiography, angiography and single positron emission computerized tomography (SPECT). The second part of the course covers recent advances in cardiac imaging in each modality with special focus on cardiac function assessment in CT and MRI.  
Instructor(s): A. Pourmorteza  
Area: Engineering, Natural Sciences.

**EN.580.105. Intellectual Property Primer for Scientists and Engineers: Patents, Copyrights, and Trademarks.**  
The course will outline the basics of protection of IP for scientists and engineers. Most of the course will cover the basics of patent law, but introductions will also be given to trademarks and copyrights. Specific problems in the areas of biotechnology, computer science and the Internet will also be highlighted. Students will obtain a basic understanding of how intellectual property is protected. No prior legal background is required.  
Instructor(s): J. Szipl  
Area: Social and Behavioral Sciences.

**EN.580.106. Discover Hopkins: Nanoparticles for Drug Delivery Applications.**  
Humans have used medication to treat diseases for many centuries; however, with the ever growing pharmaceuticals industry and stronger, more effective agents being designed, it has become clear that getting these drugs to their target cells only is a significant issue. Possibly the most striking example is intravenously (IV) administered chemotherapy agents. Patients receiving IV chemotherapy experience severe side-effects throughout their entire body such as hair loss, fatigue, nausea and general pain. This clearly illustrates the need for delivering drugs locally or targeting them to reach only the desired tissues, and this is where the field of nanoparticle drug delivery comes into play. Drug delivery involves encapsulating drugs in a delivery vehicle that can help sustain the release at therapeutic levels over an increased period of time and deliver it to the desired site. This course will focus on current developments as well as the methods used in the field of nanoparticle.  
Instructor(s): C. Bishop; K. Maisel  
Area: Engineering, Natural Sciences.

**EN.580.107. Immunoengineering: A New Frontier.**  
What therapy could cure debilitating diseases such as cancer, HIV, allergies, diabetes, Alzheimers, or influenza? Engineers and Immunologists are attempting to create this with your body’s own immune system. Understanding how these therapies work, how they might work in the future, and how to apply engineering principles to enhance these therapies will be the focus of this course.  
Instructor(s): A. Kosmides; J. Hickey  
Area: Engineering.

**EN.580.108. Neurologic Diseases to Nanoparticles.**  
This course will bring together ideas from neuropathology and bioengineering in order to build an experimental framework for translational research. Within lecture, we will outline challenges faced in the delivery of therapeutics to the central nervous system and describe how nanoparticles may overcome these obstacles. Labs will involve design and characterization of nanoparticles using dynamic light scattering and electron microscopy in addition to observing surgical procedures with animal models. Geared towards freshmen and sophomores.  
Instructor(s): N. O’Donnell; R. Shyam  
Area: Engineering, Natural Sciences.

**EN.580.109. Random Walks in Biology.**  
Since Einstein’s groundbreaking paper on the Brownian motion in 1905, there has been an explosion of activity in applying the concept of random walks to physics and biology. In this course, we will focus on the applications of random walks to cell biology. We will develop a detailed theory, and continue on to fascinating examples from ion diffusion to bacterial flagellar motion. Students will have the opportunity to suggest applications in their chosen biological area of interest.  
Instructor(s): H. Bazzazi  
Area: Natural Sciences.

**EN.580.111. BME Modeling and Design.**  
Working in teams with upperclassmen this course (1) introduces biomedical engineering freshmen to an orderly method for analyzing and modeling biological systems and (2) introduces engineering principles to solve design problems that are biological, physiological, and/or medical. Freshmen are expected to use the informational content being taught in calculus, physics and chemistry and to apply this knowledge to the solution of practical problems encountered in biomedical engineering. BME Freshmen only.  
Instructor(s): Staff  
Area: Engineering, Natural Sciences.

**EN.580.112. BME Design Group.**  
A two-semester course sequence where freshmen work with groups of BME upperclassmen mentors, and learn to use engineering principles to solve design problems that are biological, physiological, and/or medical. Freshmen are expected to use the informational content being taught in calculus, physics, and chemistry and apply this knowledge to the solution of practical problems encountered in biomedical engineering.  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering, Natural Sciences.
EN.580.117. Introduction to Research Laboratory Skills.
This course aims to familiarize first-year undergraduates with the basic lab skills necessary to work in a wet-lab. Specific skills covered will include pipetting, microscopy, PCR, gel electrophoresis, basic cell culture, simple microfluidics, and more! This hands-on experience will fully immerse students in the basics of laboratory research and should help prepare students looking for research or internship opportunities in the upcoming spring or summer semester.
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

The field of computational medicine faces a growing challenge presented by models and data of increasing size and complexity. Consequently, high performance computing (HPC) drives much leading-edge research in computational medicine. Students will be introduced to technical topics including C programming, memory management, data structures, algorithm design and analysis, computer architecture, debugging, optimization, numerical methods, MPI, and GPU programming. Techniques will be illustrated through biomedical applications including model simulation, sequence analysis, and image processing.
Instructor(s): M. Walker
Area: Engineering.

EN.580.122. Biotechnology Entrepreneurship.
This course will guide students through the basics of biotechnology entrepreneurship including the fundamentals, trials, and potential pitfalls. Students will learn the processes of identifying and validating industry needs, conducting market research, managing intellectual property, writing a business plan, developing a capitalization table, incorporating a formal entity, and raising funding. The course will also focus on development of intangible qualities of successful entrepreneurs and allow students to meet with and learn from seasoned Maryland entrepreneurs.
Instructor(s): K. Parikh
Area: Engineering.

EN.580.123. Introduction to SolidWorks for BMEs.
Undergraduate students are introduced to 3D modeling using SolidWorks. Basic part and assembly construction is taught. Proper geometric dimensioning and tolerancing (GDT) is discussed for industry-acceptable production of part drawings. Biomedical engineering applications and methods will be used as examples. One project will allow groups of students to 3D print a small part of their own design.
Instructor(s): A. Edwards
Area: Engineering.

This course will provide basic electronic theory of DC and AC circuits, components and their use. The course will emphasize hands-on circuit building. Students will have lecture and reading but 2/3’s of the course will be lab work. Students will be able to read basic schematics and breadboard 4-5 circuit projects using several devices.
Instructor(s): C. Browne
Area: Engineering.

EN.580.125. Principles of Osteochondral Eng..
The purpose of this course is to provide relevant background in biology and engineering principles to facilitate the design of engineered osteochondral grafts. The course will give an overview of osteochondral biology and development, followed by mechanical considerations with an emphasis on math-based theory. The course will also give an overview of biomaterials used in osteochondral engineering. Finally, we will go over examples of osteochondral engineering from the literature.
Instructor(s): B. Hung
Area: Engineering.

EN.580.200. Introduction to Scientific Computing in BME using Python, Matlab, and R.
This course is an introduction to scientific programming and computing designed for first-year students. The aim is to develop core computer skills required to succeed in research. Programming projects are drawn from current biomedical applications within BME. Emphasis is on algorithm development, large scale data analysis, and effective visualization of results, using MATLAB, Python, and R. Prior programming experience is not required.
Instructor(s): W. Timp
Area: Engineering.

Open only to engineering students; A series of weekly lectures to inform students about careers in biomedical engineering and to discuss technological, social, ethical, legal, and economic issues relevant to the profession. Topics include academic careers in biomedical engineering; biomedical engineering in industry (large corporations to sole entrepreneurship); health care delivery; ethical issues; legal issues (patenting, licensing, product liability); standards and government regulations; and economic issues in biomedical engineering industry (start-up companies, global businesses).
Instructor(s): A. Popel.

EN.580.205. The Heart: from Images to Models.
This course aims to familiarize students with the state-of-the-art imaging and computational modeling of the heart and how they could be employed in the diagnosis and treatment of heart disease. An overview of cardiac anatomy and electrophysiology along with the fundamentals of image acquisition in magnetic resonance imaging (MRI) and computed tomography (CT) will be provided. Special topics in cardiac MRI such as CINE, tagging, contrast enhancement and diffusion imaging will be discussed further. Students will then be familiarized with computer models of the heart and how they could be integrated with images to simulate electromechanical activity of the heart in patients. The course may involve hands-on experience with cardiac data.
Instructor(s): F. Pashakhanloo
Area: Engineering, Natural Sciences.

EN.580.211. BME Design Group.
Sophomore-level version of EN.580.311-312 or Perm. Req’d
Instructor(s): E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.

EN.580.212. BME Design Group.
Sophomore-level version of EN.580.111-112. Permission of course directors required.
Instructor(s): E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.
Primarily dealing with the process of recent advances in regenerative medicine, this course will focus on the interweaving of ethics, business, and science in recent issues and news (e.g. face transplants, Prop 71, FDA regulations, the stress-induced stem cell hoax, organ transplants, clinical trials of lab grown organs) and the practical applications of those interweavings on the students’ future careers. The course will also cover the common ethical frameworks, emerging economic factors, and considerations of both donor consent and donor rights.
Instructor(s): E. Nyberg
Area: Engineering, Social and Behavioral Sciences.

EN.580.216. Introduction to Synthetic Biology.
This course aims to make students familiar with the basic concepts in the field of synthetic biology. An overview of artificial and reengineered biological devices, perspectives, and ethical implications will be presented. Fundamental engineering principles of modularity, standardization, and abstraction hierarchy will be covered. The design of a subset of nucleic acid, protein-based devices as well artificial cells, tissues, and organisms will be discussed in further detail. Basic techniques used to engineer these synthetic systems will be presented. By the end of the course students will be asked to conceptualize the design of a device of their choice, and their strategy to build such a device.
Instructor(s): S. Razavi.

EN.580.218. Complex Network Analysis for Biology.
The study of networks of molecules, genes, proteins, individuals, and species is an important tool in areas such as systems biology and epidemiology in the health sciences. High throughput experimental techniques and databases of accumulated biological data provide a rich source of network data in the molecular biology domain. Network analysis can give us insights into the systematic organization of these networks and what it means for biology and it can also be a tool to generate testable hypotheses for individual genes or molecules. This class requires bringing a laptop to class.
Instructor(s): Y. Suhail
Area: Engineering, Natural Sciences.

EN.580.219. This Course Blows: Principles of Pulmonary Physiology.
This course will provide students with an introduction to basic concepts in the structure and function of the respiratory system. Topics to be covered will include basic anatomy, lung mechanics, gas exchange, and tests of pulmonary function and cardiopulmonary exercise. Class sessions will mix both lecture and hands-on measurement, and will include a field trip to a clinical physiology laboratory at JHH. It is recommended before beginning this course that students have completed a semester each of chemistry, physics, and calculus. Additionally, students must have at least one working lung.
Instructor(s): D. Shade
Area: Engineering, Natural Sciences.

EN.580.221. Molecules and Cells.
An introduction to modern molecular and cellular biology in the context of potential biomedical engineering applications. Topics covered: reactions between molecules, including receptor-ligand and antigen-antibody specificity, protein structure, enzyme catalysis, genetic information, protein processing and secretion, cell physiology and cell functions. Advanced quantitative treatment including multi-state kinetics, Monte Carlo simulations of biochemical reactions, and transport phenomena. Recommended Course Background: AS.030.101 and AS.030.104
Instructor(s): E. Haase; F. Macgabhann; K. Yarema
Area: Natural Sciences.

EN.580.222. Systems and Controls.
An introduction to linear systems: analysis, stability and control. Topics include first and second order systems, linear time invariant discrete and continuous systems, convolution, Fourier series, Fourier transforms, Laplace transforms, stability of linear systems, input output and state space representation of linear systems, stability, observability, controlability, and PID controller design. Recommended Course Background: AS.171.102 and AS.110.201, AS.110.302 or EN.550.291
Instructor(s): M. Miller; S. Sarma
Area: Engineering.

EN.580.223. Models and Simulations.
This course introduces students to modeling and analysis of biological systems. The first portion of the course focuses on linear systems. Topics include harmonic oscillators, pharmacokinetics, reaction-diffusion equation, heat transfer, and fluid flow. The second half of the course focuses on non-linear systems. Topics include iterated maps, bifurcations, chaos, stability of autonomous systems, the Hodgkin-Huxley model, bistability, limit cycles, and the Poincare-Bendixson theorem. The course also introduces students to the Matlab programming language, which allows them to implement the models discussed in class. Recommended Course Background: AS.110.201, AS.110.302, or EN.550.291
Instructor(s): A. Popel; M. Beer
Area: Engineering.

EN.580.302. Careers in Biomedical Engineering.
See description for EN.580.202. This course is designed for upperclassmen that wish to meet with weekly speakers to discuss careers issues. Junior/Senior Engineers only.
Instructor(s): A. Popel.

This course will explore recent advances in analysis of intracellular pathways, particularly how cells respond and regulate themselves in the presence of noise and temporal signals. We will draw material from various research articles. Topics include gene circuits, regulatory logic, information processing and cell memory, noise description, network graph analysis, signaling motifs, and feedback control.
Instructor(s): D. Holland
Area: Engineering, Natural Sciences.

EN.580.304. From Coin Flips to Brains.
Have you ever wondered if an equation could capture the human brain? This course will show you how flipping coins can be the basis for modelling brain function. It will provide both the concepts and practical hands-on training to implement Point Process Models. The hands-on training will focus on modelling neural data, although the technique has many other applications.
Area: Engineering, Quantitative and Mathematical Sciences.
EN.580.305. Introduction to Epigenetics.  
This course will explore the role of Epigenetics in modern biomedical research. Following an introduction of fundamental concepts and a historical review of key ideas, we will survey experimental techniques and topics such as the epigenetics of cancer, common disease and mental illness, stem cell biology and reprogramming. We will contemplate the controversy surrounding how epigenetics is changing how we think about disease etiology, diagnosis and treatment. We will employ active learning techniques.  
Instructor(s): E. Pujadas  
Area: Engineering.

EN.580.311. BME Design Group.  
A two-semester course sequence where juniors and seniors work with a team leader and a group of BME freshmen and sophomores, to solve open-ended problems in biomedical engineering. Upperclassmen are expected to apply their general knowledge and experience, and their knowledge in their concentration area, to teach lower classmen and to generate the solution to practical problems encountered in biomedical engineering.  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering, Natural Sciences.

EN.580.312. BME Design Group.  
A two-semester course sequence where juniors and seniors work with a team leader and a group of BME freshmen and sophomores, to solve open-ended problems in biomedical engineering. Upperclassmen are expected to apply their general knowledge and experience, and their knowledge in their concentration area, to teach lower classmen and to generate the solution to practical problems encountered in biomedical engineering.  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering, Natural Sciences.

Basic principles of statistical physics and thermodynamics with application to biological systems. Topics include fundamental principles of thermodynamics, chemical equilibrium and thermodynamics of reactions in solutions, and elementary statistical mechanics.  
Recommended Course Background: AS.110.108-AS.110.109, AS.030.101-AS.030.102, AS.171.101-AS.171.102; Freshman/Sophomore Chemistry and Physics  
Instructor(s): M. Beer  
Area: Engineering, Natural Sciences.

EN.580.401. Compressed Sensing MRI.  
How many Magnetic Resonance Imaging (MRI) measurements do you need to make a good image? Compressed Sensing theory states that an image can be reconstructed using very few measurements if it can be represented sparsely in one domain and measured in an incoherent domain. After this course, students will be familiar with Compressed Sensing theory in the context of MRI reconstruction. This course is focused on hands on exploration. Students will acquire their own MRI data which will be used in reconstruction experiments. They will explore different state of the art methods of reconstructing this data while learning core Compressed Sensing concepts. Finally, the course will conclude with a competition in which students design their own reconstruction algorithm and attempt to beat the state of the art. Matlab and C programming experience required. Linear algebra highly recommended. For more information, please see the course website: https://sites.google.com/site/compressedsensingmri/  
Instructor(s): T. Ngo  
Area: Engineering, Natural Sciences.

EN.580.402. Intro. to Embedded Microcontrollers.  
Introduction to embedded microcontrollers in digital systems, with an emphasis on biomedical applications. Students will be instructed in embedded hardware and software design and implementation. Topics include embedded architecture, interrupt-driven programming, timers, real-time data processing, analog to digital sampling, and peripheral communication protocols. In-class laboratory will provide applications of concepts introduced in class.  
Instructor(s): D. Herzfeld; T. Reppert  
Area: Engineering.

EN.580.404. The Bionic Ear: an odyssey from profound deafness to possible hearing.  
This course aims to examine the growth and success of cochlear implants as a biotechnology tool in aural rehabilitation. A unique perspective will come from Dr. Ratnanather who has been profoundly hearing impaired since birth via his impending CI surgery in mid-semester and subsequent activation. The course will consist of 10-12 seminars. Students will learn among other things the auditory system and clinical aspects of cochlear implantation. Each seminar will involve a discussion of one or two key papers and may include a talk by an otologist. The course will conclude with attendance at a day-long session on rehabilitation and music at CI2012 in downtown Baltimore which reflects Johns Hopkins’ pre-eminence position in pediatric aural rehabilitation. Pass/Fail Only.  
Instructor(s): J. Ratnanather  
Area: Engineering.

The goal of this course will be to survey the state of the art of several key medical technologies. Topics can include: Medical Robotics, Interventional Imaging, Medical Implants, Prosthetics, and Brain Computer Interface. The course will conclude with a student group mini design proposal project with the goal of writing a 5-10 minute pitch for a novel medical technology that addresses a current clinical problem.  
Instructor(s): K. Olds  
Area: Engineering, Quantitative and Mathematical Sciences.

EN.580.410. BME Teaching Practicum.  
Senior biomedical engineering students will assist the core course instructors and PhD students in managing the sections and recitations and or lab component of a course. Permission required.  
Instructor(s): M. Beer.

EN.580.411. BME Design Group.  
Perm. Req’d. Senior-level version of EN.580.311-312.  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering.

EN.580.412. BME Design Group.  
Senior-level version of EN.580.311-312. Permission of course directors required  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering.

EN.580.413. Design-Team, Team Leader.  
A two-semester sequence where leaders direct a team of undergraduate biomedical engineering students in a series of design problems. Prior design team experience and permission of course director required.  
Perm. Req’d.  
Instructor(s): E. Logsdon; N. Durr; R. Allen  
Area: Engineering.
EN.580.414. Design Team/Team Leader.
A two-semester sequence where leaders direct a team of undergraduate biomedical engineering students in a series of design problems. Prior design team experience and permission of course directors required. Instructor(s): E. Logsdon; N. Durr; R. Allen Area: Engineering.

EN.580.415. Ethics of Biomedical Engineering Innovation.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Instructor(s): F. Macgabhann Area: Social and Behavioral Sciences.

EN.580.416. BME Advanced Teaching Practicum.
Senior biomedical engineering students will assist the core course instructors in managing the sections, recitations, or lab component of a course. Permission required. Instructor(s): M. Beer.

EN.580.420. Build-a-Genome.
Must understand fundamentals of DNA structure, DNA electrophoresis and analysis, Polymerase Chain Reaction (PCR) and must be either a) Experienced with molecular biology lab work or b) Adept at programming with a biological twist. In this combination lecture/laboratory "Synthetic Biology" course students will learn how to make DNA building blocks used in an int’l. project to build the world’s first synthetic eukaryotic genome, Saccharomyces cerevisiae v. 2.0. Please study the wiki www.syntheticyeast.org for more details about the project. Following a biotechnology boot-camp, students will have 24/7 access to computational and wet-lab resources and will be expected to spend 15-20 hours per week on this course. Advanced students will be expected to contribute to the computational and biotech infrastructure. Successful completion of this course provides 3 credits toward the supervised research requirement for Molecular and Cellular Biology majors, or 2 credit hours toward the upper level elective requirement for Biology or Molecular and Cellular Biology majors. Prerequisites: Students must have completed Lab Safety training prior to registering for this class. Instructor(s): J. Bader; K. Zeller Area: Engineering, Natural Sciences.

EN.580.421. Systems Bioengineering I.
A quantitative, model-oriented investigation of the cardiovascular system. Topics are organized in three segments. (1) Molecular/cellular physiology, including electrical signaling and muscle contraction. (2) Systems cardiovascular physiology, emphasizing circuit-diagram analysis of hemodynamics. (3) Cardio-vascular horizons and challenges for biomedical engineers, including heart failure and its investigation/treatment by computer simulation, by gene-array analysis, by stem-cell technology, and by mechanical devices (left-ventricular assist and total-heart replacement). Recommended Course Background: EN.580.221 and EN.580.222 Instructor(s): L. Schramm Area: Engineering, Natural Sciences.

EN.580.422. Systems Bioengineering II.
A quantitative, model-oriented approach to the study of the nervous system. Topics include functional anatomy of the central and autonomic nervous systems, neurons and networks, learning and memory, structure and function of the auditory and visual systems, motor systems, and neuro-engineering. Recommended Course Background: EN.580.221, EN.580.222, EN.580.223, AS.110.302, EN.580.421; Corequisite: EN.580.424 Instructor(s): E. Haase; X. Wang Area: Engineering, Natural Sciences.

EN.580.423. Systems Bioengineering Lab I.
A two-semester laboratory course in which various physiological preparations are used as examples of problems of applying technology in biological systems. The emphasis in this course is on the design of experimental measurements and on physical models of biological systems. Priority to Junior BME majors. Recommended Corequisite: EN.580.421. Instructor(s): E. Haase Area: Natural Sciences.

A laboratory course in which various physiological preparations are used as examples of problems of applying technology in biological systems. The emphasis in this course is on the design of experimental measurements and on physical models of biological systems. Recommended Corequisite: EN.580.422 Prerequisites: Students must have completed Lab Safety training prior to registering for this class. Instructor(s): E. Haase.

EN.580.425. Ion Channels in Excitable Membranes.
Ion channels are key signaling molecules that support electrical communication throughout the body. As such, these channels are a central focus of biomedical engineering as it relates to neuroscience, computational biology, biophysics, and drug discovery. The course introduces the engineering and molecular strategies used to understand the function of ionic channels. The course also surveys key papers that paint the current picture of how ion channels open and close. Biological implications of these properties are emphasized throughout. Finally, the course introduces how optical and electrophysiological methods now promise to revolutionize understanding of ionic channels. This course can be seen as a valuable partner of Models of the Neuron (EN.580.439). Recommended Course Background: EN.580.421 and EN.580.422 or equivalent, AS.110.201, AS.110.302 Area: Engineering, Natural Sciences.
EN.580.429. Systems Bioengineering III.
Computational and theoretical systems biology at the cellular and molecular level. Topics include organizational patterns of biological networks; analysis of metabolic networks, gene regulatory networks, and signal transduction networks; inference of pathway structure; and behavior of cellular and molecular circuits. Recommended Course Background: EN.580.221 and EN.580.222 or Permission Required. Instructor(s): J. Bader
Area: Engineering, Natural Sciences.

We have moved beyond the ‘one-size-fits-all’ era of medicine. Individuals are different, their diseases are different, and their responses to drugs are different too. This variability is not just from person to person; heterogeneity is observed even between tumors within the same person, and between sites within the same tumor. These levels of variability among the human population must be accounted for to improve patient outcomes and the efficiency of clinical trials. Some of the ways in which this is being explored include: drugs are being developed hand-in-hand with the tests needed to determine whether or not they will be effective; tumor fragments excised from patients are being cultured in the lab for high-throughput testing of drugs and drug combinations; data-rich assays such as genomics and proteomics identify thousands of potentially significant differences between individuals; and computational models are being used to predict which therapies will work for which patients. This course will focus on the applications of pharmacokinetics and pharmacodynamics to simulating the effects of various drugs across a heterogeneous population of diseased individuals. Such computational approaches are needed to harness and leverage the vast amounts of data and provide insight into the key differences that determine drug responsiveness. These approaches can also explore the temporal dynamics of disease and treatment, and enable the modification of treatment during recovery. Recommended background: 110.201 Linear Algebra, 110.302 Differential Equations, and 550.311 Probability and Statistics (or equivalent).
Instructor(s): F. Macgabhann
Area: Engineering.

EN.580.431. Introduction to Computational Medicine I. 3
Credits
Computational medicine is an emerging discipline in which computer models of disease are developed, constrained using data measured from individual patients, and then applied to deliver precision health care. Introduction to Computational Medicine I is the first in a sequence of two courses on computational medicine. It covers the core concepts of computational physiological medicine and computational anatomy. The first half of this course will cover computational physiological medicine. Students will learn how to: use biophysical laws and data to formulate computational models of physiological systems in health and disease; analyze the behaviors of these models using analytical and simulation approaches; apply models to understand their use in diagnosing and treating disease. The second half of this course will cover computational anatomy. Students will learn how to: model anatomy using magnetic resonance imaging data; compare anatomies via mappings onto anatomical atlases; discover anatomical biomarkers of disease; analyze changes in the connectivity of anatomies in disease. Class time will emphasize hands-on learning through data analysis, software development, and simulation. All instructional materials will be made available at the beginning of the course. Recommended background: Calculus I-III, linear algebra, and ordinary differential equations. Proficiency in C++, Matlab or Python is required.
Instructor(s): M. Miller; R. Winslow.

This course has been revised to include numerous examples of bioelectrically active tissues and organs, complemented by relevant engineering principles. Topics include bioelectric currents and potentials, measurements of biological electric fields, wound repair in skin and epithelia, early history of bioelectricity, volume conductor theory, cardiac electrogram and lead theory, electromanipulation of cells, galvanotaxis, stem cell development, bone repair, and neuronal growth. Recommended Prereqs: EN.580.421 and EN.580.422.
Instructor(s): L. Tung
Area: Engineering.

Single-neuron modeling, emphasizing the use of computational models as links between the properties of neurons at several levels of detail. Topics include thermodynamics of ion flow in aqueous environments, biology and biophysics of ion channels, gating, nonlinear dynamics as a way of studying the collective properties of channels in a membrane, synaptic transmission, integration of electrical activity in multi-compartment dendritic tree models, and properties of neural networks. Students will study the properties of computational models of neurons; graduate students will develop a neuron model using data from the literature. Recommended Course Background: AS.110.301, EN.580.421-EN.580.422 or equivalent. Meets with EN.580.639
Instructor(s): E. Young
Area: Engineering, Natural Sciences.

EN.580.441. Cellular Engineering.
This course focuses on principles and applications in cell engineering. Class lectures include an overview of molecular biology fundamentals, protein/ligand binding, receptor/ligand trafficking, cell-cell interactions, cell-matrix interactions, and cell adhesion and migration at both theoretical and experimental levels. Lectures will cover the effects of physical (e.g. shear stress, strain), chemical (e.g. cytokines, growth factors) and electrical stimuli on cell function, emphasizing topics on gene regulation and signal transduction processes. Furthermore, topics in metabolic engineering, enzyme evolution, polymeric biomaterials, and drug and gene delivery will be discussed. This course is intended as Part 1 of a two-semester sequence recommended for students in the Cell and Tissue Engineering focus area. Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306 or equivalent and AS.030.205 Meets with EN.580.641
Instructor(s): J. Green; K. Yarema
Area: Engineering.

EN.580.442. Tissue Engineering.
This course focuses on the application of engineering fundamentals to designing biological tissue substitutes. Concepts of tissue development, structure and function will be introduced. Students will learn to recognize the majority of histological tissue structures in the body and understand the basic building blocks of the tissue and clinical need for replacement. The engineering components required to develop tissue-engineered grafts will be explored including biomechanics and transport phenomena along with the use of biomaterials and bioreactors to regulate the cellular microenvironment. Emphasis will be placed on different sources of stem cells and their applications to tissue engineering. Clinical and regulatory perspectives will be discussed. Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306, AS.030.205 Recommended EN.580.441/EN.580.641 Co-listed with EN.580.642
Instructor(s): J. Elisseeff; W. Grayson
Area: Engineering.
**EN.580.444. Biomedical Applications of Glycoengineering.**
This course provides an overview of carbohydrate-based technologies in biotechnology and medicine. The course will begin by briefly covering basics of glycbiology and glycochemistry followed by detailed illustrative examples of biomedical applications of glycoengineering. A sample of these applications include the role of sugars in preventative medicine (e.g., for vaccine development and probiotics), tissue engineering (e.g., exploiting natural and engineered polysaccharides for creating tissue or organs de novo in the laboratory), regenerative medicine (e.g., for the treatment of arthritis or degenerative muscle disease), and therapy (e.g., cancer treatment). A major part of the course grade will be based on class participation with each student expected to provide a “journal club” presentation of a relevant paper as well as participate in a team-based project designed to address a current unmet clinical need that could be fulfilled through a glycoengineering approach. Recommended Course Background: EN.580.221 Molecules and Cells
Instructor(s): K. Yarema
Area: Engineering, Natural Sciences.

**EN.580.445. Networks.**
Networks are ubiquitous in our modern society. The World Wide Web that links us to and enables information flows with the rest of the world is the most visible example. It is, however, only one of many networks within which we are situated. Our social life is organized around networks of friends and colleagues. These networks determine our information, influence our opinions, and shape our political attitudes. They also link us, often through important but weak ties, to everybody else in the United States and in the world. Economic and financial markets also look much more like networks than anonymous marketplaces. Firms interact with the same suppliers and customers and use Web-like supply chains. Financial linkages, both among banks and between consumers, companies and banks, also form a network over which funds flow and risks are shared. Systemic risk in financial markets often results from the counterparty risks created within this financial network. Food chains, interacting biological systems and the spread and containment of epidemics are some of the other natural and social phenomena that exhibit a marked networked structure. This course will introduce the tools for the study of networks. It will show how certain common principles permeate the functioning of these diverse networks and how the same issues related to robustness, fragility, and interlinkages arise in several different types of networks. Biological applications will be highlighted as material is presented. Recommended Course Background: EN.580.222
Instructor(s): S. Sarma
Area: Engineering.

**EN.580.448. Biomechanics of the Cell.**
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. We will discuss the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models. Co-listed with EN.530.410 Recommended course background: AS.171.101-102, AS.110.108-109 and AS.110.202
Area: Engineering.

**EN.580.451. Cell and Tissue Engineering Lab.**
Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn basic cell culture procedures and specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Co-listed with EN.530.451. Senior and Graduate students only; others, instructor permission required. Fall semester only. Lab Fee: $100
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

**EN.580.452. Cell and Tissue Engineering Lab.**
This laboratory course will consist of three experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Spring semester only.
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

**EN.580.455. Introduction to Orthopaedic Biomechanics.**
This course will cover static and dynamic force in the musculoskeletal systems, joint reactions, soft and hard tissue response to force loads, muscle mechanics, material properties, biomechanical lumped parameter systems, modeling and injury mechanisms. Co-listed with EN.580.655. Recommended Course Background: AS.110.302
Instructor(s): R. Allen
Area: Engineering.

**EN.580.456. Introduction to Rehabilitation Engineering.**
The primary objective of this course is to introduce biomedical engineering students to the challenges of engineering solutions for persons functioning with disabilities. In order to achieve this goal, other objectives include: gaining a basic appreciation of the modalities used to treat impairments, the opportunities for application of engineering to improve treatment delivery, understanding the science and engineering applied to helping persons with disabilities function in the everyday world and an basic knowledge of the legal, ethical issues and employment opportunities in rehabilitation engineering. By the conclusion of this class, students should be able to: • Understand the breadth and scope of physical impairment and disability, including its associated pathophysiology • Characterize the material and design properties of current evaluation tools for assessment of impairments and adaptations for disability • Characterize the material and design properties of current modalities of treatment of impairments and adaptations for disability • Apply engineering analysis and design principles to critique current solutions for persons with disabilities in order to suggest improvements
Prerequisites: EN.580.421 AND EN.580.422
Instructor(s): S. Paul
Area: Engineering.
The primary objective of this course is to give biomedical engineering students who have completed 580.456 (Intro to Rehab Engineering) the opportunity to apply the knowledge they have gained in that course and their prior coursework to the development of a new, improved device to be used for measurement or treatment of an impairment or disability. In doing so, they will learn the biomedical engineering design process and its application to persons with disabilities. Working in groups of four to five, teams will work on a project derived from a needs analysis based on their visits to rehabilitation centers in the fall semester. Project will require instructor approval before the beginning of the spring semester. Each project will consist of a proposal for design of a new device or solution to a problem faced by persons with disabilities, preliminary “virtual” (e.g., CAD), and actual proof of concept working prototype. Projects will be judged by the proposal, prototypes, and in-class presentations.
Prerequisites: Prereq: EN.580.456
Instructor(s): S. Paul
Area: Engineering.

EN.580.460. Theory of Cancer.
The course will deal with important problems in cancer and how they can be approached using mathematical and computational modeling. The course will be organized around introductory material describing the biological and clinical problem and the mathematical and computational methodology that will be used for its analysis. This will be followed by analysis of key modeling papers dealing with the problem. An important part of the course will be a computational modeling project (small group or individual) dealing with modeling of cancer in which the students will extend existing models or formulate novel models of cancer, including cancer therapeutics. The students will strive to create models leading to new discoveries.
Instructor(s): A. Popel
Area: Engineering.

Denosing, segmentation, texture modeling, tracking, object recognition are challenging problems in imaging. We will present a collection of statistical models and methods in order to address these, including the E.M algorithm, Maximum Entropy Modeling, Markov Random Fields, Markov Chain Monte Carlo, Boltzmann Machines and Multilayer Perceptrons. Recommended Course Background: AS.110.202 and EN.550.310 or equivalent.
Instructor(s): B. Jedynak
Area: Engineering, Quantitative and Mathematical Sciences.

EN.580.468. Upward Spiral of Science.
In this course, we will cover the fundamentals of doing data science research, explaining “best practices” for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) positing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Note that this course will largely be project based; each student will be expected to complete each of the above steps on some real data of interest to the student. Lectures will be minimal, giving introductory explanations one day, hopefully only part of the time. The rest of the time, we will work independently or in small groups to complete the weekly portion of the overall project. Please come ready to do science! If you don’t have questions that you want answered, you can work in small groups, but each student will need to write the code and reports on their own. Recommended Course Background: No courses are formally required, though students will need to write numerical code (in R, Python, or Julia), and make reports using LaTeX, knitr, or Jupyter notebooks or similar.
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.469. Design of Economic Health Care Technologies.
Permission of instructor. This spring semester course is offered to juniors and seniors in engineering with an interest in developing economic health care technologies for global health care needs. Health care technologies for global use need to be cost effective and serve the needs of the disadvantaged population. In the US as well health care costs are spiraling and economic health care technologies and solutions will be necessary. This laboratory course will focus on identifying the health care needs, coming up with innovative technical solutions, designing and building such instrument prototypes and exploring how such technologies can be disseminated globally. A new laboratory, EcoHealth, will be set up to do rapid prototyping and the students will do independent designs in this lab after doing proper needs identification and will be responsible for finding appropriate target needs. Students will be required to write the problem statement and the need analysis, submit a patent on the design, and a short proposal to seek funding from philanthropic or Government/non-Government agencies. The course will focus on hands on design and projects, doing research and writing reports (or patents) pertaining to novel and useful technologies, and will receive 2 design credits and writing credits. This course, along with the 4 credit 580.471 (Principles of Design of Medical Instrumentation) offered in fall, and the 2 credit 580.571 (Honors Instrumentation) offered during the Intersession comprises an 8 credit design sequence that can serve the requirements for a full Capstone Design experience. The enrollment is restricted and subject to approval by the instructor, Prof. Nitish Thakor (nitish@jhu.edu). Selection of the students will depend on commitment and experience with hands on design and instrumentation development and an interest in global health care needs.
Area: Engineering.
EN.580.471. Principles of Design of BME Instrumentation. This core design course will cover lectures and hands-on labs. The material covered will include fundamentals of biomedical sensors and instrumentation, FDA regulations, designing with electronics, biopotentials and ECG amplifier design, recording from heart, muscle, brain, etc., diagnostic and therapeutic devices (including pacemakers and defibrillators), applications in prosthetics and rehabilitation, and safety. The course includes extensive laboratory work involving circuits, electronics, sensor design and interface, and building complete biomedical instrumentation. The students will also carry out design challenge projects, individually or in teams (examples include “smart cane for blind,” “computer interface for quadriplegic”). Students satisfying the design requirement must also register for EN.580.571. Lab Fee: $150. Recommended Course Background: EN.520.345
Instructor(s): N. Thakor
Area: Engineering, Natural Sciences.

EN.580.472. Medical Imaging Systems. An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): J. Prince
Area: Engineering.

EN.580.473. Modern Biomedical Imaging Instrumentation and Techniques. An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.520.434 Recommended course background: EN.520.432 or EN.580.472
Prerequisites: EN.520.432 OR EN.580.472
Instructor(s): B. Tsui
Area: Engineering, Natural Sciences.

EN.580.476. Magnetic Resonance in Medicine. This course provides the student with a complete introduction to the physical principles, hardware design, and signal processing used in magnetic resonance imaging and magnetic resonance spectroscopy. The course is designed for students who wish to pursue research in magnetic resonance. Recommended course background: EN.580.222 or EN.520.214. Co-listed with EN.580.673.
Instructor(s): D. Herzka
Area: Engineering.

EN.580.477. Advanced Topics in Magnetic Resonance Imaging. An advanced imaging course with in-depth quantitative coverage of topics central to magnetic resonance imaging, ranging from techniques currently used in the radiology practice to new developments at the cutting edge of MRI research. Topics include: steady-state imaging and contrast mechanisms, MRI simulations, RF pulse and coil design, flow imaging and angiography, cardiac imaging, diffusion imaging, functional MRI, parallel imaging, and high-field imaging. As part of the course, students will be expected to read and understand classic and current literature. The course is taught by a team of experts in the respective fields and will provide an excellent foundation for students interested in deep understanding of magnetic resonance imaging.
Instructor(s): D. Herzka
Area: Engineering.

EN.580.479. X-ray Imaging and Computed Tomography. This course provides students with an intermediate-level understanding of the physics, engineering, algorithms, and applications of medical x-ray imaging and computed tomography (CT). It is intended for senior undergraduates (EN.580.479) and/or graduate students (EN.580.679) in Biomedical Engineering, Computer Science, Electrical and Computer Engineering, or related fields in science and engineering. Topics include the physics of x-ray interaction and detection, image quality modeling and assessment, 3D image reconstruction (including analytical and iterative approaches), and applications in diagnostic and image-guided procedures. Background knowledge required of students includes EN.580.472 and/or EN.580.473 and familiarity with Matlab.
Instructor(s): J. Siewerdsen
Area: Engineering.

EN.580.483. Nuclear Medicine Imaging. This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473
Instructor(s): A. Rahmim; B. Tsui; E. Frey; Y. Du
Area: Engineering.

EN.580.488. Foundations of Computational Biology & Bioinformatics II. This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Foundations of Computational Biology I is not a prereq. Recommended Course Background: Math through linear algebra and differential equations, EN.580.221 or equivalent, EN.600.226 or equivalent
Instructor(s): R. Karchin
Area: Engineering, Natural Sciences.
The course introduces the probabilistic foundations of learning theory. We will discuss topics in regression, estimation, optimal control, system identification, Bayesian learning, and classification. Our aim is to first derive some of the important mathematical results in learning theory, and then apply the framework to problems in biology, particularly animal learning and control of action. Recommended Course Background: AS.110.201 and AS.110.302
Instructor(s): R. Shadmehr
Area: Engineering.

EN.580.492. Build-a-Genome Mentor.
In addition to producing and sequencing DNA segments like regular B-a-G students, mentors will help prepare and distribute reagents, and maintain a Moddle site to track student reagent use and productivity. Mentors will also be expected to mentor specific students who are learning new techniques for the first time, contribute to the computational and biotech infrastructure associated with Build-a-Genome, and pursue at least one independent research project. Successful completion of this course provides 3 credit hours toward the supervised research requirement for Molecular and Cellular Biology majors. Co-listed AS.020.451. Permission Required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Bader; J. Boeke; K. Zeller
Area: Engineering, Natural Sciences.

EN.580.493. Imaging Instrumentation.
This course is intended to introduce students to imaging instrumentation. The class will be lab-oriented, giving hands-on experience with data collection and processing using a configurable optical system. Specific topics will include the programming and control of electromechanical elements, imaging data acquisitions, image formation and processing (e.g. 3D reconstruction), and imaging system analysis and optimization. Recommended Course Background: EN.580.222 Systems and Controls or EN.520.214 Signals and Systems. Programming experience highly desirable.
Instructor(s): J. Stayman
Area: Engineering.

EN.580.495. Microfabrication Lab.
This laboratory course introduces the principles used in the construction of microelectronic devices, sensors, and micromechanical structures. Students will work in the laboratory on the fabrication and testing of a device. Accompanying lecture material covers basic processing steps, design and analysis CAD tools, and national foundry services. Co-listed with EN.530.495 and EN.520.495. Seniors only. Permission Required.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.580.501. Fall BME Research - Freshman/Sophomore.
Instructor(s): Staff.
Practicum in Biomedical Engineering Research projects or engineering design projects under the supervision of any member of the BME faculty.
Instructor(s): Staff.
EN.580.511. Fall BME Independent Study - Freshman/Sophomore.
Instructor(s): K. Yarema; M. Beer; R. Allen.

Directed readings or other literature research under the direction of any member of the BME faculty.
Instructor(s): Staff.
EN.580.531. Fall BME Research - Junior/Senior.
Instructor(s): Staff.
EN.580.532. Spring BME Research - Junior/Senior.
Research projects or engineering design projects under the supervision of any member of the BME faculty.
Instructor(s): Staff
Area: Engineering.

EN.580.541. Fall BME Independent Study - Junior/Senior.
Directed readings or other literature research under the direction of any BME faculty member. Junior or Senior standing.
Instructor(s): Staff.
EN.580.542. Spring BME Independent Study - Junior/Senior.
Directed readings or other literature research under the direction of any BME faculty member.
Instructor(s): Staff.

EN.580.570. Internship.

EN.580.571. Honors Instrumentation.
Student must have taken 580.471/771. Students will develop a term paper and patent application and carry out a hands-on individual or team project throughout the semester. Previous projects include design of EEG amplifier, voltage clamp and patch clamp, vision aid of blind, pacemaker/defibrillator, sleep detection and alert device, glucose sensor and regulation, temperature controller, eye movement detection and device control, ultrasound ranging and tissue properties, impedance plethysmography, lie detector, blood alcohol detector, pulse oximeter, etc.
Instructor(s): N. Thakor
Area: Engineering.

EN.580.574. BME Research - Intersession.
Instructor(s): Staff.
EN.580.576. BME Independent Study - Intersession.
Instructor(s): J. Wang; R. Allen.
EN.580.580. Senior Design Project.
Per Independent or team design project to design and evaluate a system. The design should demonstrate creative thinking and experimental skills, and must draw upon advanced topics of biomedical and traditional engineering. Permission Required.
Instructor(s): R. Allen.

EN.580.581. Senior Design Project.
Independent or team design project to design and evaluate a system. The design should demonstrate creative thinking and experimental skills, and must draw upon advanced topics of biomedical and traditional engineering. Permission Required.
Instructor(s): R. Allen.
EN.580.590. Biomedical Internship.
Instructor(s): Staff.
EN.580.595. BME Senior Design-Summer.
Instructor(s): J. Green; L. Schramm; R. Allen.
EN.580.597. BME Research - Summer.
Instructor(s): Staff.
**EN.580.598. Design Project.**
Instructor(s): R. Allen.

**EN.580.599. Independent Study.**
Instructor(s): A. Shoukas; H. Goldberg; K. Yarema; N. Thakor; S. Kuo.

**EN.580.601. Special Topics in Bioengineering Innovation and Design.**
This year long seminar series features experts from the medical device industry, venture capital firms, FDA, patent attorneys, entrepreneurs, and many more. They will share their real-world insights into the medical device innovation and commercialization process. Some of the topics covered will include bioethics, regulatory and reimbursement planning, medical device recalls, good design practices, and entrepreneurial success stories. The overarching philosophy of this seminar series is to complement the theoretical and practical aspects of the program curriculum, by learning from the experiences and insights of professionals in the field. These seminars are taken in a sequence of summer, fall, and spring. They are required for CBID masters students and are open to those students only.
Instructor(s): S. Acharya.

**EN.580.602. Special Topics in Bioengineering Innovation and Design.**
This year long seminar series features experts from the medical device industry, venture capital firms, FDA, patent attorneys, entrepreneurs, and many more. They will share their real-world insights into the medical device innovation and commercialization process. Some of the topics covered will include bioethics, regulatory and reimbursement planning, medical device recalls, good design practices, and entrepreneurial success stories. The overarching philosophy of this seminar series is to complement the theoretical and practical aspects of the program curriculum, by learning from the experiences and insights of professionals in the field. For CBID MSE students only. Registration with instructor’s permission only.
Instructor(s): S. Acharya.

**EN.580.603. Special Topics in Bioengineering Innovation & Design.**

Instructor(s): S. Acharya.

**EN.580.604. I: Business of Bioengineering Innovation and Design.**
This course comprises two distinct, but related, components. The first is a broad introduction to the terms, concepts, and values of business and management. Particular emphasis will be placed on the economic, financial, and corporate contexts of our business culture, and how they impact the organization, strategy, and decision-making of business firms. The second component is an introduction to the sociological and economic forces that shape the development and diffusion of new technologies. This part is primarily designed to provide a framework for determining the commercial viability of new medical devices and the best path for realizing their value, including how to develop a compelling value proposition, analyze markets and competitors, and protect intellectual property. Throughout, the course utilizes individual exercises, case analyses, and team projects.
Instructor(s): L. Aronhime.

**EN.580.605. II: Business of Bioengineering Innovation and Design.**
This course comprises two distinct, but related, components. The first is a broad introduction to the terms, concepts, and values of business and management. Particular emphasis will be placed on the economic, financial, and corporate contexts of our business culture, and how they impact the organization, strategy, and decision-making of business firms. The second component is an introduction to the sociological and economic forces that shape the development and diffusion of new technologies. This part is primarily designed to provide a framework for determining the commercial viability of new medical devices and the best path for realizing their value, including how to develop a compelling value proposition, analyze markets and competitors, and protect intellectual property. Throughout, the course utilizes individual exercises, case analyses, and team projects.
Instructor(s): L. Aronhime.

**EN.580.607. Regulation of Medical Devices.**
This course introduces graduate students in Bioengineering Innovation and Design to the medical device regulatory framework, as it pertains to bringing a medical device from concept to market. Topics covered include: FDA Design Controls; Regulatory Approval mechanisms, including the 510k and PMA process; Investigational Device exemption (IDE); planning clinical trials needed for bringing a medical device to market; and postmarket surveillance. Students learn from a series of invited lecturers from the FDA as well as professionals from the medical device industry. This summer course is required for CBID masters students and is not open to any other students.
Instructor(s): S. Acharya.
EN.580.608. Identification and Validation of Medical Device Needs.
This course teaches the art and skill of identifying medical device opportunities by experiencing real world scenarios in an immersive clinical environment. Students rotate through multiple clinical disciplines and become part of the team of senior clinicians, surgeons, residents, fellows, nurses and medical technologists. They learn to identify unmet medical device needs through direct observations in a variety of clinical settings including the hospital ward and operating room, interviews (with patients, doctors, nurses, hospital administration), literature survey, and more. Concurrently, they learn the process of filtering all observations to a few valid medical device opportunities by assessing the market size, intellectual property landscape, regulatory framework, and competitor dynamics in addition to the clinical impact that such a device could have. The ability to identify a relevant medical device need is an important first step in the medical device innovation cycle; this course aims to provide students with practical hands-on training in that process.
Instructor(s): C. Weiss; H. Nguyen; S. Acharya.

EN.580.609. BME Teaching Practicum.
Instructor(s): M. Beer.

EN.580.611. Medical Device Design and Innovation.
For CBID MSE students only. Registration with instructor’s permission only.
Instructor(s): S. Acharya.

EN.580.612. Medical Device Design and Innovation.
For CBID MSE students only.
Instructor(s): S. Acharya.

EN.580.616. Introduction to Linear Dynamical Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. BME EN.580.616 can be used to fulfill the requirement of ME EN.530.616 or ECE EN.520.601.
Instructor(s): S. Sarma.

Limited to CBID students only
Instructor(s): S. Acharya.

For CBID MSE students only. Registration with instructor’s permission only.
Instructor(s): S. Acharya.

EN.580.620. Principles and Practice of Global Health Innovation and Design.
For CBID MSE students only. Instructor’s Permission Required.
Instructor(s): S. Acharya.

EN.580.621. Insight Informed Innovation I.
For CBID MSE students only. Registration with instructor’s permission only.
Instructor(s): B. Craft; P. Fears.

CBID MSE Student Only. This intersession course builds on the work done in the fall on the global health device projects. Students will engineer and build several prototypes of their devices and work with technical experts from Jhpiego, the School of Medicine, Laerdal Global Health, and others to perfect the model and begin planning the testing phase.
Instructor(s): S. Acharya.

EN.580.623. Insight Informed Innovation II.
This course is intended to equip students with a structured process and the tools required to: 1. Identify opportunities for new medical devices through unmet, unarticulated and underserved stakeholder needs 2. Link these insights to an exhaustive set of potential solutions 3. Synthesize solutions and features into product concepts
Recommended Course Background: Insight Informed Innovation I (summer)
Instructor(s): B. Craft; P. Fears.

This course will cover basic mechanisms and functions of the inner ear and brainstem. This is a companion course and alternates with EN.580.626, although these can be taken in either order. The focus is on transmission and transduction of sound and head movements by the auditory and vestibular periphery. Topics include: cellular and molecular mechanisms of mechanotransduction, synaptic signaling and development, primary afferents and the first-order brainstem nuclei, as well as clinical consequences of peripheral damage. Undergraduates with knowledge in Neuroscience welcome. Recommended Course Background: an introduction to neuroscience.
Instructor(s): E. Glowatzki; P. Fuchs.

Brain mechanisms and perception of sound and balance. This course is an accompaniment for EN.580.625, although the courses can be taken in either order. Topics include representation of sound and balance in neural discharge patterns, anatomy of the central auditory and vestibular systems, synaptic transmission and signal processing in central neurons, and complex sound perception and movement control. Aspects such as speech perception, sound localization, vestibular reflexes and vestibular compensation are discussed with an integrated perspective covering perceptual, physiological, and mechanistic data. Recommended Course Background: EN.580.222 and EN.580.422 or equivalent. Taught at the School of Medicine.
Instructor(s): E. Young; X. Wang.

EN.580.628. Topics in Systems Neuroscience.
This course consists of weekly discussions of current literature in systems neuroscience. The selected readings will focus on neural mechanisms for perception, attention, motor behavior, learning, and memory, as studied using physiological, psychophysical, computational, and imaging techniques. Students are expected to give presentations and participate in discussions. Recommended Course Background: AS.110.302, EN.520.214, EN.580.421 or equivalent
Instructor(s): K. Zhang; X. Wang.
EN.580.630. Theoretical Neuroscience.
Theoretical methods for analyzing information encoding and functional representations in neural systems. Models of single and multiple neural spike trains based on stochastic processes and information theory; detection and estimation of behaviorally relevant parameters from spike trans.; system theoretic methods for analyzing sensory receptive fields; network models of neural systems. Both theoretical methods and the properties of specific well-studied neural systems will be discussed. Recommended Course Background: EN.580.422 or equivalent, EN.550.420 or equivalent, EN.580.222 or equivalent. Instructor(s): E. Young.

EN.580.632. Ionic Channels in Excitable Membranes.
Ion channels are key signaling molecules that support electrical communication throughout the body. As such, these channels are a central focus of biomedical engineering as it relates to neuroscience, computational biology, biophysics, and drug discovery. The course introduces the engineering and molecular strategies used to understand the function of ionic channels. The course also surveys key papers that paint the current picture of how ion channels open and conduct ions. Biological implications of these properties are emphasized throughout. Finally, the course introduces how optical and electrophysiological methods now promise to revolutionize understanding of ionic channels. This course can be seen as a valuable partner of Models of the Neuron (EN.580.439). Recommended Course Background: EN.580.421 and EN.580.422 or equivalent, AS.110.201, AS.110.302
Area: Engineering, Natural Sciences.

EN.580.633. Horizons in Biological Calcium and Voltage Signaling.
Introductory survey of current and classic discoveries relating to calcium and voltage signaling in biology. Fluctuations of free calcium concentration within cells, and electrical potential differences across cell membranes, turn out to be the currency by which information is communicated in relation to a vast array of vital biological processes. Understanding how these signals are generated, encoded, and decoded is therefore the key to unraveling complex biological signaling networks, and a Rosetta stone for next-generation disease treatments at the molecular and cellular level. Students and faculty will present a mixture of papers and didactic lectures that will give a flavor of this burgeoning area of biophysics, engineering, and systems biology. Appropriate for seniors and graduate students of all levels.
Instructor(s): D. Yue.

EN.580.634. Bioelectricity.
Instructor(s): L. Tung.

EN.580.639. Models of the Neuron.
See description for EN.580.439. Differs in that an advanced modeling project using data from the literature is required. Graduate version of EN.580.439. Recommended Course Background: AS.110.301-AS.110.302, EN.580.421-EN.580.422 or equivalent.
Instructor(s): E. Young.

This course focuses on principles and applications in cell engineering. Class lectures include an overview of molecular biology fundamentals, protein/ligand binding, receptor/ligand trafficking, cell-cell interactions, cell-matrix interactions, and cell adhesion and migration at both theoretical and experimental levels. Lectures will cover the effects of physical (e.g. shear stress, strain), chemical (e.g. cytokines, growth factors) and electrical stimuli on cell function, emphasizing topics on gene regulation and signal transduction processes. Furthermore, topics in metabolic engineering, enzyme evolution, polymeric biomaterials, and drug and gene delivery will be discussed. This course is intended as Part 1 of a two-semester sequence recommended for students in the Cell and Tissue Engineering focus area. Meets with EN.580.441. Recommended Course Background: EN.580.221 or AS20.305 and AS.020.306 (or equivalent) and AS.030.205
Instructor(s): J. Green; K. Yarema.

EN.580.642. Tissue Engineering.
This course focuses on the application of engineering fundamentals to designing biological tissue substitutes. Concepts of tissue development, structure and function will be introduced. Students will learn to recognize the majority of histological tissue structures in the body and understand the basic building blocks of the tissue and clinical need for replacement. The engineering components required to develop tissue-engineered grafts will be explored including biomechanics and transport phenomena along with the use of biomaterials and bioreactors to regulate the cellular microenvironment. Emphasis will be placed on different sources of stem cells and their applications to tissue engineering. Clinical and regulatory perspectives will be discussed. Co-listed with EN.580.442. Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306, AS.030.205, EN.580.441/EN.580.641
Instructor(s): J. Elisseeff; W. Grayson
Area: Engineering.

This course is intended to provide a comprehensive overview on the current state of the field of Orthopaedic Tissue Engineering. Students will apply engineering fundamentals learned in the Tissue Engineering course (580.442/580.642) with special emphasis on how they apply to bone, cartilage, and skeletal muscle tissue engineering. The development, structure, mechanics, and function of each of these tissues will be discussed. Key articles from the last three decades that focus on stem cell- and cell-free, biomaterial-based approaches to regenerate functional tissues will be presented and analyzed. Practical (regulatory/commercial) considerations that restrict the translation of therapies to the clinic will be discussed. Undergraduate by permission only. Recommend Course Background: EN.580.442 or EN.580.642.
Instructor(s): W. Grayson.
EN.580.644. Biomedical Applications of Glycoengineering.
This course provides an overview of carbohydrate-based technologies in biotechnology and medicine. The course will begin by briefly covering basics of glycobiology and glycochemistry followed by detailed illustrative examples of biomedical applications of glycoengineering. A sample of these applications include the role of sugars in preventative medicine (e.g., for vaccine development and probiotics), tissue engineering (e.g., exploiting natural and engineered polysaccharides for creating tissue or organs de novo in the laboratory), regenerative medicine (e.g., for the treatment of arthritis or degenerative muscle disease), and therapy (e.g., cancer treatment). A major part of the course grade will be based on class participation with each student expected to provide a “journal club” presentation of a relevant paper as well as participate in a team-based project designed to address a current unmet clinical need that could be fulfilled through a glycoengineering approach. Recommended background: EN.580.221 Molecules and Cells
Instructor(s): K. Yarema
Area: Engineering, Natural Sciences.

EN.580.655. Introduction to Orthopedic Biomechanics.
This course will cover static and dynamic force in the musculoskeletal systems, joint reactions, soft and hard tissue response to force loads, muscle mechanics, material properties, biomechanical lumped parameter systems, modeling and injury mechanisms. Co-listed with EN.580.455. Recommended Course Background: AS.110.302
Instructor(s): R. Allen
Area: Engineering.

EN.580.668. Upward Spiral of Science.
In this course, we will cover the fundamentals of doing data science research, explaining “best practices” for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) positing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Note that this course will largely be project based; each student will be expected to complete each of the above steps on some real data of interest to the student. Lectures will be minimal, giving introductory explanations one day, hopefully only part of the time. The rest of the time, we will work independently or in small groups to complete the weekly portion of the overall project. Please come ready to do science! If you don’t have questions that you want answered, you can work in small groups, but each student will need to write the code and reports on their own. Recommended background: No courses are formally required, though students will need to write numerical code (in R, Python, or Julia), and make reports using LaTeX, knitr, or Jupyter notebooks or similar.
Instructor(s): J. Vogelstein
Area: Engineering.

This course provides the student with a complete introduction to the physical principles, hardware design, and signal processing used in magnetic resonance imaging and magnetic resonance spectroscopy. The course is designed for students who wish to pursue research in magnetic resonance. Recommended course background: EN.580.222 or EN.550.214. Co-listed with EN.580.476.
Instructor(s): D. Herzka.

EN.580.677. Advanced Topics in Magnetic Resonance Imaging.
An advanced imaging course with in-depth quantitative coverage of topics central to magnetic resonance imaging, ranging from techniques currently used in the radiology practice to new developments at the cutting edge of MRI research. Topics include: steady-state imaging and contrast mechanisms, MRI simulations, RF pulse and coil design, flow imaging and angiography, cardiac imaging, diffusion imaging, functional MRI, parallel imaging, and high-field imaging. As part of the course, students will be expected to read and understand classic and current literature. The course is taught by a team of experts in the respective fields and will provide an excellent foundation for students interested in deep understanding of magnetic resonance imaging.
Instructor(s): D. Herzka.

EN.580.678. Biomedical Photonics.
This course will cover the basic optics principles including geometric, beam and wave description of light. The course will also cover the basic generation and detection techniques of light and the principles of optical imaging and spectroscopy. After the basis is established, we will focus on some commonly employed optical techniques and tools for biomedical research including various optical microscopy technologies, fiber optics, Raman spectroscopy, Fluorescence (lifetime), FRAT, FRET and FCS. The recent development in tissue optics, biomedical optical imaging/spectroscopy techniques (such as OCT, multiphoton fluorescence and harmonics microscopy, Structured Illumination, light scattering, diffuse light imaging and spectroscopy, optical molecular imaging, photo-acoustic imaging) will also be discussed. Representative biomedical applications of translational biomedical photonics technologies will be integrated into the corresponding chapters.
Instructor(s): X. Li
Area: Engineering.

This course provides students with an intermediate-level understanding of the physics, engineering, algorithms, and applications of medical x-ray imaging and computed tomography (CT). It is intended for senior undergraduates (580.479) and/or graduate students (580.679) in Biomedical Engineering, Computer Science, Electrical and Computer Engineering, or related fields in science and engineering. Topics include the physics of x-ray interaction and detection, image quality modeling and assessment, 3D image reconstruction (including analytical and iterative approaches), and applications in diagnostic and image-guided procedures. Background knowledge required of students includes EN.580.472 and/or EN.580.473 and familiarity with Matlab.
Instructor(s): J. Siewerdsen
Area: Engineering.
**EN.580.683. Nuclear Medicine Imaging.**

This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473

Instructor(s): A. Rahimim; B. Tsui; E. Frey; Y. Du

Area: Engineering.

**EN.580.684. Ultrasound Imaging: Theory and Applications.**

This course is designed to teach students the theory behind ultrasound imaging and provide an opportunity to apply this theory in a final project. The projects will be centered around advanced beamformers, photoacoustic imaging and thermal imaging. Recommended course background: EN.520.432 or EN.580.472 or equivalent.

Instructor(s): E. Boctor.

**EN.580.688. Foundations of Computational Biology & Bioinformatics II.**

This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Recommended Course Background: Math through linear algebra and differential equations, EN.580.221 or equivalent, EN.600.226 or equivalent.

Instructor(s): R. Karchin.

**EN.580.689. Computational Personal Genomics.**

What can we learn from the genome sequence of an individual? Genomic technology now makes it possible to generate huge amounts of DNA sequence data for a single individual at a relatively low cost. To make sense of this data, we need to employ sophisticated computational methods to identify genetic variations that influence an individual’s health. In this course, we will first review the state of the art in sequencing technology, and discuss how this technology is being applied to study human biology and disease. We will then explore the computational methods used to turn raw sequence data into knowledge. Topics will include genetic variant detection; discovery of chromosomal rearrangements and fusions; methods to measure gene expression from RNA; and measurements of the microbiome living inside our bodies.

Recommended Course Background: EN.600.439/639, EN.600.363/463, EN.600.688, EN.580.688 (any one is sufficient), or permission of the instructor. Course is also open to undergraduate students.

Instructor(s): J. Vogelstein

Area: Engineering.

**EN.580.691. Learning Theory.**

This course introduces the probabilistic foundations of learning theory. We will discuss topics in regression, estimation, Kalman filters, Bayesian learning, classification, reinforcement learning, and active learning. Our focus is on iterative rather than batch methods for parameter estimation. Our aim is to use the mathematical results to model learning processes in the biological system. Recommended Course Background: Probability and Linear Algebra.

Instructor(s): R. Shadmehr.

**EN.580.693. Imaging Instrumentation.**

This course is intended to introduce students to imaging instrumentation. The class will be lab-oriented, giving hands-on experience with data collection and processing using a configurable optical system. Specific topics will include the programming and control of electromechanical elements, imaging data acquisitions, image formation and processing (e.g. 3D reconstruction), and imaging system analysis and optimization. Recommended Course Background: EN.580.222 Systems and Controls or EN.520.214 Signals and Systems.

Programming experience highly desirable.

Instructor(s): J. Stayman.

**EN.580.694. Statistical Connectomics.**

This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).

Instructor(s): J. Stayman

Area: Engineering.

**EN.580.718. Advanced Seminars in Integrative and Systems Biology.**

The course is designed to introduce the current concepts, methods and modes of analysis being developed in the context of experimental and computational systems biology, with the particular emphasis on the study of signal transduction and cell-cell communication networks. Topics include development and analysis of computational and experimental models of cell interactions with other cells, with extracellular matrix and with micro- and nano-fabricated analysis platforms. The areas of application range from the bacterial signaling to stem cell development and tissue regeneration. Students will be required to read current journal articles, online presentations and actively participate in the in-class discussions. Every student will also be required to be engaged in individual projects and report on their progress. Graduate Level. Seniors by permission. Fall semester only.

**EN.580.690. Systems Biology of Cell Regulation.**

This course will explore the recent advances in Systems Biology analysis of intracellular processes. Examples of the modeling and experimental studies of metabolic, genetic, signal transduction and cell cycle regulation networks will be studied in detail. The classes will alternate between consideration of network-driven and network element (gene, metabolite or protein)-driven approaches. Recommended Course Background: AS.110.201, AS.110.302 or equivalent, advanced biology.

Instructor(s): A. Levchenko.
EN.580.719. Advanced Seminars in Integrative and Systems Biology.
The course is designed to introduce the current concepts, methods and modes of analysis being developed in the context of experimental and computational systems biology, with the particular emphasis on the study of signal transduction and cell-cell communication networks. Topics include development and analysis of computational and experimental models of cell interactions with other cells, with extracellular matrix and with micro- and nano-fabricated analysis platforms. The areas of application range from the bacterial signaling to stem cell development and tissue regeneration. Students will be required to read current journal articles, online presentations and actively participate in the in-class discussions. Every student will also be required to be engaged in individual projects and report on their progress. Spring semester only.
Instructor(s): A. Levchenko.

Top researchers from around the world will present the latest research on stem cell science and clinical application followed by discussion. School of Medicine campus: PCTB, Mountcastle Auditorium
Instructor(s): J. Elisseeff.

This course uses the current literature to teach advanced topics in carbohydrate engineering. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: sugars as information storage entities and signaling molecules; methods to manipulate and characterize complex carbohydrates in vivo, through chemoenzymatic methods, and emerging high-throughput methodology; carbohydrate-based drug development; and the role of sugars in stem cell biology and tissue engineering. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): K. Yarema.

We live in a new era in the understanding, diagnosis and treatment of human disease. Over the past ten years, extraordinary advances in modeling and computing technologies have opened the door to an array of possibilities that were previously beyond the reach of biomedical researchers. Today’s powerful computational platforms are allowing us to begin to identify, analyze, and compare the fundamental biological components and processes that regulate human diseases and their impact on the body. The next step, then, is to harness the potential of these theoretical and computational tools and theory in a meaningful way - that is, to apply this “new medicine” to the exploration and treatment of many of our current diseases. This lecture series will feature world experts in computational medicine as well as laboratories at JHU’s institute for Computational Medicine (ICM). Fall semester only.
Instructor(s): F. Macgabhann; S. Sarma.

This lecture series will feature world experts in computational medicine as well as laboratories at JHU’s institute for Computational Medicine (ICM). Spring semester only. **This course will meet on: February 2, March 1, April 5, and May 3.
Instructor(s): F. Macgabhann; S. Sarma.

EN.580.738. Advanced Seminars in Cardiac Electrophysiology and Mechanics.
This course uses the current literature to teach advanced topics in cardiac electrophysiology and mechanics. Students will be required to read current articles and then conduct interactive teaching sessions with faculty and other students. Potential topics will include: ion channels, cardiac excitation-contraction coupling, myofilament regulation, cardiac arrhythmias, heart failure, therapies for arrhythmias and pump dysfunction. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): N. Trayanova.

EN.580.739. Advanced Seminars in Cardiac Electrophysiology and Mechanics.
This course uses the current literature to teach advanced topics in cardiac electrophysiology and mechanics. Students will be required to read current articles and then conduct interactive teaching sessions with faculty and other students. Potential topics will include: ion channels, cardiac excitation-contraction coupling, myofilament regulation, cardiac arrhythmias, heart failure, therapies for arrhythmias and pump dysfunction. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission only (signed add/drop form). Spring semester only.
Instructor(s): N. Trayanova.

EN.580.746. Imaging Science Seminar.
Fall semester only.
Instructor(s): M. Miller; R. Vidal.
Spring semester only.
Instructor(s): M. Miller; R. Vidal.

EN.580.748. Advanced Seminars in Magnetic Resonance Imaging.
This course uses the current literature to teach advanced topics in magnetic resonance imaging. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: image artifacts, effect of motion, resolution and SNR, realtime imaging, clinical applications. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): E. McVeigh.

Potential topics will include: image artifacts, effect of motion, resolution and SNR, realtime imaging, clinical applications. Evaluation will be both by faculty and fellow students. Spring semester only.
Instructor(s): E. McVeigh.

This course is designed for graduate students interested in learning basic biomedical instrumentation design concepts and translating these into advanced projects based on their research on current state-of-the-art. They will first gain the basic knowledge of instrumentation design, explore various applications, and critically gain hands-on experience through laboratory and projects. At the end of the course, students would get an excellent awareness of biological or clinical measurement techniques, design of sensors and electronics (or electromechanical/ chemical, microprocessor system and their use). They will systematically learn to design instrumentation with a focus on the use of sensors, electronics to design a core instrumentation system such as an ECG amplifier. Armed with that knowledge and lab skills, students will be encouraged to discuss various advanced instrumentation applications, such as brain monitor, pacemaker/ defibrillator, or prosthetics. Further, they will be “challenged” to come up with some novel design ideas and implement them in a semester-long design project. Students will take part in reading the literature, learning about the state-of-the-art through journal papers and patents, and discussing, critiquing, and improving on these ideas. Finally, they will be implementing a selected idea into a semester-long advanced group project. Meets with 580.471 Graduate students only
Instructor(s): N. Thakor.

EN.580.781. Biomedical Engineering Seminar.
Instructor(s): J. Bader.

EN.580.801. Research in Biomedical Engineering.
Graduate Students only
Instructor(s): K. Yarema.

EN.580.802. Research in Biomedical Engineering.
Directed research for MSE and PhD students
Instructor(s): K. Yarema.

Cross Listed Courses

Physics Astronomy

AS.173.110. Introduction to Labview.
This is a first course in programming LabVIEW for students with no programming experience. LabVIEW is widely used in research and industry for interfacing computers to instrumentation for data acquisition, analysis, and control. The topics emphasized are basic programming structures and best practices for programming in the LabVIEW environment. Additional topics are the basic concepts of working with digital signals, data acquisition, and signal processing. Lectures are interspersed with activities on using programming structures and on interfacing with equipment. Students should bring a USB memory stick to class.
Instructor(s): S. Wonnell
Area: Engineering, Natural Sciences.

General Engineering

EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

Electrical Computer Engineering

EN.520.315. Introduction to Information Processing of Sensory Signals.
An introductory course to basic concepts of information processing of human communication signals (sounds, images) in living organisms and by machine. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473
Prerequisites: EN.520.432 OR EN.580.472
Instructor(s): B. Tsui.
This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, acoustics, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing. 
Instructor(s): M. Elhilali 
Area: Engineering.

EN.520.601. Introduction to Linear Systems Theory.
A beginning graduate course in multi-input multi-output, linear, time-invariant systems. Topics include state-space and input-output representations; solutions and their properties; multivariable poles and zeros; reachability, observability and minimal realizations; stability; system norms and their computation; linearization techniques. Recommended Course Background: Undergraduate courses in control systems and linear algebra.
Instructor(s): P. Iglesias.

By employing fundamental concepts from diverse areas of research, such as statistics, signal processing, biophysics, biochemistry, cell biology, and epidemiology, this course introduces a multidisciplinary and rigorous approach to the modeling and computational analysis of complex interaction networks. Topics to be covered include: overview of complex nonlinear interaction networks and their applications, graph-theoretic representations of network topology and stoichiometry, stochastic modeling of dynamic processes on complex networks and master equations, Langevin, Poisson, Fokker-Plank, and moment closure approximations, exact and approximate Monte Carlo simulation techniques, time-scale separation approaches, deterministic and stochastic sensitivity analysis techniques, network thermodynamics, and reverse engineering approaches for inferring network models from data. 
Instructor(s): J. Goutsias.

Mechanical Engineering

EN.530.410. Biomechanics of the Cell.
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. Discussion of the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models. 
Instructor(s): S. Sun 
Area: Engineering, Natural Sciences.

Course will cover selected topics from physiological fluid dynamics, including respiratory flow patterns, blood flow and pulse propagation, aerodynamics of phonation and speech, rheology of blood flow in the microcirculation, aquatic animal propulsion, and animal flight. 
Instructor(s): R. Mittal 
Area: Engineering.

This class will introduce fundamental concepts of statics and solid mechanics and apply them to study the mechanical behavior bones, blood vessels, and connective tissues such as tendon and skin. Topics to be covered include concepts of small and large deformation, stress, constitutive relationships that relate the two, including elasticity, anisotropy, and viscoelasticity, and experimental methods. Recommended Course Background: AS.110.201 and AS.110.302, as well as a class in statics and mechanics 
Instructor(s): L. Voo.

Applied Mathematics Statistics

EN.550.450. Computational Molecular Medicine.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional "omics" data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful). 
Prerequisites: ( EN.550.420 AND EN.550.430 ) OR equivalent courses in probability and statistics.
Instructor(s): D. Geman 
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.635. Topics in Bioinformatics.
A "readings" course organized around research articles in the recent bioinformatics and computational biology literatures. In this term, the choice of papers will favor work on inferring phenotype from genotype, and modeling signaling networks, based on gene microarrays bearing the expression levels of thousands of transcripts, and on properties of proteins, such as predicting active sites and detecting harmful mutations. One major objective is to prepare students to comfortably read articles which involve extensive mathematical and statistical modeling as well as techniques from pattern recognition and machine learning. Most papers will be presented by the students. In addition, student expositions will be preceded by "tutorials" by the instructor on various aspects of statistical learning, modeling and prediction, such as properly estimating generalization error in cancer classification and avoiding over-fitting in learning networks of molecular interactions. Recommended Course Background: course in statistics; previous exposure to machine learning or pattern recognition 
Instructor(s): D. Geman.
Computer Science

EN.600.340. Introduction to Genomic Research.
This course will use a project-based approach to introduce undergraduates to research in computational biology and genomics. During the semester, students will take a series of large data sets, all derived from recent research, and learn all the computational steps required to convert raw data into a polished analysis. Data challenges might include the DNA sequences from a bacterial genome project, the RNA sequences from an experiment to measure gene expression, the DNA from a human microbiome sequencing experiment, and others. Topics may vary from year to year. In addition to computational data analysis, students will learn to do critical reading of the scientific literature by reading high-profile research papers that generated groundbreaking or controversial results. [Applications] Recommended Course Background: Knowledge of the Unix operating system and programming expertise in a language such as Perl or Python.
Instructor(s): S. Salzberg
Area: Engineering.

EN.600.438. Computational Genomics: Data Analysis.
Genomic data has the potential to reveal causes of disease, novel drug targets, and relationships among genes and pathways in our cells. However, identifying meaningful patterns from high-dimensional genomic data has required development of new computational tools. This course will cover current approaches in computational analysis of genomic data with a focus on statistical methods and machine learning. Topics will include disease association, prediction tasks, clustering and dimensionality reduction, data integration, and network reconstruction. There will be some programming and a project component. [Applications] Recommended Course Background: EN.600.226 or other programming experience, probability and statistics, linear algebra or calculus. Students may receive credit for EN.600.438 or EN.600.638, but not both.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.

EN.600.461. Computer Vision.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modelling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. Students may receive credit for at most one of EN.600.361 or EN.600.461 or EN.600.661. [Applications] Prerequisites (soft): intro programming, linear algebra, and prob/stat.
Prerequisites: If you have completed EN.600.361 OR EN.600.661 you cannot enroll in EN.600.461.
Instructor(s): A. Reiter
Area: Engineering, Quantitative and Mathematical Sciences.

How can robots localize themselves in an environment when navigating? Can we predict which patients are at greatest-risk for complications in the hospital? Which movie should I recommend to you. Also, sit through the first few sessions and first homework to get a recommendation and inference. We will use Murphy’s book, Machine Learning: a Probabilistic Perspective, as the text for this course. Assignments are solved in groups of size 1-3 students. The class will have 4 interactive sessions during which we brainstorm how to solve example open-ended real-world problems with the tools learnt in class. Students are also required to do a project of their choice within which they experiment with the ideas learnt in class. [Analysis or Applications] Students may receive credit for EN.600.476 or EN.600.676, but not both. Requisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.638. Computational Genomics: Data Analysis.
Graduate level version of EN.600.438. [Applications] Recommended Course Background: EN.600.226 or other programming experience, probability and statistics, linear algebra or calculus. Students may receive credit for EN.600.438 or EN.600.638 but not both.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.

Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. One should have taken at least an introductory course in probability theory and linear algebra. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Requisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria.

Chemical and Biomolecular Engineering

Chemical and Biomolecular Engineering (ChemBE) is dedicated to the study and exploitation of chemical, biological, and physical processes and phenomena for chemical and biological applications. As a result of the scope and breadth of this rigorous undergraduate program, our students commonly secure employment in industries such as Chemical and Pharmaceutical Production, Biomedicine, Biotechnology, Material Design, Food, and Energy. Graduates may embark on a career to explore new products such as:

- Novel polymers and materials
- Biopharmaceuticals
- Biofuels
- Drugs and Vaccines
- Gene Therapy Products
- Drug Delivery Devices
- Cells and Tissues
- Semiconductors
The demands on the modern engineer are high, and graduates must possess a wide range of skills in order to be competitive in a global market. The ChemBE program successfully satisfies these demands. Students take advanced courses in chemistry, physics, mathematics, and biology. Additionally, students are trained in transport, kinetics, and thermodynamics, which are essential to solving real-world engineering problems. Students also hone their professional and communication skills (report writing, oral presentations, and teamwork) in courses involving experimental projects, process design and product design.

Depending on their interests and future career goals, students can choose electives from exciting areas including green engineering, nanotechnology, and bioengineering. These courses, along with undergraduate research opportunities offered by our faculty, are designed to prepare graduates for careers in the chemical industry, biotechnology, pharmaceuticals or microelectronics. The curriculum also offers an outstanding foundation for advanced graduate studies in Chemical and Biomolecular Engineering, Biomedical Engineering, Materials Engineering, or for medical, law, or business school.

Students also have the opportunity to develop more in-depth specialty in one or two areas within chemical and biomolecular engineering. Our two tracks are Interfaces and Nanotechnology (IN) and Molecular and Cellular Bioengineering (MCB).

Interfaces and Nanotechnology (IN) Track
Interesting and new physics exist at nanometer length scales, as the surface area of an object begins to approach and exceed its volume. In this focus area, students are trained in the fundamental sciences used to solve problems in nanotechnology and interfacial science. Students take a chemistry course in Materials and Surface Characterization, an advanced physical chemistry laboratory course, and two electives such as Colloids and Nanoparticles, Supramolecular Materials and Nanomedicine and Micro/Nanotechnology: the Science and Engineering of Small Structures.

Molecular and Cellular Bioengineering (MCB) Track
Fields in Biotechnology and Biomedicine often involve processes at biological, cellular and molecular levels. Common areas utilizing skills in the MCB focus area include the genetic manipulation of cells for protein and vaccine production, and the study and treatment of diseases such as arteriosclerosis and cancer. Students in this focus area must take a chemistry course in Materials and Surface Characterization, and two electives such as Metabolic Systems Biotechnology, Bioengineering in Regenerative Medicine, and Computational Protein Structure Prediction. In addition, students will take the Biomolecular Engineering Laboratory to learn the hands-on skills required for future careers in biological systems at the molecular and cellular level.

Our mission is to define and educate a new archetype of innovative and fundamentally-grounded engineer at the undergraduate and graduate levels through the fusion of fundamental chemical engineering principles and emerging disciplines. We will nurture our passion for technological innovation, scientific discovery, and leadership in existing and newly created fields that transcend traditional boundaries. We will be known for developing leaders in our increasingly technological society who are unafraid to explore uncharted engineering, scientific, and medical frontiers that will benefit humanity. Recent graduates of the Chemical and Biomolecular Engineering program will attain within a few years of graduation:

- careers in industrial, academic, or government organizations related to chemical, physical, and life sciences and engineering, and/or pursue graduate or professional education.
- positions in which they apply their chemical and biomolecular engineering skills to solve diverse traditional and emerging problems in the workplace.

The department also offers graduate programs leading to the Master of Science and Ph.D. degrees. These programs emphasize research leading to a written thesis.

Undergraduate students strongly involved in research may be interested in our B.S./M.S.E. program in Chemical and Biomolecular Engineering that allows students to obtain a master’s of science in engineering immediately after completion of their bachelors.

Facilities
The offices and state-of-the-art laboratories of Chemical and Biomolecular Engineering are located in Croft Hall and Maryland Hall on the Homewood campus. The research laboratories are well-equipped for studies in the areas of biochemical engineering, cell and tissue engineering, phase equilibria, membrane science, polymer science, interfacial phenomena, separation processes, fluid mechanics, and nucleation phenomena. The Milton S. Eisenhower Library on the Homewood campus contains over two million volumes and access to more than 325 electronic journals. The university’s other libraries located at the School of Medicine and at the Applied Physics Laboratory are also available to students. Through close collaborations with scientists at the National Institutes of Health, and the National Institute of Standards and Technology, The Institute for Genomic Research, Human Genome Sciences, Inc., and the Food and Drug Administration, students and faculty also have access to a variety of world-class facilities and other resources for research.

Financial Aid
Undergraduate scholarships and financial assistance are described in the catalog (see page 25). Part-time work is available in the Chemical and Biomolecular Engineering research laboratories on research projects supported by grants and contracts. There also is a federally sponsored work-study program for qualified students.

Financial assistance to graduate students is available in the forms of research assistantships, teaching assistantships, fellowships, and partial or full tuition remission. The financial aid package is specified following acceptance into the graduate program.

Graduates receive a Bachelor of Science degree in Chemical and Biomolecular Engineering accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org. As permitted under the ABET guidelines, we are continually updating our undergraduate programs to include the latest advances in chemical and biomolecular engineering. Such modifications will enable us to offer the best possible education experience to our undergraduates. For the latest chemical engineering educational programs, potential applicants are referred to our website at http://www.jhu.edu/chembe/
Requirements for the B.S. Degree

The Bachelor of Science degree requires a minimum of 128 credits. Additional details are given in the Chemical and Biomolecular Engineering Undergraduate Advising Manual available from the department or online. The 128 credits must include:

- Chemical and Biomolecular Engineering Core Courses
  - EN.540.101 Chemical Engineering Today 1
  - EN.540.202 Introduction to Chemical & Biological Process Analysis 4
  - EN.540.203 Engr Thermodynamics 3
  - EN.540.301 Kinetic Processes 3
  - EN.540.303 Transport Phenomena I 3
  - EN.540.304 Transport Phenomena II 4
  - EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers 3
  - EN.540.306 Chemical & Biomolecular Separation 3
  - EN.540.311 Chemical Engineering Lab I 6
  - or EN.540.313 Chemical and Biomolecular Engineering Lab 6
  - EN.540.314 ChemBE Product Design 2
  - EN.540.315 Process Design with Aspen 2
  - EN.540.409 Dynamic Modeling and Control 4
  - EN.540.490 Chemical Laboratory Safety* 1
  - Engineering electives 9

- Physics Courses and Laboratories
  - AS.171.101 General Physics: Physical Science Major I 4
  - or AS.171.107 General Physics for Physical Sciences Majors (AL) 4
  - AS.173.111 General Physics Laboratory I 1
  - AS.171.102 General Physics: Physical Science Majors II 4
  - or AS.171.108 General Physics for Physical Science Majors (AL) 4

- Basic Chemistry Courses and Laboratories
  - AS.030.101 Introductory Chemistry I 3
  - AS.030.105 Introductory Chemistry Lab I 1
  - AS.030.102 Introductory Chemistry II 3
  - AS.030.106 Introductory Chemistry Laboratory II 1

- Advanced Chemistry and Biology Courses**
  - AS.020.305 Biochemistry 4
  - EN.540.307 Cell Biology for Engineers (Optional; students must take this or EN.540.204) 3
  - AS.020.315 Biochemistry Laboratory 2
  - or AS.030.307 Physical Chemistry Instrumentation Laboratory III

- Mathematics Requirement***
  - AS.110.108 Calculus I 4
  - AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
  - AS.110.202 Calculus III 4
  - or AS.110.211 Honors Multivariable Calculus 4
  - AS.110.302 Diff Equations/Applic 4

Total Credits 90

- Humanities and Social Sciences Courses. Eighteen credits designated as Humanities or Social and Behavioral Sciences are required. Students are required to take these courses in at least two subject areas other than writing. At least one of these courses must be an advanced course at the 300-level or higher. See the Chemical and Biomolecular Engineering Undergraduate Advising Manual for more details.

- Writing Courses. Two writing intensive courses are required. One of the courses must be EN.661.315 Culture of the Engineering Profession. The courses that are taken to satisfy the university writing requirement must be passed with a grade of C- or better.

- Undesignated Electives. A minimum of 128 credits is required for the degree. Therefore, in addition to all the credits taken to fulfill the requirements mentioned in the various sections above (e.g., chemical engineering core courses, engineering electives, basic science, advanced chemistry electives, mathematics requirement, and Humanities and Social and Behavioral Sciences courses) additional credits (called undesignated credits) are required.

* Students also must have a grade point average of at least 2.00 in the chemical and biomolecular engineering core courses to graduate. The core courses for GPA calculation comprise all of the above courses except for EN.540.101 Chemical Engineering Today and EN.540.490 Chemical Laboratory Safety.

** Students need additional courses beyond these courses. Requirements include additional courses in Chemistry and Biology. Students who are pursuing tracks in Molecular and Cellular Bioengineering or Interfaces and Nanotechnology have additional and/or alternate requirements.

*** Calculus is so essential to Chemical Engineering that a grade of C- or better in both Calculus I and Calculus II is required.

Students completing a track will have this fact designated on their official university checklist. These focus areas have additional and/or alternate requirements, as described.

**Molecular and Cellular Bioengineering (MCB) Track**

Students must fulfill the following requirements:

- Students take either AS.020.306 Cell Biology or EN.540.307 Cell Biology for Engineers.
- The Advanced Chemistry and Biology laboratory requirement is fulfilled with AS.020.315 Biochemistry Laboratory or AS.250.253 Protein Engineering and Biochemistry Lab.
- Six credits of bioengineering electives are required. See department for a list of approved electives.
- Students take EN.540.313 Chemical and Biomolecular Engineering Lab instead of EN.540.311 Chemical Engineering Lab I.

**Interfaces and Nanotechnology (IN) Focus Area**

Students must fulfill the following requirements

- Students take EN.540.204 Applied Physical Chemistry.
- The Advanced Chemistry and Biology laboratory requirement is fulfilled with AS.030.307 Physical Chemistry Instrumentation Laboratory III.
- AS.030.452 Materials & Surface is required and satisfied three credits of the advanced chemistry electives.
- Six credits of interfaces and nanotechnology electives are required. See department for a list of approved electives.

**B.S./M.S.E. Program in Chemical and Biomolecular Engineering**

The B.S./M.S.E. program in Chemical and Biomolecular Engineering allows students to obtain a master of science in engineering immediately after the bachelor of science degree by adding at least a year of study. For students who qualify academically, the Whiting School of Engineering allows a 50 percent waiver after the completion of eight semesters or having received the Bachelor of Science degree.

**Master of Science in Engineering**

Students have two options in pursuing an M.S.E. in Chemical and Biomolecular Engineering.

1. Master of Science in Engineering (requiring an essay)
   - The student must complete six graduate (600-799) level courses approved by the student’s research advisor. The student and advisor select these courses to design a curriculum appropriate for the student’s research interest and educational goals.
   - These six courses cannot include seminars, independent study, graduate research, or special studies.
   - At least four of the six courses must be in the Department of Chemical and Biomolecular Engineering.
   - Students are allowed to count 400-level courses toward their M.S.E. degree if (1) the course is not offered at the 600-level, and (2) if the department offering the course considers it to be a graduate-level course in their program. Courses offered at both the 400- and 600-level must be taken at the 600-level to fulfill M.S.E. course requirements. All ChemBE coursework must be taken at the 600-level.
   - The student must also enroll in at least one semester of graduate seminars EN.540.600 Chemical and Biomolecular Engineering Seminar and EN.540.601 Chemical and Biomolecular Engineering Seminar throughout his or her tenure in the Department of Chemical and Biomolecular Engineering at Johns Hopkins University.
   - Students must have a B average in coursework to complete this degree.
   - No D grade in ChemBE courses can be counted towards the requirements. In a given semester, one D grade, one F grade, or two C grades will result in probation. Once on probation, an additional grade of C or below will result in termination from the program.
   - Students must remain in good research standing with his or her research advisor. Failure to do so will result in probation and transfer to the coursework M.S. program.
   - The student must write an essay based on original research and literature review and present his or her results at an open seminar attended by the faculty and students. The essay must be approved by the departmental graduate committee which consists of the graduate research advisor and at least one more faculty member from the Department of Chemical and Biomolecular Engineering.

2. Master of Science in Engineering (course work only)
   - The student must complete ten graduate (600-799) level courses approved by the Director of Graduate Studies. The student and Director of Graduate Studies select these courses to design a curriculum for the student's interest and educational goals.
   - These ten courses cannot include seminars, independent study, graduate research or special studies.
   - At least six of the ten courses must be in the Department of Chemical and Biomolecular Engineering.
Recommended courses for all M.S.E. students

Completion of two of the four core courses of the Ph.D. program is recommended (but not required) for M.S.E. students. The four core Ph.D. courses are:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.540.630</td>
<td>Thermodynamics, Statistical Mechanics, and Kinetics</td>
</tr>
<tr>
<td>EN.540.652</td>
<td>Advanced Transport Phenomena</td>
</tr>
<tr>
<td>EN.540.602</td>
<td>Metabolic Systems Biotechnology</td>
</tr>
<tr>
<td>EN.540.615</td>
<td>Interfacial Science with Applications to Nanoscale Systems</td>
</tr>
</tbody>
</table>

Additional information and requirements can be found in the department Graduate Handbook.

Doctor of Philosophy

The Ph.D. degree is awarded for original research performed under the guidance of a thesis advisor. The formal requirements for this degree are:

1. Successful completion of six graduate-level courses including the four required core courses.
2. Successful completion of the Preliminary Research Exam during the student’s first year.
3. Successfully serve as a teaching assistant for at least two required undergraduate courses.
4. Completion of an original research project, documented in a dissertation that is defended by the candidate in a public presentation.
5. Successful completion of the Graduate Board Oral Exam.

Course Work

Student must successfully complete six graduate-level courses including the four required core courses listed below:

In addition:

- Students are allowed to count 400-level courses toward their M.S.E. degree if (1) the course is not offered at the 600-level, and (2) if the department offering the course considers it to be a graduate-level course in their program. Courses offered at both the 400- and 600-level must be taken at the 600-level to fulfill M.S.E. course requirements. All ChemBE coursework must be taken at the 600-level.
- The student must also enroll in at least one semester of graduate seminars (EN.540.601 Chemical and Biomolecular Engineering Seminar/EN.540.600 Chemical and Biomolecular Engineering Seminar) throughout his or her tenure in the Department of Chemical and Biomolecular Engineering at Johns Hopkins University.
- Students must have a B average in coursework to complete this degree.
- No D grade in ChemBE courses can be counted towards the requirements. In a given semester, one D grade, one F grade, or two C grades will result in probation. Once on probation, an additional grade of C or below will result in termination from the program.

Ph.D. Thesis Criteria and Graduate Board Oral Exam

Candidates must write a dissertation conforming to university requirements that describes the students work and results in detail. A public defense of the dissertation is required, and will be followed by a closed examination session. Because the closed examination session fulfills the university Graduate Board Oral (GBO) examination requirement, all procedures pertaining to GBOs as established by the University Graduate Board must be followed.

Additional information can be found in the department Graduate Handbook.

Faculty

Chair
Konstantinos Konstantopoulos
Professor: cell and molecular engineering; cell signaling, adhesion and migration; microfluidics; nanobiotechnology; cancer metastasis.
Professors

Michael J. Betenbaugh
Professor: genomics, recombinant DNA biotechnology, biopharmaceuticals, metabolic engineering, insect and mammalian cell culture, glycosylation engineering, and cell death processes.

Michael A. Bevan
Professor and Director of Graduate Studies: colloidal interactions, dynamics, assembly, nanoparticle materials and devices, biomacromolecular interactions

Marc D. Donohue
Professor: phase equilibria, statistical thermodynamics, kinetics of diffusion and phase transitions, adsorption.

David Gracias
Professor: micro and nanotechnology, surface science, metamaterials, complex systems, nanoelectronics, nanomedicine, regenerative medicine, drug delivery and microfluidics.

Jeffrey Gray
Professor and Director of Graduate Admissions: biomolecular modeling, protein-protein docking, therapeutic antibodies, allostery, protein-surface interactions and design.

Marc A. Ostermeier
Professor: biomolecular engineering, molecular evolution, protein engineering, combinatorial methods, biosensors, protein therapeutics.

Denis Wirtz
Professor and Vice Provost for Research: cell adhesion and migration, cell mechanics, cytoskeleton, receptor-ligand interactions, cancer, particle tracking, new proteomics tools.

Associate Professors

Sharon Gerecht
Associate Professor: embryonic and adult stem cells, vascular regeneration, micro/nano fabrication, biomaterials, tissue engineering.

Joelle Frechette
Associate Professor and Director of Master’s Studies: properties of surfaces, thin films; fluid interfaces and confined fluids; measurements of surface forces and adhesion; micro and nanotechnology; microfluidics; nanoparticles.

Assistant Professors

Honggang Cui
Assistant Professor: nanoscience and nanotechnology, biomolecular engineering, peptide synthesis and assembly, drug delivery, supramolecular polymers, nanoparticle imaging, diagnosis, and cancer therapeutics.

Zachary Gagnon
Assistant Professor: electrokinetic phenomena in micro/nanofluidic environments, cell signaling, cell migration, micro/nano fabrication, dielectrophoresis, biological separation, manipulation and characterization in microdevices.

Rebecca Schulman
Assistant Professor: nanotechnology, self-assembly, theory and experiment, nucleation, biomaterials, DNA, nanoelectronics, biomolecular engineering, single-molecular analysis.

Chao Wang
Assistant Professor: heterogeneous catalysis, renewable energy technologies e.g., photoelectrochemical solar cells and lithium batteries, and green chemical engineering.

Senior Lecturer

Lise Dahuron
Senior Lecturer and Director of Undergraduate Studies: separations, distillation, membrane technology, new product development, process design.

An Goffin
Senior Lecturer: fluid and bioactive interfaces, kinetic processes, principles in chemical engineering, product design.

Professor Emeritus

Joseph L. Katz
Professor Emeritus: nucleation processes (e.g., condensation of supersaturated vapors, boiling of superheated liquids and its applications, e.g., the Ouzo effect, parts per quadrillion detection) formation of nanosized ceramic oxide powders in flames, new proteomics tools.

Research Professor

Gregory Aranovich
Research Professor: molecular thermodynamics, phase equilibria, adsorption phenomena, separation processes, and diffusion.

Assistant Research Professor

Daniele Gilkes
Eva Lai
Assistant Research Professor: biomedical sciences, biomonitoring technologies, regenerative medicine, tissue engineering.

Adjunct Professor

Joseph Shiloach
Senior Investigator, National Institute of Diabetes and Digestive and Kidney Diseases

Adjunct Assistant Professor

Jerry S. H. Lee
Program Director, National Cancer Institute and National Institute of Health

Associate Research Professor

George Oyler

Adjunct Assistant Research Scientist

Sai Prakash

Joint, Part-Time and Visiting Appointments

Steven An
Associate Professor, Johns Hopkins University Bloomberg School of Public Health

Patrick Breysse
Professor, Johns Hopkins University School of Medicine, Division of Environmental Health Engineering

Jennifer Elisseeff
A series of weekly lectures to introduce students to chemical and biomolecular engineering and its role as a profession in addressing contemporary technological, social, ethical, and economic issues in today’s world. The lectures will include examples of how chemical and biomolecular engineers apply the principles of physics and chemistry to develop new products, improve process efficiencies, and alleviate the strain on the ecosystem through the design of novel environmentally conscious processes. In addition, the lectures will highlight exciting new areas now being advanced by chemical and biomolecular engineers, such as biochemical engineering, tissue engineering, nanoparticle fabrication, and processing smart polymers for applications in computer technology and as sensors. Freshmen Only.
Instructor(s): L. Dahuron
Area: Engineering.

EN.540.111. Introduction to Programming for ChemBEs: Matlab Made Easy.
Computer programming is as crucial a tool for modern engineering as calculus. Engineers use computers for almost everything: from design and manufacturing in industry to data collection and analysis in research. In this course, students will use a piece of popular engineering software, Matlab, to learn the fundamentals of programming. We will start simple, exploring such questions as: What is a program? How can we use loops and branches to accomplish a task? What exactly is Matlab doing when it's running a script? Finally, we will build upon the fundamentals of programming to tackle relevant engineering problems.
This course will help ChemBE students excel in subsequent engineering courses, such as Modeling and Statistics for ChemBEs, Separations, and Chemical Kinetics, by giving students' knowledge of the tool that helps solve complex engineering problems.
Instructor(s): D. Scalise; J. Zenk
Area: Engineering.

Introduction to chemical and biomolecular engineering and the fundamental principles of chemical process analysis. Formulation and solution of material and energy balances on chemical processes. Reductionist approaches to the solution of complex, multi-unit processes will be emphasized. Introduction to the basic concepts of thermodynamics as well as chemical and biochemical reactions.
Prerequisites: Prereqs: ( AS.030.101 OR AS.030.103 ) AND ( AS.171.101 OR AS.171.107 ) AND ( AS.030.102 OR AS.030.103 OR AS.110.109 OR AS.171.102 )
Instructor(s): J. Gray; L. Dahuron
Area: Engineering.

EN.540.203. Engr Thermodynamics.
Formulation and solution of material, energy, and entropy balances with an emphasis on open systems. A systematic problem-solving approach is developed for chemical and biomolecular process-related systems. Extensive use is made of classical thermodynamic relationships and constitutive equations for one and two component systems. Applications include the analysis and design of engines, refrigerators, heat pumps, compressors, and turbines.
Prerequisites: Prereqs: EN.540.202
Instructor(s): C. Wang
Area: Engineering.

EN.540.204. Applied Physical Chemistry.
The topics in this course include thermodynamic models for multicomponent phase equilibrium including vapor liquid equilibrium, phase diagrams, activity models and colligative properties in both non-electrolyte and electrolyte solutions. A link between average thermodynamic properties and microstates and molecular interactions is made via a discussion of intermolecular forces and the partition function. Also covered are thermodynamic relationships to describe chemical equilibria, and basic concepts in quantum mechanics and statistical mechanics.
Prerequisites: EN.540.203.
Instructor(s): D. Gracias
Area: Engineering.
This course will engage students with a variety of physical and biological phenomena as they relate to fictional creatures such as dragons. This course seeks to serve as an exercise on applying engineering knowledge of transport phenomena, genetic modification and expression, metabolic networks, and biochemical reactions into a cohesive, refreshing look at creatures of myth and literature. Course is designed to be accessible for students of all backgrounds.
Area: Natural Sciences.

The courses EN.540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and efficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue

Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.301. Kinetic Processes.
Review of numerical methods applied to kinetic phenomena and reactor design in chemical and biological processes. Homogeneous kinetics and interpretation of reaction rate data. Batch, plug flow, and stirred tank reactor analyses, including reactors in parallel and in series. Selectivity and optimization considerations in multiple reaction systems. Non isothermal reactors. Elements of heterogeneous kinetics, including adsorption isotherms and heterogeneous catalysis. Coupled transport and chemical/biological reaction rates.
Prerequisites: EN.540.203 AND EN.540.303
Instructor(s): A. Goffin
Area: Engineering.

EN.540.303. Transport Phenomena I.
Molecular mechanisms of momentum transport (viscous flow), energy transport (heat conduction), and mass transport (diffusion). Isothermal equations of change (continuity, motion, and energy). The development of the Navier Stokes equation. The development of non isothermal and multi component equations of change for heat and mass transfer. Exact solutions to steady state, isothermal unidirectional flow problems, to steady state heat and mass transfer problems. The analogies between heat, mass, and momentum transfer are emphasized throughout the course. Recommended Corequisite: AS.110.302, Introduction to the field of transport phenomena.
Instructor(s): K. Konstantopoulos
Area: Engineering.

EN.540.304. Transport Phenomena II.
Prerequisites: EN.540.303.
Instructor(s): Z. Gagnon
Area: Engineering.

EN.540.305. Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers.
This course seeks to build the student’s strength in Chemical Engineering computing and data analysis. To this end, in the first part of the course, we will become familiar with the Matlab/Octave computing environment and solve problems in Chemical Engineering that involve concepts from Process Analysis, Thermodynamics, Transport Phenomena, and Kinetics. In the subsequent part, we will build on the skills learnt earlier and tackle problems in Data Analysis and Hypothesis testing. Recommended Corequisites: EN.540.203 and EN.540.303 and EN.540.304.
Prerequisites: EN.540.202 OR AS.110.302
Instructor(s): R. Schulman
Area: Engineering.

This course covers staged and continuous-contacting separations processes critical to the chemical and biochemical industries. Separations technologies studied include distillation, liquid-liquid extraction, gas absorption, membrane ultrafiltration, reverse osmosis, dialysis, adsorption, and chromatography. Particular emphasis is placed on the biochemical uses of these processes and consequently on how the treatment of these processes differs from the more traditional approach.
Prerequisites: EN.540.303 AND EN.540.202 AND EN.540.203; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): M. Betenbaugh
Area: Engineering.
This course explores fundamental structural details and molecular functions of different parts of the cell. Considerable emphasis is placed on experimental/quantitative approaches to answering these questions. Topics include Central dogma and the nucleus; protein trafficking; ion transporters; cytoskeleton; molecular motors; cell cycle and cell division; signal transduction, cell growth and cancer; cell death, the extracellular matrix; cell adhesion, cell junctions and epithelium; and muscle contraction, cell motility and morphogenesis.
Prerequisites: Cell Biology restriction: students who have completed AS.020.306 may not enroll.
Instructor(s): J. Yang; X. Chan
Area: Natural Sciences.

This course guides the student through the steps of product design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments. This course is the first part of a two-semester sequence that optionally can be taken instead of EN.540.314 Chemical and Biomolecular Engineering Product Design. The material covered is the same as in EN.540.314, but more time is allowed so that laboratory tests can be performed and/or prototypes can be made. Note that students must take 540.310 to complete this sequence and before receiving credits for 540.309. Recommended Course Background: EN.540.301, EN.540.304, EN.540.311 or EN.540.313 or permission of instructor.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): M. Donohue
Area: Engineering.

This course is one part of a two semester sequence that optionally can be taken instead of for This course is the second part of a two semester sequence (with EN.540.309) that optionally can be taken instead of EN.540.314 Chemical and Biomolecular Engineering Product Design. Students continue to work with their team on their product design project. Students report several times both orally and in writing on their accomplishments. The material covered is the same as in EN.540.314, but more time is allowed so that laboratory tests can be performed and/or prototypes can be made. Note that both courses, EN.540.309 and EN.540.310 must be taken to satisfy the Undergraduate degree requirement of the Chemical and Biomolecular Engineering program. The two courses can be started in any term. Recommended Course Background: EN.540.301, EN.540.304, EN.540.311 or EN.540.313 or permission of instructor.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.311. Chemical Engineering Lab I.
This course challenges students with laboratory projects that are not well-defined. Students work in groups to develop an effective approach to experiments. They identify the important operating variables, decide how best to obtain them using measured or calculated values. Based on their results they predict, carryout, analyze and improve experiments. Each student analyzes three of the following projects: distillation, gas absorption, and one of the projects in EN.540.313. In addition to technical objectives, this course stresses oral and written communication. Students will have additional meeting times with the instructors and some writing professors outside of class.
Prerequisites: EN.540.301, EN.540.304, EN.540.306, EN.540.490 and EN.661.315
Instructor(s): A. Goffin; L. Dahuron
Area: Engineering.

EN.540.312. Chemical and Biomolecular Engineering Lab: Part 2.
Students who, as a part of an exchange program, participated in a laboratory course at the Technical University of Denmark at Copenhagen during the summer are required to register for this course to complete their equivalency requirement for the Chemical and Biomolecular Engineering Laboratory course offered in fall at JHU. The final grade for this course will incorporate the DTU grade. In addition, students perform one experimental project and submit a full professional report along with the current Senior Lab students. Students make a 15-min presentation to the junior class about their projects and of their experience in Denmark. Recommended Course Background: EN.540.301, EN.540.304, EN.540.306, EN.540.490, EN.661.315
Instructor(s): L. Dahuron
Area: Engineering.

EN.540.313. Chemical and Biomolecular Engineering Lab.
This course challenges students with laboratory projects that are not well-defined. Students work in groups to develop an effective approach to experiments. They identify the important operating variables, decide how best to obtain them using measured or calculated values. Based on their results they predict, carryout, analyze and improve experiments. Each student analyzes at least two of the following biomolecular projects: bioreactor, biocatalysis and membrane separation and one of the projects in EN.540.311. In addition to technical objectives, this course stresses oral and written communication. Students will have additional meeting times with the instructors and some writing professors outside of class.
Instructor(s): A. Goffin; L. Dahuron; M. Ostermeier; S. Gerecht
Area: Engineering.

This course guides the student through the contrasting aspects of product design and of process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Process design concerns the quantitative description of processes, which serve to produce many commodity chemicals, the estimation of process profitability, and the potential for profitability improvement through incremental changes in the process. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments.
Prerequisites: (EN.540.311 OR EN.540.312 OR EN.540.313) AND EN.540.301 AND EN.540.306
Instructor(s): A. Goffin; L. Dahuron
Area: Engineering.
Prerequisites: (EN.540.311 OR EN.540.312 OR EN.540.313) AND EN.540.301 AND EN.540.306
Instructor(s): A. Goffin; L. Dahuron
Area: Engineering.

The courses EN.540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. EN.540.400. Project in Design: Pharmacokinetics.
This design project will be to develop a chemical process model of the human body that can be used to understand the temporal distribution, spatial distribution and bioavailability of pharmaceutical drugs. The course (and software to be developed) will cover the spectrum of factors affecting pharmaceutical bioavailability including drug formulation, mode of dosing and dosing rate, metabolism and metabolic cascades, storage in fatty tissues, and diffusional limitations (such as in crossing the blood-brain barrier or diffusional differences between normal and cancerous cells). The goal is to develop a process model of the human body that will predict pharmaceutical bioavailability as a function of time and organ (or cell) type that will work for a wide variety of pharmaceuticals including small molecules, biologics, and chemotherapy agents. Instructor(s): M. Donohue
Area: Engineering.

This course is a group design project (i.e. not a lecture course) to use chemical processing simulation tools (Aspen) to model a real-world process of interest to Chemical and Biomolecular Engineers. The goal of the project will be to develop a process model that is sufficiently complete and robust that it can be used to understand the important factors in the process design and/or operation. This design project is focused on the role alternative energy will play in our country's future. About a third of the course will be devoted to understanding the role of energy and alternative energy in the US and world economies. The remainder of the course will be devoted to a technical and economic analysis of the feasibility of making biofuel from algae. Instructor(s): M. Donohue
Area: Engineering.

The aim of this course is to provide a fundamental understanding of the quantitative principles and methodologies of systems biology and biochemical engineering of metabolism. This includes concepts of cellular growth, cellular stoichiometric models, metabolic networks, metabolite fluxes, and genome-scale metabolic models. Quantitative methods and systems biology approaches for metabolic flux analysis and metabolic control theory will be included as well as an analysis of biochemical systems and bioreactors including a consideration of mass transport processes. Prerequisites: AS.020.306 OR (EN.580.440 OR EN.580.441) OR EN.540.307
Instructor(s): M. Betenbaugh
Area: Engineering.

EN.540.403. Colloids and Nanoparticles.
Fundamental principles related to interactions, dynamics, and structure in colloidal, nanoparticle, and interfacial systems. Concepts covered include hydrodynamics, Brownian motion, diffusion, sedimentation, electrophoresis, colloidal and surface forces, polymeric forces, aggregation, deposition, and experimental methods. Modern topics related to colloids in nano-science and technology will be discussed throughout the course with frequent references to recent literature. Meets with EN.540.603
Instructor(s): M. Bevan
Area: Engineering.

EN.540.405. The Design of Biomolecular Systems.
This course covers new topics in the design of systems of biomolecules, both in vitro and in vivo, for decision making and control. The course will begin with an overview of how logical decision making and control with biomolecules as is achieved in biology and then proceed to consider various strategies of engineering similar systems. The focus of the course will be on systems level principles rather than the biochemical basis of molecular design. Topics will include engineering of transcriptional networks and genetic control for logically programming of cells, the design of in vitro mimics of genetic controls, molecular computing and systems aspects of metabolic engineering. The course will also cover quantitative and computational techniques for the simulation and analysis of biomolecular systems. Co-listed with EN.540.605
Instructor(s): R. Schulman.
This course describes the most recent progress in molecular self-assembly, with a focus on the application aspects of self-assembling materials in medical and energy-related areas. Specifically, the course consists of about twelve lectures covering a broad range of topics, including: principles of static and dynamic molecular assembly, nanomaterials and phase/morphology diagrams of small molecular and macromolecular amphiphiles, self-assembly in biological systems, supramolecular polymers for energy and medicine, key challenges in the fabrication of organic solar cells, and self-healing materials. The class will be taught in a seminar format, with discussions led by graduate students or post docs. Instructor permission required. Juniors and Seniors only.
Instructor(s): J. Frechette
Area: Engineering.

This course will consist of student-led discussions of current literature in protein structure prediction, protein-protein docking, and computational protein design. Related advanced computational approaches of the Rosetta3 protein structural modeling platform will be discussed and object-oriented software design concepts dissected. Students will present and critique C++ and Python code and scripts corresponding to related research projects. Permission of Instructor Required
Instructor(s): J. Gray.

This course covers pharmacodynamics, i.e. how pharmaceuticals affect biological processes. The course will use MatLab to aid in the design of new drug formulations.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.418. Projects in the Design of a Chemical Car.
Ready to put those concepts from class into practice? Members work over the course of the semester to design and build a chemically powered vehicle that will compete with other college teams at the American Institute of Chemical Engineers ( AIChE) Regional Conference. In this course, the students work in small groups to design and construct the chassis along with chemically powered propulsion and break mechanisms within the constraints of the competition. In addition, students will give oral presentation, write reports, and do thorough safety analysis of their prototypes. Both semesters must be completed with passing grades to receive credit. Instructor Approval Only.
Instructor(s): L. Dahuron
Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.419. Projects in the Design of a Chemical Car.
This course will consist of student-led discussions of current literature in protein structure prediction, protein-protein docking, and computational protein design. Related advanced computational approaches of the Rosetta3 protein structural modeling platform will be discussed and object-oriented software design concepts dissected. Students will present and critique C++ and Python code and scripts corresponding to related research projects. Permission of Instructor Required
Instructor(s): J. Gray
Area: Engineering.
EN.540.422. Introduction to Polymeric Materials.  
Polymeric materials are ubiquitous in our society from Nature-made proteins and polysaccharides to synthetic plastics and fibers. Their applications range from day-to-day consumables to high performance materials used in critically demanding areas, such as aviation, aerospace and medical devices. The objective of this course is to provide an introductory overview on the field of polymer science and engineering. Students will learn some basic concepts in polymer synthesis, characterization, and processing. With the basic concepts established, industrial applications of polymeric materials will be discussed in two categories: structural polymers and functional polymers. Structural polymers, including plastics, fibers, rubbers, coatings, adhesives, and composites, will be discussed in terms of their structure, processing, and property relationship with a flavor of industrial relevant products and applications. Future trends in developing environmentally friendly polymers from renewable resources (“green polymer chemistry”) will also be covered. Lectures on functional polymers will be focused on their unique properties that are enabled by rational molecular design, controlled synthesis and processing (e.g. supramolecular assembly, and microfabrication). This class of specialty materials can find their use in high performance photovoltaics, batteries, membranes, and composites, and can also serve as “smart” materials for use in coatings, sensors, medical devices, and biomimicry.  
Prerequisites: AS.030.205 or by instructor permission.  
Instructor(s): H. Cui; K. Qi  
Area: Engineering.

EN.540.426. Biomacromolecules at the Nanoscale.  
This course introduces modern concepts of polymer physics at the nanoscale to describe the conformation and dynamics of biological macromolecules such as filamentous actin, microtubule, and nucleic acids. We will introduce scattering techniques, nano-manipulation techniques, as well as nano-rheology applied to the study of polymers for tissue engineering, nanoparticles, and drug delivery applications.  
Instructor(s): D. Wirtz  
Area: Engineering.

EN.540.428. Supramolecular Materials and Nanomedicine.  
Nanomedicine is a quickly growing area that exploits the novel chemical, physical, and biological properties of nanostructures and nanostructured materials for medical treatments. This course presents basic design principles of constructing nanomaterials for use in drug delivery, disease diagnosis and imaging, and tissue engineering. Three major topics will be discussed, including 1) nanocarriers for drug delivery that are formed through soft matter assembly (e.g., surfactants, lipids, block copolymers, DNA, polyelectrolytes, peptides), 2) inorganic nanostructures for disease diagnosis and imaging (e.g., nanoparticles of gold and silver, quantum dots and carbon nanotubes), and 3) supramolecular scaffolds for tissue engineering and regenerative medicine. Students are expected to learn the physical, chemical and biological properties of each nanomaterial, the underlying physics and chemistry of fabricating such material, as well as their advantages and potential issues when used for biomedical applications. This course will also provide students opportunities for case studies on commercialized nanomedicine products. After this class, students should gain a deeper understanding of current challenges in translating nanoscience and nanotechnology.  
Instructor(s): H. Cui  
Area: Engineering, Natural Sciences.

One semester overview of year long course, students that want a comprehensive understanding of pharmacokinetics and pharmacodynamics should take the 2 courses EN.540.400 and EN.540.421. This course covers the principles of pharmacokinetics and pharmacodynamics. Computer models of pharmacokinetic and pharmacodynamics behavior will be developed and then used to design better drug delivery regimens and to analyze drug chemistry modifications.  
Instructor(s): M. Donohue  
Area: Engineering, Natural Sciences.

EN.540.437. Application of Molecular Evolution to Biotechnology.  
One of the most promising strategies for successfully designing complex biomolecular functions is to exploit nature’s principles of evolution. This course provides an overview of the basics of molecular evolution as well as its experimental implementation. Current research problems in evolution-based biotechnology and engineering will be used to illustrate principles in the design of biomolecules (i.e. protein engineering, RNA/DNA engineering), genetic circuits and complex biological systems including cells. Meets with EN.540.637  
Instructor(s): M. Ostermeier  
Area: Engineering, Natural Sciences.

The field of micro / nanotechnology has been gaining tremendous momentum as evidenced by an explosive rise in the number of publications, patents and commercial activities. This is an introductory course intended to expose students to the field as well as real world applications. Lectures will include an overview of scaling of material properties at the nanoscale, micro and nanofabrication methods and essential analytical tools of relevance to the field. All through the course, we will go over electronic, optical and biological applications of emerging micro and nanoscale devices and materials. Co-listed with EN.540.640.  
Instructor(s): D. Gracias  
Area: Engineering.

EN.540.443. Topics in Vascular Engineering.  
In-depth discussion and hands-on course focused on engineering approaches for vascular regeneration. The course will focus on engineering principles of the vasculature including induction of differentiation and administration of cell therapies. Seminal papers and approaches to analyze vascular tissues and cultures will be examined and discussed. Students will perform hands on experiments focused on vascular differentiation and regeneration. In addition, the course will be integrated with students’ presentations throughout the semester on selected topics in vascular engineering.  
Instructor(s): S. Gerecht  
Area: Engineering.

A selection of problems in fluid mechanics at low and moderate Reynolds numbers. This is a highly interactive class in which students are expected to choose topics and prepare a presentation at least twice a semester. Therefore, the list of problems will vary depending on student selection. Typically Tuesdays will be an introductory class and Thursdays will be seminars on a specific topic or paper. Meets with 540.647  
Instructor(s): G. Drazer  
Area: Engineering, Natural Sciences.
**EN.540.449. Logic and Decision-making in Biomolecular Systems.**

From the smallest change in gene expression to life and death and reproduction, biomolecular decision-making processes govern cellular fate. In this course we explore the design principles by which biomolecules make decisions and orchestrate complex processes such as signal transduction, homeostasis or apoptosis. We will also explore how we can in turn design complex biomolecular networks that can control biological systems and biomolecular materials. Topics will include the design and analysis of molecular logic circuits, transcriptional and translational control, signal transduction cascades, biomolecular oscillators and cycles, DNA nanotechnology and nanobiotechnology, and molecular computing. The course will introduce principles from electrical circuit theory, computing and control theory and show how these tools can be applied to these systems. Students should be familiar with programming and chemical engineering principles.

**Instructor(s):** R. Schulman  
**Area: Engineering, Natural Sciences.**

**EN.540.452. Eukaryotic Cell Biotechnology.**

This course involves integrated lecture/discussion and laboratory components to review and participate in current and emerging topics involving eukaryotic biotechnology. Lectures and discussions review how fundamentals of biochemical kinetics and biomolecular engineering are connected to emerging problems in mammalian, algal, and stem cell biotechnology. Laboratory activities are connected to diverse scientific and technological fundamental topics on these same themes. Journal article and research presentations provide a context for laboratory activities with respect to emerging industrial applications for eukaryotic cell types. Research design and strategy is discussed in terms of its ultimate implementation in laboratory, pilot plant, and eventually manufacturing facilities. Methodologies implemented include cell and metabolic engineering for improving yields and production rates of proteins, cells, and tissues. Example topics include expansion of mammalian, stem cells, and algae for the production of membrane proteins, biologics, biofuels, and complex metabolites.

**Instructor(s):** M. Betenbaugh.

**EN.540.459. Bioengineering in Regenerative Medicine.**

Introduction and in-depth discussion course focused on tissue and stem cell engineering. The course will focus on principles in tissue engineering, mechanisms of regeneration, and stem cell therapies. Topics will include introduction to regenerative medicine, bioreactors and scaffolds in tissue engineering, adult and pluripotent stem cells, engineering the niche, and two sessions will focus on legal and ethical issues. Selected approaches to analyze tissues and stem cell culture will also be discussed. In addition, the course will be integrated with graduate students’ presentations on selected topics in stem cell engineering. Co-listed with EN.540.659 Recommended Course Background: AS.020.306 or EN.580.221.

**Instructor(s):** S. Gerecht  
**Area: Engineering.**

**EN.540.460. Computational and Experimental Design of Biomolecules.**

This course reviews current research problems in biomolecular design both from computational and experimental approaches. Current methods in structure prediction (folding, docking and design) will illustrate fundamental concepts in protein structure, biophysics, and optimization. Current research problems in evolution-based biomolecular engineering will illustrate principles in the design of biomolecules (i.e. protein engineering, RNA/DNA engineering), metabolic pathways, signaling pathways, genetic circuits and complex biological systems including cells. Recommended Course Background: AS.020.305  
**Area: Engineering.**

**EN.540.463. Current Topics: Biochemistry and Biophysics of Cancer.**

*Attendance to this course is limited to ChemBE students who are working in the instructors lab. This course focuses on the application of engineering fundamentals to cancer metastasis. Class lectures will include an overview of molecular biology fundamentals, an extensive review on extracellular matrix and basics of receptors, followed by topics on tumor cell-host cell and tumor cell-matrix interactions at both theoretical and experimental levels. Lectures will also cover the effects of physical (e.g. shear stress, strain) and chemical (e.g. cytokines, growth factors) stimuli on tumor cell function.

**Instructor(s):** K. Konstantopoulos  
**Area: Engineering.**

**EN.540.464. Current Topics: The Statistical Mechanics of Malignant Neoplasm.**

This course will introduce students involved in cancer engineering research the fundamental elements of statistical mechanics relevant to tumor growth and progression to metastatic disease. Topics include: Fokker-Planck equation for collective cancer migration, tumor growth as a phase transition, and cancer cell motility in nth-dimension space.

**Instructor(s):** D. Wirtz.

**EN.540.477. Current Topics in Transport and Interfacial Phenomena: Electrokinetics.**

This course involves integrated lecture/discussion and interfacial science are connected to emerging problems in micro- and nanotechnologies. The focus area of the class is Electrokinetic Phenomena. The mandatory laboratory component is aimed at connecting the topics covered in the class to scientific problems. Student participation will involve presentation of laboratory results and research papers.

**Instructor(s):** G. Drazer; J. Frechette; Z. Gagnon.
This course involves integrated lecture/discussion and laboratory components to review and participate in current and emerging topics involving eukaryotic biotechnology. Lectures and discussions review how fundamentals of biochemical kinetics and biomolecular engineering are connected to emerging problems in mammalian, algal, and stem cell biotechnology. Laboratory activities are connected to diverse scientific and technological fundamental topics on these same themes. Journal article and research presentations provide a context for laboratory activities with respect to emerging industrial applications for eukaryotic cell types. Research design and strategy is discussed in terms of its ultimate implementation in laboratory, pilot plant, and eventually manufacturing facilities. Instructor(s): M. Betenbaugh  
Area: Engineering.

EN.540.480. Current Topics in Eukaryotic Cell Biotechnology Part II.
This course involves integrated lecture/discussion and laboratory components to review and participate in current and emerging topics involving eukaryotic biotechnology. Lectures and discussions review how fundamentals of biochemical kinetics and biomolecular engineering are connected to emerging problems in mammalian, algal, and stem cell biotechnology. Laboratory activities are connected to diverse scientific and technological fundamental topics on these same themes. Journal article and research presentations provide a context for laboratory activities with respect to emerging industrial applications for eukaryotic cell types. Research design and strategy is discussed in terms of its ultimate implementation in laboratory, pilot plant, and eventually manufacturing facilities. Methodologies implemented include genomics, metabolic flux analysis, and cell and metabolic engineering for improving yields and production rates of proteins, cells, and tissues. Example topics include expansion of mammalian cells and algae for the production of membrane proteins, biologics, biofuels, and complex metabolites.
Instructor(s): M. Betenbaugh.

EN.540.490. Chemical Laboratory Safety.
This course is meant to provide the student with a basic knowledge of laboratory safety; hazards, regulations, personal protective equipment, good laboratory practice, elementary toxicology, and engineering controls. It has been developed by the Department of Chemical and Biomolecular Engineering to assist with regulatory compliance, minimize hazards, and reduce the severity of any incidents that may occur in the department's laboratories. The course is a prerequisite of EN.540.311/EN.540.313. It is required of all Chemical and Biomolecular Engineering undergraduates. In addition once per year a three-hour refresher seminar must be taken by all students involved in laboratory research.
Instructor(s): D. Kuespert; L. Dahuron  
Area: Engineering.

Instructor(s): J. Hanes.

Instructor(s): J. Frechette; K. Konstantopoulos; M. Donohue; M. Ostermeier; S. Gerecht.

EN.540.509. Undergraduate Internship.
Internship unpaid and approved by ChemBE faculty.  
Area: Engineering.
EN.540.605. The Design of Biomolecular Systems.
This course covers new topics in the design of systems of biomolecules, both in vitro and in vivo, for decision making and control. The course will begin with an overview of how logical decision making and control with biomolecules as is achieved in biology and then proceed to consider various strategies of engineering similar systems. The focus of the course will be on systems level principles rather than the biochemical molecule design. Topics will include engineering of transcriptional networks and genetic control for logically programming of cells, the design of in vitro mimics of genetic controls, molecular computing and systems aspects of metabolic engineering. The course will also cover quantitative and computational techniques for the simulation and analysis of biomolecular systems. Co-listed with EN.540.405
Instructor(s): R. Schulman.

Supervised Graduate Study
Instructor(s): M. Donohue
Area: Engineering.

EN.540.609. Chemical and Biomolecular Engineering Design.
This course is one part of a two semester sequence in Chemical and Biomolecular Engineering Product Design. It is intended for students in the ChemBE master’s program. This course guides the student through the complex process of new product design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill needs. Students work in small teams to develop a new product idea, design the product and then iterate on prototype development. Students report several times both orally and in writing on their accomplishments. Time is allowed so that laboratory tests can be performed and/or prototypes can be built. Note that generally both courses, 540.609 and 540.610 must be taken to complete the prototype development. The two courses can be started in any term.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.610. Chemical and Biomolecular Engineering Design: Spring.
This course is one part of a two semester sequence. This course guides the student through the contrasting aspects of product design and of process design. Process design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Process design concerns the quantitative description of processes which serve to produce many commodity chemicals, the estimation of process profitability, and the potential for profitability improvement through incremental changes in the process. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments. Laboratory tests can be performed and/or prototypes can be made. Note that both courses, 540.609 and 540.610 must be taken, the two courses can be started in any term.
Instructor(s): M. Donohue.

EN.540.614. Computational Protein Structure Prediction and Design.
This class will introduce the fundamental concepts in protein structure, biophysics, optimization and informatics that have enabled the breakthroughs in computational structure prediction and design. Problems covered will include protein folding and docking, design of ligand-binding sites, design of turns and folds, design of protein interfaces. Class will consist of lectures and hands-on computer workshops. Students will learn to use molecular visualization tools and write programs with the PyRosetta protein structure software suite, including a computational project. Programming experience is recommended.
Instructor(s): J. Gray
Area: Engineering.

EN.540.615. Interfacial Science with Applications to Nanoscale Systems.
Nanostructured materials intrinsically possess large surface area (interface area) to volume ratios. It is this large interfacial area that gives rise to many of the amazing properties and technologies associated with nanotechnology. In this class we will examine how the properties of surfaces, interfaces, and nanoscale features differ from their macroscopic behavior. We will compare and contrast fluid-fluid interfaces with solid-fluid and solid-solid interfaces, discussing fundamental interfacial physics and chemistry, as well as touching on state-of-the-art technologies.
Instructor(s): J. Frechette
Area: Engineering.

EN.540.616. Current Topics in Protein Structure Prediction.
Permission of instructor required.
Instructor(s): J. Gray.

This design project is focused on the role alternative energy will play in our country’s future. About a third of the course will be devoted to understanding the role of energy and alternative energy in the US and world economies. The remainder of the course will be devoted to a technical and economic analysis of the feasibility of making biofuel from algae. Graduate level. Meets with EN.540.401
Instructor(s): M. Donohue.

EN.540.621. Project in Design: Pharmacodynamics.
This course covers pharmacodynamics, i.e. how pharmaceuticals affect biological processes. The course will use MatLab to aid in the design of new drug formulations.
Instructor(s): M. Donohue.
EN.540.622. Introduction to Polymeric Materials.  
Polymeric materials are ubiquitous in our society from Nature-made proteins and polysaccharides to synthetic plastics and fibers. Their applications range from day-to-day consumables to high performance materials used in critically demanding areas, such as aviation, aerospace and medical devices. The objective of this course is to provide an introductory overview on the field of polymer science and engineering. Students will learn some basic concepts in polymer synthesis, characterization, and processing. With the basic concepts established, industrial applications of polymeric materials will be discussed in two categories: structural polymers and functional polymers. Structural polymers, including plastics, fibers, rubbers, coatings, adhesives, and composites, will be discussed in terms of their structure, processing, and property relationship with a flavor of industrial relevant products and applications. Future trends in developing environmentally friendly polymers from renewable resources (“green polymer chemistry”) will also be covered. Lectures on functional polymers will be focused on their unique properties that are enabled by rational molecular design, controlled synthesis and processing (e.g. supramolecular assembly, and microfabrication). This class of specialty materials can find their use in high performance photovoltaics, batteries, membranes, and composites, and can also serve as “smart” materials for use in coatings, sensors, medical devices, and biomimicry.  
Instructor(s): H. Cui; K. Qi  
Area: Engineering.

EN.540.626. Biomacromolecules at the Nanoscale.  
This course introduces modern concepts of polymer physics at the nanoscale to describe the conformation and dynamics of biological macromolecules such as filamentous actin, microtubule, and nucleic acids. We will introduce scattering techniques, nano-manipulation techniques, as well as nano-rheology applied to the study of polymers for tissue engineering, nanoparticles, and drug delivery applications.  
Instructor(s): D. Wirtz.

EN.540.628. Supramolecular Materials and Nanomedicine.  
Nanomedicine is a quickly growing area that exploits the novel chemical, physical, and biological properties of nanostructures and nanostructured materials for medical treatments. This course presents basic design principles of constructing nanomaterials for use in drug delivery, disease diagnosis and imaging, and tissue engineering. Three major topics will be discussed, including 1) nanocarriers for drug delivery that are formed through soft matter assembly (e.g., surfactants, lipids, block copolymers, DNA, polyelectrolytes, peptides), 2) inorganic nanostructures for disease diagnosis and imaging (e.g., nanoparticles of gold and silver, quantum dots and carbon nanotubes), and 3) supramolecular scaffolds for tissue engineering and regenerative medicine. Students are expected to learn the physical, chemical and biological properties of each nanomaterial, the underlying physics and chemistry of fabricating such material, as well as their advantages and potential issues when used for biomedical applications. This course will also provide students opportunities for case studies on commercialized nanomedicine products. After this class, students should gain a deeper understanding of current challenges in translating nanoscience and nanotechnology into medical therapies.  
Instructor(s): H. Cui  
Area: Engineering, Natural Sciences.

In this course we will aim for understanding the thermodynamics of chemical and bio-molecular systems. We will first review classical, macroscopic thermodynamics covering concepts such as equilibrium, stability and the role of therodynamic potentials. Our goal will be to gain a feel for the generality of thermodynamics. Statistical mechanics provides a link between the mechanics of atoms and macroscopic thermodynamics. We will introduce this branch in two distinct ways: 1) following standard methods of developing concepts such as ensembles and partition functions, and 2) where we will treat the basis of statistical mechanics as a problem in inference. With this foundation, we will consider concepts relevant to understanding the liquid state. Chemical transformations in a liquid are of importance in much of chemistry and biology; quasi-chemical generalizations of the potential distribution theorem will be introduced to present these ideas. We hope to give an overview of modern developments relating equilibrium work to non-equilibrium work, as these are of increasing importance in studies on single molecule systems. Registration by instructor permission only.  
Instructor(s): C. Wang  
Area: Engineering.

EN.540.632. Project in Design: Pharmacokinetics.  
This course covers pharmacodynamics, i.e. how pharmaceuticals affect biological processes. The course will use Matlab to aid in the design of new drug formulations.  
Instructor(s): M. Donohue  
Area: Engineering.

One semester overview of year long course, students that want a comprehensive understanding of pharmacokinetics and pharmacodynamics should take the 2 all 540.632 Projects in Design: Pharmacokinetics Spring 540.621 Projects in Design: Pharmacodynamics. This course covers the principles of pharmacokinetics and pharmacodynamics. Computer models of pharmacokinetic and pharmacodynamics behavior will be developed and then used to design better drug delivery regimens and to analyze drug chemistry modifications.  
Instructor(s): M. Donohue.

EN.540.637. Application of Molecular Evolution to Biotechnology.  
One of the most promising strategies for successfully designing complex biomolecular functions is to exploit nature’s principles of evolution. This course provides an overview of the basics of molecular evolution as well as its experimental implementation. Current research problems in evolution-based biomolecular engineering will be used to illustrate principles in the design of biomolecules (i.e. protein engineering, RNA/DNA engineering), genetic circuits and complex biological systems including cells. Will meet with EN.540.437. Recommended Course Background: AS.020.305  
Instructor(s): M. Ostermeier  
Area: Engineering, Natural Sciences.
The field of micro/nanotechnology has been gaining tremendous momentum as evidenced by an explosive rise in the number of publications, patents and commercial activities. This is an introductory course intended to expose students to the field as well as real world applications. Lectures will include an overview of scaling of material properties at the nanoscale, micro and nanofabrication methods and essential analytical tools of relevance to the field. All through the course, we will go over electronic, optical and biological applications of emerging micro and nanoscale devices and materials. Co-listed with EN.540.440.
Instructor(s): D. Gracias.

This course will (1) focus on transport processes that are different or more prominent in microfabricated systems, (2) present practical aspects of experimental and theoretical work in microscale and nanoscale transport processes and (3) develop a working knowledge of the relevant literature. Some topics include Maxwell and Navier-Stokes equations, Couette/Poiseuille flow, Stokes flow, fluid circuits, microfluidic mixing, mass and charge transport, electrodynamics, electrophoresis, electro-osmosis, dielectrophoresis, induced-charge electrokinetics, DNA transport, and zeta potential.
Prerequisites: Prereq: EN.540.304 Transport II OR the equivalent. Instructor permission required.
Instructor(s): Z. Gagnon
Area: Engineering, Natural Sciences.

EN.540.645. Intro to Research in Micro and Nanotechnology.
A class room based learning of all aspects of conducting research in Micro and Nanotechnology including review of state-of-the-art in the field and original research descriptions. In the course, you will learn the state of the art in Micro and Nanotechnology, critical analysis of research including Design of Experiments, research ethics and strategies to deliver effective research presentations. Instructor Approval.
Instructor(s): D. Gracias.

A selection of problems in fluid mechanics at low and moderate Reynolds numbers. This is a highly interactive class in which students are expected to choose topics and prepare a presentation at least twice a semester. Therefore, the list of problems will vary depending on student selection. Typically Tuesdays will be an introductory class and Thursdays will be seminars on a specific topic or paper. Meets with 540.447
Instructor(s): G. Drazer
Area: Engineering, Natural Sciences.

EN.540.649. Logic and Decision-making in Biomolecular Systems.
From the smallest change in gene expression to life and death and reproduction, biomolecular decision-making processes govern cellular fate. In this course we explore the design principles by which biomolecules make decisions and orchestrate complex processes such as signal transduction, homeostasis or apoptosis. We will also explore how we can in turn design complex biomolecular networks that can control biological systems and biomolecular materials. Topics will include the design and analysis of molecular logic circuits, transcriptional and translational control, signal transduction cascades, biomolecular oscillators and cycles, DNA nanotechnology and nanobiotechnology, and molecular computing. The course will introduce principles from electrical circuit theory, computing and control theory and show how these tools can be applied to these systems. Students should be familiar with programming and chemical engineering principles.
Instructor(s): R. Schulman.

It is the goal of this course to move the graduate student (and advanced undergraduate student) from the introductory level of transport phenomena (undergraduate) to a level that will allow them to be effective in researching transport-related topics in a variety of biomedical, chemical and biochemical engineering areas. The basic equations that govern mass, momentum, and energy transport will be derived and used to solve problems that demonstrate the physical insight necessary to apply these equations to original situations. Some topics include solution techniques utilizing expansions of harmonic functions, singularity solutions, lubrication theory for flow in confined geometries, boundary layer theory, Stokes flow, forced convection, buoyancy-driven flow, Taylor-Aris dispersion, and reaction-diffusion.
Instructor(s): Z. Gagnon
Area: Engineering.

EN.540.659. Bioengineering in Regenerative Medicine.
Introduction and in-depth discussion course focused on tissue and stem cell engineering. The course will focus on principles in tissue engineering, mechanisms of regeneration, and stem cell therapies. Topics will include introduction to regenerative medicine, bioreactors and scaffolds in tissue engineering, adult and pluripotent stem cells, engineering the niche, and two sessions will focus on legal and ethical issues. Selected approaches to analyze tissues and stem cell culture will also be discussed. In addition, the course will be integrated with graduate students’ presentations on selected topics in stem cell engineering. Recommended Course Background: AS.020.306 or EN.580.221 or EN.580.440 Co-listed with EN.540.459
Instructor(s): S. Gerecht
Area: Engineering.

EN.540.661. Nanobioengineering Laboratory.
Students explore different experimental methodologies in Nanobioengineering. Students work in small teams to complete one or more major projects expanding their understanding and applying their theoretical knowledge to practical problems. The course will employ a variety of experimental methods, from material synthesis to biological applications. Students report several times either orally and in writing on their accomplishments. Project meetings may be held outside of the appointed class time. Graduate students only
Instructor(s): A. Goffin; J. Frechette.
In this graduate level course, we will cover important principles in thermodynamics and kinetics along with examples relevant to engineering practice. After a short review of the first and second law of thermodynamics, we will move on to their application in engines and refrigeration. We will discuss the thermodynamic properties of systems consisting of pure species and mixtures, and address phase equilibria. With the key thermodynamic concepts in place, we will discuss topics in kinetics, including the fundamentals of reaction rates, rate laws, multiple reactions and non-elementary reaction kinetics. Finally, we will address how reactor type and properties, transport limitations, and phase equilibria influence reaction rate.
Instructor(s): A. Goffin; C. Pereira.

EN.540.673. Advanced Chemical Reaction Engineering in Practice.
Chemical reaction engineering deals with the analysis on data and the design of equipment in which reactions occur. Reactors may contain one or more phases and be used to conduct chemical or biochemical transformations. The course will cover the fundamental aspects of kinetics, data acquisition, data interpretation, heterogeneous catalysis and heat and mass transfer for each type of reactor. Special emphasis will be placed on the practical application of reaction engineering in the petrochemical, chemical, biochemical and materials industries. The course will make student aware of the needs and opportunities for chemical reaction engineering in industry.
Instructor(s): C. Pereira.

EN.540.801. Graduate Research.
Instructor(s): Staff.

Instructor(s): M. Donohue.

EN.540.811. Graduate Independent Study.
Instructor(s): M. Donohue.

EN.540.871. Research - Intersession.

Cross Listed Courses
Institute for NanoBio Technology
This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanomaterials. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patternning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.

Civil Engineering
Civil engineers apply sophisticated analysis and design techniques to advance the needs of society for shelter, infrastructure, and a safe environment. Graduates are employed in the fields of structural analysis and design, soil mechanics and foundation design, environmental engineering and policy, materials engineering, and coastal and ocean engineering, and increasingly are taking on far-reaching management roles in infrastructure, hazard mitigation, sustainability, and technical roles in the planning, design, and construction of large-scale engineered systems. In addition, a civil engineering degree provides exposure to broad societal challenges and the logical thinking necessary for pursuing careers in other professional fields, such as law, business, and medicine.

The Department of Civil Engineering offers programs at the undergraduate, graduate, and postdoctoral levels. Civil Engineering at Hopkins offers a unique balance centered in mechanics fundamentals, and enriched by state-of-the-art tools in modeling, simulation, and physical experimentation. The small size of the CE Department fosters a collegial, close-knit relationship between the students, staff, and faculty, while our partnerships with other Johns Hopkins departments provide a wide range of collaborative opportunities that span the larger disciplines of fluids, systems, structures, and materials. A wide range of research opportunities distinguishes the program. Students have participated in projects on structural reliability, earthquake resistance of structures, testing and analysis of historic bridges, computational design of materials, failure of brittle materials, cold-formed steel members and their connections, and coastal and ocean engineering to name a few. A five-year bachelor’s/master’s degree program is also offered. Graduates of Johns Hopkins University have traditionally risen to leadership roles in education, research, industry, and government.

Facilities
The Department’s teaching and research labs are located in Latrobe Hall and the Stieff Building. Teaching laboratories, all located in Latrobe Hall, include a modern multi-use facility for exploring experiments in statics, mechanics of materials, dynamics and other courses, a dedicated soil mechanics laboratory, and a dedicated computing facility. Research laboratories include the Thin-walled Structures Laboratory, and the Sensor Technology and Infrastructure Risk Mitigation (STIRM) Laboratory in Latrobe Hall, and the Coastal Engineering Laboratory in the Stieff Building. The department also provides space for undergraduate research, the student chapter of the American Society of Civil Engineers, a graduate student lounge, and office space for doctoral students.

The department sponsors an undergraduate and graduate seminar series, as well as the Richard J. Carroll endowed lectureship; all of which are designed to bring prominent civil engineers to campus to speak with students and faculty.

The mission of the undergraduate program is to educate intellectual leaders of the profession by instilling in them a fundamental understanding of the mathematical principles of physics and nature that underlie engineering science, a practical appreciation of the challenges of creative engineering design, and a sense of responsibility for professional service. The undergraduate program has been designed to provide a firm foundation in a wide breadth of modern civil engineering so that within a few years our graduates attain:

1. a. an advanced degree in engineering or
b. required experience toward professional licensure as an engineer, or
c. an advanced degree in a field other than engineering, or
d. a position within an organization that broadly supports the goals of civil engineering; and
2. a position or degree that values adaptability and innovation in their work.

Building on the strengths of the faculty and supporting our vision for the field of civil engineering, the department emphasizes four technical areas: environmental engineering, geotechnical engineering, structural engineering, and systems engineering. Some flexibility is built into the curriculum so that students may pursue advanced topics in one or more of these areas. Upon completion of the B.S. in civil engineering, students will demonstrate:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multidisciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in lifelong learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

The program has been accredited by ABET, the Accreditation Board for Engineering and Technology, since 1936.

Requirements for the B.S. Degree

The B.S. degree in civil engineering requires 128 credits. A brief summary of the requirements are listed below. For more detailed information students should look at the Civil Engineering Department website (http://engineering.jhu.edu/civil/undergraduate-studies). Each student is assigned an advisor who will provide guidance to ensure all requirements are met.

No course listed as a requirement may be taken satisfactory/unsatisfactory. Any other course used to fulfill a requirement under humanities and social sciences or under unspecified electives can be taken S/U. Technical electives may be taken satisfactory/unsatisfactory only with the approval of the advisor. No more than two grades of D in the required engineering and technical electives may be counted.

Technical Electives (9 credits)

Students may explore one or more of the civil technical areas (environmental engineering, geotechnical engineering, structural engineering, and systems engineering) in greater depth through technical electives.

Total Credits 128

* We recommend either AS.270.220 The Dynamic Earth: An Introduction to Geology or AS.270.205 Introduction to Geographic Information Systems and Geospatial Analysis.
** Classes in the Humanities and Social and Behavioral Sciences provide students with an appreciation for societal concerns and humanistic issues, tools that are essential for a professional who serves the public good. Requirements are as follows: Students must take a minimum of two 3-credit H elective courses and two 3-credit in S elective courses. Two additional 3-credit courses may be taken in either area: H or S. A minimum of one H and one S elective course must be at or above the 300-level. One writing-intensive requirement must be fulfilled by the H/S electives. This can either be done through AS.060.113/AS.060.114 Expository Writing or a 300-level, Writing-Intensive, H or S elective course. Given the increasingly global nature of the civil engineering field, students are also required to take one H or S course from the KSAS International Studies major (see http://krieger.jhu.edu/internationalstudies/courses/). (http://www.krieger.jhu.edu/internationalstudies/courses))

*** Technical electives (all required to be at or above the 300-level) are designed to provide students with greater depth in one or more of the civil engineering technical areas above. To that end, a minimum of one 3-credit technical elective must be in a civil engineering technical area. One 3-credit technical elective must have an E distribution credit, but may be a course offered outside of traditional civil engineering areas, and one 3-credit technical elective may come from any (Q), (N), or (E) course. While the Department of Civil Engineering allows some flexibility in students’ choice of technical electives, we advise that to the extent possible, students select their technical electives from within the department’s offerings.

Sample B.S. Program

To view a sample civil engineering program, visit the Civil Engineering website and click on Undergraduate Studies, Academic Advising or click here. (http://engineering.jhu.edu/civil/wp-content/uploads/sites/10/2014/08/2014-Sample-Program-Mechanics-Option.pdf) This sample illustrates the general sequence of courses; individual programs may vary as a result of AP credits, study abroad, or pursuit of a minor in another department.

Minor in Civil Engineering

This program is available to nondepartmental majors only who would like an overview of the principles of civil engineering. In addition to the prerequisite courses of AS.171.101 General Physics:Physical Science Major I for Physical Science Majors, AS.110.108 Calculus I, and AS.110.109 Calculus II (For Physical Sciences and Engineering), 18 credits are required for the minor, including 12 credits from fundamental civil engineering courses and 6 credits from a two-course sequence in one of three civil technical areas (geotechnical engineering, structural engineering, or systems engineering). No D grades can be counted toward the minor.

EN.560.141 Perspectives on the Evolution of Structures 3
EN.560.201 Statics & Mechanics of Materials 4
EN.560.206 Solid Mechanics & Theory of Structures 4
EN.560.491 Civil Engineering Seminar I .5
EN.560.492 Civil Engineering Seminar II .5

Students must choose to focus in one of the following three technical areas, completing two courses in one area of their choice.

Structural Engineering

EN.560.320 Structural Design I 3
EN.560.325 Structural Design II 3

Financial Aid

Scholarships and other forms of financial assistance for undergraduates are described under Admissions and Finances (p. 9). In addition, some undergraduate students are employed by departmental faculty to provide assistance on research projects.

Combined Bachelor’s/Master’s Programs

The Department of Civil Engineering offers combined bachelor’s/master’s degrees. One program combines a B.S. in Civil Engineering with a Master of Science in Engineering (M.S.E.) in Civil Engineering. For students who are admitted to this program, the two degrees typically require five years total to complete. The other option combines a B.S. in Civil Engineering with a Master of Science in Engineering Management (M.S.E.M.) (http://msem.engineering.jhu.edu). Formal application through the M.S.E.M. Department (http://msem.engineering.jhu.edu) is required. Students enrolled in a Combined B.S./M.S.E. program are awarded a Dean’s Master’s Fellowship, covering half their tuition, after they have completed eight semesters of undergraduate study. More information about these programs can be found at http://engineering.jhu.edu/academics/combined-bachelors-masters/.

Civil engineering today is a dynamic, complex, and technologically sophisticated field. Powerful computational methods and high-strength materials offer new opportunities and new challenges. The Department of Civil Engineering offers a graduate program that is based primarily in mechanics of materials, systems, and structures. Fundamental to these areas is research in solid, structural, and stochastic mechanics. The graduate program is designed to instill in the student the fundamental theoretical concepts of mechanics as well as practical knowledge of modern materials, systems, and structural engineering. To be admitted to the program, students are expected to have graduated with an outstanding record in an appropriate undergraduate program.

Requirements for the M.S.E. Degree

After admission to the M.S.E. program, students must successfully complete one of two requirements in order to obtain the M.S.E. degree: either the 10 courses (course-only) option, or the 8 courses and a final M.S.E. Essay and Defense option. All courses must be 300-level or above, with a maximum of two (2) courses at the 300-level. With approval from the academic advisor, one of the 10 courses required for the M.S.E. degree may be a course at the 300-level or above from the Center for Leadership Education. Academic advisors, in consultation with the faculty in the Civil Engineering Department, will determine whether the 8 or 10 courses leading to this degree are appropriate and if they have been completed satisfactorily. No more than one course with a grade lower than a B- may be counted toward the course requirement. Typically the M.S.E. degree requires one to two years to
complete, if the student is making steady progress. In some cases, the degree may take longer.

The M.S.E. Essay must be approved by the student’s faculty advisor and one reader, who will typically be a full-time Johns Hopkins Civil Engineering faculty member. Any external reader must be approved by the Chair of the Civil Engineering Department. M.S.E. students are expected to give a presentation to the department regarding their thesis research. This requirement can be waived in extraordinary circumstances with approval of the Department Chair. Click here for the (http://eng.jhu.edu/images/uploads/civil/Masters_Essay_Readers_Letter.doc)Master’s Essay Readers’ Letter.

Typically limited financial support is available for M.S.E. students. Funding decisions will be made on an individual basis by the student’s research advisor.

Requirements for the Ph.D. Degree

There are a number of Whiting School of Engineering policies related to Ph.D. students, which are listed at http://engineering.jhu.edu/graduate-policies. Ph.D. student requirements for the Civil Engineering Department include:

- 10 Courses*
- Department Qualifying Examination (DQE)
- Annual Meetings and Reports to Ph.D. Advisory Committee
- Annual Review
- Graduate Board Oral Examination (GBO)
- Responsible Conduct of Research Course (AS.360.625)
- Academic Ethics (EN.500.603)
- Final Ph.D. Thesis Defense

*All courses must be completed with a grade of B or better. At least 8 of the 10 courses must be at the 600- or 700-level. Note that students entering with a Masters degree may receive a maximum of 4 transfer courses. The number of transfer courses accepted is determined by the Department. Students transferring courses from a prior Masters degree must fulfill the remainder of the course requirement with courses only at the 600- or 700-level. Typically, in the Spring of the first year a student’s permanent advisor will consult with the Department to determine the appropriate number of transfer courses. These credits may accelerate the timeline given below. These are guidelines, and exceptions may be made under special circumstances.

Typical Timeline for Ph.D. Students

**Year 1 Fall:**
- Arrival prior to start of classes
- Selection of first semester courses (typically 4) with advisor
- Language/communication testing and placement for International Students
- Responsible Conduct of Research Course (AS.360.625) (https://engineering.jhu.edu/wse-research/resources-policies-forms/responsible-conduct-of-research)
- Academic Ethics Course (EN.500.603)
- First semester coursework and teaching assistant/research assistant duties where assigned
- Determination of permanent advisor in first semester

**Year 1 Intersession:**
- Intersession research
- Oral Department Qualifying Exam (DQE) (completed in early January)
- Annual review must be completed by January 31

**Year 1 Spring:**
- Second semester coursework and teaching assistant/research assistant duties where assigned
- Advisor and student identify Ph.D. Thesis Committee and student meets with members individually
- Responsible Conduct of Research course (AS.360.625)

**Year 1 Summer:**
- Research

**Year 2 Fall:**
- Research
- Coursework (typically fewer than in Year 1)
- Ph.D. Thesis Committee Meeting required prior to end of Fall semester

**Year 2 Intersession:**
- Research
- Annual review must be completed by January 31

**Year 2 Spring:**
- Research
- Coursework (typically finishing up this semester)

**Year 2 Summer:**
- Research

**Year 3:**
- Research (Year-round)
- Ph.D. Thesis Committee Meeting
- Annual review must be completed by January 31
- GBO: Exact timing determined by advisor in consultation with the student

**Year 4 and Beyond:**
- Research (Year-round)
- Ph.D. Thesis Committee Meeting every Fall prior to the end of the semester
- Annual review must be completed by January 31

**Final semester:**
- Thesis Defense

**Language/Communication Testing and Placement:**
All Ph.D. students who do not have a prior degree from an English speaking university must take an English Language Assessment. If it is determined at the assessment that the student needs further English language instruction, he/she will be required to take 370.600 or equivalent.

**Determination of Permanent Advisor**
In some cases students are admitted to work with a specific advisor, in which case the permanent advisor is the faculty member listed in the admissions letter. In other cases students are not assigned a specific advisor at the time of the admission letter. During September and October of the first semester, these students should meet with the faculty, discuss their research interests, and learn more about the research being conducted by the faculty. By the beginning of November the student must state his/her preference(s) for a permanent advisor. The faculty will meet and determine the final advisor placements prior to the end of the semester. Every effort will be made to match students with their requested advisors, but financial constraints may not always make this possible.

Intersession
Intersession (the period between Fall and Spring terms) is an important time for research. Intersession is not a vacation. Any leave taken during intersession is subject to the policies outlined in the Graduate Student Assistant Leave Guidelines (http://engineering.jhu.edu/include/content/pdf/RA_TA%20leave%20guidelines%20(FINAL).pdf). Release time (if any) granted in that period must be approved by the advisor.

Department Qualifying Examination (DQE)
The DQE is a comprehensive oral exam designed to determine whether or not the student is properly prepared to continue in the Ph.D. program. All first-year students studying for a Ph.D. take the DQE after their first semester of enrollment, typically in early January of the first year. This exam tests whether the student is prepared to continue in their Ph.D. studies based on their grasp of basic undergraduate-level and beginning graduate-level Civil Engineering knowledge. Possible outcomes of the exam are Pass, Retake, or Fail. Only an outcome of Pass is considered passing the exam. If the student receives a Retake, they are provided a single retake of the exam, typically in the Fall or early January of their second year. Possible outcomes of this exam retake are Pass or Fail. If the outcome of the exam is Fail, the student may pursue, with approval from the chair, a M.S.E. degree. Financial support for such a student during this period is not typical.

Annual Reviews
Reviews of all Ph.D. students in Civil Engineering must be performed annually prior to January 31, which is consistent with the WSE policy found on the WSE Academic Policies & Procedures (http://engineering.jhu.edu/graduate-studies/academic-policies-procedures-graduate) webpage. The review process follows the format given in the annual review form. The completed form must be submitted to the Academic Program Coordinator by January 31. If this annual review is not completed by this date, the student’s funding may be jeopardized.

Ph.D. Thesis Committee
Every Ph.D. student must have a Thesis Committee of at least 3 faculty members. The Advisor, in consultation with his/her Student, selects the makeup of the committee, and this information is recorded in the student’s file. The student is expected to meet with this committee a minimum of once per year. The thesis committee also typically serves as a subset of the actual GBO examination committee and forms the final Ph.D. defense committee. This committee must consist of a minimum of 2 full-time faculty of the Civil Engineering Department.

Ph.D. Thesis Committee Meeting
Thesis Committee meetings are expected to occur annually in the fall from Year 2 until the Ph.D. final defense. The student is required to submit a report to the committee members at least one week prior to the meeting. A typical report would include a literature review of the field relevant to the student’s research, a progress report of research performed to date, goals for research in the coming year, and a basic timeline of expected activities in the remaining years of the Ph.D. degree. The committee meeting should consist of a presentation of key aspects of the report, along with discussion and feedback from the Thesis Committee. In certain cases, particularly in later years of the Ph.D. degree, it may be deemed acceptable for the student to meet individually with members of the committee in lieu of the group meeting; however, such an exception can only be granted with permission of the Advisor and all committee members. Once the Thesis Committee meeting is completed, the Ph.D. Thesis Committee Meeting Form must be signed by the members of the committee and submitted to the Department.

Responsible Conduct of Research
Every Ph.D. student of the Whiting School of Engineering is required to take a Responsible Conduct of Research course (details on the requirement can be found on the WSE Policy on the Responsible Conduct of Research Training (http://engineering.jhu.edu/wse-research/resources-policies-forms/responsible-conduct-of-research) webpage. For Civil Engineering students, this should be completed in Spring or Summer of the first year of studies. Students who do not complete this requirement prior to Fall of their third year of studies may put their funding in jeopardy.

GBO Examination
The University maintains complete guidelines for the Graduate Board Orals Exam (http://homewoodgrad.jhu.edu/academics/graduate-board/degree-candidacy). The GBO committee consists of 5 members, (3 in Department, 2 outside) with 2 alternates (1 in Department, 1 outside) and is selected by the Chair of the Department and the Director of Graduate Studies, who will consult with the student’s advisor. When a Ph.D. student and advisor feel that the student is ready to take the GBO, the advisor should consult with the Director of Graduate Studies and the Civil Engineering Academic Program Coordinator to initiate the process of scheduling the exam. Both students and advisors should be aware that 4-6 weeks advance notice is needed in order to allow for scheduling the exam with the faculty and with the Graduate Board.

The exact format of each GBO examination is specified by the individual Chair of the GBO committee. The student may be requested to provide to the GBO committee prior to the examination some written document describing his or her research. In such cases, the latest annual Thesis Committee report and/or a recent conference or journal publication may suffice. It is typical that the student would be asked to provide a brief presentation of research at the beginning of the examination (no more than 10 slides, no longer than 10 minutes). The examination questions may be on any topic of the committee members’ choosing, but many of the questions relate to the student’s coursework and research. At the conclusion of the examination, the GBO committee may recommend pass, conditional, pass, fail with re-examination, fail (final) as detailed here (http://homewoodgrad.jhu.edu/academics/graduate-board/degree-candidacy).

M.S.E. Degree for Ph.D. Students
Ph.D. students may petition for a M.S.E. degree following their GBO Examination. If the student passes the GBO, he/she may file for a non-terminal M.S.E. degree. If the student fails (final) the GBO, he/she may petition for a terminal M.S.E. degree. In all instances the students must have satisfied the M.S.E. degree course requirements as detailed here (http://engineering.jhu.edu/civil/graduate-studies/mse-requirements). In instances where the research is highly interdepartmental, the student, with permission of the advisor, may request that the M.S.E.
degree be awarded by another department in the Whiting School of Engineering. In such cases, the student must have satisfied M.S.E. degree requirements and receive the approval of, and an accepted application to, the awarding Department, as well as satisfied M.S.E. degree requirements of the Civil Engineering Department and receive approval from the Civil Engineering Chair. In all cases, the awarding of any JHU M.S.E. degree to a Civil Engineering Ph.D. student may only occur after the student has completed the GBO exam.

**Thesis Defense**

The Thesis Defense is the final examination before conferral of the Ph.D. degree. The student defends his/her thesis in a seminar setting that is open to the public. The seminar is followed by a comprehensive examination of the student, focused on the thesis research.

**Ethics:** The Department of Civil Engineering is dedicated to upholding the highest standards of academic and research integrity. Plagiarism, and other forms of unethical conduct, are not tolerated. Students are referred to the Graduate Student Resources (http://engineering.jhu.edu/graduate-studies/full-time-graduate-student-resources) webpage of the Whiting School of Engineering for these and other policies related to graduate students.

**Defense Committee:** A committee of at least 3 members administers the exam (typically the Ph.D. Thesis Committee). The Advisor, in consultation with the Department, selects the committee members, at least 2 of whom must be full-time faculty of the Civil Engineering Department. This should be done at the beginning of the semester in which the student plans to graduate. It is the student’s responsibility to keep the committee members apprised of all deadline dates.

**Scheduling and Pre-Defense:** The defense should be scheduled at least 3 weeks in advance through the Department’s Academic Coordinator. A complete written dissertation should be given to the committee at least 14 days in advance of the defense. Failure to meet this 2 week deadline will result in rescheduling the Ph.D. defense. The date and place of the defense, along with the thesis abstract, should be circulated 5-7 days prior to the defense.

**Post-Defense:** Completion of the Ph.D. requirements typically takes 4-8 weeks after a successful defense examination. All data and source codes related to the thesis should be properly archived according to requirements set forth by the Advisor. Any changes or additions specifically requested by the reviewers before or during the defense seminar should be incorporated into the thesis in consultation with the Advisor. A final copy of the thesis must then be made available to the reviewers for inspection no less than 48 hours before the deadline date for filing set by the Graduate Board. Upon approval, the student should submit a copy of the thesis and the Department’s “Certification for Advanced Degrees” form to the Department Administrative Assistant. In return, the Department will send to the Graduate Board Office or the Whiting School of Engineering Graduate Committee the “Certification of Completion of Department Requirements for an Advanced Degree,” signed by the Department Chairman.

**Additional Information:** It is the responsibility of the student to be aware of requirements and deadlines. It is suggested that this information be obtained before the start of the semester of intended graduation. All students should plan the timing of the final defense accordingly (making sure to account for the 4-8 week period following the defense) to satisfy any deadlines related to upcoming graduation or exhaustion of funding.

University requirements for the thesis can be obtained from the Graduate Board (http://homewoodgrad.jhu.edu/academics/graduate-board/degree-candidacy) website. Information sheets entitled “Dissertation Requirements” are available to students and contain details on the form, cost and timing for submitting the thesis. Doctoral Theses must be submitted to both the ETD (Library) and the Department of Civil Engineering. The deadline date for filing is set by the Graduate Board Office. This date also applies to filing with the Whiting School Graduate Committee and with the Department. A receipt of ETD approval must be sent to the department, Graduate Board/WSE Office of Academic Affairs (for M.S.E. students).

**Financial Aid**

A limited amount of financial assistance is available to Civil Engineering graduate students is available in the form of teaching assistantships, research assistantships, and partial or complete tuition fellowships, including fellowships from the Joseph Meyerhoff Scholarship Fund, the Richard D. Hickman Endowment, and the Hooomes Rich Graduate Fellowship. Fellowships and Assistantships are awarded on a competitive basis and continued support is subject to the student’s performance and future availability of research or teaching assistantship funds.

For current faculty and contact information go to http://engineering.jhu.edu/civil/faculty/

**Faculty**

**Chair**

Lori Graham-Brady

Professor

**Professors**

Robert A. Dalrymple

Professor and Willard and Lillian Hackerman Chair in Civil Engineering: coastal engineering, water wave mechanics, fluid mechanics.

Somnath Ghosh

Professor and Michael G. Callas Chair in Civil Engineering: multiscale mechanics, finite elements, material fatigue modeling.

Lori Graham-Brady

Professor: probabilistic mechanics, finite elements, stochastic modeling of materials.

Takeru Igusa

Professor: structural dynamics, earthquake engineering, analysis of uncertainties.

Benjamin Schafer

Professor, Swinnow Family Faculty Scholar: structural stability, computational mechanics, experimental methods, thin-walled structures.

**Associate Professor**

James K. Guest

Associate Professor: topology optimization, structural and material design optimization, computational mechanics.

**Assistant Professors**

Stavros Gaitanaros
Assistant Professor: design and mechanics of cellular materials at the macro- and nanoscale.

Judith Mitrani-Reiser
Assistant Professor: performance-based engineering, structural dynamics, earthquake engineering, multi-hazard loss estimation.

Michael D. Shields
Assistant Professor: stochastic simulation, uncertainty quantification, computational stochastic mechanics

Sauleh Siddiqui
Assistant Professor: optimization, equilibrium problems, systems in energy and environmental markets, transportation, and public health.

Lecturer
Rachel H. Sangree
Lecturer, Program Chair EP Civil Engineering: structural engineering, historic structures.

Adjunct Professors
Xin Chen
Adjunct Professor: geotechnical engineering, infrastructure asset management.

Byung-Lip (Les) Lee
Adjunct Professor, Program Manager for Mechanics of Multifunctional Materials & Microsystems, U.S. Air Force: multifunctional design of autonomic / self-sustaining systems, multifunctional design of reconfigurable system, materials & micro-devices, sensing, detection & self-diagnosis

John A. Matteo
Adjunct Professor, Director of Design: structural engineering and architecture, historic structures.

Lucas de Melo
Adjunct Professor: geotechnical engineering.

Assistant Research Professor
Shahabeddin Torabian
Assistant Research Professor: thin-walled structures

Joint, Part-Time and Visiting Appointments
J. Hugh Ellis
Joint, Part-Time, and Visiting Appointment: Professor (DoGEE): structural health engineering, environmental systems.

Joshua M. Epstein
Joint Appointment: Professor: Department of Emergency Medicine: integrated computational modeling of social, behavioral, and biomedical dynamics, agent-based modeling.

Seth Guikema
Joint Appointment: Assistant Professor (DoGEE): probabilistic risk analysis, environmental life-cycle assessment.

Ayse Gurses

Thomas Dean Kirsch
Joint Appointment, Associate Professor: Department of Emergency Medicine, Department of International Health: disaster planning and response, wilderness medicine, health care management.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

EN.560.101. Freshman Experiences in Civil Engineering.
An introduction to civil engineering for first-year students. This course welcomes freshmen to the major by exploring civil engineering design and the range of design projects in which professional civil engineers engage. Students will have the opportunity to practice the design process using hands-on team-based projects, with emphasis on creative design, graphical communication, and teamwork. Instructor(s): R. Sangree Area: Engineering.

Why do buildings and bridges look the way they do today? Students will be provided the tools to answer this question for themselves through a study of the history of the design of buildings and bridges throughout the world from both engineering and architectural/aesthetic perspectives. Only simple mathematics is required (no calculus). Students will participate in individual and group critique of structures from engineering, architectural, and social points of view. Instructor(s): R. Sangree Area: Engineering, Quantitative and Mathematical Sciences.

Basic principles of classical mechanics applied to the equilibrium of particles and rigid bodies at rest, under the influence of various force systems. In addition, the following topics are studied: free body concept, analysis of simple structures, friction, centroids and centers of gravity, and moments of inertia. Includes laboratory experience. Co-listed with EN.530.201. Recommended Course Background: AS.171.101, or EN.530.103/EN.530.104 or instructor permission. Instructor(s): R. Sangree Area: Engineering.

Basic principles of classical mechanics applied to the motion of particles, system of particles and rigid bodies. Kinematics: analytical description of motion; rectilinear and curvilinear motions of particles; rigid body motion. Kinetics: force, mass, and acceleration; energy and momentum principles. Introduction to vibration. Includes laboratory experience. Prerequisites: Students must have completed Lab Safety training prior to registering for this class.;(EN.560.201 OR EN.530.201 ) AND AS.110.109 AND (AS.171.101 or (EN.530.103 AND EN.530.104)) Instructor(s): L. Graham-Brady Area: Engineering.
Application of the principles of structural analysis for statically determinant and indeterminate structures (trusses, cables, beams, arches, and frames). Calculation of internal forces and stresses in members and structures. Determination of deflections by equilibrium and energy methods. Analysis of indeterminate structures by flexibility and stiffness methods.
Prerequisites: EN.560.201 OR EN.530.201
Instructor(s): M. Shields
Area: Engineering.

EN.560.220. Civil Engineering Analysis.
Civil engineering problems are formulated and then solved by numerical methods. Matrix inversion, data fitting and interpolation, root-finding, and solutions of ordinary and partial differential equations are presented. Matlab programming will be introduced to facilitate the solutions. Recommended Course Background: AS.110.106, AS.110.107/AS.110.109
Instructor(s): J. Mitrani-Reiser
Area: Engineering.

EN.560.305. Soil Mechanics.
Prerequisites: EN.560.351 OR EN.570.351; Prerequisite: EN.560.206.
Corequisites: Corequisite: EN.570.351 or EN.560.351
Instructor(s): L. de Melo
Area: Engineering.

EN.560.320. Structural Design I.
Introduction to structural design using common building materials (structural steel, reinforced concrete, and wood). Emphasis will be placed on the application of solid mechanics principles to the design of structural components (beams, columns, and tension members).
Instructor(s): R. Sangree
Area: Engineering.

EN.560.325. Structural Design II.
A continuation of Structural Design I, this course explores the behavior and conceptual design of structures. Emphasis is placed on identifying load paths through typical structures and lateral load systems, modeling loads on real structures, and designing structural systems. Designing connections capable of transferring loads through a structural system will also be covered. Recommended Course Background: EN.560.320
Prerequisites: EN.560.206
Instructor(s): R. Sangree
Area: Engineering.

EN.560.330. Foundation Design.
Application of soil mechanics theory and soil test results to the analysis and design of foundations for structures; retaining walls; embankments; design of pile and shallow footing foundations; slope stability.
Instructor(s): L. de Melo
Area: Engineering.

EN.560.335. Computer Aided Drafting for Civil Engineers.
This course presents a tutorial on engineering drafting using AutoCAD software. Students will have the opportunity to explore AutoCAD while learning the rules and terminology associated with drafting. A term project will allow students to apply their acquired skills to an engineering drawing of their choosing.
Instructor(s): D. Ayhan
Area: Engineering.

EN.560.348. Probability & Statistics for Engineers.
Development and applications of the analysis of uncertainty, including basic probability, statistics and decision theory, in civil engineering systems. Recommended Course Background: AS.110.109
Instructor(s): S. Siddiqui
Area: Engineering.

EN.560.351. Introduction to Fluid Mechanics.
Introduction to the use of the principles of continuity, momentum, and energy to fluid motion. Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow, form and surface resistance with application to fluid measurement, flow in conduits, and channels, pumps, or turbines. Co-listed with EN.570.351.
Area: Engineering.

EN.560.380. Introduction to Ocean Wind Engineering.
Fundamentals of hydrodynamics, aerodynamics and flow-structure interactions with applications in coastal/ocean engineering and wind engineering. Topics include wind and current past blunted bodies, flow-induced structure vibrations, ocean waves and wave/flood loads, wind field and wind loads, sustainable energy from wind and wave and model testing.
Instructor(s): W. Marr
Area: Engineering.

The renovation of existing buildings often holds many advantages over new construction, including greater economy, improved sustainability, and the maintenance of engineering heritage and architectural character in our built environment. Yet, the renovation of existing structures presents many challenges to structural engineers. These challenges include structural materials that are no longer in widespread use (e.g., unreinforced masonry arches and vaults, cast iron, and wrought iron) as well as structural materials for which analysis and design practices have changed significantly over the last half-century (e.g., wood, steel, and reinforced concrete). This course will examine structures made of a wide variety of materials and instruct the student how to evaluate their condition, determine their existing capacity, and design repairs and/or reinforcement. The investigation and analysis procedures learned from this course may then be applied to create economical and durable structural alterations that allow for the reuse of older buildings. Site visits near Homewood campus will supplement lectures.
Prerequisites: (EN.560.201 OR EN.530.201) AND EN.560.206 AND EN.560.320 or equivalent for graduate students.
Area: Engineering.
Building on the content in Preservation Engineering I: Theory and Practice, this course will begin with materials introduced at the start of the Industrial Revolution—nearly with the beginning of the use of iron materials as major structural elements within buildings. The course will continue with the introduction of cast iron, wrought iron, and finally, structural steel members. After introducing iron materials the course will continue with the early use of reinforced concrete as a major structural material. The course will discuss the historic structural analysis methods associated with such materials and contrast such methods with more modern analytical approaches. It will also discuss concrete deterioration and repair methods. Concepts related to masonry facade investigation and repair will be presented along with the analytical methods associated with thin-shell masonry construction from the 19th and 20th centuries. The course will conclude with a review of the assessment and retrofit of historic foundations. 
Instructor(s): E. Meade; J. Spivey 
Area: Engineering.

Finite Element Methods (FEM) are one of the most powerful engineering tools that are widely used in various disciplines. This course introduces concepts, capabilities, and limitations of FEM and is intended to facilitate applications of FEM in student’s research. The course covers fundamental theories with a focus on stiffness formulation techniques, element types, and computational procedures. The course also offers finite element programming with MATLAB. 
Instructor(s): N. Nakata 
Area: Engineering.

Provide an introduction to equilibrium problems involving systems. The course will start with an introduction to optimization theory followed by various equilibrium problems including market, spatial, and network models. Solution techniques to these types of problems will be discussed, along with applications to systems engineering. 
Recommended Course Background: AS.110.201 and AS.110.109 or equivalent. 
Instructor(s): S. Siddiqui 
Area: Engineering.

Matrix methods for the analysis of statistically indeterminate structures such as beams, plane and space trusses, and plane and space frames. Stiffness and flexibility methods, Linear elastic analysis and introduction to nonlinear analysis. 
Prerequisites: EN.560.206 
Instructor(s): J. Guest 
Area: Engineering.

The course provides an interdisciplinary overview of mathematical and computational models of human driven systems. It spans a wide range of topics including the spread of infectious diseases, the dynamics of revolution and civil violence, ethnic segregation, land use change, urban disaster preparedness, computational reconstruction of ancient civilizations, and more. The course prepares students to develop their own models—alone or in teams. The NetLogo modeling environment will be presented, although students are welcome to use any language. Students are assessed by class projects at the end of the course. 
Instructor(s): E. Hatna; J. Epstein 
Area: Engineering, Social and Behavioral Sciences.

EN.560.451. Civil Engineering Design I. 
A study of the engineering design process from problem definition to the final design. There are team projects which include written and oral presentations. Senior only or Permission Required 
Instructor(s): J. Matteo 
Area: Engineering.

EN.560.452. Civil Engineering Design II. 
A study of the engineering design process from problem definition to the final design. There are team projects which include written and oral presentations. Requirements: Student must be a senior in Civil Engineering. 
Instructor(s): J. Matteo 
Area: Engineering.

The physiological and psychological aspects of man in the sea are presented with the related engineering requirements. Topics include hyperbaric physiology, decompression theory, carbon dioxide absorption, thermal protection, psychrometrics. saturation diving, life support equipment, deep dive systems, diving operations and hazards. 
Instructor(s): W. Marr 
Area: Engineering.

EN.560.491. Civil Engineering Seminar I. 
Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only 
Instructor(s): R. Sangree 
Area: Engineering.

EN.560.492. Civil Engineering Seminar II. 
Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only 
Instructor(s): R. Sangree 
Area: Engineering.

EN.560.493. Civil Engineering Seminar III. 
Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only 
Instructor(s): R. Sangree 
Area: Engineering.

EN.560.494. Civil Engineering Seminar IV. 
Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only 
Instructor(s): R. Sangree 
Area: Engineering.

Introduction to analytical tools in the three major functional areas of systems engineering: design, analysis and control. Recommended Corequisite: EN.560.348 or equivalent course in probability theory. Restricted to Civil Engineering majors or by permission of instructor. 
Area: Engineering.
EN.560.525. Independent Study.  
Instructor(s): J. Guest; R. Dalrymple; S. Siddiqui; T. Igusa.

EN.560.526. Independent Study - Civil Engineering.  
Instructor(s): B. Schafer; J. Mitrani-Reiser; L. Graham-Brady; R. Dalrymple; T. Igusa.

EN.560.535. Research in Civil Engineering.  
Perm. Req’d.  
Instructor(s): Staff.

EN.560.536. Research in Civil Engineering.  
Instructor(s): Staff.

EN.560.547. Research-Intersession.

EN.560.590. Civil Engineering Internship.  
Instructor(s): B. Schafer; J. Guest.

EN.560.597. Summer Research - Civil Engineering.  
Instructor(s): Staff.

EN.560.602. GPU Programming for Engineers.  
Video graphics cards can be repurposed to perform massively parallel computations rapidly. This course will provide students the ability to program these graphics cards to speed up numerical computations. The course will begin with an introduction to C++ programming followed by concepts in parallel computing. Finally, the CUDA extensions to C++ that is used on Nvidia graphics cards. Students will be programming GPUs during the course. Recommended course background: Some programming experience.  
Area: Engineering.

Basic solid mechanics for structural engineers. Stress, strain and constitutive laws. Linear elasticity and viscoelasticity. Introduction to nonlinear mechanics. Static, dynamic and thermal stresses. Specialization of theory to one- and two-dimensional cases: plane stress and plane strain, rods, and beams. Work and energy principles; variational formulations.  
Instructor(s): S. Gaitanaros.

Covers probabilistic computational modeling in civil engineering and mechanics: Monte Carlo simulation, sampling methods and variance reduction techniques, simulation of stochastic processes and fields, and expansion methods. Applications to stochastic finite element, uncertainty quantification, reliability analysis, and model verification and validation.  
Instructor(s): M. Shields.

Matrix methods for the analysis of statistically indeterminate structures such as beams, plane and space trusses, and plane and space frames. Stiffness and flexibility methods. Linear elastic analysis and introduction to nonlinear analysis.  
Instructor(s): J. Guest

Area: Engineering.

Introduction to optimization theory and algorithms and their application to the design of structures, including structural systems, mechanisms, devices, and materials. Strong emphasis on topology optimization using finite element methods and design problems governed by solid and structural mechanics. Extensions to other physics and multiple physics are also introduced (e.g., fluids, heat transfer, optics, etc.). Course assumes familiarity with finite element methods and assumes no prior coursework in optimization.  
Area: Engineering.

EN.560.630. Structural Dynamics.  
Functional and computational examination of elastic and inelastic single degree of freedom systems with classical and non-classical damping subject to various input excitations including earthquakes with emphasis on the study of system response. Extension to multi-degree of freedom systems with emphasis on modal analysis and numerical methods. Use of the principles of structural dynamics in earthquake response.  
Instructor(s): J. Mitrani-Reiser.

This is a course in the concept, design, development and integration of systems from individual systems to system-of-systems. Lessons are reinforced by case studies and assignments, taking a holistic systems view and integrating aspects of product development and system architecture within systems engineering. This course will teach UML and SysML as model based system engineering languages for systems design, analysis, and documentation in a concurrent engineering, team-oriented design setting. The system language IDEFx will be covered to the degree that students can read and interpret legacy systems documented using IDEFx. In addition to lectures, a case study approach will be employed to develop analytical, technical, management, and teamwork skills through exercises in planning, documentation, presentation, and the creative process of systems engineering design.  
Instructor(s): T. Speller  
Area: Engineering.

EN.560.642. Systems Modeling and Simulation.  
Students will learn to develop agent-based and systems dynamics models to simulate complex systems. Models with hierarchical and other structures will be examined, and applications will be chosen based on student interest.

Course will address various themes related to modeling complex systems through critical evaluation of technical articles, open discussion, faculty presentations, and computational workshops. Teams of 3-5 faculty will develop monthly units based on different themes, examples of which may include: optimization and uncertainty modeling in science and engineering, particle-based modeling, experimental and field measurements in multi-scale models, linking atomistic- to continuum-scale models, challenges in climate and ocean modeling, homogenization and upscaling of small-scale data. This course is a requirement for MCS IGERT trainees, but it is open to all graduate students.  
Instructor(s): L. Graham-Brady.
This course will discuss the computational design tool of topology optimization and its application to the design of "structures", including structural systems, complaint mechanisms, multifunctional devices, and material architectures. Particular emphasis will be placed on the emerging trend known as Design for Additive Manufacturing (AM), and the role of topology optimization in guiding the design of parts to be fabricated by AM processes (3D printing, Selective Laser Sintering, etc.). The course will largely focus on design problems concerned with mechanical properties, with extensions to fluidic, thermal, optical, etc. properties also discussed. The course assumes some familiarity with finite element methods and assumes no prior coursework in optimization.
Instructor(s): J. Guest
Area: Engineering.

EN.560.682. Introduction to Water Wave Mechanics.
The theories governing water wave motion, from linear to nonlinear waves, is presented. Wave propagation and transformation, including shoaling, refraction, and diffraction, is shown. Wave breaking and the basic interaction of waves with structures and the ocean bottom are covered.
Instructor(s): R. Dalrymple.

EN.560.691. Graduate Seminar.
Graduate students are expected to register for this course each semester. Both internal and outside speakers are included.
Instructor(s): M. Shields.

EN.560.692. Civil Engineering Graduate Seminar.
Seminar series of speakers on various aspects of civil engineering. Different speakers are invited each semester. Full time civil engineering graduate students must enroll in the seminar course every semester unless excused by the Department.
Instructor(s): M. Shields.

EN.560.724. Cold-Formed Steel Structures.
Practical introduction to the analysis, design, and experimentation of cold-formed steel members and structures. Followed by an in-depth treatment of the theories which underpin modern analytical and computational tools used in exploring cold-formed steel behavior, and an introduction to topics under current research.

Variational methods and mathematical foundations, Direct and Iterative solvers, 1-D Problems formulation and boundary conditions, Trusses, 2-D/ 3D Problems, Triangular elements, QUAD4 elements, Higher Order Elements, Element Pathology, Improving Element Convergence, Dynamic Problems.

Instructor(s): B. Schafer.

EN.560.764. Infrastructure Asset Management.
Introduction to concept of infrastructure asset management. Topics include performance & condition data collection and modeling, geographical information system (GIS), life-cycle economic analysis, maintenance, rehabilitation, and renovation (MR&R) strategies, innovative contracting using PPP and performance based design, construction, maintenance, and operation. Undergraduates must be seniors or obtain permission of instructor.
Instructor(s): X. Chen.

EN.560.770. Advanced Finite Element Methods and Multi-Scale Methods.
Addresses advanced topics in various areas of the finite element methodology. Covers a range of topics, viz. element stability and hourglass control, adaptive methods for linear and nonlinear problems, mixed and hybrid element technology, eigen-value problems, multi-scale modeling for composites and polycrystalline materials. Recommended Course Background: EN.530.730 or EN.560.730.

This course will discuss state of the art theoretical developments and modeling techniques in nonlinear computational mechanics, for problems with geometric and material nonlinearities. Large deformation of elastic-plastic and visco-plastic materials, contact-friction and other heterogeneous materials like composites and porous materials will be considered. A wide variety of applications in different disciplines, e.g. metal forming, composite materials, polycrystalline materials will be considered. Co-listed with EN.530.772
Instructor(s): S. Ghosh.

EN.560.782. Hydrodynamics.
Fundamentals of fluid mechanics in the context of ocean science and engineering, naval architecture, and coastal processes, at engineering scales.
Area: Engineering.

EN.560.785. Coastal & Ocean Modeling.
Course discusses the numerical and physical modeling techniques used in coastal and ocean engineering, including finite difference, finite and boundary element methods, and particle methods. Some aspects of parallel computing will be included.
Area: Engineering, Natural Sciences.

EN.560.826. Graduate Independent Study.
Independent Study
Instructor(s): T. Igusa
Area: Engineering.

EN.560.835. Graduate Research.
Instructor(s): Staff.

EN.560.836. Graduate Research.
Instructor(s): Staff.

Cross Listed Courses
Earth Planetary Sciences
AS.270.205. Introduction to Geographic Information Systems and Geospatial Analysis.
The course provides a broad introduction to the principles and practice of Geographic Information Systems (GIS) and related tools of Geospatial Analysis. Topics will include history of GIS, GIS data structures, data acquisition and merging, database management, spatial analysis, and GIS applications. In addition, students will get hands-on experience working with GIS software.
Instructor(s): X. Chen
Area: Engineering, Natural Sciences.

Geography Environmental Engineering
EN.570.351. Introduction to Fluid Mechanics.
Introduction to the use of the principles of continuity, momentum, and energy to fluid motion. Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow. Recommended Course Background: Statics, Dynamics, and AS.110.302
Instructor(s): M. Karweit
Area: Engineering.
Computational Medicine

jhu.icm.edu (http://icm.jhu.edu)

The Institute for Computational Medicine (ICM) is proud to offer an undergraduate minor in Computational Medicine, the first educational program in CM, reflecting Johns Hopkins University’s leadership in this field. Like the ICM itself, the undergraduate minor in Computational Medicine is integrative and multidisciplinary. The 19 ICM Core Faculty who serve as advisors to the undergraduate minor in Computational Medicine hold primary and joint appointments in multiple Johns Hopkins University departments and schools including Biomedical Engineering, Computer Science, Electrical and Computer Engineering, Mechanical Engineering, Applied Mathematics and Statistics (WSE); Neurosurgery, Emergency Medicine, Medicine, and the Divisions of Cardiology and Health Sciences Informatics (SOM); and Health Policy and Management (BSPH).

Computational Medicine (CM) is an emerging discipline devoted to the development of quantitative approaches for understanding the mechanisms, diagnosis and treatment of human disease through applications of mathematics, engineering and computational science. The core approach of CM is to develop computational models of the molecular biology, physiology, and anatomy of disease, and apply these models to improve patient care. CM approaches can provide insight into and across many areas of biology, including genetics, genomics, molecular networks, cellular and tissue physiology, organ systems, and whole body pharmacology.

CM is distinct from Computational Biology in its focus on human health, disease, and treatment; translation to and application in the clinic is a near-term goal of all CM research. Applications of CM are as broad as Medicine itself, and include: identification of optimal drugs using associated genomic and proteomic biomarkers; discovery of image-based biomarkers for diagnosis and prognosis; design and dynamic adjustment of individualized non-drug therapies such as deep brain stimulation, cardiac stimulation, and cochlear implants; modeling and learning from patient EHR data to improve patient outcomes and efficiency of care; optimization of healthcare policy decisions by quantitative analysis; and more.

This field will continue to grow and to have a transformative impact on human health. CM research at ICM is sub-divided into four key areas: Computational Molecular Medicine (http://icm.jhu.edu/research-areas-2/computational-molecular-medicine); Computational Physiological Medicine (http://icm.jhu.edu/research-areas-2/computational-physiological-medicine); Computational Anatomy (http://icm.jhu.edu/research-areas-2/computational-anatomy); Computational Healthcare (http://icm.jhu.edu/research-areas-2/computational-healthcare). CM is one of the pillars of the University’s Strategic Initiative in Individualized Health.

What will you gain from a minor in CM?

With a minor in CM, students will have a solid grounding in the development and application of computational methods in multiple key areas of medicine. Specifically, they will understand how mathematical models can be constructed from biophysical laws or experimental data, and how predictions from these models facilitate diagnosis and treatment of a disease. Graduating students will be conversant with a wide variety of statistical, deterministic and stochastic modeling methods. They will be able to develop a model and to write code to implement it; they will be able to analyze and visualize the resulting data from the simulations. These skills are essential to the advancement of modern medicine, and are prized both in academic research and industrial research. The courses and research opportunities available in the CM minor will place students at the forefront of the application of mathematics, computing and engineering to human health. Whether you go on to medical school, graduate research, or biomedical industries, the comprehensive quantitative training and exposure to cutting edge CM techniques will give you a competitive advantage for working in the medicine of tomorrow – which will be data-driven, predictive, personalized and preventative.

Will you have opportunities to specialize within Computational Medicine?

Yes. The minor will provide both foundational training and opportunities for specialization in Computational Medicine. Students can select electives from an approved list that match their interests. We also provide examples of curricula in some key subareas of Computational Medicine, including:

- **Computational Physiological Medicine** develops mechanistic models of biological systems in disease, and applies the insights gained from these models to develop improved diagnostics and therapies. Therapies could be diverse drugs, electrical stimulation, mechanical support devices and more.
- **Computational Molecular Medicine** harnesses the enormous amount of disease-relevant data produced by next-generation sequencing, microarray and proteomic experiments of large patient cohorts, using statistical models to identify the drivers of disease and the susceptible links in disease networks.
- **Computational Anatomy** uses medical imaging to analyze the variation in structure of human organs in health and disease. Such image analysis has been integrated into clinical workflows to assist in the diagnosis and prognosis of complex diseases.
- **Computational Healthcare** is an emerging field devoted to understanding populations of patients and their interaction with all aspects of the healthcare process.

Techniques for and applications in each of these four key subareas will be introduced in the required core courses, so that students will be exposed to the breadth of Computational Medicine, and will be able to identify preferred areas of interest.

Interested students should contact Tifphany Cantey, ICM Administrative Coordinator, to receive guidance on declaring the minor:

Phone: 410-516-4116
Email: tcantey1@jhu.edu

Minor Prerequisites

Before attempting the minor, undergraduates will have taken the following courses:

1. AS.110.108 Calculus I or AS.110.106 Calculus I
2. AS.110.109 Calculus II (For Physical Sciences and Engineering) or AS.110.107 Calculus II (For Biological and Social Science)
3. Probability and Statistics: either a single course covering both (e.g., EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering), or a course devoted to each (e.g., EN.550.420 Introduction to Probability and EN.550.430...
Introduction to Statistics) – this may be taken concurrent with EN.580.431 Introduction to Computational Medicine I
4. At least one additional course in mathematics or applied mathematics (at least 3 credits)
5. At least one course in programming (at least 3 credits)
6. At least one course in biological sciences (at least 3 credits)

Core Courses
Introduction to Computational Medicine is a required two-semester core course (EN.580.431 Introduction to Computational Medicine I and EN.580.432 Introduction to Computational Medicine II). The expectation is that students will be prepared to take these in their junior year. The Intro to CM course provides a broad view of the scope and applications of Computational Medicine, as well as providing a foundation in the techniques and methods used in Computational Medicine.

Seminar Series
Students in the minor must register at least once for EN.580.737 Distinguished Lecture Series in Computational Medicine. At least eight of these seminars are held each academic school year. Students will be required to attend at least 6 such seminars (attendance is recorded).

Elective Courses
Following satisfaction of the prerequisites, to complete the minor, an undergraduate must take at least 6 CM courses totaling at least 18 credits. This includes two one-semester core courses plus four approved courses selected from those listed below. The following restrictions are noted:

1. At most 3 of the 18 credits can consist of independent research in Computational Medicine, as defined and agreed to in advance by the minor advisor;
2. The 18 credits will all be at 300-level or above, and courses must be passed at a C- level or above;
3. At least 2 non-core courses must be outside the student’s home department
4. At least 4 courses (which can include the two core elective) must have a substantial biology or medicine component, as identified in the list below with an (M) designation.
5. At least 1 non-core course must have a substantial programming component, as identified in the list below with an (C) designation

Electrical and Computer Engineering
EN.520.315 Introduction to Information Processing of Sensory Signals 3
EN.520.432 Medical Imaging Systems (M) 3
EN.520.601 Introduction to Linear Systems Theory 3
EN.520.621 Introduction To Nonlinear Systems 3

Mechanical Engineering
EN.530.343 Design and Analysis of Dynamical Systems 4
EN.530.676 Locomotion in Mechanical and Biological Systems (M) 3

Chemical and Biomolecular Engineering
EN.540.400 Project in Design: Pharmacokinetics 3
EN.540.421 Project in Design: Pharmacodynamics 3

Applied Mathematics and Statistics
EN.550.391 Dynamical Systems 4
EN.550.420 Introduction to Probability 4
EN.550.426 Introduction to Stochastic Processes 4
EN.550.430 Introduction to Statistics 4

Civil Engineering
EN.560.447 Systems Science for a Dynamic World 3

Biomedical Engineering
EN.580.430 Systems Pharmacology and Personalized Medicine (M) 3
EN.580.445 Networks (C) 3
EN.580.460 Theory of Cancer (M, C) 3
EN.580.488 Foundations of Computational Biology & Bioinformatics II (M) 3
EN.580.689 Computational Personal Genomics (M, C) 3
EN.580.694 Statistical Connectomics (M, C) 3

Computer Science
EN.600.120 Intermediate Programming (C) 4
EN.600.323 Data-Intensive Computing (C) 3
EN.600.439 Computational Genomics (M, C) 3
EN.600.461 Computer Vision (C) 3
EN.600.476 Machine Learning: Data to Models (C) 3
EN.600.624 Advanced Topics in Data-Intensive Computing (C) 3
EN.600.640 Frontiers of Sequencing Data Analysis (M, C) 3

Declaring the Minor
Interested students should contact Tiphany Cantey, ICM Administrative Coordinator, to receive guidance on declaring the minor:

Laurent Younes  
Professor and Chair, Dept. of Applied Mathematics and Statistics

**Computer Science**

Computing has grown to be a pervasive element of society, business, science, and entertainment. The availability of relatively inexpensive high performance computing capabilities, ubiquitous high speed and wireless networking, and mobile computing have powered a technology-driven restructuring of the way society and most professions now operate. Information, and its associated processing and transport, is the commodity upon which corporations are built and lives are improved. At the center of this revolution, making it happen, are those who study computer science.

There are two dimensions to the field of computer science that establish it as a unique area. CS can be viewed as a stand-alone discipline worthy of study unto itself, and/or as an empowering discipline to be studied in conjunction with other areas. Core CS careers include (but are not limited to) software design and development, computer systems engineering or administration, and information security. Application areas span a wide range of fields and disciplines such as robotics, medical or health informatics, gaming/entertainment, business computing, and scientific research to name a few.

Because computer science is a highly diverse and broadly applied field, studies can proceed in many different directions. Accordingly, the undergraduate and graduate programs in the Department of Computer Science at Johns Hopkins are flexible curricula designed to accommodate a wide range of goals. A student at Johns Hopkins can pursue appropriately customized versions of the following computer science programs: minor, bachelor of science, bachelor of arts, masters of science in engineering, and doctor of philosophy. Most of this catalog section is devoted to details regarding these programs.

Computer science research laboratories are currently active in the following areas at Hopkins: algorithm design and analysis, human-computer interaction, machine learning, health informatics, computational medicine, computer vision and image processing, computer graphics, geometric modeling, programming languages, natural language and speech processing, information retrieval, cryptography and information security, secure and robust systems, storage systems, high-performance and scientific computing, computational genomics, networks and distributed systems, stream processing, parallel and distributed databases, robotics, computer-integrated surgical systems, and wireless and sensor systems.

Additionally, interdisciplinary research centers in the university have heavy involvement by Computer Science faculty: the Information Security Institute (ISI), the Center for Computer-Integrated Surgical Systems and Technology (CISST), the Laboratory for Computational Sensing and Robotics (LCSR), the Center for Language and Speech Processing (CLSP), and the Institute for Data Intensive Engineering and Science (IDIES). An important component of the educational process in the department is the opportunity for undergraduate and graduate student participation in the research programs of the faculty. In particular, original research in close association with individual faculty members is emphasized at the graduate level.

There are several closely related programs at the undergraduate and graduate levels which involve significant coursework and faculty involvement from the Department of Computer Science. The Laboratory for Computational Sensing and Robotics (LCSR) offers a minor in robotics and also a minor in computer integrated surgery through the Engineering Research Center for Computer Integrated Surgical Systems and Technology. Details of these programs may be found elsewhere in this catalog in the section pertaining to the Laboratory for Computational Sensing and Robotics (p. 1066). Undergraduates with a strong interest in system design and performance may elect to pursue a bachelor degree in computer engineering (p. 927). This field of study includes course work in computer science, as well as electrical and computer engineering. Although jointly administered by both departments, specific goals and requirements of the computer engineering degree may be found in the catalog section pertaining to the Department of Electrical and Computer Engineering only.

At the graduate level, the LCSR (p. 1066) offers a Master of Science in Engineering (M.S.E.) in Robotics, designed for students from a wide variety of engineering, scientific, and mathematical backgrounds to advance their interdisciplinary knowledge in robotics. Details of this program may be found in the LCSR section of this catalog, or on the web at www.lcsr.jhu.edu/MSE. Lastly, the Master of Science in Security Informatics (M.S.S.I.) is a specialized graduate program offered through the Information Security Institute (p. 987) (ISI) in the WSE. The field of security informatics is fundamentally based on information security and
assurance technologies (hardware, software, and networks) as related 
to issues such as policy, management, privacy/trust, health care, and 
law, from both national and international perspectives. Interested 
students can obtain detailed information regarding the M.S.S.I. online at 
www.jhuisi.jhu.edu or in the ISI section of this catalog.

For additional information regarding the academic programs available 
in Computer Science, and the facilities provided, please consult the 
sections which follow, or the departmental website www.cs.jhu.edu.

Facilities

The CS department is primarily housed in Malone Hall, a state of the art, 
open concept research facility. Additional department research space is 
located in the adjacent Hackerman Hall.

The general department computing facilities include numerous 
workstations and servers. Undergraduate laboratories combine to 
provide approximately 24 Linux workstations, and several Windows 
stations. One of these labs is a collaboration room allowing students 
to work in a team-based environment, with several private breakout 
rooms as well. At the graduate level there is a Master’s Lab consisting 
of a collaboration area and workstation area, both consisting of several 
Linux workstations. All Ph.D. students are assigned dedicated desks 
in their research labs. Additionally, multiple high-speed networked 
laser printers, as well as a networked color copier and remotely 
accessible Linux compute servers are available to both graduate and 
undergraduate students.

Focused research laboratories have significant resources that provide 
greater specialization, including isolated networks of PCs for security 
studies, high-performance computing clusters, sensor and wireless 
computing testbeds, robots and computer vision systems, a mock 
operating room equipped with medical robots and imaging equipment, 
and more.

The general department computing facilities are tied together by our 
own LAN, and access to specialized hardware in other departments, 
labs, and institutions is available via the university intranet and the 
Internet. In addition, the university provides wireless access to the JHU 
intranet and the Internet, as well as server systems that provide e-mail 
accounts for all students.

(See also General Requirements for Departmental Majors (p. 20))

The objectives of our bachelor degree programs are to train computer 
scientists who will be able to:

- Successfully engage in professional practice in the computing 
  sciences or apply computer science tools and techniques to another 
  field of interest.
- Pursue advanced study in the computing sciences.
- Behave in a professional and ethical manner.
- Work successfully in both independent and team environments.

A successful major program of study leads to either the Bachelor of 
Science in Computer Science (B.S.) or the Bachelor of Arts in Computer 
Science (B.A.). Students should decide which degree program to 
complete by about their junior year. Both degree programs require 
specific courses and/or credits in several key areas: computer science, 
math, basic science, humanities and social sciences. However, there is 
much flexibility in how these requirements are fulfilled. Undergraduate 
majors may choose to pursue a broad selection of computer science 
and distributional courses, or to pursue a specific track within the field. 
Current tracks reflect departmental and school strengths: information 
security, natural language processing, robotics, software engineering, 
and video game design. Further information on these tracks may be 
found in the computer science undergraduate advising manual.

All undergraduate students majoring or minorin majoring in computer science 
must have a faculty advisor in the department. They will be assigned 
an advisor as entering freshmen or upon deciding on the major/minor. 
Every major must follow a program approved by his/her faculty advisor.

The department also offers a minor in computer science, and 
tangentially, a minor in computer integrated surgery and a minor in 
robotics. Some students majoring in computer science may be eligible 
for a concurrent bachelor’s/master’s degree program. Requirements 
for these programs are included here as well. Additional details 
regarding undergraduate programs can be found in the department’s 
undergraduate advising manual or on the website at www.cs.jhu.edu.

Requirements for the B.S. Degree

The Bachelor of Science in Computer Science degree program is 
accredited by the Computing Accreditation Commission of ABET, 
www.abet.org (http://www.abet.org). It provides for the acquisition of 
the following knowledge base and skill set:

- An ability to apply knowledge of computing and mathematics 
  appropriate to the discipline.
- An ability to analyze a problem, and identify and define the 
  computing requirements appropriate to its solution.
- An ability to design, implement, and evaluate a computer-based 
  system, process, component, or program to meet desired needs.
- An ability to function effectively on teams to accomplish a common 
  goal.
- An understanding of professional, ethical, legal, security, and social 
  issues and responsibilities.
- An ability to communicate effectively with a range of audiences.
- An ability to analyze the local and global impact of computing on 
  individuals, organizations, and society.
- Recognition of the need for and an ability to engage in continuing 
  professional development.
- An ability to use current techniques, skills, and tools necessary for 
  computing practice.
- An ability to apply mathematical foundations, algorithmic principles, 
  and computer science theory in the modeling and design of 
  computer-based systems in a way that demonstrates comprehension 
  of the trade-offs involved in design choices.
- An ability to apply design and development principles in the 
  construction of software systems of varying complexity.

To meet the course credit requirements for the B.S. in computer 
science, the student must complete a minimum of 126 credits. The 
basic requirements for the B.S. degree are as follows:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Science</td>
<td>42</td>
</tr>
<tr>
<td>Mathematics</td>
<td>22</td>
</tr>
<tr>
<td>Basic Sciences</td>
<td>16</td>
</tr>
<tr>
<td>Humanities/Social Sciences</td>
<td>18</td>
</tr>
<tr>
<td>Broadening Electives</td>
<td>12</td>
</tr>
<tr>
<td>Two Writing Intensive Courses</td>
<td></td>
</tr>
</tbody>
</table>
Electives 16
Total Credits 126

Details and course recommendations for these distributional requirements are below. These requirements add up to at most 116 credits and fulfill general university requirements, leaving at least 10 elective credits that students choose freely. Freshman majors are also expected to take EN.600.105 M & Ms: Freshman Experience (optional for transfers into the major). This is a one credit S/U course that may only be counted as an elective.

Except for electives, courses should not be taken on a satisfactory/unsatisfactory basis. By university policy, no more than 18 D or D+ credits can be counted toward the total credit requirements for a degree.

**Computer Science (42 credits)**

The following foundational courses in computer science must be included in a student’s program:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.600.104 Computer Ethics</td>
<td>1</td>
</tr>
<tr>
<td>EN.600.107 Introductory Programming in Java (or equivalent)</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.120 Intermediate Programming</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.226 Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.233 Computer System Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.271 Automata &amp; Computation Theory</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.363 Introduction To Algorithms</td>
<td>3</td>
</tr>
<tr>
<td>or EN.600.463 Algorithms I</td>
<td></td>
</tr>
</tbody>
</table>

At least 16 credit hours must be at the 300-level or above, including EN.600.363/463. At least one course in each classification area of Analysis, Applications and Systems must be chosen. An exhaustive list of the area classifications for each of our courses may be found on the department’s website.

Students must take at least one of the following courses which contain oral communication components. The course satisfying this requirement may overlap other requirements:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.600.255 Introduction to Video Game Design</td>
<td>1</td>
</tr>
<tr>
<td>EN.600.321/.420 Object Oriented Software Engineering</td>
<td></td>
</tr>
<tr>
<td>EN.600.355 Video Game Design Project</td>
<td></td>
</tr>
<tr>
<td>EN.600.392 CS Design Project</td>
<td></td>
</tr>
<tr>
<td>EN.600.446 Computer Integrated Surgery II</td>
<td></td>
</tr>
<tr>
<td>EN.600.520 Senior Honors Thesis</td>
<td></td>
</tr>
</tbody>
</table>

Eight additional credits of Computer Science are required. 8

**Mathematics (22 credits)**

The following courses must be included:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.108 Calculus I</td>
<td>4</td>
</tr>
<tr>
<td>AS.110.109 Calculus II (For Physical Sciences and Engineering)</td>
<td>4</td>
</tr>
<tr>
<td>EN.550.171 Discrete Mathematics</td>
<td>4</td>
</tr>
</tbody>
</table>

The remaining courses must be 200-level or above, chosen from Mathematics (110.xxx) or Applied Math and Statistics (550.xxx), and must include coverage of both probability and statistics. Some highly recommended math electives are Probability & Statistics, Calculus III, Linear Algebra, and Differential Equations. Note that students will need at least six courses to fulfill the credit requirement.

**Basic Sciences (16 credits)**

At least two semesters of physics or two semesters of chemistry, with the associated laboratories, must be included. The remaining courses must be chosen in accordance with the list posted on the department’s website, which includes most courses in Physics, Chemistry, Biology, Biophysics, Earth & Planetary Sciences, Natural Sciences designated engineering courses, and some Natural Sciences designated courses in Neuroscience & Cognitive Science, but not all. At most 2 credits from satisfactory/unsatisfactory intersession courses may be used to fulfill this requirement.

**Humanities/Social Sciences (18 credits)**

Six courses in the Humanities and Social Behavioral Sciences must be taken, with each course at least 3 credits. These courses must have either an Humanities or Social and Behavioral Sciences area designator on them; however, foreign language courses (without an Humanities or Social and Behavioral Sciences) may also be used to satisfy this requirement.

**Broadening Electives (12 credits)**

At least 12 additional credits must be taken in areas such as Humanities, Social and Behavioral Science, Natural Science, arts, business, engineering, or other disciplines that serve to broaden the student’s background. Courses used to fulfill this requirement must not be from computer science, computer and electrical engineering, or math departments.

**Writing Requirement**

Students are required to fulfill the university’s requirement of two writing intensive courses, each at least 3 credits. Students must receive at least a C- grade or better in these writing courses. These courses may overlap other requirements. At least one of the following options should be chosen:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.060.113 Expository Writing</td>
<td></td>
</tr>
<tr>
<td>EN.661.110 Professional Writing and Communication</td>
<td></td>
</tr>
<tr>
<td>AS.220.105 Fiction Poetry Writing I</td>
<td></td>
</tr>
<tr>
<td>AS.220.106 Fiction Poetry Writing II</td>
<td></td>
</tr>
</tbody>
</table>

**Electives**

Electives to be chosen by the student with guidance and approval of his/her advisor.

Total Credits 126

* With the advisor’s explicit permission regarding course selections, up to 6 of the 42 required credits may be taken in the Department of Electrical and Computer Engineering or the Information Security Institute.

No more than 6 credits of independent study (including EN.600.491-EN.600.492) and no more than 3 credits of short courses can be counted toward this requirement. However, B.S. students doing the Senior Honors Thesis (EN.600.519-EN.600.520) may use an additional three credits of independent work toward their CS requirements, for a total of 9 credits.

No courses with grades below C- or with satisfactory/unsatisfactory grades can be used to fulfill this requirement unless they are not offered for a grade.

** AP Statistics credits may not be used to satisfy these credit requirements; however, they do meet the need for coverage of statistics (not probability).
Requirements for the B.A. Degree

To meet the course credit requirements for the B.A. in computer science, the student must complete a minimum of 120 credits. The basic requirements for the B.A. degree are:

<table>
<thead>
<tr>
<th>Area</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer Science</td>
<td>32</td>
</tr>
<tr>
<td>Mathematics</td>
<td>18</td>
</tr>
<tr>
<td>Basic Sciences</td>
<td>12</td>
</tr>
<tr>
<td>Humanities/Social Sciences</td>
<td>18</td>
</tr>
<tr>
<td>Foreign Language</td>
<td>6</td>
</tr>
<tr>
<td>4 Writing Intensive Courses</td>
<td></td>
</tr>
<tr>
<td>Electives</td>
<td>34</td>
</tr>
<tr>
<td>Total Credits</td>
<td>120</td>
</tr>
</tbody>
</table>

* To be chosen by the student with the guidance and approval of his/her advisor. Freshman majors are also expected to take EN.600.105 M & Ms: Freshman Experience (optional for transfers into the major). This is a one credit Satisfactory/Unsatisfactory course that may only be counted as an elective.

Details and course recommendations of these distributional requirements are below. These requirements add up to 84 credits and fulfill general university distribution requirements.

Except for electives, courses should not be taken on a satisfactory/unsatisfactory basis. By university policy, no more than 18 D or D+ credits can be counted toward the total credit requirements for a degree.

Computer Science (32 credits)

The following foundational courses in computer science must be included in a student’s program:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.600.107 Introductory Programming in Java (or equivalent)</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.120 Intermediate Programming</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.226 Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.233 Computer System Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.271 Automata &amp; Computation Theory</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.363 Introduction To Algorithms</td>
<td>3</td>
</tr>
<tr>
<td>or EN.600.463 Algorithms I</td>
<td></td>
</tr>
<tr>
<td>At least 15 credit hours must be at the 300-level or above, including EN.600.363/463.</td>
<td>12</td>
</tr>
</tbody>
</table>

Mathematics (18 credits)

The following courses must be included:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.108 Calculus I</td>
<td>4</td>
</tr>
<tr>
<td>AS.110.109 Calculus II (For Physical Sciences and Engineering)</td>
<td>4</td>
</tr>
<tr>
<td>EN.550.171 Discrete Mathematics</td>
<td>4</td>
</tr>
<tr>
<td>The remaining courses may be chosen from Mathematics (110.xxx) or Applied Math and Statistics (550.xxx). At least one course must be 200-level or above.</td>
<td>6</td>
</tr>
</tbody>
</table>

Basic Sciences (12 credits)

At least two semesters of physics or chemistry or a combination of both, with the associated laboratories, must be included. The remaining courses must be chosen in accordance with the list posted on the department website, which includes most courses in Physics, Chemistry, Biology, Biophysics, Earth & Planetary Sciences, ‘N’ designated engineering courses, and some ‘N’ designated courses in Neuroscience and Cognitive Science, but not all. At most 2 credits from (S/U) intersession courses may be used to fulfill this requirement.

Humanities/Social Sciences (18 credits)

Six courses in the Humanities/Social Sciences must be taken, with each course at least 3 credits. At least two 3-credit courses at the 300-level or above are required. As befits a B.A. degree, students have ample flexibility to choose courses that broaden the scope of their study, in consultation with their advisors. A subset of the courses selected to satisfy this requirement should demonstrate coherence within an area. Any course with Humanities or Social Sciences area designators may fulfill these distributional requirements.

Foreign Language (6 credits)

Two courses in a foreign language, with a total of at least 6 credits are required. These foreign language credits are in addition to the 18 required Humanities/Social Sciences credits.

Writing Requirement

All primary computer science majors pursuing a B.A. degree are required to fulfill the university’s requirement of four writing intensive courses, each at least 3 credits. Students must receive at least a C- grade in these courses. These courses may overlap other requirement areas. Highly recommended, at least one of:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.060.113 Expository Writing</td>
<td></td>
</tr>
<tr>
<td>AS.220.105 Fiction Poetry Writing I</td>
<td></td>
</tr>
<tr>
<td>&amp; AS.220.106 Fiction Poetry Writing II</td>
<td></td>
</tr>
<tr>
<td>EN.661.110 Professional Writing and Communication</td>
<td></td>
</tr>
</tbody>
</table>

Electives

Electives to be chosen by the student with guidance and approval of his/her advisor.

<table>
<thead>
<tr>
<th>Area</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Humanities/Social Sciences</td>
<td></td>
</tr>
<tr>
<td>Professional Writing and Communication</td>
<td></td>
</tr>
<tr>
<td>Total Credits</td>
<td>120</td>
</tr>
</tbody>
</table>

* With the advisor’s permission, up to 3 of the 32 required credits may be taken in the Department of Electrical and Computer Engineering or the Information Security Institute.

No more than 3 credits of short courses or 3 credits of independent study (including EN.600.491-EN.600.492) may be applied toward this requirement. However, B.A. students doing the Senior Honors Thesis (EN.600.519-EN.600.520) may use an additional 3 credits of independent work toward their CS requirements, for a total of 6 credits.

No courses with grades below C- or with satisfactory/unsatisfactory grades may be used to fulfill this requirement unless they are not offered for a grade.

** Highly recommended: Calculus III, Linear Algebra, Differential Equations, Probability/Statistics. Note that students will need at least five courses to fulfill the credit requirement.

Minor in Computer Science

To satisfy the course credit requirements for a minor in computer science, a student must take a minimum of seven courses, with a total of at least 23 credits, earning at least a C- in each course. These must include four core courses, to provide the student with a foundation, and
three upper-level courses (300-level and above), to allow the student to pursue an advanced topic in depth.

While not explicitly required, we also strongly recommend taking EN.550.171 Discrete Mathematics as preparation for several computer science courses, including EN.600.271 Automata & Computation Theory.

**Core Courses**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Description</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.600.107</td>
<td>Introductory Programming in Java (or AP credit)</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.120</td>
<td>Intermediate Programming</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.226</td>
<td>Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>Choose one of the following:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EN.600.233</td>
<td>Computer System Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.600.271</td>
<td>Automata &amp; Computation Theory</td>
<td></td>
</tr>
</tbody>
</table>

**Upper-Level Courses**

These courses should be chosen to form a cohesive minor and must be accepted by the computer science minor advisor. **

**Total Credits:** 23

* With the approval of a faculty member in the Department of Computer Science, serving as a computer science minor advisor, substitutions for these core courses are possible.

** It is strongly recommended that students choose all three courses from within one of the three research areas of analysis, applications, and systems. Each upper-level course description in this catalog includes its area for reference. In addition, a current listing of courses with area designators is provided on the departmental website.

Short courses cannot be used toward the minor requirements. All courses must be taken for a grade, not Satisfactory/Unsatisfactory.

Students whose primary major is in the Whiting School may use the same courses to satisfy the requirements of the primary major and also those of a computer science minor. Students who plan to fulfill requirements for a minor must go to the Department of Computer Science director of undergraduate studies to declare the minor and be advised on course selections, and inform the Office of Academic Advising by the end of their junior year.

**Short Courses**

The Department of Computer Science offers 1-credit short courses covering a variety of topics in computer science and engineering. The purpose of the short courses is to expose students to topics of current interest in the field of computer science and engineering. Short courses are taught not only by faculty and graduate students in the Department of Computer Science and visiting faculty from other universities, but by individuals from local government or industry who have demonstrable expertise in a given area and are practicing the application of computer science theory and concepts.

Students should be aware that short course offerings are likely to change from year to year, depending on instructor commitments: there is no guarantee that the same course will be available at a later time. Students interested in getting details about a particular short course can contact the instructor through the departmental office. No more than 3 credits of short courses may be applied toward the computer science course credit requirement for the B.S. or the B.A. degrees.

**Double Majors with Computer Science**

It is possible for students to pursue a double major program in which one of the majors is computer science. The computer science requirements are flexible enough to allow for combination with most majors in the Whiting School of Engineering and the Krieger School of Arts and Sciences. Whether computer science is your primary or secondary major, you will be assigned a faculty advisor in the department. In order to declare a first or second major in computer science, students should see the Director of Undergraduate Studies before the start of senior year. Those students must also inform the Office of Academic Affairs of the Whiting School of Engineering and the Registrar of their double major status. Subject to restrictions set by the department offering a second major, students whose primary major is in the Whiting School may use courses to satisfy both the requirements of the student’s primary major and those of a double major.

**Combined Bachelor's/Master's Program**

As early as the end of their sophomore year, qualified students may apply for admission to a combined bachelor's/master's program which combines a B.S. or B.A. degree (in any department) with a master of science in engineering degree in Computer Science. This program allows students to simultaneously pursue both an undergraduate and a graduate degree program of study. Generally, the combined B.S./M.S.E. or B.A./M.S.E. program is accomplished in five years, although some students take more or less time. Applicants are judged on the basis of their performance in courses and their letters of recommendation. Double counting of at most two courses is subject to current WSE and departmental policies. Students may not take a 600.3xx course as an undergraduate and the corresponding 600.4xx course for the M.S.E.; likewise for 600.4xx/6xx course offerings. Upon admission to the program students will be assigned a graduate faculty advisor in the Computer Science Department who must approve the courses to be applied toward the master’s degree. For information on the requirements of the M.S.E. degree, see the Graduate Programs tab on this page, or ask in the departmental office for the document that lists those requirements.

Every graduate student in the Department of Computer Science must follow a program approved by a faculty advisor in the department. The advisor assigned to a student may change, subject to the acceptance of the new advisor.

**Requirements for the M.S.E. Degree**

The Master of Science in Engineering (M.S.E.) is a day program offered by the Department of Computer Science. Most students complete the program in three full-time semesters. Two consecutive semesters of residence as a full-time graduate student are required. Those interested in part-time evening study should refer to Engineering for Professionals at ep.jhu.edu.

Entering students are expected to have completed a program of study equivalent to that required by the B.S. in computer science. Applicants from other disciplines are expected to have coursework (or equivalent experience) in intermediate programming (C++ and Java), data structures, computer system fundamentals, and automata theory. Upon admission to the Master of Science in Engineering program, a student is assigned a graduate advisor from the Department of Computer Science who must approve the courses to be applied to the M.S.E. degree.
The Department of Computer Science classifies its courses into three sub-areas: Analysis, Applications, and Systems. All M.S.E. candidates must complete at least two graduate courses (3 class hours each) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. M.S.E. students must also complete an additional two elective graduate courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) for a total of eight graduate courses. In the Department of Computer Science, graduate courses are 600-level and above, or 400-level courses that are not offered at the 600-level. The coursework program must be approved by the student’s faculty advisor.

In addition to the eight courses, a student must elect one of the following options in order to fulfill the degree requirements:

- Two additional graduate courses in Computer Science, approved as above.
- A supervised research project including an approved project report that will be made publicly available.
- An original, faculty-approved master’s essay, submitted to the Milton S. Eisenhower Library.

By satisfying the Ph.D. qualifying course requirements and the first qualifying project, a student will also satisfy the M.S.E. degree requirements (unless more than two course requirements have been satisfied using courses transferred from other institutions). Please refer to the Ph.D. program information for details.

All M.S.E. degree candidates are encouraged to regularly attend the department seminars. You may enroll in EN.600.601 Computer Science Seminar—EN.600.602 Computer Science Seminar; however, these courses may not be counted toward the degree course requirements.

Course Requirement Details

- All courses counted toward the M.S.E. degree requirement must be taken at the graduate level. In the Department of Computer Science, graduate courses are 600-level and above, or 400-level courses that are not offered at the 600-level.
- At most, two courses with grades less than B- may be counted toward the coursework requirements. No courses with grades less than C- may be counted.
- The overall grade point average of the courses counted toward the coursework requirements must be a 3.0 or higher (B average).
- At most, two independent study courses can be counted toward the course requirements.
- Other than independent study courses, no courses with grades of P can be counted toward the coursework requirement. Courses with grades of P will not be included in the grade point average calculation.
- One of the courses required for the M.S.E. degree, but only one, can be replaced by 3 credits from comparable short courses.
- A majority of the courses counted toward the degree must be taught in the Department of Computer Science.
- At most, two courses can be transferred from graduate programs of other institutions to be counted toward the degree requirements.

Such transfer courses must be approved by the student’s faculty advisor and the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested.

- A grade of D or F results in probation; a second D or F is cause for being dropped from the program.
- Any master’s student engaged in research for payment or to help meet degree requirements is required to complete Responsible Conduct of Research training. Students receiving payment from NIH training grants or fellowships must take the in person course—AS.360.625 Responsible Conduct of Research. All other students can take the course online—AS.360.624 Responsible Conduct of Research (Online). Instructions for accessing and signing up for the course can be found here: http://engineering.jhu.edu/wse-research/resources-policies-forms/responsible-conduct-of-research/online-training-course-for-the-responsible-conduct-of-research/

Additional information regarding this training can be found here: http://eng.jhu.edu/wse/page/conduct-of-research-training. Students who are required to complete this training will not receive a diploma until the course has been completed.

Tuition Support

M.S.E. students are not normally eligible for tuition waivers, but will be able to work on campus up to 19.99 hours per week for hourly rates. There are also course assistant positions available for qualified students who are seeking financial support. Those interested must apply at the start of each semester for specific courses in need.

Requirements for the Ph.D. Degree

The goal of the Doctor of Philosophy (Ph.D.) program in the Department of Computer Science is to prepare first-rate scholars in the analysis, systems, and applications areas of computer science. Successful graduates may assume significant positions in academia, research institutes, industry, or government laboratories.

Applications for admission to the Ph.D. program in Computer Science are reviewed by a faculty committee. Although the specific criteria are not rigid, all students admitted will exhibit exceptional intellectual achievements and promise. Applicants must submit letters of recommendation, GRE scores, and (for foreign applicants) TOEFL scores.

In keeping with Hopkins’ traditions, program requirements are flexible, as described below. For more detailed policies regarding the PhD program, please visit the Advising Manual (http://www.cs.jhu.edu/graduate-studies/phd-requirements) on our departmental website.

University Residency

Two consecutive semesters of residence as a full-time graduate student are required.

Seminar Attendance

All Ph.D. degree candidates are required to enroll and maintain satisfactory attendance in Computer Science Seminar 600.601-602 each semester for the duration of their enrollment in the program. Although seminar attendance is required, the seminar may not be counted toward the qualifying course requirement.

Responsible Conduct of Research

All doctoral students are required to take AS.360.625 Responsible Conduct of Research. Students are expected to complete the course by
the end of the first year but have until the start of the fourth semester to meet this requirement. Failure to do so may result in a loss of funding. Additional information regarding this requirement can be found here: http://eng.jhu.edu/wse/page/conduct-of-research-training.

Qualifying Course Requirements

The Department of Computer Science classifies its courses into three research areas: analysis, applications, and systems. All Ph.D. candidates must complete at least two graduate courses (3 class hours each) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. Ph.D. students must also complete an additional two elective graduate courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) for a total of eight graduate courses. In the Department of Computer Science, graduate courses are 600-level and above, or 400-level courses that are not offered at the 600-level. The coursework program must be approved by the student’s faculty advisor. The overall grade point average for these eight courses must be at least equivalent to a B+. No course with a grade of less than C- may be counted toward this Ph.D. qualifying course requirement. Other than independent study courses, no courses with grades of P can be counted toward the coursework requirement. Courses with grades of P will not be included in the grade point average calculation. One of the courses required for the degree, but only one, may be replaced by 3 credits from comparable short courses. With approval of the student’s faculty advisor, up to two courses can be transferred from graduate programs of other institutions; more than two such courses can be transferred with approval of the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested. Students are expected to complete the course requirements by the end of their second year as a Ph.D. candidate.

Qualifying Project Requirements

A Ph.D. student must complete two projects, each under the supervision and with the written agreement of a different faculty member in the Department of Computer Science. Upon conclusion of each project, the student must write a “Project Report” describing the project in detail. This report will be a public document and will be kept on file in the department office. The supervising faculty member must approve the project report. Students are expected to complete the qualifying projects by the end of their third year as a Ph.D. candidate.

Upon completion of the Ph.D. qualifying course requirements and the first qualifying project, students are ordinarily eligible to receive a master of science in engineering degree. The degree will be awarded upon student request.

Graduate Board Oral Examination (GBO)

This examination is a university requirement, ideally taken in the student’s third year. The oral exam is administered by a panel consisting of the research sponsor, two faculty members from the Department of Computer Science, and two from outside the department. The exam seeks to establish the student’s readiness to conduct original research in the area of his or her “Preliminary Research Proposal,” which should be distributed to the examiners in advance and presented by the student at the start of the exam.

Part-Time Ph.D.

Two consecutive semesters of residence as a full-time graduate student are required by the university. Part-time students must pass both the Ph.D. qualifying requirements and the Graduate Board oral exam within four years of being admitted to the program. Attempting to obtain a Ph.D. is a major commitment and involves close coordination with a faculty advisor in the department. Part-time students must be able to establish and maintain these close links.

Departmental Seminar

Ph.D. students must give an official departmental seminar on their research area. This is to be done after the GBO and prior to the dissertation defense, or as part of the dissertation defense.

Dissertation and Defense

Ph.D. students must write a dissertation consisting of original research in their chosen area. They must deliver a public presentation of the dissertation before a dissertation committee consisting of the faculty advisor, a second faculty member in the Department of Computer Science (who must have a primary tenure-track appointment in the Department if the advisor does not), and one or more other members with Ph.D. degrees. In conformity with University requirements, the members of the dissertation committee must submit a referee’s letter to the Graduate Board recommending that the dissertation be accepted. Completed dissertations will be formatted and submitted to the Milton S. Eisenhower Library for electronic publication (http://guides.library.jhu.edu/etd).

Teaching Requirement

Beginning in Fall 2015, all Ph.D. students are required to serve as a Teaching Assistant at least one semester during their program of study. As part of the requirement, the supervising course instructor must give the TA an opportunity to be in front of a group of students at least once during the course. Students are required to sign-up for the course EN.600.807 Teaching Practicum during the semester in which the requirement is being fulfilled, and at the end of the semester his/her performance will be evaluated by the course instructor.

Student Progress Review

Ph.D. students are reviewed annually by their advisor(s) and the department, and notified in writing as to their standing in the program. Students deemed to not be making satisfactory progress may be placed on probation.

Financial Aid

Financial aid is available for candidates of high promise. Fellowships provide a student with a stipend plus tuition. Research assistantships are available on sponsored research projects directed by members of the faculty. Teaching assistantships normally consist of tuition plus a stipend commensurate with the teaching or grading duties assigned. Students determined to have significant deficiency in spoken English may be required to take one or more semesters of English as a Second Language in order to qualify for employment as a teaching or research assistant.
For current faculty and contact information go to http://cs.jhu.edu/faculty/

**Faculty**

**Chair**

Yair Amir
Professor: distributed systems, resilient clouds and critical infrastructure, overlay networks, distributed algorithms.

**Professor Emeritus**

Gerald M. Masson
Fault tolerant computing, systems diagnosis theory, distributed computing, real-time error monitoring of hardware/software, software design for testability, interconnection networks.

**Professors**

Randal Burns
Storage systems, high performance and scientific computing, and database federations.

Jason M. Eisner
Computational linguistics (syntax and phonology), natural language processing, statistical machine learning, programming language design.

Gregory D. Hager
Vision, robotics, human-machine systems, computer-integrated medicine.

Philipp Koehn
Statistical machine translation.

S. Rao Kosaraju
Edward J. Schaefer Professor in Engineering: design of algorithms, pattern matching, and derandomization.

Nassir Navab
Augmented reality, vision, medical image computing and computer assisted interventions.

Aviel Rubin
Technical Director, Information Security Institute: system and networking security, computer privacy, applied cryptography.

Steven Salzberg
Bloomberg Distinguished Professor: genomics, bioinformatics, genome assembly, gene finding, sequence analysis algorithms.

Scott F. Smith
Programming languages, type systems, security in language design, component programming languages.

Alexander Szalay
Bloomberg Distinguished Professor: data intensive computing, theoretical astrophysics, galaxy formation.

Russell H. Taylor
John C. Malone Professor; Director, LCSR & CISST ERC: medical robotics, computer-integrated interventional medicine, medical image analysis, human-machine robotic systems.

David Yarowsky
Natural language and speech processing, information retrieval, machine translation, and machine learning.

**Associate Professor**

Michael Kazhdan
Computer graphics, surface reconstruction, image and geometry processing.

**Assistant Professors**

Yanif Ahmad
Data management, stream processing, declarative languages, parallel and distributed databases.

Raman Arora
Machine learning, statistical signal processing, stochastic approximation algorithms, applications to speech and language processing.

Alexis Battle
Genetics of complex traits, graphical models, transfer learning, structured regularization methods.

Vladimir Braverman
Algorithms, massive data sets, data streams, and database systems.

Michael Dinitz
Theoretical computer science, approximation algorithms, applications to networks and distributed computing.

Abhishek Jain
Cryptography, security, theoretical computer science.

Benjamin Langmead
Computational genomics, sequence alignment, text indexing, parallel and high performance computing.

Xin Li
Theory of computation, randomness, complexity theory, distributed computing, cryptography.

Suchi Saria
Machine learning, computational medicine, health informatics, and applications of machine learning in natural language processing, activity recognition and human-machine systems.

**Research Professors**

Amihood Amir
Algorithms design and analysis, multidimensional pattern matching, knowledge discovery algorithms, real time systems algorithms, computational molecular biology.

Bharat Doshi
Optical and wireless networking technologies, internet protocols and architectures, speech technologies and signal processing, and network design and analysis algorithms and tools.

**Associate Research Professors**

Giuseppe Ateniese
Applied cryptography, network security, and secure e-commerce.

Philippe Burlina
Computer vision, visual analysis and communications, multi-modality image exploitation, enterprise software systems for content and e-process management.

Chris Callison-Burch
Statistical natural language processing, machine translation, paraphrasing, evaluation of human language technologies.

Susan Hohenberger-Waters
Cryptography, computer security, algorithms, and complexity theory.

Peter Kazanzides
Medical robots, computer-assisted surgery, real-time systems.

James Mayfield
Information retrieval, cross-language retrieval, information extraction, natural language processing.

Andreas Terzis
P2P, overlay and sensor networks, resilient internet infrastructure, NP-based architectures.

**Assistant Research Professors**

Mark Dredze
Machine learning, natural language processing, health informatics.

Matthew Green
Applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Simon Leonard
Visual servoing, hand-eye coordination.

Christine Piatko
Computational geometry, information visualization, information retrieval.

Austin Reiter
Application of computer vision to robotics, machine vision, 3D reconstruction, image registration, visual recognition.

Benjamin Van Durme
Artificial intelligence, natural language processing (computational semantics), and streaming algorithms.

I-Jeng Wang
Wireless networking, Bayesian networks, probabilistic models.

Qinqing Zhang
Wireless communications and networking, Mobile Ad-hoc networks, cellular system and network technologies, multimedia applications and QoS, Internet protocol and algorithm design, performance analysis.

**Associate Teaching Professors**

Sara Miner More
Foundations of computing, computer science education, cryptography, information flow.

Joanne Selinski
Director of Undergraduate Studies: CS education, software engineering.

**Senior Lecturer**

Peter Fröhlich
Programming languages, software engineering, systems software, video game design, web applications.

**Part-time Lecturers**

Antonio DeSimone

Networks.

Sheela Kosaraju
Computer ethics.

Harold Lehmann
Medical informatics.

Christopher Pappacena
Cryptography.

**Visiting Professor**

Mitra Basu
Computational biology, pattern recognition, neural networks, artificial intelligence.

**Visiting Associate Professor**

H. Howie Huang
Computer systems and architecture, cloud computing, big data, high-performance computing & storage systems.

**Associate Research Scientist**

Anton Dahbura
Interim Executive Director, Information Security Institute: Information security, fault-tolerant computing, distributed systems, testing.

**Assistant Research Scientist**

Matt Post
Machine translation, syntax, parsing and language modeling.

**Adjunct Professors**

Gabor Fichtinger
Applied surgical robotics, surgical CAD/CAM systems, percutaneous therapies, stereotactic radiosurgery.

John W. Sheppard
Artificial intelligence, machine learning, data mining.

**Adjunct Assistant Professor**

Han Liu
Statistical machine learning, high dimensional nonparametric learning and massive-data analysis, multiple hypotheses testing, time series analysis, genomics, proteomics, cognitive neuroscience.

**Adjunct Associate Research Professors**

Seth Nielson
Network security.

Joshua Vogelstein
Scalable statistical inference methodologies, computational statistical methods.

Lawrence Watkins
Critical infrastructure security, network security.

**Joint Appointments**

Joel Bader
Associate Professor (Biomedical Engineering): bioinformatics and computational biology.

Emad Bector
Assistant Professor (Radiology-Medical Imaging Physics): image-guided intervention, ultrasound imaging, elasticity, and thermal imaging.

Tamas Budavari
Assistant Professor (Applied Mathematics and Statistics): computational statistics, bayesian inference, low-dimensional embeddings, streaming and randomized algorithms.

Gregory Chirikjian
Professor (Mechanical Engineering): robotics, kinematics, dynamics, control, motion planning.

Noah Cowan
Associate Professor (Mechanical Engineering): sensor-based control of locomotion and manipulation, and biologically inspired robotics.

Ralph Etienne-Cummings
Professor (Electrical and Computer Engineering): mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

James Fill
Professor (Applied Mathematics and Statistics): probability, stochastic processes, random structures, and algorithms.

Liliana Florea
Assistant Professor (McKusick-Nathans Institute for Genetic Medicine): application of computation techniques towards modeling and solving problems in biology and genetic medicine.

Rachel Karchin
Associate Professor (Biomedical Engineering): computational molecular biology, bioinformatics, genetic variation.

Sanjeev Khudanpur
Associate Professor (Electrical and Computer Engineering): information theory, statistical language modeling for speech recognition and machine translation

Elliot McVeigh
Professor (Biomedical Engineering): cardiovascular MRI, image guided therapy, novel MRI methods.

Michael I. Miller
Professor (Biomedical Engineering): image understanding, computer vision, medical imaging, computational anatomy.

Mihaela Pertea
Assistant Professor (Medicine): computational tools for RNA-seq analysis, gene finding, splice site prediction, sequence motif finding.

Carey Priebe
Professor (Applied Mathematics and Statistics): computational statistics, kernel and mixture estimates, statistical pattern recognition, and statistical image analysis.

Jerry L. Prince
William B. Kouwenhoven Professor (Electrical and Computer Engineering) (Associate Director for Research, CISST ERC): image processing, computer vision, medical imaging.

Assistant Professor (Chemical and Biomolecular Engineering): molecular programming, DNA nanotechnology, self-assembly (theory and experiment), theoretical and systems biology, smart materials, nanoscale robotics.

Ralph Semmel
Professor (Director, APL): artificial intelligence, database systems, software engineering.

Jeff Siewerdsen
Professor (Biomedical Engineering): imaging physics, diagnostic radiology, image-guided interventions.

James Taylor
Associate Professor (Biology): genome informatics.

Rene Vidal
Associate Professor (Biomedical Engineering): computer vision, machine learning, robotics, and control.

Raimond L. Winslow
Professor (Biomedical Engineering): modeling of biological systems, nonlinear systems theory, grid computing and data management, biomedical ontologies.

Thomas B. Woolf
Professor (Physiology): bioinformatics, computational biophysics.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

**EN.600.101. MATLAB for Data Analytics.**
MATLAB is a numerical-computing environment that is popular and powerful. In this course, you will learn to develop MATLAB scripts and functions to manipulate data, to visualize your results, and to share your results with others. Lecture time will be split between lecture and interactive sessions. This course is intended for students who are new to programming and numerical computing, though this is not a course on general-purpose programming.

Instructor(s): R. DiPietro
Area: Engineering.

**EN.600.103. Fundamentals of Practical Computing.**
Intended audience: students majoring in science, engineering or medicine. This course will provide a sampling of the theory behind and practical use of a broad spectrum of computational tools and technologies. We will start with Scratch (a programming language for kids) and show how many of the same concepts show up in Web Programming (HTML & Javascript). There will be a taste of algorithms, databases (SQL), Unix, statistics packages (R), data mining and visualization tools (graphviz), natural language processing, web search, interpreted languages (Python & LISP), compiled languages (C), and more. Students should come away with a few tools and concepts that will prove useful in their major, as well as the confidence that they can search the web to find what they need, when they need it, just-in-time.

Instructor(s): A. Irvine
Area: Engineering.
EN.600.104. Computer Ethics.
Students will examine a variety of topics regarding policy, legal, and moral issues related to the computer science profession itself and to the proliferation of computers in all aspects of society, especially in the era of the Internet. The course will cover various general issues related to ethical frameworks and apply those frameworks more specifically to the use of computers and the Internet. The topics will include privacy issues, computer crime, intellectual property law -- specifically copyright and patent issues, globalization, and ethical responsibilities for computer science professionals. Work in the course will consist of weekly assignments on one or more of the readings and a final paper on a topic chosen by the student and approved by the instructor. CS Majors Only - Alternate Weeks
Instructor(s): S. Kosaraju
Area: Humanities.

This course is required for all freshmen Computer Science majors. Transfers into the major and minors may enroll by permission only. Students will attend four 3-week blocks of meetings with different computer science professors, focused on a central theme. Active participation is required. Satisfactory/Unsatisfactory only.
Instructor(s): G. Hager; J. Selinski.

EN.600.106. Introductory Programming in Java.
This course introduces fundamental structured and object-oriented programming concepts and techniques, using Java, and is intended for all who plan to use computer programming in their studies and careers. Topics covered include variables, arithmetic operators, control structures, arrays, functions, recursion, dynamic memory allocation, files, class usage and class writing. Program design and testing are also covered, in addition to more advanced object-oriented concepts including inheritance and exceptions as time permits. First-time programmers are strongly advised to take EN.600.108 concurrently in Fall/Spring semesters.
Prerequisites: Students may receive credit for EN.600.107 or EN.600.112, but not both.
Instructor(s): S. More
Area: Engineering.

EN.600.107. Introduction to Programming Lab.
This course is intended for novice programmers, and must be taken in conjunction with EN.600.107. The purpose of this course is to give first-time programmers hands-on practice with guided supervision. Students will work in pairs each week to develop working programs, with checkpoints for each development phase. Must have familiarity with computers. Satisfactory/Unsatisfactory only.
Prerequisites: Coreq for EN.600.106: EN.600.107
Corequisites : Coreq: EN.600.107
Instructor(s): S. More
Area: Engineering.

EN.600.109. C++ Crash Course.
This is a crash course in C++ programming, primarily aimed at basic science students who need to use it as a tool in their field. The course will cover fundamental programming constructs in C++ including variables, decision statements and loops, along with input/output, functions, and arrays. Object oriented programming will be introduced if time permits. Students should have some prior programming experience in another language to include familiarity with variables, decisions statements and loops.
Instructor(s): O. Buzek
Area: Engineering.

EN.600.111. Python Scripting.
For non-majors, this is an introductory "learning by doing" course focused on the quick prototyping of computational solutions to problems from a variety of disciplines. After an introduction to the UNIX and IDLE environments we briefly cover the basics of programming in Python. We then spend the rest of the semester surveying a variety of powerful Python libraries, frameworks, and tools. We use these building blocks to create, for example, systems for image and sound processing, data analysis and visualization, event-based simulation, or database-driven web applications. There will be several sizeable team-based programming projects. [Note: This course may not be used for the CS major or minor requirements, except perhaps as a substitute for 600.107.]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.112. Introductory Programming for Scientists and Engineers.
An introductory "learning by doing" programming course for scientists, engineers, and everybody else who will need basic programming skills in their studies and careers. We cover the fundamentals of structured, modular, and (to some extent) object-oriented programming as well as important design principles and software development techniques such as unit testing and revision control. We will apply our shiny new programming skills by developing computational solutions to a number of real-world problems from a variety of disciplines. Students new to computer programming are encouraged to enroll into EN.600.113 IPSE Lab concurrently with this course. Students may receive credit for no more than one of the following: EN.600.107 or EN.600.111 or EN.600.112. [Note: This course may not be used for the CS major or minor requirements, except as a substitute for EN.600.107]
Prerequisites: Students who have taken EN.600.107 may not register for EN.600.112.; Students who have taken EN.600.111 may not register for EN.600.112.
Instructor(s): J. Selinski
Area: Engineering.

EN.600.113. IPSE Lab.
This course is intended for novice programmers, and must be taken in conjunction with EN.600.112. The purpose of this course is to give first-time programmers hands-on practice with guided supervision. Students may receive credit for EN.600.108 or EN.600.113, but not both. Co-requisite: EN.600.112. Satisfactory/Unsatisfactory only.
Prerequisites: Corequisite: EN.600.112; Students may receive credit for EN.600.108 or EN.600.113, but not both.
Instructor(s): J. Selinski
Area: Engineering.

EN.600.120. Intermediate Programming.
This course teaches intermediate to advanced programming, using C and C++. (Prior knowledge of these languages is not expected.) We will cover low-level programming techniques, as well as object-oriented class design, and the use of class libraries. Specific topics include pointers, dynamic memory allocation, polymorphism, overloading, inheritance, templates, collections, exceptions, and others as time permits. Students are expected to learn syntax and some language specific features independently. Course work involves significant programming projects in both languages. Recommended Course Background: AP CS, EN.600.107, EN.600.111, EN.600.112 or equivalent.
Instructor(s): B. Langmead; S. More
Area: Engineering.
EN.600.127. Fun With Haskell.
Functional programming, which emphasizes the mathematical aspects of computations, is central to many modern efforts to build fast, scalable systems. This course will provide an introduction to the (lazy) functional style of computer programming, using the increasingly-popular Haskell language. Prerequisite: 600.107 or equivalent
Instructor(s): N. Filardo.

This hands-on course will be a gentle introduction to the field of embedded computing: computer systems that interact with the real world, making possible cell phones, MP3 players, flash drives, Wii games, and many more. Students will be programming different projects in modern microcontrollers, witnessing the effects immediately. The course will address the hardware-software interface of computer systems, setting a good foundation to understand the physical layer of computer applications and networking. The main topics are computer architecture fundamentals, assembly language, interfacing peripherals, programming device drivers, working with sensors, and data acquisition. Each student will be provided with the material to perform experiments individually, as well as with learning handouts. The course will be intensive but fun. (Projected syllabus http://www.cs.jhu.edu/~jorgev/cs333/ESF.pdf)
Area: Engineering.

EN.600.134. Embedded Software Architecture.
Most efforts to improve software quality focus exclusively on process improvements, such as adoption of coding standards and better use of static analysis tools, code reviews, and testing. But poor software quality also results from bad decisions about the architecture of that software. Software architecture is a critical area for all embedded programmers to understand because of the importance of meeting real-time deadlines and ensuring safe and reliable operation. This hands-on course teaches software architecture with a focus specifically on real-time and embedded software.
Prerequisites: Intermediate Programming EN.600.120 AND Computer System Fundamentals ( EN.600.333 OR EN.600.433 )
Instructor(s): M. Barr
Area: Engineering.

This course will give an introduction to the concepts and major elements of computer-integrated surgery (CIS) through clinical applications. Students will learn to ask questions and look for answers the way clinical engineers build and analyze CIS systems. Major topics will include medical imaging, image processing, surgical planning, surgical robotics, robot navigation, systems integration, and clinical validation. No computer programming will be necessary to complete the assignments.
Instructor(s): S. Leonard
Area: Engineering.

EN.600.146. Introduction to Medical Imaging.
This intersession class will provide an introduction to medical imaging. It will cover the following imaging modalities: X-ray, computed tomography (CT), ultrasound, photoacoustic, and magnetic resonance imaging (MRI). The basic principles, instrumentation, and applications of each imaging modality will be presented. The course will include a mixture of lectures, classroom discussions, student presentations, and imaging demos using medical imaging resources at Hackerman Hall. Assignments will test theoretical knowledge and practical applications. Introductory physics, chemistry, and pre-calculus math are recommended pre-requisites. Note: Students should not expect an in depth analysis of medical imaging systems. This class is not intended as a substitute for Medical Imaging courses offered during fall and spring terms.
Instructor(s): M. Bell
Area: Engineering.

EN.600.148. Engineering How Surgeons Learn to Operate on Patients.
Can the da Vinci robot sitting in Hackerman Hall operate with/like a surgeon? Can engineers change the world, “Millions at a time”? In this course, we will consider challenges surgeons face in learning how to operate. We will explore a few different techniques that have been developed for measuring surgical skill. Students will learn how to read and discuss scientific articles, and gain perspective on how engineering solutions developed in symbiosis with surgery and data and measurement sciences can help surgeons train to provide safe and effective patient care.
Area: Natural Sciences, Quantitative and Mathematical Sciences.

EN.600.211. Unix System Programming.
This course covers a variety of topics in UNIX programming, including process control, signal handling, daemon processes, and interprocess communication. Participants must be familiar with using the UNIX environment and be fluent in the C programming language.
Prerequisites: Prereq: EN.600.120
Instructor(s): P. Froehlich
Area: Engineering.

Prereq: 600.120 This course will provide students with a modern and historical understanding of malicious software (i.e., malware) from a technical and societal perspective. The class will consist of lectures, discussion, and programming projects in which students will identify, exploit, and correct vulnerabilities that have been leveraged by malware. Due to the nature of the class projects, this course is intended for students with programming experience.
Prerequisites: EN.600.120
Instructor(s): S. Small
Area: Engineering.
EN.600.221. An Introduction to Connectomics.
This course will introduce the emerging field of connectomics, and give students the opportunity to contribute directly to ongoing research efforts within the computer science department. The field enables novel brain circuit analysis at the ultrastructure level (i.e., individual synapses and neurons) and promises insight into areas such as biofidelic algorithms and the validation of the cortical column hypothesis first proposed at JHU by Vernon Mountcastle in the 1960s. We will begin by broadly surveying the field of brain mapping across different scales, and more deeply examine research in ultrastructure electron microscopy reconstruction efforts. Students will learn about scalable algorithms and approaches to extract graphs from large image volumes (O(100 TB+)), and the importance of computer science in addressing modern neuroscience challenges. Programming experience in MATLAB, Python or R is helpful but not required.
Instructor(s): W. Gray Roncal
Area: Engineering, Natural Sciences.

EN.600.226. Data Structures.
This course covers the design and implementation of data structures including collections, sequences, trees, and graphs. Other topics include sorting, searching, and hashing. Course work involves both written homework and Java programming assignments. Recommended Course Background: AP CS, EN.600.107 or EN.600.120.
Instructor(s): G. Hager
Area: Engineering, Quantitative and Mathematical Sciences.

[Formerly EN.600.333/433] We study the design and performance of a variety of computer systems from simple 8-bit micro-controllers through 32/64-bit RISC architectures all the way to ubiquitous x86 CISC architecture. We'll start from logic gates and digital circuits before delving into arithmetic and logic units, registers, caches, memory, stacks and procedure calls, pipelined execution, super-scalar architectures, memory management units, etc. Along the way we'll study several typical instruction set architectures and review concepts such as interrupts, hardware and software exceptions, serial and other peripheral communications protocols, etc. A number of programming projects, frequently done in assembly language and using various processor simulators, round out the course. [Systems] Students may receive credit for only one of EN.600.233, EN.600.333 or EN.600.433.
Recommended Course Background: intro programming
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.243. Introduction to Hardware Hacking.
Our favorite electronic devices, such as gaming consoles and smartphones, have a common root --- hardware. These deceptively simple interconnections of electronic components perform arithmetic and logic operations that enable our devices to interact with us and extend current methods for software security, communication, and marketing. In this course, we first survey hacks (e.g., rooting) that furnish a practical understanding of the hardware/software relationship. We continue this relationship by examining the use of hardware emulation and security extensions. Lastly, we explore other niche hardware uses such as asset tracking, advertising, and authentication. Recommended Background: Intermediate Programming, Data Structures, CSF.
Area: Engineering, Quantitative and Mathematical Sciences.

This course will give an introduction to the concepts and major elements of computer-integrated surgery (CIS) and its clinical applications. Major topics will include image processing, surgical planning, surgical robotics, surgical navigation, systems integration, and clinical validation. The class may include a clinical lab module. Grades will be calculated based on participation in class and three homework assignments. No computer programming will be necessary or required to complete the assignments. Recommended Course Background: Pre-calculus, Linear Algebra and Vector Calculus.
Instructor(s): R. Kumar
Area: Engineering.

EN.600.250. User Interfaces and Mobile Applications.
This course will provide students with a rich development experience, focused on the design and implementation of user interfaces and mobile applications. A brief overview of human computer interaction will provide context for designing, prototyping and evaluating user interfaces. Students will invent their own mobile applications and implement them using the Android SDK, which is JAVA based. An overview of the Android platform and available technologies will be provided, as well as XML for layouts, and general concepts for effective mobile development. Students will be expected to explore and experiment with outside resources in order to learn technical details independently. There will also be an emphasis on building teamwork skills, and on using modern development techniques and tools.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): J. Selinski
Area: Engineering.

EN.600.255. Introduction to Video Game Design.
A broad survey course in video game design (as opposed to mathematical game theory), covering artistic, technical, as well as sociological aspects of video games. Students will learn about the history of video games, archetypal game styles, computer graphics and programming, user interface and interaction design, graphical design, spatial and object design, character animation, basic game physics, plot and character development, as well as psychological and sociological impact of games. Students will design and implement an experimental video game in interdisciplinary teams of 3-4 students as part of a semester-long project. Section 1 requires technical skills, including at least one programming course (preferably 2 or more). Section 2 requires artistic skills, including at least one multimedia course (preferably 2 or more). Open to sophomores and above.
Corequisites: Co-req: 600.256
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.256. Introduction to Video Game Design Lab.
A lab course in support of 600.255: Introduction to Video Game Design covering a variety of multi-media techniques and applications from image processing, through sound design, to 3D modeling and animation. See 600.255: Introduction to Video Game Design for details about enrolling.
Corequisites: EN.600.255
Instructor(s): P. Froehlich.
This course is an introduction to the theory of computing. Topics include design of finite state automata, pushdown automata, linear bounded automata, Turing machines and phrase structure grammars; correspondence between automata and grammars; computable functions, decidable and undecidable problems, P and NP problems, NP-completeness, and randomization. Students may not receive credit for EN.600.271 and EN.600.471 for the same degree.
Prerequisites: EN.550.171
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.306. Introduction to Speech.
This course will introduce students to speech from an interdisciplinary perspective including Computer Science, Electrical Engineering, Linguistics and Psychology. Topics such as pitch will be discussed from a variety of perspectives including signal processing (estimating fundamental frequency), perception, linguistics and computational linguistics. Vowels will be described from multiple perspectives ranging from distinctive features in linguistics to formants in signal processing. Students will become familiar with a variety of topics ranging from spectrogram reading to using XML to program phones and Python (NLTK) to find interesting patterns in text corpora. To reach a diverse interdisciplinary audience, no background experience is required. Short course.
Instructor(s): K. Church
Area: Engineering.

EN.600.311. Sparse Representation in Computer Vision.
Techniques from sparse signal representation have seen significant impact in computer vision, often on non-traditional applications where the goal is not just to obtain a compact high-fidelity representation of the observed signal, but also to extract semantic information. The choice of dictionary plays a key role in bridging this gap: unconventional dictionaries consisting of, or learned from, the training samples themselves provide the key to obtaining state-of-the-art results and to attaching semantic meaning to sparse signal representations. Understanding the good performance of such unconventional dictionaries in turn demands new algorithmic and analytical techniques. This short course highlights a few representative examples of how the interaction between sparse signal representation and computer vision can enrich both fields. Recommended Course Background: EN.600.107, AS.110.201, and EN.550.310.
Area: Engineering.

EN.600.315. Databases.
Introduction to database management systems and database design, focusing on the relational and object-oriented data models, query languages and query optimization, transaction processing, parallel and distributed databases, recovery and security issues, commercial systems and case studies, heterogeneous and multimedia databases, and data mining. [Systems] Students may receive credit for EN.600.315 or EN.600.415, but not both.
Prerequisites: Prerequisite: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.316. Database Systems.
This course serves as an introduction to the architecture and design of modern database management systems. Topics include query processing algorithms and data structures, data organization and storage, query optimization and cost modeling, transaction management and concurrency control, high-availability mechanisms, parallel and distributed databases, and a survey of modern architectures including NoSQL, column-oriented and streaming databases. Course work includes programming assignments and experimentation in a simple database framework written in Java. [Systems] Students may receive credit for EN.600.316 or EN.600.416, but not both.
Prerequisites: EN.600.120 AND EN.600.226; Students may receive credit for EN.600.316 or EN.600.416, but not both.
Instructor(s): Y. Ahmad
Area: Engineering.

This course covers fundamental topics related to operating systems theory and practice. Topics include processor management, storage management, concurrency control, multi-programming and processing, device drivers, operating system components (e.g., file system, kernel), modeling and performance measurement, protection and security, and recent innovations in operating system structure. Course work includes the implementation of operating systems techniques and routines, and critical parts of a small but functional operating system. Students may receive credit for EN.600.318 or EN.600.418 but not both. Recommended Course Background: EN.600.211
Prerequisites: Students may receive credit for EN.600.318 or EN.600.418 but not both.; Prereqs: EN.600.120 AND EN.600.226 AND (EN.600.233 OR EN.600.333)
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.320. Parallel Programming.
This course prepares the programmer to tackle the massive data sets and huge problem size of modern scientific and enterprise computing. Google and IBM have commented that undergraduate CS majors are unable to "break the single server mindset" (http://www.google.com/intl/en/press/pressrel/20071008_ibm_univ.html). Students taking this course will abandon the comfort of serial algorithmic thinking and learn to harness the power of cutting-edge software and hardware technologies. The issue of parallelism spans many architectural levels. Even "single server" systems must parallelize computation in order to exploit the inherent parallelism of recent multi-core processors. The course will examine different forms of parallelism in four sections. These are: (1) massive data-parallel computations with Hadoop; (2) programming compute clusters with MPI; (3) thread-level parallelism in Java; and, (4) GPGPU parallel programming with NVIDIA's Cuda. Each section will be approximately 3 weeks and each section will involve a programming project. The course is also suitable for undergraduate and graduate students from other science and engineering disciplines that have prior programming experience. [Systems] Students may receive credit for EN.600.320 or EN.600.420, but not both. Recommended Course Background: EN.600.233
Prerequisites: Prereq: EN.600.120 and EN.600.226; recommended 600.333/433
Instructor(s): R. Burns
Area: Engineering.
EN.600.321. Object Oriented Software Engineering.
This course covers object-oriented software construction methodologies and their application. The main component of the course is a large team project on a topic of your choosing. Course topics covered include object-oriented analysis and design, UML, design patterns, refactoring, program testing, code repositories, team programming, and code reviews. [Systems or Applications] (http://pl.cs.jhu.edu/oose/index.shtml) Students may receive credit for EN.600.321 or EN.600.421, but not both.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): S. Smith
Area: Engineering.

Data-Intensive Computing is an experiential education course in computing with massive data sets that covers the software, algorithms, and systems used to ingest, store, and analyze. Specific topics include: NoSQL software systems including key/value stores and graph databases, scientific python, array databases, (semi)-external memory array and graph algorithms, extract-transform-load (ETL) processing, spatial indexing, OpenCL GPU code acceleration, and performance management of clusters. The course will utilize the unique computing resources at JHU, including the DataScope (5PB of storage), the GPU cluster (110 TFlops), and the Homewood High Performance Computing Cluster (1600 cores). The entire course will take place in several lengthy lab sessions each week. Course time will be divided roughly into team projects (30%), ad-hoc tasks (50%), presentation (10%) and using collaboration tools for concurrent reading and authoring and interactive self-assessment. [Systems]
Prerequisites: EN.600.320 OR EN.600.420
Instructor(s): R. Burns
Area: Engineering.

EN.600.325. Declarative Methods.
Suppose you could simply write down a description of your problem, and let the computer figure out how to solve it. What notation could you use? What strategy should the computer then use? In this survey class, you'll learn to recognize when your problem is an instance of satisfiability, constraint programming, logic programming, dynamic programming, or mathematical programming (e.g., integer linear programming). For each of these related paradigms, you'll learn to reformulate hard problems in the required notation and apply off-the-shelf software that can solve any problem in that notation -- including NP-complete problems and many of the problems you'll see in other courses and in the real world. You'll also gain some understanding of the general-purpose algorithms that power the software. [Analysis]
Prerequisites: EN.600.325 or EN.600.425, not both.
Instructor(s): J. Eisner
Area: Engineering.

EN.600.328. Compilers and Interpreters.
Introduction to compiler design, including lexical analysis, parsing, syntax-directed translation, symbol tables, run-time environments, and code generation and optimization. Students are required to write a compiler as a course project.[Systems] Co-listed with EN.600.428
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.335. Artificial Intelligence.
The course situates the study of Artificial Intelligence (AI) first in the broader context of Philosophy of Mind and Cognitive Psychology and then treats in-depth methods for automated reasoning, automatic problem solvers and planners, knowledge representation mechanisms, game playing, machine learning, and statistical pattern recognition. The class is recommended for all scientists and engineers with a genuine curiosity about the fundamental obstacles to getting machines to perform tasks such as deduction, learning, and planning and navigation. Strong programming skills and a good grasp of the English language are expected; students will be asked to complete both programming assignments and writing assignments. The course will include a brief introduction to scientific writing and experimental design, including assignments to apply these concepts. [Applications] Prerequisites: EN.600.226, 550.171; Recommended: linear algebra, prob/stat. Students can only receive credit for EN.600.335 or EN.600.435, not both.
Prerequisites: EN.600.226(C) AND EN.550.171(C)
Instructor(s): P. Koehn
Area: Engineering.

This is an introductory course presenting a series of algorithms related to the representation and use of geometric models acquired from sensor data. Course topics include: basic sensing and estimation techniques, geometric model representations, and motion planning algorithms. The course will also discuss applications in diverse areas such as mobile systems, robot manipulation, and medicine. Students may receive credit for EN.600.336 or EN.600.436, but not both.
Recommended Course Background: AS.110.106, probability/statistics.
Prerequisites: EN.600.226(C)
Instructor(s): G. Hager
Area: Engineering.

EN.600.337. Distributed Systems.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently in a consistent manner over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. [Systems]. Students may receive credit for EN.600.337 or EN.600.437 but not both.
Instructor(s): Y. Amir
Area: Engineering.

EN.600.340. Introduction to Genomic Research.
This course will use a project-based approach to introduce undergraduates to research in computational biology and genomics. During the semester, students will take a series of large data sets, all derived from recent research, and learn all the computational steps required to convert raw data into a polished analysis. Data challenges might include the DNA sequences from a bacterial genome project, the RNA sequences from an experiment to measure gene expression, the DNA from a human microbiome sequencing experiment, and others. Topics may vary from year to year. In addition to computational data analysis, students will learn to do critical reading of the scientific literature by reading high-profile research papers that generated groundbreaking or controversial results. [Applications]
Recommended Course Background: Knowledge of the Unix operating system and programming expertise in a language such as Perl or Python.
Instructor(s): S. Salzberg
Area: Engineering.
Topics covered will include application layer protocols (e.g., HTTP, FTP, SMTP), transport layer protocols (UDP, TCP), network layer protocols (e.g., IP, ICMP), link layer protocols (e.g., Ethernet) and wireless protocols (e.g., IEEE 802.11). The course will also cover routing protocols such as link state and distance vector, multicast routing, and path vector protocols (e.g., BGP). The class will examine security issues such as firewalls and denial of service attacks. We will also study DNS, NAT, Web caching and CDNs, peer to peer, and protocol tunneling. Finally, we will explore security protocols (e.g., TLS, SSH, IPsec), as well as some basic cryptography necessary to understand these. Grading will be based on hands-on programming assignments, homeworks and two exams. [Systems] Students can only receive credit for EN.600.344 or EN.600.444, not both.
Prerequisites: Prereqs for EN.600.344: EN.600.233/333/433 or permission. Students can only receive credit for EN.600.344 or EN.600.444, not both
Instructor(s): A. DeSimone
Area: Engineering.

EN.600.355. Video Game Design Project.
An intensive capstone design project experience in video game development. Students will work in groups of 4-8 on developing a complete video game of publishable quality. Teams will (hopefully) include programmers, visual artists, composers, and writers. Students will be mentored by experts from industry and academia. Aside from the project itself, project management and communication skills will be emphasized. Enrollment is limited to ensure parity between the various disciplines. [General] May involve travel to MICA. Junior or senior standing recommended.
Prerequisites: EN.600.255 and EN.600.256 or permission of instructor
Instructor(s): P. Froehlich
Area: Engineering.

This course introduces computer graphics techniques and applications, including image processing, rendering, modeling and animation. [Applications] Students may receive credit for EN.600.357 or EN.600.457, but not both. No Audits.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.363. Introduction To Algorithms.
This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis. [Analysis] Students may receive credit for EN.600.363 or EN.600.463, but not both.
Prerequisites: EN.600.226 and EN.550.171 or permission
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.371. Software Tools Practicum.
This course will survey the wide range of tools, frameworks and packages that form a foundation for much of the modern Internet. Each week, a group of students will present a particular software package to the class, exploring the architectural, historical and competitive aspects. The weekly lab work and assignments will focus on testing the software and understanding its contributions to providing the services that support the Internet. The software will be chosen from a list of popular packages like Hudson, Drupal, Docker, WordPress, Node.js, jQuery, Django, Ruby on Rails, Git, Coffeescript, Ember, Angular, MongoDB, Couch, and others. Students will select one package and work with others to explore the packages, learn how they work and then summarize this knowledge by creating a presentation for the class. [General] CS majors only.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): P. Wayner
Area: Engineering.

EN.600.384. Augmented Reality.
Undergraduate level version of EN.600.684. Students may take EN.600.384 or EN.600.684, but not both.
Prerequisites: Students may take EN.600.384 or EN.600.684, but not both.; EN.600.120 AND EN.600.226 AND AS.110.201
Linear Algebra
Instructor(s): N. Navab
Area: Engineering.

EN.600.392. CS Design Project.
This course will give junior and senior CS majors an intensive design project experience. Students will work in groups with real world customers to develop a working system. Project design, management and communication skills will be emphasized. Software development methodologies may also be presented. Recommended Course Background: EN.600.321
Prerequisites: EN.600.120 AND EN.600.226; Recommended 600.321
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.402. Digital Health and Biomedical Informatics.
Advances in technology are driving a change in medicine, from personalized medicine to population health. Computers and information technology will be critical to this transition. We shall discuss some of the coming changes in terms of computer technology, including computer-based patient records, clinical practice guidelines, and region-wide health information exchanges. We will discuss the underlying technologies driving these developments - databases and warehouses, controlled vocabularies, and decision support.
Instructor(s): H. Lehmann
Area: Engineering.

EN.600.411. Computer Science Innovation & Entrepreneurship II.
This course is the second half of a two-course sequence and is a continuation of course EN.600.410.01, CS Innovation and Entrepreneurship, offered by the Center for Leadership Education (CLE). In this sequel course the student groups, directed by CS faculty, will implement the business idea which was developed in the first course and will present the implementations and business plans to an outside panel made up of practitioners, industry representatives, and venture capitalists. [General]
Prerequisites: EN.660.410 AND ( EN.600.321 OR EN.600.421)
Instructor(s): A. Dahbura; L. Aronhime
Area: Engineering.
EN.600.415. Databases.
Graduate level version of EN.600.315 [Systems]. Students may receive credit for EN.600.315 or EN.600.415, but not both. Recommended Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

Similar material as EN.600.316, covered in more depth. Intended for upper-level undergraduates and graduate students. Students may receive credit for EN.600.316 or EN.600.416, but not both. Recommended Course Background: EN.600.120 and EN.600.226
Prerequisites: Students may receive credit for EN.600.316 or EN.600.416, but not both.
Instructor(s): Y. Ahmad
Area: Engineering.

EN.600.418. Operating Systems.
Similar material as EN.600.318, covered in more depth. Intended for upper-level undergraduates and graduate students. Students may receive credit for EN.600.318 or EN.600.418, but not both. [Systems]
Prerequisites: Students may receive credit for EN.600.318 or EN.600.418, but not both.
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.420. Parallel Programming.
Graduate level version of EN.600.320. Students may receive credit for EN.600.320 or EN.600.420, but not both. Recommended Course Background: EN.600.120 or equivalent.
Instructor(s): R. Burns
Area: Engineering.

EN.600.421. Object Oriented Software Engineering.
Graduate level version of EN.600.321 [Systems or Applications]. Students may receive credit for EN.600.321 or EN.600.421, but not both. Recommended Course Background: EN.600.226 and EN.600.120
Instructor(s): S. Smith
Area: Engineering.

Graduate student version of EN.600.323. [Systems] Students may receive credit for EN.600.323 or EN.600.423, but not both.
Prerequisites: EN.600.320 OR EN.600.420
Instructor(s): R. Burns
Area: Engineering.

This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] EN.600.120 (or equivalent) recommended. Recommended Course Background: 600.120, 600.226, 600.344, 600.444 or permission.
Prerequisites: 600.226 and (600.344 or 600.444) or permission; 600.120 (or equivalent) recommended.
Instructor(s): S. Nielson
Area: Engineering.

Students can only receive credit for EN.600.325 or EN.600.425, not both. Graduate level version of EN.600.325. Recommended Course Background: EN.600.226, EN.600.271, AS.110.107/AS.110.109
Instructor(s): J. Eisner
Area: Engineering.

EN.600.426. Principles of Programming Languages.
Functional, object-oriented, and other language features are studied independent of a particular programming language. Students become familiar with these features by implementing them. Most of the implementations are in the form of small language interpreters. Some type checkers and a small compiler will also be written. The total amount of code written will not be overly large, as the emphasis is on concepts. The ML programming language is the implementation language used. [Analysis] Requistes include 600.226. No Freshmen or Sophomores.
Instructor(s): S. Smith
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.428. Compilers & Interpreters.
Introduction to compiler design, including lexical analysis, parsing, syntax-directed translation, symbol tables, run-time environments, and code generation and optimization. Students are required to write a compiler as a course project. Co-listed with EN.600.328. Students should have knowledge of C/C++ programming and data structures. Graduate version of EN.600.328. Students may receive credit for EN.600.328 or EN.600.428, but not both.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.429. Functional Programming at Work - Haskell and Domain-Specific Languages.
This course studies pure functional programming in the Haskell language and the use of functional programming to build domain specific languages (DSLs): customized, application specific programming languages. This course starts with an introduction to Haskell and its essential ideas of lazy evaluation and type inference. Advanced functional programming topics will include type classes, monads and monad transformers, arrows, templates, dependent types, parser combinators, and multiple parameter type classes. The class will study existing DSLs and DSL implementation techniques, including languages for reactive programming, computer vision, hardware design, computer music, and parallel processing. Students will implement a DSL of their choice in Haskell.
Instructor(s): J. Peterson
Area: Engineering.
EN.600.430. Ontologies and Knowledge Representation. Knowledge representation (KR) deals with the possible structures by which the content of what is known can be formally represented in such a way that queries can be posed and inferences drawn. Ontology concerns the hierarchi- cal classification of entities from given domains of knowledge together with the relations between various classes or subclasses. We begin with KR, examining the standard variety of frameworks developed or implemented over the last twenty years, including 1st-order logic and automated theorem proving, networks, frames, and description logics. Then we move on to a study of the problems inherent in ontology development and examine the some of the currently prevalent environments, including Universal Modeling Language, OWL and Protege’, RDFS and semantic web applications. [Analysis] Recommended Course Background: EN.600.107 and EN.600.271
Instructor(s): R. Rynasiewicz
Area: Humanities, Quantitative and Mathematical Sciences.

EN.600.433. Computer Systems. Graduate version of 600.333. Students may receive credit for 600.333 or 600.433, but not both. [Systems]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.435. Artificial Intelligence. Students may receive credit for EN.600.335 or EN.600.435, not both. Graduate level version of 600.335 [Applications]. Prerequisite: EN.600.226, EN.550.171; Recommended: linear algebra, prob/stat.
Instructor(s): P. Koehn
Area: Engineering.

EN.600.436. Algorithms for Sensor-Based Robotics. This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis] Formerly EN.600.336. Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Prerequisites: EN.600.226 and Linear Algebra and Probability; Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): S. Leonard
Area: Engineering.

EN.600.437. Distributed Systems. Graduate version of 600.337 Systems. Students may receive credit for 600.337 or 600.437 but not both. Recommended Course Background: EN.600.120, EN.600.226
Instructor(s): Y. Amir
Area: Engineering.

EN.600.438. Computational Genomics: Data Analysis. Genomic data has the potential to reveal causes of disease, novel drug targets, and relationships among genes and pathways in our cells. However, identifying meaningful patterns from high-dimensional genomic data has required development of new computational tools. This course will cover current approaches in computational analysis of genomic data with a focus on statistical methods and machine learning. Topics will include disease association, prediction tasks, clustering and dimensionality reduction, data integration, and network reconstruction. There will be some programming and a project component. [Applications] Recommended Course Background: EN.600.226 or other programming experience, probability and statistics, linear algebra or calculus. Students may receive credit for EN.600.438 or EN.600.638, but not both.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.]
Instructor(s): A. Battle
Area: Engineering.

EN.600.439. Computational Genomics. Your genome is the blueprint for the molecules in your body. It’s also a string of letters (A, C, G and T) about 3 billion letters long. How does this string give rise to you? Your heart, your brain, your health? This, broadly speaking, is what genomics research is about. This course will familiarize you with a breadth of topics from the field of computational genomics. The emphasis is on current research problems, real-world genomics data, and efficient software implementations for analyzing data. Topics will include: string matching, sequence alignment and indexing, assembly, and sequence models. Course will involve significant programming projects. [Applications]
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): B. Langmead
Area: Engineering.

EN.600.441. Machine Learning for Genomic Data - Trends and Applications. Genomic data is becoming available in large quantities, but understanding how genetics contributes to human disease and other traits remains a major challenge. Machine learning approaches allow us to automatically analyze and combine genomic data, build predictive models, and identify genetic elements important to disease and cellular processes. This course will cover uses of machine learning in diverse genomic applications. Students will present and discuss current literature. Topics include predicting disease risk from genomic data, integrating diverse genomic data types, gene network reconstruction, and other topics guided by student interest. The course will include a project component with the opportunity to explore publicly available genomic data. Recommended course background: coursework in data mining, machine learning. [Applications] Students may receive credit for 600.441 or 600.641, but not both.
Prerequisites: Students may receive credit for 600.441 or 600.641, but not both.
Instructor(s): A. Battle
Area: Engineering.
EN.600.442. Modern Cryptography.
This course focuses on cryptographic algorithms, formal definitions, hardness assumptions, and proofs of security. Topics include number-theoretic problems, pseudo-randomness, block and stream ciphers, public-key cryptography, message authentication codes, and digital signatures. Recommended Course Background: EN.600.226 and a 300-level or above systems course; EN.600.271/EN.600.471 and EN.550.171 or equivalent.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

Lecture topics will include computer security, network security, basic cryptography, system design methodology, and privacy. There will be a heavy work load, including written homework, programming assignments, exams and a comprehensive final. The class will also include a semester-long project that will be done in teams and will include a presentation by each group to the class. [Applications] Recommended Course Background: A basic course in operating systems and networking, or permission of instructor.
Instructor(s): M. Green
Area: Engineering.

EN.600.444. Computer Networks.
This course considers intersystem communications issues. Topics covered include layered network architectures; the OSI model; bandwidth, data rates, modems, multiplexing, error detection/correction; switching; queuing models, circuit switching, packet switching; performance analysis of protocols, local area networks; and congestion control. Recommended Course Background: EN.600.120 and EN.600.233. Students can only receive credit for EN.600.344 or EN.600.444, not both.
Prerequisites: Students can only receive credit for EN.600.344 or EN.600.444, not both.
Instructor(s): A. Rubin
Area: Engineering.

This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Required Course Background: AS.110.201 or permission of instructor. Recommended Course Background: EN.600.120, EN.600.457, EN.600.461, image processing.
Prerequisites: EN.600.226
Instructor(s): R. Taylor
Area: Engineering.

EN.600.446. Computer Integrated Surgery II.
This weekly lecture/seminar course addresses similar material to EN.600.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.600.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. Students may also take this course as EN.600.646. The only difference between EN.600.446 and EN.600.646 is the level of project undertaken. Typically, EN.600.646 projects require a greater degree of mathematical, image processing, or modeling background. Prospective students should consult with the instructor as to which course number is appropriate. [Applications] Students may receive credit for EN.600.446 or EN.600.646, but not both.
Prerequisites: Prereq for EN.600.446: EN.600.445 or EN.600.645 or permission
Instructor(s): R. Taylor
Area: Engineering.

This course is an introduction to fundamental concepts of networked embedded systems and wireless sensor networks. It is intended for juniors, seniors and first year graduate students in Computer Science and other engineering majors with the prerequisite background. Covered topics include: embedded systems programming concepts, low power and power aware design, radio technologies, communication protocols for ubiquitous computing systems, and some of the mathematical foundation of sensor behavior. Laboratory work consists of a set of programming assignments that consider a set of the issues described in class. Recommended Course Background: EN.600.226, EN.600.120, and EN.600.344/EN.600.444
Instructor(s): M. Chang
Area: Engineering.

EN.600.451. Introduction to Bitcoin and Other Cryptocurrencies.
This course covers the basics of Bitcoin and the underlying technologies driving it. The course is intended for students interested in the cryptographic techniques devised to make digital currencies and payment systems secure. Topics include Bitcoin transactions, the blockchain, mining, and decentralized consensus. The course will include a brief introduction to public-key cryptography, digital signatures, hash functions, proof of work/space, multisignatures, and elliptic curve cryptography. The course concludes with an overview of the Bitcoin scripting language and Bitcoin 2.0 platforms. [Systems] Recommended Course Background: EN.600.344/444 (Computer Networks) and EN.550.171 (Discrete Math)
Prerequisites: EN.600.226
Instructor(s): G. Ateniese
Area: Engineering.

EN.600.452. Seminar: Computer Integrated Surgery II.
Students may receive credit for EN.600.446 or EN.600.452, but not both. Lecture only version of EN.600.446 (no project). Recommended Course Background: EN.600.445 or instructor permission required.
Instructor(s): R. Taylor
Area: Engineering.
EN.600.454. Practical Cryptographic Systems.
This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems]
Instructor(s): M. Green
Area: Engineering.

Graduate level version of EN.600.357. Students may receive credit for EN.600.357 or EN.600.457, but not both. Recommended Course Background: EN.600.120, EN.600.226, AS.110.201 or instructor permission.
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.459. Computational Geometry.
This course will provide an introduction to computational geometry. It will cover a number of topics in two- and three-dimensions, including polygon triangulations and partitions, convex hulls, Delaunay and Voronoi diagrams, arrangements, and spatial queries. Time-permitting, we will also look at KD-trees, general BSP-trees, and quadtrees. [Analysis] Recommended Course Background: EN.600.120 AND EN.600.226 AND (EN.600.363 OR EN.600.463).
Prerequisites: Students may receive credit for EN.600.459 or EN.600.659, but not both.
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.460. Software Vulnerability Analysis.
This course will examine vulnerabilities in C source, stack overflows, writing shell code, etc. Also, vulnerabilities in web applications: SQL injection, cookies, as well as vulnerabilities in C binary fuzzing, and exploit development without source among other topics. Co-listed with EN.650.460
Instructor(s): S. Checkoway
Area: Engineering.

EN.600.461. Computer Vision.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modelling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. Students may receive credit for at most one of EN.600.361 or EN.600.461 or EN.600.661. [Applications] Prerequisites (soft): intro programming, linear algebra, and prob/stat.
Prerequisites: If you have completed EN.600.361 OR EN.600.661 you cannot enroll in EN.600.461.
Instructor(s): A. Reiter
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.463. Algorithms I.
Graduate version of EN.600.363. Students may receive credit for EN.600.363 or EN.600.463, but not both. Recommended Course Background: EN.600.226 and EN.550.171 or instructor permission required.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.464. Randomized and Big Data Algorithms.
The course emphasizes algorithmic design aspects, and how randomization can be a helpful tool. The topics covered include: tail inequalities, linear programming relaxation & randomized rounding, de-randomization, existence proofs, universal hashing, markov chains, metropolis and metropolis-hastings methods, mixing by coupling and by eigenvalues, counting problems, semi-definite programming and rounding, lower bound arguments, and applications of expanders. [Analysis] (www.cs.jhu.edu/~cs464) Recommended Course Background: EN.600.363 or EN.600.463.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.465. Natural Language Processing.
This course is an in-depth overview of techniques for processing human language. How should linguistic structure and meaning be represented? What algorithms can recover them from text? And crucially, how can we build statistical models to choose among the many legal answers? The course covers methods for trees (parsing and semantic interpretation), sequences (finite-state transduction such as morphology), and words (sense and phrase induction), with applications to practical engineering tasks such as information retrieval and extraction, text classification, part-of-speech tagging, speech recognition and machine translation. There are a number of structured but challenging programming assignments. [Applications] Recommended Course Background: EN.600.226
Instructor(s): J. Eisner
Area: Engineering.

EN.600.466. Information Retrieval and Web Agents.
An in-depth, hands-on study of current information retrieval techniques and their application to developing intelligent WWW agents. Topics include a comprehensive study of current document retrieval models, mail/news routing and filtering, document clustering, automatic indexing, query expansion, relevance feedback, user modeling, information visualization and usage pattern analysis. In addition, the course explores the range of additional language processing steps useful for template filling and information extraction from retrieved documents, focusing on recent, primarily statistical methods. The course concludes with a study of current issues in information retrieval and data mining on the World Wide Web. Topics include web robots, spiders, agents and search engines, exploring both their practical implementation and the economic and legal issues surrounding their use. Recommended Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.467. Wireless Networks.
This course covers the basics of mobile communication and wireless networking for computer science majors by keeping a balance between communication and networking topics. In this course the students will be exposed to wireless transmission fundamentals (path loss, shadowing, modulation, coding and channel models), wireless cellular networks (cellular concept, channel reuse, capacity limits, and cellular systems such as GSM, GPRS and UMTS), and learn about mobile network and transport layers, medium access control protocols, wireless local area networks (IEEE 802.11), wireless mesh networks (IEEE 802.16), and emerging dynamic spectrum access networks based on cognitive radios. Recommended Course Background: EN.600.344/EN.600.444 or equivalent.
Prerequisites: EN.600.344 OR EN.600.444 or equivalent
Instructor(s): A. Mishra
Area: Engineering.
Google translate can instantly translate between any pair of over fifty human languages (for instance, from French to English). How does it do that? Why does it make the errors that it does? And how can you build something better? Modern translation systems learn to translate by reading millions of words of already translated text, and this course will show you how they work. The course covers a diverse set of fundamental building blocks from linguistics, machine learning, algorithms, data structures, and formal language theory, along with their application to a real and difficult problem in artificial intelligence.
Recommended Course Background: prob/stat, EN.600.226; EN.600.465
Instructor(s): P. Koehn
Area: Engineering.

EN.600.469. Approximation Algorithms.
This course provides an introduction to approximation algorithms. Topics include vertex cover, TSP, Steiner trees, cuts, greedy approach, linear and semi-definite programming, primal-dual method, and randomization. Additional topics will be covered as time permits. There will be a final project. Students may receive credit for EN.600.469 or EN.600.669, but not both. [Analysis]
Prerequisites: EN.600.363 OR EN.600.463 OR permission of instructor.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.470. Combinatorics & Graph Theory in Computer Science.
This is a graduate level course studying the applications of combinatorics and graph theory in computer science. We will start with some basic combinatorial techniques such as counting and pigeon hole principle, and then move to advanced techniques such as the probabilistic method, spectral graph theory and additive combinatorics. We shall see their applications in various areas in computer science, such as proving lower bounds in computational models, randomized algorithms, coding theory and pseudorandomness.[Analysis] Recommended Course Background: probability theory and linear algebra
Prerequisites: EN.550.171
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.

This is a graduate-level course studying the theoretical foundations of computer science. Topics covered will be models of computation from automata to Turing machines, computability, complexity theory, randomized algorithms, inapproximability, interactive proof systems and probabilistically checkable proofs. Students may not take both EN.600.271 and EN.600.471, unless one is for an undergrad degree and the other for grad. [Analysis]Recommended Course Background: EN.550.171 or instructor permission.
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.473. Algorithmic Game Theory.
This course provides an introduction to algorithmic game theory: the study of games from the perspective of algorithms and theoretical computer science. There will be a particular focus on games that arise naturally from economic interactions involving computer systems (such as economic interactions between large-scale networks, online advertising markets, etc.), but there will also be broad coverage of games and mechanisms of all sorts. Topics covered will include a) complexity of computing equilibria and algorithms for doing so, b) (in)efficiency of equilibria, and c) algorithmic mechanism design. [Analysis] Students may receive credit for EN.600.473 or EN.600.673, but not both.
Prerequisites: EN.600.363 OR EN.600.463 OR EN.600.673, but not both.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

This course takes an application driven approach to current topics in machine learning. The course covers supervised learning (classification/structured prediction/regression/ranking), unsupervised learning (dimensionality reduction, bayesian modeling, clustering) and semi-supervised learning. Additional topics may include reinforcement learning and learning theory. The course will also consider challenges resulting from learning applications, such as transfer learning, multitask learning and large datasets. We will cover popular algorithms (naive Bayes, SVM, perceptron, HMM, winnow, LDA, k-means, maximum entropy) and will focus on how statistical learning algorithms are applied to real world applications. Students in the course will implement several learning algorithms and develop a learning system for a final project. [Applications] Recommended Course Background: multivariate calculus.
Instructor(s): I. Shpitser
Area: Engineering.

How can robots localize themselves in an environment when navigating? Can we predict which patients are at greatest-risk for complications in the hospital? Which movie should I recommend to this user given his history of likes? Many such big data questions can be answered using the paradigm of probabilistic models in machine learning. These are especially useful when common off-the-shelf algorithms such as support vector machines and k-means fail. You will learn methods for clustering, classification, structured prediction, recommendation and inference. We will use Murphy’s book, Machine Learning: A Probabilistic Perspective, as the text for this course. Assignments are solved in groups of size 1-3 students. The class will have 4 interactive sessions during which we brainstorm how to solve example open-ended real-world problems with the tools learnt in class. Students are also required to do a project of their choice within which they experiment with the ideas learnt in class. [Analysis or Applications] Students may receive credit for EN.600.476 or EN.600.676, but not both. Requisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria
Area: Engineering, Quantitative and Mathematical Sciences.
EN.600.479. Representation Learning.
Often the success of a machine learning project depends on the choice of features used. Machine learning has made great progress in training classification, regression and recognition systems when "good" representations, or features, of input data are available. However, much human effort is spent on designing good features which are usually knowledge-based and engineered by domain experts over years of trial and error. A natural question to ask then is "Can we automate the learning of useful features from raw data?" Representation learning algorithms such as principal component analysis aim at discovering better representations of inputs by learning transformations of data that disentangle factors of variation in data while retaining most of the information. The success of such data-driven approaches to feature learning depends not only on how much data we can process but also on how well the features that we learn correlate with the underlying unknown labels (semantic content in the data). This course will focus on scalable machine learning approaches for learning representations from large amounts of unlabeled, multi-modal, and heterogeneous data. We will cover topics including deep learning, multi-view learning, dimensionality reduction, similarity-based learning, and spectral learning. Students may receive credit for 600.479 or 600.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra.
Prerequisites: If you have completed EN.600.679 you may not enroll in EN.600.479.
Instructor(s): R. Arora
Area: Engineering.

EN.600.488. Foundations of Computational Biology & Bioinformatics II.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Foundations of Computational Biology I is not a prereq. [Analysis or Applications] Co-listed with EN.580.488. Recommended Course Background: math through linear algebra and differential equations, at least one prob/stat course, EN.580.221 or equivalent, EN.600.226 or equivalent.
Instructor(s): R. Karchin
Area: Engineering, Natural Sciences.

EN.600.491. Computer Science Workshop I.
An applications-oriented, computer science project done under the supervision and with the sponsorship of a faculty member in the Department of Computer Science. Computer Science Workshop provides a student with an opportunity to apply theory and concepts of computer science to a significant project of mutual interest to the student and a Computer Science faculty member.Permission to enroll in CSW is granted by the faculty sponsor after his/her approval of a project proposal from the student. Interested students are advised to consult with Computer Science faculty members before preparing a Computer Science Workshop project proposal.
Instructor(s): D. Yarowsky; J. Selinski; P. Froehlich; S. Smith; Staff
Area: Engineering.

EN.600.503. Independent Study.
Individual guided study for undergraduate students under the direction of a faculty member in the department. The program of study, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.600.504. Undergraduate Independent Study.
For undergraduate students. Permission of faculty sponsor is required.
Instructor(s): Staff.

EN.600.507. Independent Research.
Individual research for undergraduates under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.600.508. Undergraduate Research.
Permission of faculty sponsor is required.
Instructor(s): Staff.

EN.600.509. Computer Science Internship.
Individual work in the field with a learning component, supervised by a faculty member in the department. The program of study and credit assigned must be worked out in advance between the student and the faculty member involved. Students may not receive credit for work that they are paid to do. As a rule of thumb, 40 hours of work is equivalent to one credit. Permission required.
Instructor(s): Staff.

EN.600.510. Computer Science Internship.
Individual work in the field with a learning component, supervised by a faculty member in the department. The program of study must be worked out in advance between the student and the faculty member involved. Students may not receive credit for work that they are paid to do. As a rule of thumb, 40 hours of work is equivalent to one credit, which is the limit per semester. Permission of faculty sponsor is required.
Instructor(s): Staff.

EN.600.519. Senior Honors Thesis.
The student will undertake a substantial independent research project under the supervision of a faculty member, potentially leading to the notation “Departmental Honors with Thesis” on the final transcript. Students are expected to enroll in both semesters of this course during their senior year. Project proposals must be submitted and accepted in the preceding spring semester (junior year) before registration. Students will present their work publicly before April 1st of senior year. They will also submit a first draft of their project report (thesis document) at that time. Faculty will meet to decide if the thesis will be accepted for honors. Computer science majors only. Students should have a 3.5 GPA in computer science courses at the end of their junior year and permission of faculty sponsor. See EN.600.491 for faculty section numbers.
Instructor(s): Staff.

EN.600.520. Senior Honors Thesis.
For computer science majors only, a continuation of EN.600.519. Recommended Course Background: EN.600.519
Instructor(s): Staff.

EN.600.546. Senior Thesis in CIS.
Prerequisites: EN.600.445 or perm req’d.
Instructor(s): R. Taylor
Area: Engineering.
EN.600.550. Internship.
Instructor(s): S. Smith; Staff.

EN.600.574. Research-Intersession.
EN.600.576. Independent Study.
Instructor(s): S. Smith.

EN.600.578. Computer Science Internship.
Instructor(s): J. Selinski.

EN.600.592. Computer Science Workshop II.
Permission of faculty sponsor is required.
Instructor(s): D. Yarowsky; J. Selinski; P. Froehlich; S. Smith
Area: Engineering.

EN.600.595. Independent Study-Summer.
Instructor(s): Staff.

EN.600.597. Research-Summer.
Instructor(s): Staff.

EN.600.599. Internship.
Instructor(s): Staff.

Required for all full-time CS PhD students. Recommended for MSE
students.
Instructor(s): S. Smith.

Required for all CS PhD students. Strongly recommended for MSE
students.
Instructor(s): S. Smith.

EN.600.615. Big Data, Small Languages, Scalable Systems.
This class will study domain-specific data management tools, focusing
on extremely scalable system design based on the domain's semantic
and structural properties. We will study a variety of data models
including stream, graph, array and probabilistic data, and their
processing on modern architectures such as column- and key-value
stores, stream and XQuery engines. Further topics include the use of
novel hardware such as solid state disks, phase change memory, GPUs,
and FPGAs. The class includes a semester long group project to develop
a query processor for an application of the group's choice (e.g. on
system log, finance, web, sensor, speech data). Recommended Course
Background: EN.600.315/EN.600.415 or equivalent.
Instructor(s): Y. Ahmad.

The advent of cloud computing has lead to an explosion of storage
system and data analysis software, including NoSQL databases,
bulk-synchronous processing, graph computing engines, and stream
processing. This course will explore scale-out software architectures
for data-processing tasks. It will examine the algorithms and data-
structures that underlie scalable systems and look at how hardware
and networking trends influence the design and deployment of cloud
computing. Recommended Course Background: EN.600.320/420 or
permission of instructor. [Systems]
Instructor(s): R. Burns.

EN.600.625. Events Semantics in Theory and Practice.
This course explores selected topics in the nature of event
representations from the perspective of cognitive science, computer
science, linguistics, and philosophy. These fields have developed a
rich array of scientific theories about the representation of events, and
how humans make inferences about them -- we investigate how (and
if) such theories could be applied to current research topics and tasks
in computational semantics such as inference from text, automated
summarization, veridicality assessment, and so on. In addition to classic
articles dealing with formal semantic theories, the course considers
available machine-readable corpora, ontologies, and related resources
that bear on event structure, such as WordNet, PropBank, FrameNet,
etc.. The course is aimed to marry theory with practice: students with
either a computational or linguistic background are encouraged to
participate. [Applications]
Instructor(s): B. Van Durme; K. Rawlins.

Graduate level version of EN.600.436 (see description above). Formerly
EN.600.436. Students may receive credit for only one of EN.600.336,
EN.600.436 or EN.600.636. Recommended Course Background:
Prerequisites: Students may receive credit for only one of
EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): S. Leonard.

EN.600.638. Computational Genomics: Data Analysis.
Graduate level version of EN.600.438. [Applications] Recommended
Course Background: EN.600.226 or other programming experience,
probability and statistics, linear algebra or calculus. Students may
receive credit for EN.600.438 or EN.600.638 but not both.
Prerequisites: Students may receive credit for EN.600.438 or
EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.

EN.600.639. Computational Genomics.
Graduate version of EN.600.439 [Applications] Students may earn credit
for EN.600.439 or EN.600.639, but not both. Recommended Course
Background: EN.600.120 and EN.600.226
Instructor(s): B. Langmead
Area: Engineering.

EN.600.640. Frontiers of Sequencing Data Analysis.
Public archives now contain petabytes of valuable but hard-to-analyze
DNA sequencing data. Analyzing even small datasets is complicated
by sequencing errors, differences between individuals, and the
fragmentary nature of the the sequencing reads. In this course, we
study recent algorithms and methods that seek to make sense of DNA
sequencing datasets from small to very large. Topics covered will vary
from year to year, but could include RNA sequencing data analysis,
other functional genomics data analysis, metagenomics analysis, data
compression, indexing, applications of streaming algorithms and sketch
data structures, assembly, etc. There will be homework assignments
and a course project. [Applications]
Prerequisites: EN.600.439 OR EN.600.639
Instructor(s): B. Langmead.
Genomic data is becoming available in large quantities, but understanding how genetics contributes to human disease and other traits remains a major challenge. Machine learning approaches allow us to automatically analyze and combine genomic data, build predictive models, and identify genetic elements important to disease and cellular processes. This course will cover uses of machine learning in diverse genomic applications. Students will present and discuss current literature. Topics include predicting disease risk from genomic data, integrating diverse genomic data types, gene network reconstruction, and other topics guided by student interest. The course will include a project component with the opportunity to explore publicly available genomic data. Recommended course background: coursework in data mining, machine learning. [Applications] Students may receive credit for 600.441 or 600.641, but not both.
**Prerequisites:** Students may receive credit for 600.441 or 600.641, but not both.
**Instructor(s):** A. Battle.

EN.600.642. Advanced Topics in Cryptography.
This course will focus on advanced cryptographic topics with an emphasis on open research problems and student presentations.
**Instructor(s):** A. Jain.

Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class. There will be homework assignments and a course project.
**Prerequisites:** EN.600.443 OR EN.600.424 or permission of instructor.

Graduate version of 600.445 (see description). Students may earn credit for 600.445 or 600.645, but not both. Prerequisites: data structures, and linear algebra, or permission; Recommended Course Background: intermediate programming in C/C++, 600.457, 600.461, image processing. [Applications]
**Instructor(s):** R. Taylor
**Area:** Engineering.

EN.600.646. Computer Integrated Surgery II.
Students may receive credit for EN.600.446 or EN.600.646, but not both. Advanced version of EN.600.446. [Applications]
**Prerequisites:** EN.600.445 OR EN.600.645 OR PERMISSION OF INSTRUCTOR
**Instructor(s):** R. Taylor.

This course presents advanced methodologies and their applications to computer graphics. Recommended Course Background: any computer science courses above the 400-level in computer graphics & linear algebra; or permission of instructor.

This course will survey individual topics in computer graphics. Throughout most of the semester, students will present one to two papers in the area each week. Then, towards the end, the course will focus on the evaluation and comparison of the covered methods. Students will collaboratively design tools for analyzing the techniques and the class will jointly write up their findings in a survey paper. In addition to providing a deep study of a particular area in computer graphics, the goal of this course is to expose students to important aspects of research, including reviewing related work, designing metrics for evaluation, and writing scientific papers.
**Instructor(s):** M. Kazhdan.

EN.600.659. Introduction to Computational Geometry.
This course will provide an introduction to computational geometry. It will cover a number of topics in two- and three-dimensions, including polygon triangulations and partitions, convex hulls, Delaunay and Voronoi diagrams, arrangements, and spatial queries. [Analysis] Recommended Course Background: EN.600.363/463
**Instructor(s):** M. Kazhdan.

EN.600.660. FFT in Graphics & Vision.
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariances, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations.
**Instructor(s):** M. Kazhdan.

EN.600.661. Computer Vision.
Graduate version of EN.600.461. Students may receive credit for at most one of EN.600.361 or EN.600.461 or EN.600.661. [Applications]
**Prerequisites:** intro programming, linear algebra, and prob/stat.
**Prerequisites:** If you have completed EN.600.361 OR EN.600.461 you cannot enroll for EN.600.661.
**Instructor(s):** A. Reiter.

EN.600.662. Topics in Illumination and Reflectance Modelingfor Computer Vision and Medical Imaging Applications.
The vast majority of all imagery on which computer vision is performed starts with a source of illumination in conjunction with a material reflectance property. Having a rigorous understanding of these phenomena is important for most students who want to be involved with further research in computer vision and computer integrated surgery, particularly for experimentation and development of new systems. This short course is for individuals who have already taken Computer Vision, and want to delve deeper into underlying physical modeling of light illumination, reflection, colorimetry, polarization and even sensor fusion of images taken at different Wavelengths.
**Prerequisites:** EN.600.361 OR EN.600.461 or Instructor permission required.
**Instructor(s):** L. Wolff.

EN.600.664. Randomized and Big Data Algorithms.
Graduate level version of EN.600.464. Recommended Course Background: EN.600.363 or EN.600.463. Students may receive credit for EN.600.464 or EN.600.664, but not both.
**Instructor(s):** V. Braverman
**Area:** Engineering.
EN.600.666. Information Extraction.
Introduction to statistical methods of speech recognition (automatic transcription of speech) and understanding. The course is a natural continuation of EN.600.465 but is independent of it. Topics include elementary information theory, hidden Markov models, the Baum and Viterbi algorithms, efficient hypothesis search methods, statistical decision trees, the estimation-maximization (EM) algorithm, maximum entropy estimation and estimation of discrete probabilities from sparse data for acoustic and language modeling. Weekly assignments and several programming projects. Co-listed as EN.520.666. Recommended Course Background: EN.600.120 and EN.550.310 or equivalent, expertise in C or C++ programming
Instructor(s): S. Checkoway.

The course explores the state of the art in distributed systems, networks and Internet research and practice, trying to see what it would take to push the envelop a step further. The course is conducted as a discussion group, where the professor and students brainstorm and pick interesting semester-long projects with high potential future impact. Example areas include robust scalable infrastructure (distributed datacenters, cloud networking, scada systems), real-time performance (remote surgery, trading systems), hybrid networks (mesh networks, 3-4G/Wifi/Bluetooth). Students should feel free to bring their own topics of interest and ideas. Recommended Course Background: a systems course (distributed systems, operating systems, computer networks, parallel programming) or permission of instructor.
Instructor(s): Y. Amir.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor
Instructor(s): S. Checkoway.

EN.600.669. Approximation Algorithms.
Graduate version of EN.600.469. Students may receive credit for EN.600.469 or EN.600.669, but not both.
Prerequisites: EN.600.363 OR EN.600.463 OR permission
Instructor(s): M. Dinitz.

EN.600.670. Pseudorandomness and Combinatorial Constructions.
Randomness is very useful in almost all areas of computer science, such as algorithms, distributed computing and cryptography. However, computers generally do not have access to truly uniform random bits. To deal with this, we rely on various pseudorandom objects to reduce either the quantity or the quality of the random bits needed. In this course, we will develop provably good pseudorandom objects for a variety of tasks. We will frequently require explicit combinatorial constructions. That is, we will want to efficiently and deterministically construct such objects. Along the way, we will also explore the close connections of such objects to many other areas in computer science and mathematics, such as graph theory, coding theory, complexity theory and arithmetic combinatorics. [Analysis] Recommended Course Background: EN.600.271/417, EN.600.363/463 and probability.
Instructor(s): X. Li.

EN.600.672. Advances in Computational Complexity.
Computational complexity theory focuses on understanding capabilities of resource bounded computation. In recent years there have been many important break-through results in this area: lower bounds for Boolean circuits, design of space efficient algorithm for undirected graph reachability problem, hardness based derandomization of randomized algorithms, probabilistic proof characterization of non-deterministic polynomial-time, to name a few. This course aims to get in detail regarding some of the very exciting recent developments in computational complexity theory. It will be useful for any student who is mathematically mature and has a keen interest in understanding the fundamental nature of computation. Recommended Course Background: EN.600.471 or equivalent.
Instructor(s): V. Vazirani.

This is a second graduate level course in machine learning. It will provide a formal and an in-depth coverage of topics at the interface of statistical theory and computational sciences. We will revisit popular machine learning algorithms and understand their performance in terms of the size of the data (sample complexity), memory needed (space complexity), as well as the overall computational runtime (computation or iteration complexity). We will cover topics including nonparametric methods, kernel methods, online learning and reinforcement learning, as well as introduce students to current topics in large-scale machine-learning and randomized projections. Topics will vary from year-to-year but the general focus would be on combining methodology with theoretical and computational foundations. [Analysis or Applications]
Prerequisites: EN.600.475 OR EN.600.476 OR EN.600.676 OR permission of the instructor.
Instructor(s): R. Arora.

Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. One should have taken at least an introductory course in probability theory and linear algebra. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Requisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria.

EN.600.679. Representation Learning.
Graduate level version of 600.479. Students may receive credit for 600.479 or 600.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra. Co-listed with EN.600.479
Prerequisites: If you have completed EN.600.479 you may not enroll in EN.600.679.
Instructor(s): R. Arora.
EN.600.682. Deep Learning for Image Understanding.
This course discusses advanced topics on the recent progresses using deep learning, specifically deep convolutional neural networks in computer vision and medical image analysis. Topics will be selected from most recent papers from CVPR/ICCV/ArXiV/NIPS/MICCAI, with the core focus on object/scene recognition, object detection, domain transfer learning and computer-aided diagnosis. This course is targeted toward graduate students who are interested in mastering the understanding of the recent massive amount of literature and applying the skills to a course project (with lectures, paper reading, in-class presentation & discussion and a final research project). [Applications]
Prerequisites: Prereq: EN.600.461 OR EN.600.661
Instructor(s): Staff.

EN.600.684. Augmented Reality.
This course introduces students to the field of Augmented Reality. It reviews its basic definitions, principles and applications. It then focuses on Medical Augmented Reality and its particular requirements. The course also discusses the main issues of calibration, tracking, multimodal registration, advance visualization and display technologies. Homework in this course will relate to the mathematical methods used for calibration, tracking and visualization in medical augmented reality. Students may also be asked to read papers and implement various techniques within group projects. Recommended Course Background: EN.600.120, EN.600.226, and AS.110.201. [Applications]
Prerequisites: Students may take only EN.600.384 or EN.600.684, not both.
Instructor(s): N. Navab.

EN.600.688. Foundations of Computational Biology & Bioinformatics II.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Co-listed with EN.580.688. Recommended Course Background: math through linear algebra and differential equations, at least one prob/stat course, EN.580.221 or equivalent, EN.600.226 or equivalent.
Instructor(s): R. Karchin.

In the era of data deluge, the development of methods for discovering structure in high-dimensional data is becoming increasingly important. This course will cover state-of-the-art methods from algebraic geometry, sparse and low-rank representations, and statistical learning for modeling and clustering high-dimensional data. The first part of the course will cover methods for modeling data with a single low-dimensional subspace, such as PCA, Robust PCA, Kernel PCA, and manifold learning techniques. The second part of the course will cover methods for modeling data with multiple subspaces, such as algebraic, statistical, sparse and low-rank subspace clustering techniques. The third part of the course will cover applications of these methods in image processing, computer vision, and biomedical imaging. Requisites include Linear Algebra, Optimization, and prior exposure to Machine I.
Instructor(s): R. Vidal.

EN.600.707. Selected Topics in CS Education.
This course will explore current issues and research in computer science education. Topics will be drawn from literature, news items, and participant experience. Current faculty and students with interests in academic careers are encouraged to attend.
Instructor(s): J. Selinski.

EN.600.716. Selected Topics on Innovative Data Systems.
This weekly reading group will survey and dissect the cutting-edge on innovative data systems research. Topics will encompass methods and abstraction in core systems and data management areas (eg, cloud computing, scalable programming and storage), as well as use-cases and “war” stories from industry, and science and engineering applications. View on web: Our semester schedule is posted at damsel.cs.jhu.edu/blockparty
Instructor(s): Y. Ahmad.

EN.600.726. Selected Topics in Programming Languages.
This seminar course covers recent developments in the foundations of programming language design and implementation. Topics covered include type theory, process algebra, higher-order program analysis, and constraint systems. Students will be expected to present papers orally.
Instructor(s): S. Smith.

EN.600.728. Selected Topics in Category Theory.
Students in this course will read a sampling of standard texts in Category Theory (e.g. the books by Awodey, Mac Lane, Pierce, or others) and papers relevant to the research of participants.
Instructor(s): N. Filardo.

EN.600.745. Seminar in Computational Sensing and Robotics.
This weekly seminar will focus on research issues in computer integrated surgery, including subjects such as medical image analysis, statistical modeling, visualization, vision/sensing, surgical planning, medical robotics, and clinical applications. The purpose of the course is to widen the knowledge and awareness of the participants in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University and beyond. The format of the course is informal presentation by a pre-eminent invited speaker, followed by free discussion. Formerly Seminar in Computer Integrated Surgery (CISST)
Instructor(s): P. Kazanzides.

EN.600.746. Seminar: Medical Image Analysis.
This weekly seminar will focus on research issues in medical image analysis, including image segmentation, registration, statistical modeling, and applications. It will also include selected topics relating to medical image acquisition, especially where they relate to analysis. The purpose of the course is to provide the participants with a thorough background in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University. The format of the course is informal. Students will read selected papers. All students will be assumed to have read these papers by the time the paper is scheduled for discussion. But individual students will be assigned on a rotating basis to lead the discussion on particular papers or sections of papers. Co-listed with En.520.746.
Instructor(s): J. Prince; R. Taylor.

EN.600.757. Selected Topics in Computer Graphics.
In this course we will review current research in computer graphics. We will meet for an hour once a week and one of the participants will lead the discussion for the week.
Instructor(s): M. Kazhdan.
**EN.600.760. CS Theory Seminar.**
Seminar series in theoretical computer science. Topics include algorithms, complexity theory, and related areas of TCS. Speakers will be a mix of internal and external researchers, mostly presenting recently published research papers.
Instructor(s): M. Dinitz; V. Braverman; X. Li.

**EN.600.763. Selected Topics in Streaming Algorithms.**
This course will focus on theoretical streaming algorithms and related methods. Examples of topics that we will address include sketching, sampling, frequency moments, heavy elements, k-wise independence, and the Johnson-Lindenstrauss lemma. Students will be required to select a paper and lead a discussion. This course is a good opportunity for motivated students to learn modern algorithmic methods. Recommended Course Background: EN.600.463 or equivalent.
Instructor(s): V. Braverman
Area: Engineering.

**EN.600.765. Selected Topics in Natural Language Processing.**
A reading group exploring important current research in the field and potentially relevant material from related fields. Enrolled students are expected to present papers and lead discussion.
Prerequisites: EN.600.465 or permission of instructor
Instructor(s): J. Eisner.

**EN.600.766. Selected Topics in Meaning, Translation and Generation of Text.**
A seminar focused on current research and survey articles on computational semantics.
Instructor(s): B. Van Durme.

**EN.600.767. Selected Topics in Systems Research.**
Students will review, present, and discuss current research in computer systems, distributed systems, and computer networks, in the contexts of dependability, performance and scalability.
Instructor(s): Y. Amir.

**EN.600.768. Selected Topics in Machine Translation.**
Students in this course will review, present, and discuss current research in machine translation. Permission of instructor.
Instructor(s): P. Koehn.

**EN.600.770. Selected Topics in Algorithms for Metric Spaces.**
This course will focus on algorithms that use, simplify, or exploit metric spaces. Examples of topics we will address include metric embeddings and their applications, algorithms to exploit low dimensionality, graph spanners and spanners, and data structures such as distance oracles and compact routing schemes that allow us to efficiently find distances and paths. This course will mostly be in the form of a reading group, and students will present a paper and lead a discussion. Recommended Course Background: EN.600.363 or EN.600.463 or permission of the instructor.
Instructor(s): M. Dinitz.

**EN.600.771. Probability on Strings, Trees, and Sequences.**
Many areas of practical computer science focus on discrete data that is sequential or tree-shaped: natural language processing (sentences and their analyses), computational biology (DNA and protein structures), programming languages (computer programs and their interpretations), and compression (sequences of bits). When the data is noisy or ambiguous, decision-making requires probabilistic methods. We will survey formal tools for manipulating sets of strings, trees, sequences, and defining probabilistic models over these sets. Much of the material covers advanced topics at the intersection of formal language and automata theory, probability, and algorithms. Respectively, these three areas will enable us to represent sets, represent uncertainty, and process everything efficiently.

**EN.600.772. Selected Topics in Linear Programming and Semi-definite Programming.**
Linear programming and semi-definite programming are powerful techniques in convex optimization. They have been used to achieve the best known approximation results for many important combinatorial optimization problems, such as vertex cover, max cut, sparsest cut and MAX-2-SAT. In this course we will together explore the applications of these techniques in computer science, as well as some recent results about their limitations. Time permitting, we may also discuss their connections to the well-known unique games conjecture. This course will be in the form of a reading group, and students are encouraged to select a paper and lead a discussion. Recommended course background: EN.600.463 and EN.600.464.
Instructor(s): X. Li.

**EN.600.775. Selected Topics in Machine Learning.**
This seminar is recommended for all students interested in data intensive computing research areas (e.g., machine learning, computer vision, natural language processing, speech, computational social science). The meeting format is participatory. Papers that discuss best practices and the state-of-the-art across application areas of machine learning and data intensive computing will be read. Student volunteers lead individual meetings. Faculty and external speakers present from time-to-time. Recommended Course Background: machine learning or permission of the instructor.
Instructor(s): M. Dredze; R. Arora.

**EN.600.780. Selected Topics in Computational Genomics.**
This course will survey current areas where computer science approaches have been applied to genomics research. Chiefly, the course focuses on DNA sequencing data analysis, including sequence alignment, de novo assembly, error correction, and DNA data compression. Subject matter will be partially guided by student interests. Students will present papers orally.
Instructor(s): B. Langmead.

**EN.600.801. Dissertation Research.**
Instructor(s): Staff.

**EN.600.802. Dissertation Research.**
Instructor(s): Staff.

**EN.600.803. Graduate Research.**
Permission required. Independent research for masters or pre-dissertation PhD students.
Instructor(s): Staff.

**EN.600.804. Graduate Research.**
Independent research for masters or pre-dissertation PhD students. Permission required.
Instructor(s): Staff.
EN.600.807. Teaching Practicum.  
PhD students will gain valuable teaching experience, working closely with their assigned faculty supervisor. Successful completion of this course fulfills the PhD teaching requirement. (grad students) Permission req’d.  
Instructor(s): J. Selinski.

EN.600.809. Independent Study.  
Permission required. Individual study in an area of mutual interest to a graduate student and a faculty member in the department.  
Instructor(s): Staff.

EN.600.810. Graduate Independent Study.  
Permission required.  
Instructor(s): Staff.

EN.600.876. Graduate Independent Study.  
Instructor(s): D. Yarowsky; S. Smith.

EN.600.891. Independent Study-Summer.  
Instructor(s): Staff.

EN.600.895. Research-Summer.  
Instructor(s): Staff.

Cross Listed Courses

Physics Astronomy

AS.171.205. Introduction to Practical Data Science: Beautiful Data.  
The class will provide an overview of data science, with an introduction to basic statistical principles, databases, fundamentals of algorithms and data structures, followed by practical problems in data analytics.  
Recommend Course Background: Familiarity with principles of computing.  
Instructor(s): S. Szalay 
Area: Natural Sciences, Quantitative and Mathematical Sciences.

General Engineering

EN.500.745. Seminar in Computational Sensing and Robotics.  
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.  
Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

Electrical Computer Engineering

EN.520.110. Introduction to Medical Imaging.  
This course will provide the student with a basic knowledge of the principles and applications of medical imaging modalities used in biomedical patient care. Modalities include X-ray imaging, CT, ultrasound, MRI and PET/SPECT. The course will cover the underlying physics, image formation, instrumentation, and metrics used to assess the quality of medical images. The course will offer a tour and practical experience with medical imaging equipment in the clinic. Notes: This course is offered at an introductory level and assumes no prior knowledge of the material. It serves as a preparation for more complete Medical Imaging courses offered during fall and spring terms. This course is co-listed as EN.600.146.13 (Computer Science).  
Instructor(s): M. Ghaly; N. Kuo  
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques.  
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473  
Prerequisites: EN.520.432 OR EN.580.472  
Instructor(s): B. Tsui.

EN.520.447. Information Theory.  
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g. image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).  
Instructor(s): S. Khudanpur  
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.701. Current Topics in Language and Speech Processing.  
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U.  
Instructor(s): S. Khudanpur.
EN.520.702. Current Topics in Language and Speech Processing. This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Cross-listed with Computer Science. Grading will be S/U.
Instructor(s): S. Khudanpur
Area: Engineering.

Mechanical Engineering
EN.530.707. Robot System Programming. This course seeks to introduce students to open-source software tools that are available today for building complex experimental and fieldable robotic systems. The course is grouped into four sections, each of which building on the previous in increasing complexity and specificity: tools and frameworks supporting robotics research, robotics-specific software frameworks, integrating complete robotic systems, and culminates with an independent project of the student's own design using small mobile robots or other robots in the lab. Students will need to provide a computer or a virtual-box (with at least a few GB of memory and a few tens of GB of disc space) running Ubuntu 14.04 LTS Trusty Tahr (http://releases.ubuntu.com/14.04 or one of its variants such as Xubuntu 14.04 LTS) and ROS Indigo Igloo (http://wiki.ros.org/indigo) - note that these specific versions of Linux and ROS are required! Students should have an understanding of intermediate programming in C/C++ (including data structures and dynamic memory allocation) Familiarity with Linux programming. Familiarity with software version control systems (e.g. subversion, mercurial, git), linear algebra. Recommended Course Background: EN.530.646 Robot Devices, Kinematics, Dynamics, and Control and EN.600.636 Algorithms for Sensor Based Robotics. Students should see the course homepage http://dscl.lcsr.jhu.edu/ME530707_2016 for more information and to get started with the course. Recommended Course Background: EN.530.646 and EN.600.436.
Instructor(s): L. Whitcomb.

Biomedical Engineering
EN.580.473. Modern Biomedical Imaging Instrumentation and Techniques. An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.520.434 Recommended course background: EN.520.432 or EN.580.472
Prerequisites: EN.520.432 OR EN.580.472
Instructor(s): B. Tsui
Area: Engineering, Natural Sciences.

EN.580.688. Foundations of Computational Biology & Bioinformatics II. This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Recommended Course Background: Math through linear algebra and differential equations, EN.580.221 or equivalent, EN.600.226 or equivalent.
Instructor(s): R. Karchin.

EN.580.689. Computational Personal Genomics. What can we learn from the genome sequence of an individual? Genomic technology now makes it possible to generate huge amounts of DNA sequence data for a single individual at a relatively low cost. To make sense of this data, we need to employ sophisticated computational methods to identify genetic variations that influence an individual’s health. In this course, we will first review the state of the art in sequencing technology, and discuss how this technology is being applied to study human biology and disease. We will then explore the computational methods used to turn raw sequence data into knowledge. Topics will include genetic variant detection; discovery of chromosomal rearrangements and fusions; methods to measure gene expression from RNA; and measurements of the microbiome living inside our bodies. Recommended Course Background: EN.600.439/639, EN.600.363/463, EN.600.688, EN.580.688 (any one is sufficient), or permission of the instructor. Course is also open to undergraduate students.
Instructor(s): S. Salzberg
Area: Engineering.

EN.580.694. Statistical Connectomics. This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).
Instructor(s): J. Vogelstein
Area: Engineering.

Electrical and Computer Engineering
The Department of Electrical and Computer Engineering at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and successful careers, and is dedicated to research that contributes to fundamental knowledge in both analytical and experimental aspects of the field. The mission of our undergraduate programs is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical and computer engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences. At the graduate level, our mission is to provide advanced training that prepares master’s graduates to work
at the forefront of knowledge in their chosen specialty, and prepares doctoral students for original research that will advance the frontiers of knowledge in their chosen areas.

The department focuses its teaching and research programs in four major areas:

1. systems, control, communications, and signal processing;
2. photonics and optoelectronics;
3. integrated electronics and computer engineering; and
4. information extraction from acoustic and visual signals.

The faculty offers undergraduate courses at both the introductory and intermediate levels in these areas, and graduate courses leading to research topics at the forefront of current knowledge. Guided individual study projects available for undergraduates provide opportunities for student participation in activities in the department and in the research programs of the faculty. In the graduate program, original research in close association with individual faculty members is emphasized.

Current Research Activities
Systems, Control, Communications, and Signal Processing

Current research in systems and control includes the development of analysis, design and state estimation techniques for hybrid and nonlinear systems; optimization methods in filtering, estimation, and control; efficient implementation and analysis of iterative algorithms on specialized computing structures; design and analysis of robust linear and hybrid control algorithms. There is also a significant effort in systems biology, particularly the analysis of signaling pathways in biological systems. Research in speech processing involves work in all aspects of language or speech science and technology, with fundamental studies under way in areas such as language modeling, pronunciation modeling, natural language processing, neural auditory processing, acoustic processing, optimality theory, and language acquisition. Image analysis efforts currently concern statistical analysis of restoration and reconstruction algorithms, development of statistical image models for image restoration and segmentation, geometric modeling for object detection and estimation, morphological image analysis, and magnetic resonance imaging. There is opportunity for joint work in image analysis with faculty in the Department of Radiology, School of Medicine.

Photonics and Optoelectronics

Current research activities include work in fiber optic sensors and endoscopic 3-D imaging devices for medical applications, theory of nonlinear waves, optical communications, and quantum well devices. Other areas of interest involve the study of the nonlinear interactions of light with matter and single elementary particles, X-ray sources and lasers, optical bi-stability, radiation protection, laser beam control and steering, the nonlinear optics of semiconductors, nonlinear optics of biological objects as well as research on sub-femtosecond pulses and devices based on single atoms. Semiconductor device studies include optical detectors, VLSI circuit design and modeling and microwave devices and circuits. Study of a laser radar and RF photonics is also being pursued. Theoretical and experimental studies involving linear optical properties of various materials and passive remote sensing of the atmosphere are being investigated.

Integrated Electronics and Computer Engineering

Computer engineering research activities include work on computer structures (with emphasis on microprocessors), parallel and distributed processing, fault-tolerant computing, analysis of algorithms, and VLSI analog architectures for machine vision, associative processing, and micropower computing.

Facilities

The department maintains extensive facilities for teaching and research in Barton Hall and Hackerman Hall. The two main teaching labs (Electrical Engineering Lab and Computer Engineering Lab) make extensive use of state-of-the-art design environments such as CADENCE, Xilinx Tools, TI DSP systems, VHDL, and Verilog. In addition, the department includes the computational sensory motor system lab, the cellular signaling control lab, the parallel computing and imaging lab, the photonics and optoelectronics lab, the semiconductor microstructures lab, and the sensory communication and microsystem lab, adaptive and the sensory communication microsystem lab.

The Department of Electrical and Computer Engineering offers two bachelor’s degree programs: one in Electrical Engineering and one in Computer Engineering (with the close collaboration of the Computer Science Department (p. 899)). Each program is described below. Both degree programs are accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Bachelor of Science in Electrical Engineering

Mission

The faculty of the Electrical Engineering Program at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences; and to provide our electrical engineering graduates with the tools, skills and competencies necessary to understand and apply today’s technologies and become leaders in developing and deploying tomorrow’s technologies.

Educational Objectives

The Program Educational Objectives (PEOs) for electrical engineering (EE) at the Johns Hopkins University describe what EE graduates are expected to attain within a few years of graduation. The PEOs are determined in consultation with the Electrical and Computer Engineering External Advisory Committee and approved by the ECE faculty.

The educational objectives of the EE program are:

- Our graduates will become successful practitioners in engineering and other diverse careers.
Outcomes

Students graduating with a B.S. in electrical engineering will have demonstrated:

- An ability to apply knowledge of mathematics, science, and engineering
- An ability to design and conduct experiments, as well as to analyze and interpret data
- An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- An ability to function on multidisciplinary teams
- An ability to identify, formulate, and solve engineering problems
- An understanding of professional and ethical responsibility
- An ability to communicate effectively
- The broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- A recognition of the need for, and an ability to engage in life-long learning
- A knowledge of contemporary issues
- An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist are provided in a separate advising manual and illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits, students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student's program will depend on effective faculty advising. Every undergraduate student in the Electrical Engineering Program must follow a program approved by the faculty advisor. The faculty advisor must be a member of the Electrical and Computer Engineering faculty.

Requirements for the Bachelor of Science in Electrical Engineering

The Bachelor of Science degree in electrical engineering requires a minimum of one hundred and twenty-six (126) credits that must include:

Forty-five (45) credits of ECE courses including the following:

Advanced laboratory, design intensive, or senior design project courses 6

Total Credits 20

* Six (6) credits of advanced laboratory, design intensive, or senior design project courses from those given in the degree planning checklist. Up to six (6) credits of computer science courses may be used to satisfy the 45-credit requirement. A GPA of at least 2.0 must be maintained in ECE courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

Some graduates will pursue advanced degree programs in engineering and other disciplines.
AS.173.112  General Physics Laboratory II  1
Total Credits  10

• Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics:Physical Science Major I - AS.171.102 General Physics: Physical Science Majors II, AS.173.111 General Physics Laboratory I and AS.173.112 General Physics Laboratory II. Courses in this group may not be taken Satisfactory/Unsatisfactory.

• At least six (6), three-credit courses in humanities and social sciences. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses, but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area with at least one of them at an advanced level.

• A programming language requirement must be met by taking or EN.600.120 Intermediate Programming.

• Two (2) writing intensive courses (at least 3 credits each) are required. The writing intensive courses may not be taken Satisfactory/Unsatisfactory and require a C- or better grade. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements. The course EN.661.315 Culture of the Engineering Profession, is recommended by the ECE Faculty as a writing intensive course.

The sample program shown has an emphasis on systems and communications aspects of electrical engineering. Other sample programs can be found in the advising manual.

**Bachelor of Science in Computer Engineering**

**Mission**

The Computer Engineering Program at Johns Hopkins is supported by faculty in the Department of Electrical and Computer Engineering and the Department of Computer Science, who are committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide students with a broad, integrated education in the fundamentals and advanced topics in computer engineering, basic sciences, mathematics, and humanities in an environment that fosters the development of analytical, computational, and experimental skills, and that involves students in design projects and research experiences; and to provide our computer engineering graduates with the tools, skills and competencies necessary to understand and apply today’s technologies and become leaders in developing and deploying tomorrow’s technologies.
Educational Objectives

The Program Educational Objectives (PEOs) for computer engineering (CE) at the Johns Hopkins University describe what CE graduates are expected to attain within a few years of graduation. The PEOs are determined in consultation with the Electrical and Computer Engineering External Advisory Committee and approved by the ECE faculty.

The educational objectives of the CE program are:

- Our graduates will become successful practitioners in engineering and other diverse careers.
- Some graduates will pursue advanced degree programs in engineering and other disciplines.

Outcomes

Students graduating with a B.S. in computer engineering will have demonstrated:

- An ability to apply knowledge of mathematics, science, and engineering
- An ability to design and conduct experiments, as well as to analyze and interpret data
- An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- An ability to function on multidisciplinary teams
- An ability to identify, formulate, and solve engineering problems
- An understanding of professional and ethical responsibility
- An ability to communicate effectively
- The broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- A recognition of the need for, and an ability to engage in life-long learning
- A knowledge of contemporary issues
- An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist included in this advising manual illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits; students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student's program will depend on effective faculty advising. Every undergraduate student in the Computer Engineering Program must follow a program approved by a faculty advisor.

Requirements for the Bachelor of Science in Computer Engineering

The Bachelor of Science degree in Computer Engineering requires a minimum of 126 credits, which must include the following:

- Forty-two (42) credits in Computer Engineering, which must include:
  - Electrical and Computer Engineering courses (15 credits)
    - EN.520.142 Digital Systems Fundamentals
    - EN.520.213 Circuits
  - EN.600.120 Intermediate Programming, EN.600.226 Data Structures
  - EN.600.233 Computer System Fundamentals
  - A GPA of at least 2.0 must be maintained in Computer Engineering courses. Courses in this category may not be taken Satisfactory/Unsatisfactory.
  - An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
  - An ability to function on multidisciplinary teams
  - An ability to identify, formulate, and solve engineering problems
  - An understanding of professional and ethical responsibility
  - An ability to communicate effectively
  - The broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
  - A recognition of the need for, and an ability to engage in life-long learning
  - A knowledge of contemporary issues
  - An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

- Six (6) credits of engineering courses from School of Engineering departments other than Computer Science, ECE, Applied Mathematics and Statistics, or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as “other engineering courses”). Students must complete enough of the approved non-CS/ECE advanced design labs so that they have at least twelve (12) credits of advanced laboratory, design intensive, or senior design project courses. Courses in this category may not be taken Satisfactory/Unsatisfactory.
  - Six (6) credits of engineering courses from School of Engineering departments other than Computer Science, ECE, Applied Mathematics and Statistics, or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as “other engineering courses”). Students must complete enough of the approved non-CS/ECE advanced design labs so that they have at least twelve (12) credits of advanced laboratory, design intensive, or senior design project courses. Courses in this category may not be taken Satisfactory/Unsatisfactory.

- Twenty-four (24) credits in mathematics courses taken from the Mathematics Department or the Applied Mathematics and Statistics Department. AS.110.109 Calculus II (For Physical Sciences and Engineering), AS.110.202 Calculus III, AS.110.201 Linear Algebra or EN.550.291 Linear Algebra and Differential Equations, EN.550.171 Discrete Mathematics, EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering/EN.550.311 Probability and Statistics for the Biological Sciences and Engineering or EN.550.420 Introduction to Probability must be taken. Elementary or precalculus courses such as AS.110.105 or EN.550.111-EN.550.112 are not acceptable. (Calculus I may be waived through an examination taken during freshman orientation. If not waived, it must be taken as a prerequisite to Calculus II.) Courses in this category may not be taken Satisfactory/Unsatisfactory.
  - Twenty-four (24) credits in mathematics courses taken from the Mathematics Department or the Applied Mathematics and Statistics Department. AS.110.109 Calculus II (For Physical Sciences and Engineering), AS.110.202 Calculus III, AS.110.201 Linear Algebra or EN.550.291 Linear Algebra and Differential Equations, EN.550.171 Discrete Mathematics, EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering/EN.550.311 Probability and Statistics for the Biological Sciences and Engineering or EN.550.420 Introduction to Probability must be taken. Elementary or precalculus courses such as AS.110.105 or EN.550.111-EN.550.112 are not acceptable. (Calculus I may be waived through an examination taken during freshman orientation. If not waived, it must be taken as a prerequisite to Calculus II.) Courses in this category may not be taken Satisfactory/Unsatisfactory.

- Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics: Physical Science Major I-AS.171.102 General Physics: Physical Science Majors II, AS.173.111 General Physics Laboratory I-AS.173.112 General Physics Laboratory II, and AS.030.101
Introductory Chemistry I. Courses in this category may not be taken Satisfactory/Unsatisfactory.

- At least six (6) three-credit courses in humanities and social sciences. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area with at least one of them at an advanced level.
- At least two (2) writing intensive courses are required (at least 3 credits each). These courses may not be taken Pass/Fail and require a grade of C- or better. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements.

Additional details concerning advising and degree requirements are in the Computer Engineering Advising Manual. The B.S. in Computer Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The sample program shown has an emphasis on hardware/device aspects of computer engineering. Other sample programs can be found in the advising manual.

**Total Credits: 124**

**Bachelor of Arts Degree**

To meet the requirements for the B.A. degree, the program must include:

- Eighteen (18) credits of humanities and social sciences courses.
- Four writing intensive courses.
- Twenty (20) credits of mathematics or mathematical statistics courses. Typically these include AS.110.108 Calculus I, AS.110.109 Calculus II (For Physical Sciences and Engineering), and AS.110.202 Calculus III or equivalent, and AS.110.201 Linear Algebra. Elementary or pre-calculus courses such as AS.110.105 or EN.550.111-EN.550.112 are not acceptable.
- Thirty (30) credits of ECE courses. Three credits of computer science courses may be counted toward this 30-credit requirement.
- Additional credits giving a total of at least 120 credits.
- Additional information on academic policies and degree requirements, including academic ethics, may be found in the Undergraduate Academic Manual of The Johns Hopkins University. Students are urged to read the credit requirements, under the credit requirements section, in the academic manual section of the Compendium.

The student should be aware that the B.A. degree program is not accredited by the Accreditation Board for Engineering and Technology (ABET).
Minor in Robotics
A minor in Robotics is offered by the Laboratory for Computational Sensing and Robotics. Detailed information regarding this program can be found at: http://lcscr.jhu.edu/robotics-minor/.

Minor in Computer-Integrated Surgery
A minor in Computer-Integrated Surgery is offered by the Laboratory for Computational Sensing and Robotics. Detailed information regarding this program can be found at: http://lcscr.jhu.edu/computer-integrated-surgery-minor/.

Bachelor’s/Master’s Program
At the end of their sophomore year, students who are majors in electrical and computer engineering may apply for admission to the combined bachelor’s/master’s program which combines a B.S. in electrical engineering with a master of science in engineering. If accepted, they must take at least two courses per semester that satisfy the requirements of the M.S.E. program.

Every graduate student in the Department of Electrical and Computer Engineering must follow a program approved by a faculty advisor in the department. The advisor assigned to the student upon admission may be changed, subject to the approval of the new advisor. Additional details are in the department’s Graduate Student Advising Manual.

Master of Science in Engineering (M.S.E.) Degree
The department offers a comprehensive and flexible Master of Science in Engineering (M.S.E.) degree program that includes courses from several areas of Electrical and Computer Engineering. In addition, the following specialized M.S.E. tracks are offered: 1) Communications, 2) Control Systems, 3) Language and Speech Processing, 4) Microsystems and Computer Engineering, and 3) Photonics and Optoelectronics.

Requirements for the M.S.E. Degree
A student who has completed a program of study similar to that required for the B.S. in electrical engineering degree must complete the following requirements for the M.S.E. degree:

• Eight one-semester graduate (400-799) courses approved by the advisor must be satisfactorily completed. At least five of these courses must come from the full-time ECE Department (520.XXX) but cannot include Independent Study, Dissertation Research, ECE Seminar or Special Studies.

• Further depth of understanding must be demonstrated by either satisfactorily completing two additional one-semester graduate (400-799) courses approved by the advisor (one of which must come from the full-time ECE Department (520.XXX), or by writing an M.S.E. thesis acceptable to a member of our faculty, or by completing a special project acceptable to a member of our faculty and writing the corresponding report.

• A course (including independent study) is satisfactorily completed if a grade of A, B, C, or P is obtained. No more than one C grade can be counted toward the requirements and a D or F or second C grade results in probation. A second D or F or a third C grade results in termination from our program.

• Students may transfer in up to two courses from outside JHU. These courses must have been completed after the undergraduate degree was conferred and not applied to a degree elsewhere.

• Every graduate course designated Independent Study, Dissertation Research, or Special Studies counted toward the M.S.E. degree must include a written report. A copy of the report will become part of the student’s permanent file.

• Every student must register for a minimum of two semesters as a full-time resident graduate student (this rule does not apply to students in the concurrent B.S./M.S.E. program). Full-time resident M.S.E. students must satisfactorily complete at least three graduate courses per semester for credit.

• Every student must be registered in the semester that degree requirements are met; this includes students who have no courses remaining in which to enroll but must resolve coursework for which an "incomplete" grade was assigned and those who must complete other academic requirements, such as a language or computing requirement (these students may apply for Nonresident Status).

• Every student must earn the M.S.E. degree within five consecutive academic years (ten semesters). Only semesters during which a student has a university-approved leave of absence are exempt from the ten semester limit; otherwise, all semesters from the beginning of the student’s graduate studies – whether the student is resident or not – count toward the ten semester limit.

• Every student must complete training on academic ethics.

• Every student must complete training on the responsible and ethical conduct of research, if applicable (Please see the WSE Policy on the Responsible Conduct of Research).

Doctor of Philosophy (Ph.D.) Degree
Graduate study in Electrical and Computer Engineering is oriented toward the Ph.D. degree, with emphasis on scholarship and research rather than formal course work. Our Ph.D. program is designed to be easily tailored to the needs and interests of individual students. There are no lists of required courses. The program is directed at independent, highly motivated individuals who desire to work closely with faculty members at the forefront of research in a variety of scientific areas, such as:

• Computational and Biomorphic Systems
• Computational Systems Biology and Bioinformatics
• Computer Engineering
• Control Systems
• Image Processing and Analysis
• Integrated Circuits and Microsystems
• Language and Speech Processing
• Photonics and Optoelectronics
• Signal Processing

Requirements for the Ph.D. Degree
University requirements for the Ph.D. degree are listed under Academic Information for Graduate Students (p. 61). In addition, the department requires satisfactory completion of the Ph.D. departmental examination and the university Graduate Board oral examination, preparation of a preliminary research proposal, a departmental seminar presentation, and an oral dissertation defense.

The departmental examination is offered twice yearly. Each faculty member prepares a set of questions, and the student must select
and complete the sets of questions of three faculty members. This examination must be passed before the beginning of the fifth semester of full-time graduate study. After passing the examination, the student can be accepted by a faculty member who will oversee the student’s research. This research advisor then guides the remainder of the student’s program leading to the Ph.D. degree.

The university Graduate Board oral examination is administered by a panel consisting of the research advisor, another faculty member in Electrical and Computer Engineering, and three faculty members from other departments. This examination must be taken before the end of the sixth semester.

In the course of research leading to the Ph.D. degree, the student must submit a preliminary research proposal to the department, and present a departmental seminar. Finally, a public dissertation defense will be conducted before a panel of readers consisting of at least three Electrical and Computer Engineering faculty members. Further details concerning M.S.E. and Ph.D. degree requirements are published in a manual for graduate students in Electrical and Computer Engineering.

Financial Aid

Financial aid is available for candidates of high promise. Research assistantships are available on sponsored research projects directed by members of the faculty.

For current faculty and contact information go to http://www.ece-jhu.org/index.php/people

Faculty

Chair
Ralph R. Etienne-Cummings
Mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

Director of Undergraduate Programs
Trac D. Tran
Filter banks, wavelets, multirate systems and applications.

Director of Graduate Programs
Pablo A. Iglesias
Edward J. Schaefer Professor: systems biology, mathematical modeling of biological systems, control theory.

Professors
Andreas G. Andreou
CMOS devices and integrated circuits, bioelectronics, nanoelectronics, life science Microsystems, natural and synthetic sensory systems, neural computation.

John I. Goutsias
Signal and image processing, computational systems biology, bioinformatics, modeling and analysis of complex networked systems.

Hynek Hermansky
Julian S. Smith Professor: emulating and integrating human-like processing strategies into speech engineering systems; neural information processing; human sensory perception; speech and speaker recognition; speech coding and enhancement; and machine learning.

Jin U. Kang
Jacob Suter Jammer Professor: fiber optic devices and lasers, biophotonics, optical imaging and sensing.

Alexander E. Kaplan

Jacob B. Khurgin
Quantum electronics, nonlinear optics.

Gerard G. L. Meyer
Parallel computing, computational methods, fault tolerant computing.

Jerry L. Prince
William B. Kouwenhoven Professor: image processing and computer vision with application to medical imaging.

T.E. (Ed) Schlesinger
Professor and Benjamin T. Tome Dean: solid state electronic and optical devices, nanotechnology, and information storage systems.

Howard L. Weinert
Fast compact algorithms and software for extracting signals from noise

Associate Professors
Mounya Elhilali
Biological basis of sound and speech perception, neural signal processing, computational neuroscience, cognitive neuromorphic engineering.

Sanjeev P. Khudanpur
Information theory, statistical language modeling.

Assistant Professors
Amy C. Foster
Silicon photonics, nonlinear optics, nanophotonics, integrated biophotonics.

Mark A. Foster
Ultrafast and nonlinear optics, all-optical signal processing, ultrafast phenomena and measurement, nonlinear dynamics.

Danielle C. Tarraf
Systems and control theory, with emphasis on hybrid systems; network analysis and control; automata theory, algebra, and combinatorics as they apply in systems and control.

Susanna M. Thon
Renewable energy conversion and storage, photovoltaics, optoelectronics, nanoengineering and nanophotonics, and scalable fabrication.

Joint, Part-Time, Visiting, and Emeritus Appointments
Emad M. Doctor
Assistant Professor (Radiology): image-guided intervention, ultrasound imaging, elasticity, and thermal imaging.

Paul A. Bottomley
Russell H. Morgan Professor (Radiology): magnetic resonance imaging, metabolic MRI.

Sang (Peter) Chin
Assistant Research Professor: compressive sensing, novel signal processing, game theory, extremal graph theory, differential geometry, and quantum computing and verification.

A. Brinton Cooper III
Associate Research Professor: error control coding, coded wireless, and optical communication.

Glenn A. Coppersmith
Assistant Research Scientist.

Richard V. Cox
Research Professor/Director, Human Language Technology Center of Excellence.

Frederic M. Davidson
Professor Emeritus

Yamac Dikmelik
Assistant Research Scientist.

Eric C. Frey
Professor (Radiology): algorithms for computed tomography, small animal X-ray microcomputed tomography, quantitative PET, SPECT and nuclear medicine imaging, image evaluation, scatter compensation in SPECT, simultaneous dual isotope SPECT and Monte Carlo simulation of radiation transport.

Israel Gannot
Associate Research Professor.

Dennice F. Gayme
Assistant Professor (Mechanical Engineering): dynamics and control of nonlinear, networked and spatially distributed systems. Applications include: the electric power grid, wall turbulence and wind farms.

Donald J. Geman
Professor (Applied Mathematics and Statistics): computer vision, computational biology, statistical learning.

Robert E. Glaser
Lecturer: advanced digital logic systems.

Moise H. Goldstein Jr.
Professor Emeritus.

Gregory D. Hager
Professor and Chair (Computer Science): vision, robotics, human-machine systems, computer-integrated medicine.

Aren Jansen
Assistant Research Professor: automatic speech recognition, sparse representations and models, unsupervised/semi-supervised learning, geometric structure of speech sounds, computational modeling of speech perception, manifold learning algorithms, novel applications of machine learning techniques.

Robert E. Jenkins
Senior Lecturer: digital systems, spacecraft systems and space technology.

Richard I. Joseph

Jacob Suter Jammer Professor Emeritus.

Xingde Li
Professor (Biomedical Engineering): Endomicroscopy technologies, nanobiophotonics and molecular imaging, early detection.

Elliot R. McVeigh
Massey Professor and Director (Biomedical Engineering): imaging.

Michael I. Miller
Hershel and Ruth Seder Professor (Biomedical Engineering and Director, Center for Imaging Science): computational anatomy, medical imaging, image understanding.

C. Harvey Palmer Jr.
Professor Emeritus.

Dzung L. Pham
Associate Professor (Radiology): homomorphic brain image segmentation, neuroanatomical atlases in MIPAV, robust tissue classification, statistical characterization of brain tissue in MRI.

Philippe O. Pouliquen
Assistant Research Professor: optoelectronic, mixed signal, low power VLSI, CAD tools for VLSI.

Carey E. Priebe

Arman Rahmim
Assistant Professor (Radiology).

Charbel Rizk
Associate Research Scientist.

Wilson J. Rugh
Edward J. Schaefer Professor Emeritus.

Nitish V. Thakor
Professor (Biomedical Engineering): medical instrumentation, medical micro and nanotechnologies, neurological instrumentation, signal processing, computer applications.

Benjamin M. W. Tsui
Professor (Radiology): quantitative SPECT, PET and CT imaging techniques, image reconstruction methods, computer simulation tools and methods in imaging, image quality assessment, small animal SPECT, PET and CT imaging techniques.

Rene Vidal
Associate Professor (Biomedical Engineering): computer vision, biomedical imaging, machine learning, signal processing.

James West
Research Professor: electroacoustics, physical acoustics, and architectural acoustics.

C. Roger Westgate
Professor Emeritus.

Raimond Winslow
Professor (Biomedical Engineering): applied statistical learning, computational cell biology, cardiac electrophysiology, grid-based computing and data sharing for collaborative science.
Courses

EN.520.108. Algorithm and Coding Interview.
This course is targeted at upper level undergraduate and graduate students who are looking for internships and jobs in computational fields. Its goal is to provide a solid understanding of the interview structure and how to have a successful interview. The participants will experience many real interview questions and get familiar with general algorithmic thinking by practicing many popular algorithm problems in searching, sorting, graph theory, probability and programming. We are also discussing many strategies for successful interview.
Instructor(s): E. Variani
Area: Engineering.

This introductory course touches upon many fundamental concepts of information theory such as entropy, mutual information, rate distortion and channel capacity. The main objective is helping students to reason intuitively about problems using information theory concepts. This course is targeted at upper level undergraduate and graduate students who delve into the fields of statistics, computer science, biology, economics, as well as electrical engineering.
Instructor(s): E. Variani
Area: Engineering.

EN.520.110. Introduction to Medical Imaging.
This course will provide the student with a basic knowledge of the principles and applications of medical imaging modalities used in biomedical patient care. Modalities include X-ray imaging, CT, ultrasound, MRI and PET/SPECT. The course will cover the underlying physics, image formation, instrumentation, and metrics used to assess the quality of medical images. The course will offer a tour and practical experience with medical imaging equipment in the clinic. Notes: This course is offered at an introductory level and assumes no prior knowledge of the material. It serves as a preparation for more complete Medical Imaging courses offered during fall and spring terms. This course is co-listed as EN.600.146.13 (Computer Science).
Instructor(s): M. Ghaly; N. Kuo
Area: Engineering.

EN.520.120. Introduction to Model Rocketry.
Model rocketry is only the small cousin of space rocketry, but it shares many interesting aspects with its real-world counterpart. This course aims to explore the different parts of this sport, with an emphasis on how engineering principles are employed in practice. Classes will cover both practical and theoretical topics such as model rocket construction and design (recovery devices, glide recovery, multistage rockets), stability, aerodynamics, altitude prediction and determination. Some familiarity with a programming language (possibly Matlab) is required for the assignments.
Instructor(s): R. Tron
Area: Engineering.

EN.520.137. Introduction To Electrical & Computer Engineering.
An introductory course covering the principles of electrical engineering including sinusoidal wave forms, electrical measurements, digital circuits, and applications of electrical and computer engineering. Laboratory exercises, the use of computers, and a design project are included in the course.
Instructor(s): T. Tran
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.142. Digital Systems Fundamentals.
Number systems and computer codes, switching functions, minimization of switching functions, Quine - McCluskey method, sequential logic, state tables, memory devices, analysis, and synthesis of synchronous sequential devices.
Instructor(s): G. Meyer; P. Julian
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.150. Light, Image and Vision.
This course is designed for beginning undergraduate students and covers the principle of optics and imaging from the human vision perspective. The topics for the course include the basic principles and properties of light, imaging and image formation, optical imaging and display systems, and human vision. The course include bio-weekly labs that allows students to implement and experience the concepts learned during the lectures.
Instructor(s): J. Kang
Area: Engineering.

EN.520.211. ECE Engineering Team Project.
This course introduces the student to the basics of engineering team projects. The student will become a member of and participate in the different aspects of an ECE team project over several semesters. (Freshmen and Sophomores)
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.212. ECE Engineering Team Project (Freshmen and Sophomores).
This course introduces the student to the basics of engineering team projects. The student will participate in an ECE engineering team project as a member. The student is expected to participate in the different aspects of the project over several semesters. (Freshmen and Sophomores)
Permission of instructor required.
Instructor(s): J. Kang; J. West; R. Etienne Cummings
Area: Engineering.

EN.520.213. Circuits.
An introductory course on electric circuit analysis. Topics include time domain and frequency domain analysis techniques, transient and steady-state response, and operational amplifiers.
Prerequisites: AS.110.108 and AS.110.109
Instructor(s): H. Weinert
Area: Engineering.

An introduction to discrete-time and continuous-time signals and systems covers representation of signals and linear time-invariant systems and Fourier analysis.
Prerequisites: Corequisite: AS.110.202; Prerequisite: EN.520.213
Instructor(s): M. Elhilali
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.216. Introduction To VLSI.
This course teaches the basics of switch-level digital CMOS VLSI design. This includes creating digital gates using MOS transistors as switches, laying out a design using CAD tools, and checking the design for conformance to the Scalable CMOS design rules. Recommended: EN.520.213.
Prerequisites: EN.520.142 and recommended: 520.213
Instructor(s): A. Andreou
Area: Engineering.

For current course information and registration go to https://isis.jhu.edu/classes/
Vector analysis, electrostatic fields in vacuum and material media, stationary currents in conducting media, magnetostatic fields in vacuum and material media. Maxwell's equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications. 
Prerequisites: Co-req: AS.110.202; Prerequisites: AS.171.101 and AS.171.102 and AS.110.109 Pre/Co-Requisite: AS.110.202  
Instructor(s): M. Foster  
Area: Engineering, Natural Sciences.

EN.520.220. Fields, Matter & Waves.  
Magnetostatic fields in vacuum and material media. Maxwell’s equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications.  
Prerequisites: EN.520.219 or equivalent  
Instructor(s): M. Foster  
Area: Engineering, Natural Sciences.

A study of the structure and organization of classical von Neuman uniprocessor computers. Topics include a brief history of modern machines starting from the Turing computer model, instruction sets, addressing, RISC versus CICS, traps and interrupt handling, two's complement arithmetic, adders and ALUs, CSA's Booth's algorithm, multiplication and division, control unit design, microprogramming, dynamic versus static linking, memory systems and memory hierarchy, paging segmentation, cache hardware, cache organizations, and replacement policies.  
Prerequisites: EN.520.142  
Instructor(s): P. Pouliquen  
Area: Engineering.

EN.520.240. Introduction to Mechatronics.  
Introduction to Mechatronics is mostly hands-on, interdisciplinary design class consisting of lectures about key topics in mechatronics, and lab activities aimed at building basic professional competence. After completing the labs, the course will be focused on a final mini-project for the remainder of the semester. This course will encourage and emphasize active collaboration with classmates. Each team will plan, design, manufacture and/or build, test, and demonstrate a robotic system that meets the specified objectives.  
Instructor(s): C. Rizk  
Area: Engineering.

This course provides an introduction to the science and engineering of renewable energy technologies. The class will begin with an overview of today's energy landscape and proceed with an introduction to thermodynamics and basic heat engines. Specific technologies to be discussed include photovoltaics, fuel cells and hydrogen, biomass, wind power and energy storage. The class should be accessible to those from a variety of science and engineering disciplines. Recommended Course Background: Introductory Physics and Calculus.  
Instructor(s): S. Thon  
Area: Engineering.

EN.520.231. Introduction to Information Processing of Sensory Signals.  
An introductory course to basic concepts of information processing of human communication signals (sounds, images) in living organisms and by machine. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.  
Instructor(s): H. Hermansky  
Area: Engineering.

EN.520.345. Electrical & Computer Engineering Laboratory.  
This course consists of 11 one-week laboratory experiments intended to provide an introduction to analog and digital circuits commonly used in engineering. Topics include phase and frequency response, transistors, operational amplifiers, filters, and other analog circuits. The experiments are done using computer controlled digital oscilloscopes, function generators, and power supplies.  
Prerequisites: 171.101-102 and EN.520.213  
Instructor(s): A. Foster; S. Ramesh  
Area: Engineering.

EN.520.349. Microprocessor Lab I.  
This course introduces the student to the programming of microprocessors at the machine level. 68HC08, 8051, and eZ8 microcontrollers are programmed in assembly language for embedded control purposes. The architecture, instruction set, and simple input/output operations are covered for each family. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.142 or equivalent.  
Instructor(s): R. Glaser  
Area: Engineering.

EN.520.353. Control Systems.  
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).  
Prerequisites: Prereqs: EN.530.343 AND EN.520.214  
Instructor(s): D. Tarraf  
Area: Engineering.

EN.520.372. Programmable Device Lab.  
The use of programmable memories (ROMs, EPROMs, and EEPROMs) as circuit elements (as opposed to storage of computer instructions) is covered, along with programmable logic devices (PALs and GALS). These parts permit condensing dozens of standard logic packages (TTL logic) into one or more off-the-shelf components. Students design and build circuits using these devices with the assistance of CAD software. Topics include programming EEPROMs; using PLDs as address decoders; synchronous sequential logic synthesis for PLDs; and PLD-based state machines. Recommended Course Background: EN.520.142 and EN.520.345  
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.  
Instructor(s): R. Glaser  
Area: Engineering.
EN.520.391. CAD Design of Digital VLSI Systems I (Juniors).
An introductory course in which students, manually and through computer simulations, design digital CMOS integrated circuits and systems. The design flow covers transistor, physical, and behavioral level descriptions, using SPICE, Layout, and Verilog HDL VLSI CAD tools. After design computer verification, students can fabricate and test their semester-long class projects. Juniors Only. Recommended Course Background: EN.520.142, EN.520.216 or equivalent; Corequisite: EN600.333, EN.600.334, EN.520.349 or EN.520.372
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.401. Basic Communication.
This course covers the principles of modern analog and digital communication systems. Topics include: amplitude modulation formats (DSB, SSB, VSB), exponential modulation formats (PM, FM), superheterodyne receivers, digital representation of analog signals, sampling theorem, pulse code modulation formats (PCM, DPCM, DM, spread-spectrum), signals with additive Gaussian noise, maximum likelihood receiver design, matched filtering, and bit error rate analyses of digital communication systems.
Prerequisites: Prereqs: EN.520.214 AND EN.550.310 or equivalent.
Instructor(s): F. Davidson
Area: Engineering.

EN.520.402. Digital Communications.
This is a first course in digital communications. Topics covered are sampling theorem, representation and reconstruction of analog signals from sampled values, quantization noise, pulse code modulation, delta modulation, digital waveform encoding, signal space descriptions of binary and M-ary signaling schemes (BPSK, QAM, FSK, PAM, PSK), optimal receivers, effects of additive Gaussian noise on bit error rates, digital transmission through band-limited channels, and multicarrier transmission systems (OFDM). System concepts will be emphasized through implementation with TIMS hardware. This course is a replacement for EN.520.401 and EN.520.465 and can not be taken by students who have taken these courses.
Prerequisites: ( EN.520.214 ) AND ( EN.550.310 OR EN.550.311 OR EN.550.420 OR equivalent);EN.520.401 AND EN.520.465.
This course is a replacement for EN.520.401 and EN.520.465 and can not be taken by students who have taken these courses.
Instructor(s): F. Davidson
Area: Engineering, Natural Sciences.

EN.520.403. Introduction to Optical Instruments.
This course is intended to serve as an introduction to optics and optical instruments that are used in engineering, physical, and life sciences. The course covers first basics of ray optics with the laws of refraction and reflection and goes on to description of lenses, microscopes, telescopes, and imaging devices. Following that basics of wave optics are covered, including Maxwell equations, diffraction and interference. Operational principles and performance of various spectrometric and interferometric devices are covered including both basics (monochromatic, Fabry-Perot and Michelson interferometers), and advanced techniques of near field imaging, laser spectroscopy, Fourier domain spectroscopy, laser Radars and others.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.407. Introduction to the Physics of Electronic Devices.
This course is designed to develop and enhance the understanding of the basic physical processes taking place in the electronic and optical devices and to prepare students for taking classes in semiconductor devices and circuits, optics, lasers, and microwaves devices, as well as graduate courses. Both classical and quantum approaches are used. Specific topics include theory of molecular bonding; basics of solid state theory; mechanical, transport, magnetic, and optical properties of the metals; semiconductors; and dielectrics.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.410. Fiber Optics & Devices.
This course covers light propagation in fiber optic light guides, integrated optic wave guides, photodetectors, and the photon nature of light. Topics include light propagation in step-index and graded-index optical fibers, dielectric slab waveguides, photodetectors, photon shot noise, and photodetector signal-to-noise ratios. Recommended Course Background: EN.520.214, EN.520.219-EN.520.220, or equivalent.
Instructor(s): F. Davidson
Area: Engineering.

EN.520.414. Image Processing & Analysis.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.415. Image Process & Analysis II.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation.
Prerequisites: EN.520.414
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.416. Processing of Audio and Visual Signals.
This course consists of two parts. The lecture component of this course is covered by attending EN.520.315. Concurrently, on the more advanced graduate level, there is an additional requirement of critical analysis of the material covered, and the hands-on homework complementing the lectures. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky
Area: Engineering.
EN.520.419. Iterative Algorithms.
An introduction to the study of the structure, behavior and design of iterative algorithms. Topics include problem formulations, algorithm description and classification, the deterministic iterative (DI) schema, doubling schema, cluster point sets, periodic points, DI schemas without stop rule, the monotonic DI schema, contractive and affine maps, bounded and Cauchy sequences, asymptotically regular sequences, monotonic sequences.
Prerequisites: AS.110.201-202.
Instructor(s): G. Meyer
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.424. FPGA Synthesis Lab.
An advanced laboratory course in the application of FPGA technology to information processing, using VHDL synthesis methods for hardware development. The student will use commercial CAD software for VHDL simulation and synthesis, and implement their systems in programmable XILINX 20,000 gate FPGA devices. The lab will consist of a series of digital projects demonstrating VHDL design and synthesis methodology, building up to final projects at least the size of an 8-bit RISC computer. Projects will encompass such things as system clocking, flip-flop registers, state-machine control, and arithmetic. The students will learn VHDL methods as they proceed through the lab projects, and prior experience with VHDL is not a prerequisite.
Prerequisites: 520.142 and 520.345. Recommended Courses: 600.333 (Computer System Fundamentals) or 520.349 (Microprocessor Lab)
Instructor(s): P. Pouliquen
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.432. Medical Imaging Systems.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Co-listed as EN.580.472
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): J. Prince
Area: Engineering.

EN.520.433. Medical Image Analysis.
This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include, interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: EN.520.432 OR EN.580.472 OR EN.550.310 OR EN.550.311
Instructor(s): J. Prince
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi- modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473
Prerequisites: EN.520.432 OR EN.580.472
Instructor(s): B. Tsui.
Methods for processing discrete-time signals. Topics include signal and system representations, z-transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214.
Instructor(s): H. Weinert
Area: Engineering.

This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing.
Instructor(s): M. Elhilali
Area: Engineering.

EN.520.447. Information Theory.
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g. image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).
Instructor(s): S. Khudanpur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.448. Electronics Design Lab.
An advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. Recommended:
EN.600.333, EN.600.334, EN.520.349, EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: EN.520.345 or equivalent Recommended: 
600.333, 600.334, 520.216, 520.349, 520.372, 520.490 or 520.491.; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Etienne Cummings

EN.520.450. Advanced Micro-Processor Lab.
This course covers the usage of common microcontroller peripherals. Interrupt handling, timer operations, serial communication, digital to analog and analog to digital conversions, and flash ROM programming are done on the 68HC08, 8051, and eZ8 microcontrollers. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.349
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Glaser.

EN.520.452. Advanced ECE Engineering Team Project.
This course introduces the student to running an ECE engineering team project. The student will participate in the team project as a leading member and is expected to manage both the team members and the different aspects of the project over several semesters. Permission of the instructor is required for new team members. (Junior and Seniors) Permission of instructor is required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.453. Advanced ECE Engineering Team Project.
The course introduces the student to running an engineering team project. The student will participate in the ECE engineering team project as a leading member. The student is expected to participate in the different aspects of the project over several semesters and manage both team members and the project. (Juniors and Seniors) Permission of instructor is required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Kang; J. West; R. Etienne Cummings
Area: Engineering.

EN.520.454. Control Systems Design.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

Basic principles of quantum mechanics for engineers. Topics include the quantum theory of simple systems, in particular atoms and engineered quantum wells, the interaction of radiation and atomic systems, and examples of application of the quantum theory to lasers and solid-state devices. Recommended Course Background: AS.171.101-AS.171.102 and EN.520.219-EN.520.220
Instructor(s): A. Kaplan
Area: Engineering.

EN.520.459. Quantum Mechanics for Engineering.
This course will describe some of the basic ideas in and early development of quantum mechanics. This course is intended for students without any previous background in this subject. A description of some of the fundamental ideas in Quantum Mechanics will be offered from a practical point of view and from a perspective that should be useful to engineers who want to understand how these concepts manifest in materials and devices. Topics include the Schrodinger Wave Equation and the concept of a wave function, quantization in atoms and engineered semiconductor heterostructures, the interaction of radiation and atomic systems, and examples of the application of quantum theory in lasers and electronic solid-state devices. Recommended background for this course includes freshmen-year physics (including fundamentals of electricity and magnetism) and sophomore-year mathematics (including partial derivatives, basic differential equations, and fundamentals of linear algebra).
Instructor(s): T. Schlesinger
Area: Engineering, Quantitative and Mathematical Sciences.
EN.520.460. The Art of Error Control Coding.
Error control coding is the study and practice of detecting and/or correcting errors that occur in the transmission of digital information over a noisy communication channel, the transferal of information to and from memory and mass storage in a computer, or in any other application where random processes corrupt information. The student will study encoders and decoders for the most important codes in current use and will confront realistic problems in the use of coding. The course will comprise lectures, discussions, and projects.
Prerequisites: (EN.550.310 OR EN.550.311) OR EN.550.420 or equivalent AND (AS.110.201 or equivalent)
Instructor(s): A. Cooper
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.465. Digital Communications I.
This course introduces the basic tools and topics of modern digital communication beginning with the mathematical representation and spectral properties of random signals and a basic introduction to the detection of real and complex signals in the presence of noise. Memoryless modulation and demodulation schemes are thoroughly studied for the Gaussian channel, and measures of performance are developed. Topics in wireless communication will be introduced.
Recommended Course Background: EN.520.401, EN.550.310 or EN.550.420
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.473. Magnetic Resonance in Medicine.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472). Co-listed with EN.580.476 and EN.580.673.
Instructor(s): D. Herzka
Area: Engineering, Natural Sciences.

EN.520.482. Introduction to Lasers.
This course covers the basic principles of laser oscillation. Specific topics include propagation of rays and Gaussian beams in lens-like media, optical resonators, spontaneous and stimulated emission, interaction of optical radiation and atomic systems, conditions for laser oscillation, homogeneous and inhomogeneous broadening, gas lasers, solid state lasers, Q-switching and mode locking of lasers.
Prerequisites: EN.520.219 AND EN.520.220
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.

EN.520.483. Bio-Photonics Laboratory.
This laboratory course involves designing a set of basic optical experiments to characterize and understand the optical properties of biological materials. The course is designed to introduce students to the basic optical techniques used in medicine, biology, chemistry and material sciences.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Kang.

This course is designed to develop and enhance the understanding of the operating principles and performance characteristics of the modern semiconductor devices used in high speed optical communications, optical storage and information display. The emphasis is on device physics and fabrication technology. The devices include heterojunction bipolar transistors, high mobility FETs, semiconductor lasers, laser amplifiers, light-emitting diodes, detectors, solar cells and others.
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.

EN.520.491. CAD Design of Digital VLSI Systems I (Seniors/Grads).
Seniors and Graduate Students Only
Instructor(s): R. Etienne Cummings
Area: Engineering.

Silicon models of information and signal processing functions, with implementation in mixed analog and digital CMOS integrated circuits. Aspects of structured design, scalability, parallelism, low power consumption, and robustness to process variations. Topics include digital-to-analog and analog-to-digital conversion, delta-sigma modulation, bioinstrumentation, and adaptive neural computation.
The course includes a VLSI design project. Recommended Course Background: EN.521.491 or equivalent.
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.495. Microfabrication Laboratory.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Perm. Req’d. Co-listed as EN.580.495 & EN.530.495
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.520.498. Senior Design Project.
Capstone design project, in which a team of students engineers a system and evaluates its performance in meeting design criteria and specifications. Example application areas are micro-electronic information processing, image processing, speech recognition, control, communications, and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics, and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering, and computer science majors, is strongly encouraged. Instructor permission required.
Instructor(s): Staff
Area: Engineering.
EN.520.499. Senior Design Project.
Capstone design project, in which a team of students engineer a system and evaluate its performance in meeting design criteria and specifications. Example application areas are microelectronic information processing, image processing, speech recognition, control, communications and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering and computer science majors, is strongly encouraged.
Instructor(s): Staff
Area: Engineering.

EN.520.501. Independent Study-Freshmen-Sophomores.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by freshmen or sophomores. Instructor permission required.
Instructor(s): A. Andreou; J. Kang; J. Prince.

EN.520.502. Indep Study - Fresh/Soph.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Instructor(s): A. Andreou.

EN.520.503. Independent Study-Juniors-Seniors.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors. Instructor permission required.
Instructor(s): Staff.

EN.520.504. Independent Study - Juniors/Seniors.
Individual study, including participation in research, under the guidance of a faculty member in the department. The program of study or research, time required, and credit assigned must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors.
Instructor(s): Staff.

EN.520.545. Research.
Instructor Approval Required. Independent study or research over the summer under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.
Instructor(s): Staff.

EN.520.548. Independent Research.
Instructor(s): S. Thon.

Instructor(s): J. Kang; T. Tran.

EN.520.572. Electrical & Computer Engineering Internship-Intersession.
EN.520.574. Research-Intersession.
EN.520.576. Independent Study.
Instructor(s): R. Etienne Cummings.

EN.520.595. Independent Study.
Instructor(s): A. Andreou; J. Kang; J. West; R. Etienne Cummings; T. Tran.

EN.520.597. Research-Summer.
Instructor(s): F. Davidson; J. West; P. Iglesias; R. Etienne Cummings; T. Tran.

EN.520.599. Internship-Summer.
Instructor(s): F. Davidson; G. Meyer; J. Kang; M. Miller.

Seminar for Electrical & Computer Engineering; required of all doctoral students who have not passed the qualifying exam. Repeatable course.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

EN.520.601. Introduction to Linear Systems Theory.
A beginning graduate course in multi-input multi-output, linear, time-invariant systems. Topics include state-space and input-output representations; solutions and their properties; multivariable poles and zeros; reachability, observability and minimal realizations; stability; system norms and their computation; linearization techniques. Recommended Course Background: Undergraduate courses in control systems and linear algebra.
Instructor(s): P. Iglesias.

EN.520.611. Ultrafast Optical Phenomena.
This course will give and introduction to the field of ultrafast phenomena which studies processes in nature and engineering occurring on the shortest of time scales. Topics will include the complex representation of ultrafast optical signals, nonlinear optics, pulse propagation effects resulting from dispersion and nonlinearities, the fundamentals of ultrafast sources including mode locking and amplification, ultrafast measurement techniques, and the wide range of cutting-edge applications of ultrafast sources.
Area: Engineering, Natural Sciences.

EN.520.613. Advanced Topics in Optical Medical Imaging.
The course will review the recent advances in photonics technologies for medical imaging and sensing. The course is designed for graduate students with a back ground in optics and engineering. The main topics for the course are: Light Source and Devices for Biomedical Imaging; Fluorescence, Raman, Rayleigh Scatterings; Optical Endoscopy and Virtual biopsy; Novel imaging contrast dyes, nanoparticles, and optical clearing reagents; Label-free optical technologies in clinical applications; Neurophotons and Optogenetics.
Instructor(s): J. Kang.

EN.520.618. Hybrid Systems.
This graduate level seminar style class focuses on the emerging field of hybrid systems. Topics covered include mathematical models of hybrid systems, analysis and controller synthesis techniques, and model complexity reduction.
Area: Engineering.

This course covers information on the non-deterministic schema and cyclic iterative schemas, Jacobians, Hessians and Mean Value Theorems, spectral norm, convex sets and positive definite majs.
Instructor(s): G. Meyer.
EN.520.621. Introduction To Nonlinear Systems.
Nonlinear systems analysis techniques: phase-plane, limit cycles, harmonic balance, expansion methods, describing function, Liapunov stability, Popov criterion. Recommended Course Background: EN.520.601 or equivalent.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

By employing fundamental concepts from diverse areas of research, such as statistics, signal processing, biophysics, biochemistry, cell biology, and epidemiology, this course introduces a multidisciplinary and rigorous approach to the modeling and computational analysis of complex interaction networks. Topics to be covered include: overview of complex nonlinear interaction networks and their applications, graph-theoretic representations of network topology and stoichiometry, stochastic modeling of dynamic processes on complex networks and master equations, Langevin, Poisson, Fokker-Plank, and moment closure approximations, exact and approximate Monte Carlo simulation techniques, time-scale separation approaches, deterministic and stochastic sensitivity analysis techniques, network thermodynamics, and reverse engineering approaches for inferring network models from data.
Instructor(s): J. Goutsias.

EN.520.624. Integrated Photonics.
This course gives an introduction to integrated photonics. Topics include: material platforms, fabrication approaches, devices and device operation, numerical modeling, nonlinear processes, and applications. Devices discussed include waveguides, resonators, sensors, modulators, detectors, and amplifiers. Recommended Course Background: EN.520.219-EN.520.220, EN.520.495, or equivalent.
Instructor(s): A. Foster
Area: Engineering, Natural Sciences.

EN.520.627. Photovoltaics and Energy Devices.
This course provides an introduction to the science of photovoltaics and related energy devices. Topics covered include basic concepts in semiconductor device operation and carrier statistics; recombination mechanisms; p-n junctions; silicon, thin film, and third generation photovoltaic technologies; light trapping; and detailed balance limits of efficiency. Additionally, thermophotovoltaics and electrical energy storage technologies are introduced. A background in semiconductor device physics (EN.520.485, or similar) is recommended.
Instructor(s): S. Thon

EN.520.633. Intro To Robust Control.
The subject of this course is robust analysis and control of multivariable systems. Topics include system analysis (small gain arguments, integral quadratic constraints); parametrization of stabilizing controllers; $\mathcal{H}_\infty$ optimization based robust control design; and LTI model order reduction (balanced truncation, Hankel reduction). Recommended Course Background: EN.520.601 or EN.530.616 or EN.580.616
Instructor(s): D. Tarraf
Area: Engineering, Natural Sciences.

EN.520.636. Signaling Pathways.
Instructor(s): P. Iglesias.

EN.520.646. Wavelets & Filter Banks.
This course serves as an introduction to wavelets, filter banks, multirate signal processing, and time-frequency analysis. Topics include wavelet signal decompositions, bases and frames, QMF filter banks, design methods, fast implementations, and applications. Recommended Course Background: EN.520.435, AS.110.201, C/C++ and Matlab programming experience.
Instructor(s): T. Tran.

EN.520.648. Compressed Sensing and Sparse Recovery.
Sparsity has become a very important concept in recent years in applied mathematics, especially in mathematical signal and image processing, as in inverse problems. The key idea is that many classes of natural signals can be described by only a small number of significant degrees of freedom. This course offers a complete coverage of the recently emerged field of compressed sensing, which asserts that, if the true signal is sparse to begin with, accurate, robust, and even perfect signal recovery can be achieved from just a few randomized measurements. The focus is on describing the novel ideas that have emerged in sparse recovery with emphasis on theoretical foundations, practical numerical algorithms, and various related signal processing applications. Recommended Course Background: Undergraduate linear algebra and probability.
Instructor(s): T. Tran.

EN.520.651. Random Signal Analysis.
A course covering second-order properties of random processes with applications in estimation and detection. A foundation course for further work in stochastic systems, signal processing, and communications. Recommended Course Background: elementary courses in probability, signals, and linear systems.
Instructor(s): S. Khudanpur

EN.520.652. Extraction of Signals from Noise.
This course is intended to give students an opportunity to do directed research in algorithm development that culminates in a MATLAB program. Students will learn about extracting signals from noise using statistical and non-statistical models. Topics include Kalman filtering, smoothing, interpolation (upsampling), spline fitting, and the numerical linear algebra issues that impact these problems. Emphasis is on fast, compact, stable algorithms. The grade is based on the term project and occasional homework. There are no examinations. Class attendance is mandatory.
Prerequisites: Some background in linear algebra, matrix theory, random signals, and MATLAB.
Instructor(s): H. Weinert.

EN.520.666. Information Extraction.
Introduction to statistical methods of speech recognition (automatic transcription of speech) and understanding. The course is a natural continuation of EN.600.465 but is independent of it. Topics include elementary information theory, hidden Markov models, the Baum and Viterbi algorithms, efficient hypothesis search methods, statistical decision trees, the estimation-maximization (EM) algorithm, maximum entropy estimation and estimation of discrete probabilities from sparse data for acoustic and language modeling. Co-listed as EN.600.666. Recommended Course Background: EN.550.310 and EN.600.120 or equivalent, expertise in C or C++ programming.
Instructor(s): S. Khudanpur.
EN.520.673. Magnetic Resonance in Medicine.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472). Co-listed with EN.580.476 and EN.580.673.
Instructor(s): D. Herzka.

EN.520.678. Biomedical Photonics.
This course will cover the basic optics principles including geometric, beam and wave description of light. The course will also cover the basic generation and detection techniques of light and the principles of optical imaging and spectroscopy. After the basis is established, we will focus on some commonly employed optical techniques and tools for biomedical research including various optical microscopy technologies, fiber optics, Raman spectroscopy, Fluorescence (lifetime), FRAT, FRET and FCS. The recent development in tissue optics, biomedical optical imaging/spectroscopy techniques (such as OCT, multiphoton fluorescence and harmonics microscopy, Structured Illumination, light scattering, diffuse light imaging and spectroscopy, optical molecular imaging, photo-acoustic imaging) will also be discussed. Representative biomedical applications of translational biomedical photonics technologies will be integrated into the corresponding chapters.
Instructor(s): X. Li
Area: Engineering.

EN.520.680. Speech and Auditory Processing by Humans and Machines.
This graduate level seminar focuses on works that are relevant to building advanced systems for information extraction from auditory signals. It loosely compliments and expands on the lecture material from the graduate course EN.520.515. Participants will take turns in presenting and critically discussing selected topics, with an aim of using this knowledge in their research projects. When available, guest speakers may at times contribute or substitute for the presentation of the participants. Recommended Course Background: Completion or concurrent participation in EN.520.515 or consent of the instructor.
Instructor(s): H. Hermansky.

EN.520.701. Current Topics in Language and Speech Processing.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U.
Instructor(s): S. Khudanpur.

EN.520.702. Current Topics in Language and Speech Processing.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Cross-listed with Computer Science. Grading will be S/U.
Instructor(s): S. Khudanpur
Area: Engineering.

EN.520.735. Sensory Information Processing.
Analysis of information processing in biological sensory organs and engineered microsystems using the mathematical tools of communication theory. Natural or synthetic structures are modeled as microscale communication networks implemented under physical constraints, such as size and available energy resources and are studied at two levels of abstraction. At the information processing level we examine the functional specification, while at the implementation level we examine the physical specification and realization. Both levels are characterized by Shannon’s channel capacity, as determined by the channel bandwidth, the signal power, and the noise power. The link between the information processing level and the implementation level of abstraction is established through first principles and phenomenological otherwise, models for transformations on the signal, constraints on the system, and noise that degrades the signals.
Instructor(s): A. Andreou.

EN.520.738. Advanced Electronic Lab Design.
This course is the graduate expansion of the EN.520.448 Electronic Design Lab, which is an advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. For this graduate expansion, all projects will be based on recently published research from IEEE Transactions. The students will be required to fully research, analyze, implement and demonstrate their chosen topic. The emphasis will be on VLSI microsystems, although other topics will also be considered. Open to graduate students only.
Instructor(s): R. Etienne Cummings.

EN.520.746. Seminar: Medical Image Analysis.
This weekly seminar will focus on research issues in medical image analysis, including image segmentation, registration, statistical modeling, and applications. It will also include selected topics relating to medical image acquisition, especially where they relate to analysis. The purpose of the course is to provide the participants with a background in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University. The format of the course is informal. It will meet weekly for approximately 1.5 hours. Students will read selected papers and will be assigned on a rotating basis to lead the discussion. Co-listed as EN.600.746.
Instructor(s): J. Prince.

EN.520.761. Large Scale Analog Compt.
Instructor(s): A. Andreou; R. Etienne Cummings.
EN.520.762. Seminar on Large Scale Analog Computation. Research seminar devoted to current research in the engineering of large scale integrated analog systems. Topics include models for vision and auditory processing as well as implementation constraints and limitations. Instructor(s): A. Andreou; R. Etienne Cummings Area: Engineering.

EN.520.771. Advanced Integrated Circuits. Instructor(s): A. Andreou.

EN.520.772. Advanced Integrated Circuits.

EN.520.773. Advanced Topics In Microsystem Fabrication. Graduate-level course on topics that relate to microsystem integration of complex functional units across different physical scales from nano to micro and macro. Topics will include emerging fabrication technologies, micro-electromechanical systems, nanolithography, nanotechnology, soft lithography, self-assembly, and soft materials. Discussion will also include biological systems as models of microsystem integration and functional complexity. Perm. Req’d. Instructor(s): A. Andreou; J. Wang.

EN.520.800. Independent Study. Individual, guided study under the direction of a faculty member in the department. May be taken either term by graduate students. Instructor(s): Staff.

EN.520.801. Dissertation Research.

EN.520.802. Dissertation Research. Instructor(s): Staff.

EN.520.809. Special Studies. Individual study in an area of mutual interest to a student and a faculty member in the department. Permission of Instructor required.

EN.520.810. Special Studies. Individual study in an area of mutual interest to a student and a faculty member in the department. Instructor(s): M. Thomas; R. Jenkins; R. Joseph.

EN.520.890. Independent Study-Summer. Instructor(s): Staff.

Cross Listed Courses

General Engineering

EN.500.745. Seminar in Computational Sensing and Robotics. Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering. Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

Materials Science Engineering

EN.510.314. Electronic Properties of Materials. Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. Instructor(s): A. Andreou; R. Etienne Cummings; R. Vidal.

EN.510.311 AND EN.510.202 or another programming course, or permission of instructor.

EN.510.418. Electronic and Photonic Processes and Devices. This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418. Instructor(s): T. Poehler Area: Engineering, Natural Sciences.

EN.510.611. Solid State Physics. An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering. Instructor(s): T. Poehler.

EN.510.612. Solid State Physics. Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611 Instructor(s): T. Poehler.
EN.510.618. Electronic and Photonic Processes and Devices.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

Mechanical Engineering
EN.530.682. Haptic Applications.
An introduction to the required theoretical and practical background in the design and development of haptic applications. Haptic technology enables users to touch and/or manipulate virtual or remote objects in simulated environments or tele-operation systems. This course aims to cover the basics of haptics through lectures, lab assignments, a term project, and readings on current topics in haptics. Through lab assignments, students learn to create haptic-enabled virtual environments using software development toolkits and a haptic device. Students will be required to complete a project with approval of the instructor. Recommended course background: ME, CS, and ECE graduate and senior undergraduate students who are being enthusiastic to learn about haptics and knowledgeable in basic C++ programming. Students with experience with other programming languages (Python, Java, etc.) should be able to self-tutor themselves to complete lab assignments.
Instructor(s): M. Zadeh.

Biomedical Engineering
What therapy could cure debilitating diseases such as cancer, HIV, allergies, diabetes, Alzheimers, or influenza? Engineers and Immunologists are attempting to create this with your body’s own immune system. Understanding how these therapies work, how they might work in the future, and how to apply engineering principles to enhance these therapies will be the focus of this course.
Instructor(s): A. Kosmides; J. Hickey
Area: Engineering.

An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): J. Prince
Area: Engineering.

This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473
Instructor(s): A. Rahnim; B. Tsui; E. Frey; Y. Du
Area: Engineering.

EN.580.616. Introduction to Linear Dynamical Systems.
This course examines linear, discrete- and continuous-time, and multi-input-output systems in control and related areas. Least squares and matrix perturbation problems are considered. Topics covered include state-space models, stability, controllability, observability, transfer function matrices, realization theory, feedback compensators, state feedback, optimal regulation, observers, observer-based compensators, measures of control performance, and robustness issues using singular values of transfer functions. BME EN.580.616 can be used to fulfill the requirement of ME EN.530.616 or ECE EN.520.601.
Instructor(s): S. Sarma.

Computer Science
EN.600.479. Representation Learning.
Often the success of a machine learning project depends on the choice of features used. Machine learning has made great progress in training classification, regression and recognition systems when “good” representations, or features, of input data are available. However, much human effort is spent on designing good features which are usually knowledge-based and engineered by domain experts over years of trial and error. A natural question to ask then is “Can we automate the learning of useful features from raw data?” Representation learning algorithms such as principal component analysis aim at discovering better representations of inputs by learning transformations of data that disentangle factors of variation in data while retaining most of the information. The success of such data-driven approaches to feature learning depends not only on how much data we can process but also on how well the features that we learn correlate with the underlying unknown labels (semantic content in the data). This course will focus on scalable machine learning approaches for learning representations from large amounts of unlabeled, multi-modal, and heterogeneous data. We will cover topics including deep learning, multi-view learning, dimensionality reduction, similarity-based learning, and spectral learning. Students may receive credit for 600.479 or 600.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra.
Prerequisites: If you have completed EN.600.679 you may not enroll in EN.600.479.
Instructor(s): R. Arora
Area: Engineering.
EN.600.679. Representation Learning.
Graduate level version of 600.479. Students may receive credit for 600.479 or 600.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra. Co-listed with EN.600.479
Prerequisites: If you have completed EN.600.479 you may not enroll in EN.600.679.
Instructor(s): R. Arora.

Master of Science in Engineering Management

The Master of Science in Engineering Management (MSEM) degree program combines advanced course work in highly-specialized technical fields with a professional education in contemporary business, entrepreneurship, and management practices. Graduates of the program will be provided with the educational background to pursue professional management roles in industry.

Facilities

The MSEM program has a dedicated seminar room housed in Whitehead 105. Students are able to study, conduct research and build prototypes within this space.

Graduate Requirements

Please consult directly with the MSEM program director or MSEM academic advisor to confirm the below requirements; changes may have occurred since annual publication.

Students in the MSEM program will take ten courses to fulfill degree requirements, with the following guidelines:

• Five advanced courses in the engineering/technical concentration
• 3 full-fall semester management courses, a full spring semester MSEM Seminar courses and 6 half-semester courses.
• No grade lower than C may be applied to the program
• Courses must be at the 400-level or higher
• Departments sponsoring technical concentrations may impose stricter requirements for course work within the concentration

At the discretion of the student’s advisors, an MSEM student may be permitted to double-count up to two JHU courses (one for the technical concentration and one for the management concentration) or apply undergraduate or graduate courses taken at JHU or elsewhere but not applied to a degree, in accordance with conditions in the WSE Policy on Double-Counting Courses.

Advising

MSEM students will receive advising on the engineering/technical concentration from a designated faculty member affiliated with that concentration. MSEM students will be advised regarding the management concentration by members of the Center for Leadership Education faculty.

Faculty

Faculty members teaching the technical concentration courses are listed in their respective engineering departments elsewhere in this catalog. Faculty members teaching the management concentration courses are listed in the Center for Leadership Education section of this catalog.

Management Concentration

The Center for Leadership Education has constructed a five-course program tailored to the needs of future engineering managers. MSEM students will participate in a cohort program, which begins each fall, where all students in an entering class will take the following five management courses together:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.662.611</td>
<td>Strategies: Accounting &amp; Finance (fall)</td>
</tr>
<tr>
<td>EN.662.651</td>
<td>Marketing Communication and Strategy (spring)</td>
</tr>
<tr>
<td>EN.662.642</td>
<td>Management and Leadership (spring)</td>
</tr>
<tr>
<td>EN.662.692</td>
<td>Strategies for Innovation &amp; Growth (fall)</td>
</tr>
<tr>
<td>EN.662.632</td>
<td>Business Law and Intellectual Property</td>
</tr>
</tbody>
</table>

In addition, all MSEM students are required to attend the MSEM Seminar (EN.662.811 M.S. in Engineering Management Seminar/EN.662.812 M.S. in Engineering Management (MSEM) Seminar) course while enrolled in the program. This will meet weekly and addresses three important content areas: Innovation and design thinking; personal skills and development especially in the communication arena; and talks with practicing engineering managers. The Engineering Management program reserves the right to change the list of eligible courses at its discretion.

MSEM Course # EN.662.802: Engineering Management Internship Assessment

This course involves the assessment of a student’s internship experience via a report and oral presentation. The questions and general format of the report and presentation will be provided by the instructor (http://memp.pratt.duke.edu/sites/memp.pratt.duke.edu/files/EGRMGMT_551_External.doc). The report and presentation will be evaluated by the instructor and both must be approved to obtain credit for this course. One full course counting toward graduation. Smedick (Summer semester)

Technical Concentrations

In addition to fulfilling the management concentration requirements, MSEM students must complete the requirements for one of fifteen technical concentrations. These are:

• Biomaterials
• Chemical & Biomolecular Engineering (pending finalized MHEC recognition- please contact Angela Ruddle for more information regarding concentration requirements and status)
• Civil Engineering
• Communications Science
• Computer Science
• Fluid Mechanics
• Materials Science and Engineering
• Mechanical Engineering
• Mechanics and Materials
• Nano-Biotechnology
• Nanomaterials and Nanotechnology
• Operations Research
• Probability and Statistics
• Smart Product and Device Design
• Environmental Systems Analysis, Economics and Public Policy

Biomaterials
(Sponsored by the Department of Materials Science & Engineering (p. 1012))

Prerequisites
• UG calculus, chemistry, biology, physics and introductory biomaterials course equivalent to EN.510.316 Biomaterials I

Required Courses (3)
<table>

Substitutions for required courses can be made at the advisor’s discretion.

Computer Science
(Sponsored by the Department of Computer Science (p. 899))

Curricular Requirements
• Any five regular graduate courses approved by the advisor, 400-level or higher, from the Department of Computer Science, not including the senior thesis. Three 1-credit graduate courses may be combined to constitute one regular graduate course.

Fluid Mechanics
(Sponsored by the Department of Mechanical Engineering (p. 1033))

Any five courses in Fluid Mechanics or closely related discipline, at the 400-level or higher, as approved by the Faculty advisor. At least two of the required technical courses must be at the 600-level or higher.

Materials Science & Engineering
(Sponsored by the Department of Materials Science & Engineering (p. 1012))

Prerequisites
• UG calculus, chemistry and physics; biology is recommended

Operations Research
(Sponsored by the Department of Applied Mathematics & Statistics (p. 816))

Prerequisites
Calculus-based background in Probability and Statistics. Students wishing to strengthen their background in this area may enroll in EN.550.420 Introduction to Probability and/or EN.550.430 Introduction to Statistics, but these courses may not be used in fulfillment of this concentration’s requirements.

Required Courses (3)
EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design 3
or EN.550.661 Foundations of Optimization
EN.570.497 Risk and Decision Analysis 3
or EN.570.608 Data Analytics for Engineering, Policy Analysis and Management
or EN.550.400 Mathematical Modeling and Consulting

Substitutions for required courses can be made at the advisor’s discretion

Elective Courses (2)
Any two courses from the following list, or a substitution as approved by the student’s concentration advisor. As course offerings vary over time, an updated list of acceptable courses will be maintained on the MSEM program website.

EN.570.493 Economic Foundations for Environmental Engineering and Policy Design
EN.570.496 Urban and Environmental Systems
EN.550.662 Optimization Algorithms
EN.550.426 Introduction to Stochastic Processes
EN.550.427 Stochastic Processes and Applications to Finance
Alternative selections can be made at the advisor’s discretion.

**Probability and Statistics**

* (Sponsored by the Department of Applied Mathematics & Statistics (p. 816))

**Admissions Requirements**

- One upper-division undergraduate course in probability (equivalent to EN.550.420 Introduction to Probability)
- One upper-division undergraduate course in mathematical statistics (equivalent to EN.550.430 Introduction to Statistics)

**Curricular Requirements**

Any five (5) of the following courses, approved by the faculty advisor:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.550.413</td>
<td>Applied Statistics and Data Analysis</td>

</tr>
<tr>
<td>EN.550.635</td>
<td>Topics in Bioinformatics</td>
</tr>
<tr>
<td>EN.550.730</td>
<td>Topics in Statistics</td>
</tr>
</tbody>
</table>

**Additional Requirements**

- An overall GPA of 3.0 must be maintained in courses used to meet the program’s technical requirements. At most two course grades of C or C+ are allowed to be used, and the rest of the course grades must be B- or better.
- Students must satisfy the department’s graduate student computing requirement.
- With advisor’s approval, one non-departmental course containing appropriate mathematical or statistical content can be counted to satisfy the five course requirement.

**Smart Product and Device Design**

* (Sponsored jointly by the Department of Mechanical Engineering (p. 1033) and the Department of Electrical & Computer Engineering [http://e-catalog.jhu.edu/departments-program-requirements-and-courses/engineering/electrical-computer-science/])

**Required Courses**

<table>
<thead>

</tr>
<tr>
<td>EN.530.421</td>
<td>Mechatronics</td>
</tr>
<tr>
<td>EN.520.448</td>
<td>Electronics Design Lab</td>
</tr>
</tbody>
</table>

Substitutions for required courses can be made at the advisor’s discretion.

**Elective Courses**

Any two (2) courses approved by the faculty advisor.

**Environmental Systems Analysis, Economics and Public Policy**

* (Sponsored by the Department of Geography & Environmental Engineering (p. 966))

**Required Courses (3)**

At least one course from each of the three following groups:

- **Economics** (with calculus)—acceptable courses include EN.570.493 Economic Foundations for Environmental Engineering and Policy Design or equivalent. (This requirement may be waived if the student has already had an intermediate microeconomics course accepted by their advisor)
- **Mathematics of Decision Making**—acceptable courses include EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design and EN.570.497 Risk and Decision Analysis
- **Policy**—acceptable courses include EN.570.659 Environmental Policy Analysis and EN.570.607 Energy Policy and Planning Models

Substitutions for required courses can be made at the advisor’s discretion.

**Elective Courses (2)**

Any of the courses listed in the Mandatory list (see Part A above)

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.570.496</td>

<td>EN.570.676</td>
<td>Stochastic Programming</td>
</tr>
</tbody>
</table>

Other courses in environmental economics, systems, or policy, as approved by the advisor.

**Additional Notes**

- All courses must be approved by the student’s advisor.
- All course must be at the 400-level or above.
- Students with a background in quantitatively rigorous economics sufficient for the economics requirement to be waived must still take five (5) courses in this area of concentration.
- No more than one course in environmental engineering may be used to fulfill the area of concentration and only with careful consultation with the student’s advisor. Candidate courses in environmental engineering include:
  - EN.570.446 Biological Process of Wastewater Treatment, EN.570.490 Solid Waste Engineering and Management, EN.570.491 Hazardous Waste Engineering and Management, EN.570.647 Hydrologic Transport in the Environment, EN.570.657 Air Pollution, etc.
- No more than one C may be used toward the degree in this concentration.

Courses

**EN.662.611. Strategies: Accounting & Finance.**
This course includes a review of financial accounting with an emphasis on the implications of GAAP selections and other managerial decisions on the financial statements. Historic financial performance is assessed using ratio analysis. Relevant cash flows are used in capital budgeting situations; projects are analyzed using discounted cash flow techniques as a measure of valuation. Managerial accounting topics of financial forecasting, cost accumulation, cost allocation, product costing, and variance analysis are used in decision making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): A. Leps.

**EN.662.620. Professional Presentations.**
This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. MSEM students only. This is a 7-week course and is not open to undergraduates. Suggested readings: The Art of Explanation by Lee Lever, Presentation Zen by Garr Reynolds
Instructor(s): J. Reiser.

**EN.662.632. Business Law and Intellectual Property.**
Business Law and Intellectual Property introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses; contracts; intellectual property; principal-agent relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. For M.S. in Engineering Management only; no audits.
Instructor(s): G. Galvez.

**EN.662.642. Management and Leadership.**
Management and Leadership is a case, experiential and research based course intended to introduce participants to issues and solutions related to growing and managing businesses with an emphasis on entrepreneurial enterprises. The course focuses on managerial decision-making and organization building through topics that include planning and managing strategic change; finding competitive advantage; making informed decisions; dealing with uncertainty; negotiating collaborative settlements; managing/leading projects, teams and professionals; networking and forming strategic alliances; valuing differences; creating and maintaining organizational cultures; and devising performance measures. Additionally, participants master aspects of management communication as they address course content. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): E. Rice.

**EN.662.650. Marketing Communications.**
Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. MSEM students only, no undergrads.
Instructor(s): R. Graham.

**EN.662.651. Marketing Communication and Strategy.**
This course is designed to introduce students to key marketing, communications, and strategic issues surrounding the process of bringing new products to the marketplace. Through cases, readings, discussion and hands-on team projects, students develop a flexible approach to thinking about marketing problems, maximizing resources and creating strategic solutions. Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. For M.S. in Engineering Management only; graded (not P/F); no audits.

**EN.662.692. Strategies for Innovation & Growth.**
This course requires participants to work in groups to address, design and plan a business solution for an engineering problem with social implications. More specifically, students will work on cross-disciplinary teams to develop a commercially viable new technology. They must select a problem amenable to an engineering solution, investigate the problem, research the issues and potential, develop a design for the technology, investigate the competitive advantage, and create and present a business plan for the idea. Course content will address many of the issues that will be encountered during the process of bringing an idea to fruition. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): P. Sheff.

**EN.662.802. Master of Science in Engineering Management Internship.**
This course involves the assessment of a student’s internship experience via a report and oral presentation. The questions and general format of the report and presentation will be provided by the instructor. The report and presentation will be evaluated by the instructor and both must be approved to obtain credit for this course. Students must be enrolled simultaneously in the internship experience.
Instructor(s): W. Smedick.
Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): S. Ozdemir.

Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): P. Sheff.

EN.662.815. CAD for MSEM.
MSEM students only or permission of instructor.
Instructor(s): M. Boyle.

W.P. Carey Minor in Entrepreneurship and Management

The Entrepreneurship & Management (E&M) program offers Johns Hopkins Arts & Sciences, Engineering, and Peabody students a broad array of courses designed to equip them to lead in business, professional, and academic arenas. Some students simply take a course or two. Many choose to fulfill the seven-course E&M minor, pairing it with their engineering, liberal arts, or public health major. The minor’s three core courses, Introduction to Business, Financial Accounting, and Marketing Principles, provide a strong foundation in the fundamentals of entrepreneurial enterprises. Students can then select any three upper-level courses (plus the required work in statistics) to complete the minor or elect to focus further in Accounting and Finance, Business Law, Leadership and Organizational Behavior, or Professional Communication.

The minor in entrepreneurship and management focuses on business and management from a multidisciplinary viewpoint, with a quantitative emphasis. The program, part of the Center for Leadership Education, offers students a diversified learning experience that emphasizes the concepts, practices, and skills necessary for effective leadership as managers and entrepreneurs in the public and private sectors.

The primary goal of the program is to provide Hopkins students with the knowledge and skills to become effective leaders and entrepreneurs. Individuals with excellent technical training and abilities often move into management positions or start new ventures. As their careers progress, they will be better prepared for success if they have the ability to understand financial reports, interpret statistical data, organize and effectively lead a team, design strategy, analyze and correct problems in the firm’s operations, and understand the dynamics of the marketplace.

The minor is purposely designed to serve different types of students. The program will help prepare students for entrance to law school, an MBA program, or other graduate school. After graduation, other students will start working in engineering or technical positions, then later move into management or start their own businesses. A third group of students is primarily interested in gaining knowledge to follow more generalized careers in finance and business.

Facilities
The CLE Full-time Faculty and staff offices are located in Whitehead Hall, suites 102, 104 and 105. Part-time Faculty and ESL Specialists offices are located in Maryland 16. Course assistants’ office hours are held in room 104.

Minor in Entrepreneurship and Management

The requirements of the minor in entrepreneurship and management can be downloaded from the Center for Leadership Education’s website under the “W.P. Carey Program in Entrepreneurship and Management” tab (http://eng.jhu.edu/wse/cle/page/em_minor). Students wishing to complete a minor in entrepreneurship and management may also obtain more information from the CLE Faculty Support Staff office located in Whitehead 105.

Core Requirements
1. Statistics - These courses expose students to the foundations of statistics that are used extensively in business decision-making. These topics include correlation, estimation, hypothesis testing, linear regression, prediction, and forecasting. Students may take either two elementary statistics courses or one intermediate/advanced calculus-based statistics course from the list below.

   - EN.550.111 Statistical Analysis I
   - or EN.550.112 Statistical Analysis II
   - or AS.230.205 Introduction to Social Statistics
   - or AS.280.345 Public Health Biostatistics
   - or EN.550.113 Statistics Through Case Study

Option One: Two Elementary Statistics Courses (EN.550.112 is the required second course). Credit earned for AP Statistics (equivalent to EN.550.111) will satisfy the first of the two required courses.

   - EN.550.111 Statistical Analysis I
   - EN.550.112 Statistical Analysis II

Option Two: One Intermediate/Calculus-Based Course (must have Calculus as a prerequisite)

   - EN.550.211 Probability and Statistics for the Life Sciences
   - EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering
   - EN.550.311 Probability and Statistics for the Biological Sciences and Engineering
   - EN.550.430 Introduction to Statistics
   - EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers
   - EN.560.348 Probability & Statistics for Engineers

2. Entrepreneurship and Management Fundamentals - Students must complete three fundamental courses in entrepreneurship and management. These courses are:

   - EN.660.105 Introduction to Business
   - EN.660.203 Financial Accounting
   - EN.660.250 Principles of Marketing

3. Upper-Level Elective Courses in Entrepreneurship and Management
Students must complete three upper level courses in entrepreneurship and management. Courses may be chosen from a number of areas, including:

**Accounting & Finance** - These courses educate students about financial concepts, investments, and financial markets. This information is valuable for the entrepreneur starting a new venture, a manager to be effective with a corporation, and management consultants.

**Business Law** - These courses educate students about legal issues in business and how the law is used to protect intellectual property.

**Leadership & Organizational Behavior** - These courses provide knowledge of both general principles and specific practices needed for working effectively with people in an organization. These courses focus on leadership, team building, ethics, and psychology.

Students who wish to complete a focus area in one of the areas listed above must complete three courses from that area, with at least one at the 400-level.

Lists of acceptable courses are provided below. These lists are regularly updated and may be obtained at the Center for Leadership Education office or on the center’s website (http://eng.jhu.edu/wse/cle/page/em_minor).

### Course and Grade Rules and Limitations

The E&M minor requires a minimum of 22 credits.

A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the E&M minor.

One course may be taken on an S/U basis.

All courses applied to the E&M minor must be completed with a grade of C- or above.

For current faculty and contact information go to http://engineering.jhu.edu/cle/faculty

### Faculty

**Director**
Annette Leps  
Senior Lecturer & Director of Entrepreneurship & Management

**Program Directors**
Lawrence Aronhime  
Senior Lecturer & Director of International Programs: accounting, finance, entrepreneurship, technology commercialization.

Julie Reiser  
Senior Lecturer & Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice
Senior Lecturer & Director of Graduate Programs: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Pamela Sheff
Senior Lecturer & Director of Master of Science in Engineering Management Program: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, higher education in prisons, community-based learning, entrepreneurship.

**Full Time Faculty**

Bob Graham
Lecturer: entrepreneurship, professional communication, oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing, internships.

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric.

William Smedick
Senior Lecturer: leadership theory, leadership in teams.

**Part Time Faculty**

Michael Agronin
Lecturer: new product development.

Laura Davis
Lecturer: Professional communication for ESL and Oral presentations for ESL.

Marci DeVries
Lecturer: marketing.

Kevin Dungey
Senior Lecturer: oral presentations.

Sean Furlong
Lecturer: Financial Accounting

David Fisher
Lecturer: business law.

Mark Franceschini
Senior Lecturer: business law, business ethics, Internet law.

Mary Beth Furst
Lecturer: Introduction to Business.

Dorothee Heisenberg
Senior Lecturer: Multinational Firms in the International Economy

Jason Heiserman
Lecturer: oral presentations.

Andrew Kulanko
Senior Lecturer: oral presentations.

Denise Link-Farajali
Lecturer: professional communication: financial math for ESL, research writing for ESL.

Bryan Rakes
Lecturer: business law.

Joshua J. Reiter
Senior Lecturer: business process management, total quality management, information technology management, Internet-based business applications, creativity and innovation, entrepreneurship.

Douglas Sandhaus
Senior Lecturer: business law, business ethics, Internet law.

Jay Thompson
Lecturer: professional communication.

Caroline Wilkins
Lecturer: professional communication.

**Courses**

**EN.660.101. Writing a Business Plan.**
This one credit, four session course offered as preparation for the JHU Business Plan Competition, will cover the fundamentals of creating and delivering a business plan for a new venture. Topics to include: organizing the business plan, market analysis, competitive analysis, financial projections, strategies to meet the expectations of varied investors, identification of necessary resources and developing and delivering a persuasive, well-articulated pitch. No audits.

Instructor(s): E. Rice.

**EN.660.103. The Promise and Peril of Microfinance.**
Microcredit, microlending and microfinance are relatively new tools, potentially useful to help alleviate poverty, contribute to local economies, earn a living and make profit. The promise and publicity has generated practices, experiments and businesses worldwide; microcredit even generated a Nobel Prize for Muhammad Yunus and the Grameen Bank in 2006. So too, the spread of the concept has produced excesses and controversy and more recently, scholarship in the practices and ideas. In this course we will explore the theory, practice and possibilities of the ideas with emphasis on both the developing world and western economies. The course uses lecture, discussion, case study and community investigation to explore the content. No audits.

Instructor(s): E. Rice.

**EN.660.105. Introduction to Business.**
This course is designed as an introduction to the terms, concepts, and values of business and management. The course comprises three broad categories: the economic, financial, and corporate context of business activities; the organization and management of business enterprises; and, the marketing and production of goods and services. Topic specific readings, short case studies and financial exercises all focus on the bases for managerial decisions as well as the long and short-term implications of those decisions in a global environment. No audits.

Instructor(s): I. Izenberg; L. Aronhime
Area: Social and Behavioral Sciences.
The course will teach basic to advanced level financial modeling techniques within the Excel environment. Students will be exposed to several real-world examples and asked to create models to solve these problems. Some Excel topics include Formulas, Formatting, Charting, Filters, Toolpaks, VLOOKUP, Data Importing, Pivot Tables, IF statements, Macros, VBA.
Instructor(s): M. Kitt.
Instructor(s): M. Kitt.
EN.660.141. Personal Finance.
The course in Personal Finance is designed to familiarize the student with the basic concepts and quantitative techniques of personal financial planning and investments. The course begins with a discussion of personal financial statements and the time value of money and moves on to the basic principles of financial planning in the areas of taxation, financial institutions and liquidity management, consumer credit, residential real estate, insurance, investments and retirement planning.
Instructor(s): L. Kendrick; M. Zafir.
EN.660.150. Media and P.R. in the Big Apple.
Gain insight into trends and career opportunities in public relations, advertising and media through one week of in-class learning (Jan. 5-9 half days) followed by a three-day trip to New York (Jan. 13-15) to network with and learn from executives from leading P.R., advertising and media firms.
Instructor(s): L. Kendrick.
Through case studies and an applied group project (developing and presenting a marketing plan for a new product launch), students will gain an understanding (from the Lecturer who is a former Procter & Gamble marketer) of the fundamentals of brand marketing. Learn how to make marketing strategy choices, how to evaluate advertising, and how to hone and perfect oral and written communication skills.
EN.660.154. The Art of the Pitch.
Donald Trump, Sergey Brin, and Steve Jobs know how to do it and so will you. “The Art of the Pitch” explores the principles of persuasive dialogue. Getting a job, raising money or selling a product: the basics of a successful pitch are the same. Guest speakers will share their best and worst pitches and what motivates them to act. Together students will craft two pitches, one for themselves and one real-time, real-world example for an outside business.
Instructor(s): J. Pennington.
EN.660.156. Social Media Strategy and Measurement.
Go beyond the textbook and develop a “real-world” social media strategy. Learn how to develop social media goals, align strategies, evaluate social media tactics and measure your results. This step-by-step method can be used for any organization or company and gives you a competitive advantage when looking for your first job. Taught by Nichole Kelly, blogger for Social Media Examiner (ranked #4 in AdAge’s top marketing blogs) and CEO of Full Frontal ROI Consulting.
Instructor(s): L. Kelly; L. Kendrick.
Taught by a professional in the field, this course will provide an introduction to negotiation principles and explore various sports negotiations, including, but not limited to, player contracts, trades, and sponsorships. The course will be interactive and include several simulations.
Instructor(s): A. Lares.
EN.660.160. Location, Location, Location.
Taught by a professional in the field and a Hopkins graduate, this course explores the basic principles of real estate development and finance. A special feature for this year encourages student participation in the analysis and project selections of an internationally focused real estate impact investment fund in the global South.
Instructor(s): J. Gorelick.
This course is for freshmen ONLY and will meet on January 24th if snow causes the class not to meet during the week. Like many other cities on the Atlantic coast, the city of Baltimore was settled in the mid-17th century by English colonists because of its prime location on an easily-navigable river. Over the past 300 years, the city has continually evolved along with the rest of the Boston-Washington megalopolis. This course, taught by a Hopkins alumnus with extensive experience in the field of real estate finance and development, will focus on the growth of the City of Baltimore as a case study in urban development. Starting with an interactive exercise exploring the roles of the stakeholders in the development process and meeting with practitioners involved in the area immediately surrounding the Homewood campus, the course will subsequently review the role of government in encouraging/discouraging certain types of development. The third thematic area focuses on the role of the private sector in shaping a city's development, with a look at the primary forces behind the urban renewal of the Inner Harbor, before wrapping up with an exploration of the concept of affordable housing (as it pertains to students) and an examination of the Homewood Master Plan and how it will impact student life, particularly for freshman, over the next four years.
Instructor(s): J. Gorelick.
The course in Financial Accounting is designed for anyone who could be called upon to analyze and/or communicate financial results and/or make effective financial decisions in a for-profit business setting. No prior accounting knowledge or skill is required for successful completion of this course. Because accounting is described as the language of business, this course emphasizes the vocabulary, methods, and processes by which all business transactions are communicated. The accounting cycle, basic business transactions, internal controls, and preparation and understanding of financial statements including balance sheets, statements of income and cash flows are covered. No audits.
Instructor(s): A. Leps; L. Aronhime; S. Furlong.
Learn the principles, values and skills necessary to lead and succeed in organizations that make a positive difference in today’s world. The course is designed to help students identify and provide opportunities to enhance their leadership skills. A “Blueprint for Success” will provide the framework for students to cultivate their own ideas for new socially conscious entrepreneurial ventures. The "Blueprint for Success" will culminate with a social entrepreneurial business plan competition where up to $5000 grants may be awarded to plans for start up costs associated with new initiatives designed to enhance the JHU and Baltimore City communities. Students can enroll in the course with predetermined social change initiatives in mind or develop new initiatives in the classroom setting.
Instructor(s): W. Smedick.
Area: Humanities, Social and Behavioral Sciences.
This course explores the role of marketing in society and within the organization. It examines the process of developing, pricing, promoting and distributing products to consumer and business markets and shows how marketing managers use the elements of the marketing mix to gain a competitive advantage. Through interactive, application-oriented exercises, case videotapes, a guest speaker (local marketer), and a group project, students will have ample opportunity to observe key marketing concepts in action. The group project requires each team to research the marketing plan for an existing product of its choice. Teams will analyze what is currently being done by the organization, choose one of the strategic growth alternatives studied, and recommend why this alternative should be adopted. The recommendations will include how the current marketing plan will need to be modified in order to implement this strategy and will be presented to the instructor in written form and presented to the class. No audits.
Instructor(s): D. Sullivan; L. Kendrick; M. Furst; Staff.

EN.660.300. Managerial Finance.
This course is designed to familiarize the student with the basic concepts and techniques of financial management practice. The course begins with a review of accounting, securities markets, and the finance function. The course then moves to discussion of financial planning, financial statement analysis, time value of money, interest rates and bond valuation, stock valuation, and concludes with capital budgeting and project analysis. A combination of classroom discussions, problem sets, and case studies will be used. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Priolo.

EN.660.303. Managerial Accounting.
This course introduces management accounting concepts and objectives including planning, control, and the analysis of sales, expenses, and profits. Major topics include cost behavior, cost allocation, product costing (including activity based costing), standard costing and variance analysis, relevant costs, operational and capital budgeting, and performance measurement. Note: not open to students who have taken EN.660.204 Managerial Accounting. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.

This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will access firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. No audits.
Prerequisites: EN.660.203 Financial Accounting
Instructor(s): A. Leps.

EN.660.306. Law and the Internet.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. No audits.
Prerequisites: Prerequisite: EN.660.205
Area: Social and Behavioral Sciences.

EN.660.307. Business Law II.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. Not open to students who have taken EN.660.206 Business Law II. No audits.
Prerequisites: EN.660.205 Business Law I; Not open to students who’ve taken EN.660.206 Business Law II
Area: Social and Behavioral Sciences.

EN.660.308. Business Law I.
This course is designed to provide students an introduction to legal reasoning and analysis. Content distinguishes forms of business, civil versus criminal law, and agency principles; intellectual property concepts, contract Law, the UCC (Uniform Commercial Code) and consumer protection are explored and discussed in the context of assigned legal cases which are intended to develop a student’s ability to analyze and apply law. Note: not open to students who have taken 660.205 Business Law I. No audits.
Prerequisites: EN.660.105
Instructor(s): C. Jeffers; D. Fisher; L. Monti; W. Rakes
Area: Social and Behavioral Sciences.

This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings—both global and personal in nature. Students will learn the reasoning and analytical skills needed to apply ethical concepts to their own decision-making, to identify moral issues involved in the management of specific problem areas in business and society, and to understand the social and natural environments which give rise to moral issues. The course focus is on performance articulated by clear reasoning and effective verbal and written communication concerning ethical issues in business and society. Not open to students who have taken EN.660.231 Case Studies in Business Ethics. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Sandhaus
Area: Humanities.
EN.660.311. Law and the Internet.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. Note: not open to students who have taken EN.660.306 Law and the Internet. No audits. 
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): I. Izenberg.
Area: Social and Behavioral Sciences.

This course focuses on preparing students to engage in and lead social enterprises as we explore the options for creating social value. Using a combination of lecture, case study and project work, we investigate both for-profit and non-profit models for creating social value with special emphasis on the non-profit community. Particular emphasis is placed on the management challenges of social enterprises such as creating and conveying their message, options for dealing with finances, relationships within communities, and methods for building constituencies. Additionally, we address critical issues such as measures of success, scale, replication and failure. The class requires contact with organizations in the community as well as one long weekend away from campus. Recommended Course Background: EN.660.105 or EN.660.333 or EN.660.220/EN.660.340. No audits.

EN.660.331. Leading in Teams.
This course will allow students to develop the analytical skills needed to effectively lead and work in teams. Students will learn tools and techniques for problem solving, decision-making, conflict resolution, task management, communications, and goal alignment in team settings. They will also learn how to measure team dynamics and performance, and assess methods for building and sustaining high-performance teams. Students will also explore their own leadership, personality and cognitive styles and learn how these may affect their performance in a team. The course will focus on team-based experiential projects and exercises as well as provide opportunities to individually reflect and write about the concepts explored and skills gained throughout the course. No Audits. Recommended Couse Background: EN.660.332 or EN.660.333.
Instructor(s): W. Smedick.

EN.660.332. Leadership Theory.
Students will be introduced to the history of Leadership Theory from the “Great Man” #theory of born leaders to Transformational Leadership theory of non-positional learned leadership. Transformational Leadership theory postulates that leadership can be learned and enhanced. The course will explore the knowledge base and skills necessary to be an effective leader in a variety of settings. Students will assess their personal leadership qualities and develop a plan to enhance their leadership potential. Recommended Course Background: EN.660.105 or EN.660.220/EN.660.340. No audits.
Instructor(s): W. Smedick
Area: Social and Behavioral Sciences.

EN.660.333. Leading Change.
In this course, we will use a combination of presentation, discussion, experiential learning, research and self-reflection to investigate issues surrounding leadership and change in communities and the economy. While considering both for-profit and non-profit entities, we will pursue topics including understanding and using theories of change; finding competitive advantage and creating strategic plans; making decisions, even in uncertain times; valuing differences; employing leadership styles; giving and receiving feedback; understanding employee relations; creating performance measures; and developing organizational cultures; and using the dynamics of influence. Not open to students who have taken EN.660.235. No audits. 
Recommended Course Background: EN.660.105
Instructor(s): W. Smedick.

EN.660.353. Negotiation and Conflict Resolution.
The focus of this class is the nature and practice of conflict resolution and negotiation within and between individuals and organizations. The primary format for learning in this class is structured experimental exercises designed to expose students to different aspects of negotiation and to build tangible skills through interpersonal exchange. While some class time is devoted to presentations on theories and approaches, the class method primarily relies on feedback from fellow classmates on their observations of negotiation situations and on personal reflections by students after each structured experience. Topics include conflict style, negotiation, and group conflict. No audits. Recommended Course Background: EN.660.105, an additional course in the Entrepreneurship and Management Program or in the social sciences.
Instructor(s): E. Rice.

So many big and seemingly intractable problems inhibit progress and diminish quality of life especially in and around urban communities. Surely there are ways to begin to tackle some of these problems, if we approach them from a multi-disciplinary perspective. This course provides that opportunity as students, who work primarily in teams, apply theory and ingenuity to investigate problems, propose solutions or invent devices that address some of these problems. Class time is spent in lecture, discussion, and applied community projects to master content. Time will be spent participating on teams and working in community organizations in addition to class.
Area: Social and Behavioral Sciences.

This course introduces the student to the management process. The course takes an integrated approach to management by examining the role of the manager from a traditional and contemporary perspective while applying decision-making and critical-thinking skills to the challenges facing managers in today’s globally diverse environment. The course examines the techniques for controlling, planning, organizing resources and leading the workforce. Not open to students who have taken EN.660.220 Principles of Management. No audits.
Prerequisites: EN.660.105
Instructor(s): I. Izenberg.
This course focuses on both quantitative and qualitative analytical skills and models essential to operations process design, management, and improvement in both service and manufacturing oriented companies. The objective of the course is to prepare the student to play a significant role in the management of a world-class company which serves satisfied customers through empowered employees, leading to increased revenues and decreased costs. The material combines managerial issues with both technical and quantitative aspects. Practical applications to business organizations are emphasized. Recommended Course Background: EN.660.105 Introduction to Business or EN.660.241 IT Management. No audits
Instructor(s): J. Reiter.

EN.660.351. Product and Brand Management.
Consumers love those little bits of crunchy orange goodness called Cheetos®. But when Frito-Lay decided that consumers might also like Cheetos®-flavored lip balm, they reacted with a hailstorm of derision. This may be proof that our free market economy is just a rudderless, if hilarious, contraption. More likely, Cheetos® Lip Balm was an example of the challenges marketers face in product and brand management. This course is a conceptual and practical exploration of how marketers deliver products and build brands that translate into competitive advantage for their companies. Among the critical concepts typically addressed in the course are developing and positioning a brand, assembling the marketing mix media into a whole, establishing price, creating packaging, and tracking the customer experience. The course uses readings, lecture, exercises, cases and examples to explore these concepts. No audits.
Prerequisites: EN.660.250
Instructor(s): D. Crane.

New product development is the ultimate interdisciplinary entrepreneurial art, combining marketing, technical, and managerial skills. A successful product lies at the intersection of the user’s need, a technical solution, and compelling execution. This class will bootstrap your experience in the art through exercises and team projects. We will examine products and services, consumer and industrial, simple and technologically complex. Case studies will feature primary sources and the instructor’s personal experiences as an inventor for a major consumer products company. Topics will span the product development cycle: identifying user needs, cool-hunting, brainstorming, industrial design, prototyping techniques, market research to validate new ideas, and project management -- especially for managing virtual teams and foreign manufacturers. No audits.
Prerequisites: EN.660.250
Instructor(s): M. Agronin.

EN.660.354. Consumer Behavior.
This course will explore how and why consumers make choices in the marketplace—the “buy-ology” of their behavior. We will learn the psychological, social, anthropological, and economic underpinnings of consumer behavior as well as the brain chemistry that affects choices in the marketplace. Students will learn how consumer behavior can and is influenced and the sometimes-unintended consequences of marketing campaigns designed to produce a particular behavior. Students will analyze how consumers solve problems, assess tradeoffs and make choices; how they integrate and react to retail surroundings, smells, product displays, brand, pricing strategies, social pressures, market structures and a myriad of other influences and motivations to buy. Students will also explore how marketers incorporate what is known about consumer behavior into advertising and promotional campaigns, market segmentation and positioning, pricing strategies and new product introductions. Student experiential projects will include ethnographic observations and analyses of real-world consumer behavior. No audits.
Instructor(s): J. Reiter.

This course will allow students to apply marketing principles and concepts to the sports marketing environment while gaining an understanding of how event sponsorships, endorsements, licensing and naming rights are used to achieve business objectives. Through case studies and a group project, students will be exposed to a broad range of sports entities including professional sports teams, governing organizations and sports media.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): R. Graham.

Uncover the process of creative thinking for innovation and conceiving “big ideas” in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. No audits.
Instructor(s): Staff.

EN.660.358. International Marketing.
This course covers product, pricing, promotion, distribution, market research, organization and implementation and control policies relating to international marketing. It also explores the economic, cultural, political and legal aspects of international marketing. Through interactive and application-oriented assignments and cases, students will gain hands-on experience in analyzing and developing marketing strategies for organizations that market both consumer and business products/services internationally. A group project will involve the development of an international marketing plan for a specific product. One or more local international marketers will be invited to speak to the class. No audits.
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.
EN.660.361. Engineering Business and Management.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): I. Izenberg; M. Agronin
Area: Engineering, Natural Sciences.

EN.660.363. Leadership & Management in Materials Science and Engineering.
In this course, you will learn about leadership, social responsibility, strategy, finance, project management and people management specifically in the materials science and engineering fields. You will practice writing concise persuasive analyses and action plans and verbally defending your ideas. You will learn the ethical guidelines for the materials science profession, to resolve team conflicts and co-lead self-managed work teams, and determine how materials science supports society’s sustainability goals and the social responsibilities of materials scientists. Our class time will feel like a business meeting, and we will refer to class periods as meetings. When you complete this course, you will be prepared to be a working professional. Your Teaching Team looks forward to seeing you develop into a career engineer, scientist, manager, entrepreneur, professor or other professional over the years.
Instructor(s): I. Izenberg
Area: Engineering, Natural Sciences.

EN.660.401. Advanced Corporate Finance.
The advanced course in corporate finance is designed to provide the upper level business student with a background in the more complex applications of financial management practice. Students will be exposed to advanced financial management concepts through a pedagogy combining classroom instruction, problem solution, business case analysis and work on a group project with coverage of the topics of capital markets, risk and portfolio theory, cost of capital, raising capital, capital structure, corporate dividend policy, real property valuation, merger and acquisition analysis, working capital management, commercial leasing strategies, international finance and derivatives analysis. No audits.
Prerequisites: EN.660.302 Corporate Finance OR EN.660.300 Managerial Finance OR 180.366 Corporate Finance.

EN.660.404. Business Law II.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. No audits.
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations. The course addresses critical issues such as the various types of intellectual property, the protection and commercialization of intellectual property by business and legal means, and the valuation of intellectual property. In addition, the tension between exclusive rights in intellectual property and free competition will be discussed throughout this course. Through interactive class discussions and a group project, students will have ample opportunity to develop a better understanding pertaining to the different types of intellectual property and to develop an intellectual property strategic plan for protecting an intellectual property portfolio. Specifically, the group project requires each team to research a selected Maryland based company’s intellectual property, its plan for protection and commercialization and its business goals, products and services. Each team will then analyze how well the company’s current business goals relate to its intellectual property portfolio, and recommend changes to better meet these company’s goals. Not open to students who have taken EN.660.305 Intellectual Property Law. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

This course is designed to give students in CS the requisite skills to generate and screen ideas for new venture creation and then prepare a business plan for an innovative technology of their own design. These skills include the ability to incorporate into a formal business case all necessary requirements, including needs identification and validation; business and financial models; and, market strategies and plans. Student teams will present the business plan to an outside panel made up of practitioners, industry representatives, and venture capitalists. In addition, this course functions as the first half of a two course sequence, the second of which will be directed by CS faculty and focus on the actual construction/programming of the business idea. Restricted to Juniors and Seniors majoring in Computer Science or by permission of instructor.
Prerequisites: Co-requisite: EN.660.321 OR EN.660.421;EN.600.226 AND EN.600.120
Instructor(s): L. Aronhime.

This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will assess firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. Not open to students who have taken EN.660.304 Financial Statement Analysis. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.
This writing intensive course helps students develop skills in formulating, implementing, and controlling a strategic marketing program for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization and support these decisions with quantitative analyses. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations, including financial projections, and presenting them to the class. No audits.
Instructor(s): L. Kendrick.

This course builds on the promotional mix concepts covered in Principles of Marketing (EN.660.250)—advertising, public relations, sales promotion and personal selling. Students will learn how marketers are changing the ways they communicate with consumers and the ways in which promotional budgets are allocated—and how this impacts the development of marketing strategies and tactics. Working with a client (provided by EdVenture Partners) that has chosen this JHU class as its “advertising agency” and an actual budget provided by the firm, the class will form small teams to mirror the functional organization of an actual ad agency (market research, media strategy/planning, copywriting/design, public relations, etc.). Student teams will then develop a promotional plan and corresponding budget to reach the desired target market (JHU undergrads who meet the client’s criteria), implement the plan and then evaluate its effectiveness through pre- and post campaign market research conducted on the target consumer. Note: Not open to students who have taken EN.660.450 as Advertising and Promotion. No audits. (Formerly Advertising and Promotion.)
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.

EN.660.453. Social Media and Marketing.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. No Audits.
Instructor(s): M. DeVries; Staff.

EN.660.456. Marketing Communication Law & Ethics.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.661.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Instructor(s): K. Quesenberry.

EN.660.460. Entrepreneurship.
This course provides students with a solid introduction to the entrepreneurial process of creating new businesses. Students will gain an appreciation for the investors’ perspective in assessing opportunities, evaluating strategies, and valuing the new enterprise. The course will cover the principal components of building a successful venture including management, market analysis, intellectual property protection, legal and regulatory issues, operations, entrepreneurial financing, and the role of the capital markets. Course work will include case studies and creation of investor marketing materials. Open to Juniors and Seniors. No Audits. Recommended Course Background: EN.660.203
Prerequisites: EN.660.105 OR EN.660.250
Instructor(s): E. Rice.

EN.660.461. Engineering Business and Management.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Area: Engineering.

EN.660.500. Business Internship.
Students may qualify for an internship with one of the many local employers with whom CLE works or they may arrange a non-local internship on their own. For non-paid internships only, students may apply for sponsorship for academic credit through CLE. Applications must include a resume, transcript and written essay and will be evaluated on the basis of work experience, GPA, writing sample, and course work. Students are expected to complete two reports assigned by the internship coordinator. S/U only.
Instructor(s): L. Kendrick.

Students work on an existing business or marketing plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students must apply by submitting a cover letter, resume, unofficial transcript, and essay describing the business concept/marketing plan. Applications must be approved by both the faculty member and director of CLE. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. Permission required. S/U only.
Instructor(s): L. Aronhime; P. Sheff.

EN.660.594. Business Internship-Summer.
Instructor(s): L. Kendrick.
The course will teach basic to advanced level financial modeling techniques within the Excel environment. Students will be exposed to several real-world examples and asked to create models to solve these problems. Some Excel topics include Formulas, Formatting, Charting, Filters, Toolpaks, VLOOKUP, Data Importing, Pivot Tables, IF statements, Macros, VBA.  
Instructor(s): M. Kitt.

Cross Listed Courses

Center for Leadership Education

EN.660.100. Hopkins Leadership Challenge Seminar.  
The Hopkins Leadership Challenge is a one-credit pass/fail seminar and is designed specifically for first-year undergraduates at JHU who are interested in developing their leadership skills and applying those skills to Hopkins life. The seminar includes both a classroom component and an experiential component. The classroom content includes leadership topics, discussions with university leaders and serves as an introduction to the history, services and involvement opportunities at Hopkins. The experiential component includes programs such as JHU history, faculty student interaction, visits to other JHU campuses and more! Interested students should register early, as there is limited space available in each section of the seminar. Freshmen only. S/U only.  
Instructor(s): J. Beauchamp; T. Sanchez  
Area: Social and Behavioral Sciences.

EN.660.370. Multinational Firms in the International Economy.  
This course on international business focuses on relationships between multinational firms and national governments throughout the world. We will read historical and contemporary authors’ conceptualizations of these relationships in the US and around the world. Students will apply concepts from the readings to real-world situations. The course is capped at 25 to allow discussion. No audits.  
Prerequisites: EN.660.105  
Instructor(s): D. Heisenberg.

EN.660.665. Technology Entrepreneurship.  
The goal of the course is to provide a strategic framework (technological, market, regulatory, and financial) for determining the commercial value of new technologies and the best path for realizing that value. Through lectures, exercises, and case studies, students will develop and advance their own innovations and inventions, culminating in a business plan. No audits.  
Area: Engineering, Natural Sciences.

Professional Communication

EN.661.453. Social Media and Marketing.  
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits.  
Prerequisites: EN.660.250 Principles of Marketing.

General Engineering

The General Engineering program offers both a B.A. with a major in general engineering and a number of non-departmental courses.

Bachelor of Arts in General Engineering

The Bachelor of Arts in General Engineering is a liberal arts degree that is designed to provide students with both a focus in some area of humanities or social sciences and the fundamental engineering principles needed to understand modern technology, innovations, and engineering practices. It is intended for undergraduate students who desire a background in engineering and technology yet have neither the desire nor the intention to become professional engineers. These students may, for example, plan to pursue graduate or professional study in architecture, business, law (e.g., intellectual property, patent law), or medicine. They may wish to work in areas which relate to engineering and technology or to thrive in the global industrial economy. The Bachelor of Arts in General Engineering is a true liberal arts degree with an emphasis in engineering.

This degree is not an engineering degree, and is not suitable for employment as a professional engineer. This program is not accredited by the Accreditation Board for Engineering and Technology. Students desiring careers as professional engineers should complete a B.S. degree in one of the engineering disciplines offered by the Whiting School.

The distinctive features of the Bachelor of Arts in General Engineering include:

- **Breadth.** Course requirements for the Bachelor of Arts in General Engineering encourage breadth, including mathematics, natural sciences, humanities and/or social sciences, international studies (language or other courses and experience in a foreign country), and in engineering. The curriculum also allows for many free electives.

- **Flexibility.** This program is designed to allow students, in consultation with their advisor, the flexibility to choose a program of study that matches their interests. The engineering focus area and the humanities and social science requirements may be departmentally based or may follow a theme designed by the student and his/her advisor. Students are encouraged to minor in any area of their choosing.

- **Interdisciplinary Study.** The distribution requirements are ideal for students who seek to understand areas at the interface between technical fields (such as robotics, nanotechnology, and biomaterials) or the connections between a technical area and a discipline in the humanities or social sciences (for example environment issues and international trade or ethics and biotechnology).

- **International Dimensions of Engineering.** Students are required to develop knowledge of the international dimensions of engineering. They may do this by studying abroad or by taking a combination of language and other classes that develop an understanding of the culture, technology, or society in a foreign country.

Requirements for the B.A. Degree

All undergraduate students majoring in the Bachelor of Arts in General Engineering must follow a program approved by their advisor. Candidates must fulfill the overall requirements for the bachelor’s degree (p. 20) described in this catalog. These include the university writing requirement, distribution requirement and 120 credit minimum. Sample curricula and details on concentrations can be found in the Advising Manual for general engineering (www.engineering.jhu.edu/academics).
Mathematics (20 credits)
Mathematics is at the core of modern science and technology and a solid foundation is required to understand how contemporary engineering problems are solved. Students are required to take five courses including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.108 Calculus I</td>
<td>4</td>
</tr>
<tr>
<td>AS.110.109 Calculus II (For Physical Sciences and Engineering)</td>
<td>4</td>
</tr>
</tbody>
</table>

One course in statistics 4
One course at the 200-level or above in either statistics or mathematics 4
One mathematics or statistics elective 4
Total Credits 12

Natural Sciences (15 credits)
Students are required to take four courses and two laboratory courses including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.171.101 General Physics:Physical Science Major I</td>
<td>3</td>
</tr>
<tr>
<td>or AS.171.103 General Physics I for Biological Science Majors</td>
<td>3</td>
</tr>
<tr>
<td>or AS.171.105 Classical Mechanics I</td>
<td>3</td>
</tr>
<tr>
<td>or AS.171.107 General Physics for Physical Sciences Majors (AL)</td>
<td>3</td>
</tr>
<tr>
<td>or EN.530.103 Introduction to Mechanics I</td>
<td>3</td>
</tr>
<tr>
<td>&amp; EN.530.104 and Introduction to Mechanics II</td>
<td>3</td>
</tr>
</tbody>
</table>

At least one course chosen from the following: 3
<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.030.101 Introductory Chemistry I</td>
<td>2</td>
</tr>
<tr>
<td>EN.510.101 Introduction to Materials Chemistry</td>
<td>3</td>
</tr>
</tbody>
</table>

Two terms of laboratory course 2
Two elective courses (area code N) 6
Total Credits 11

Humanities and Social Sciences (24 credits)

Writing Requirement. Students must complete at least four (minimum of 12 credits) writing intensive courses (catalog code W) and one of these courses must specifically develop writing skills, such as EN.661.110 Professional Writing and Communication or AS.060.113 Expository Writing.

Humanities or Social Science Focus. A minimum of four courses (12 credits) must be taken as a coherent group in either the humanities or social sciences, of which two are at the advanced (300+) level.

Humanities or Social Science Elective. Three additional courses (9 credits) in either the humanities or social sciences. These electives are typically used to take courses in economics and the history of science and technology, depending on the courses chosen to fulfill the concentration requirements detailed above.

International Dimensions of Engineering
Because of the importance of the globalization of technology, all students completing the B.A. in general engineering are required to demonstrate competence in being able to address technical issues within the context of another society. This can be done in one of three different ways.

First, students are encouraged to study abroad for a minimum of one fall or one spring semester in any foreign country (except Canada). In that country, they must take the equivalent of a minimum of 12 credits which are transferred to their Hopkins transcript. In this case, these credits can satisfy any degree requirements (Humanities or Social Sciences, Engineering Concentration, Mathematics, Free Electives, etc.).

Second, students may complete the equivalent of two semesters of the same foreign language (students may not use language courses in their native language to satisfy this requirement) and one additional course which relates to the culture, economy, social structure, or politics of a country to which uses this foreign language (9 credits).

Third, students may demonstrate proficiency in a foreign language by taking an intermediate course in a foreign language (this can include their native tongue) and two additional courses which relate to the culture, economy, social structure, or politics of a country which uses this foreign language (9 credits).

Engineering Core (15 credits)
One course (3 credits) that is an introduction to an engineering discipline. Examples include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.500.101 What Is Engineering?</td>
<td>3</td>
</tr>
<tr>
<td>EN.520.137 Introduction To Electrical &amp; Computer Engineering</td>
<td>3</td>
</tr>
<tr>
<td>EN.530.101 Freshman Experiences in Mech. Eng.</td>
<td>2</td>
</tr>
<tr>
<td>EN.560.141 Perspectives on the Evolution of Structures</td>
<td>3</td>
</tr>
<tr>
<td>EN.570.108 Introduction Environmental Engineering</td>
<td>3</td>
</tr>
</tbody>
</table>

One course (at least 3 credits) in a computer language. Examples include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.500.200 Computing for Engineers and Scientists</td>
<td>4</td>
</tr>
<tr>
<td>EN.600.107 Introductory Programming in Java</td>
<td>3</td>
</tr>
</tbody>
</table>

Three courses in the fundamentals of engineering science (at least one course from three of the following four areas):

Area 1: Circuits
EN.520.213 Circuits 4

Area 2: Statics
EN.530.201 Statics and Mechanics of Materials 4
or EN.560.201 Statics & Mechanics of Materials

Area 3: Materials Science
EN.510.201 Introductory Materials Science for Engineers 3
or EN.510.311 Structure of Materials

Area 4: Thermodynamics
EN.530.231 Mechanical Engineering Thermodynamics 3
or EN.540.203 Engr Thermodynamics
Engineering Focus Area (20 credits)
The engineering focus area must consist of at least six courses (minimum of 20 credits) that are related thematically or departmentally; at least three (3) of which must be at the advanced level (300 or above). While examples of focus areas are provided in the Advising Manual, students are encouraged to develop their own focus areas in consultation with their faculty advisor.

Free Electives
Between five and nine full courses (at least 3 credits each) to ensure a minimum of 120 credits in total. The number of courses required will depend on how the International Dimensions requirement is satisfied and on the courses chosen in other areas. Students must select these courses in consultation with their advisor. These free electives are designed to allow students to develop a curriculum of study uniquely suited to their interests.

Students are required to have a minimum cumulative GPA of 2.0 to graduate. Further, a maximum of 12 “D” credits may be counted toward degree requirements. There is a maximum limit of six “D” credits in any combination of courses used to satisfy the Humanities or Social Sciences focus, the Engineering Core and the Engineering Focus Area (47 total credits).

For current faculty and contact information go to http://engineering.jhu.edu/academics/general-engineering/people/ Faculty
Chair
Edward Scheinerman
Professor (Applied Mathematics and Statistics) and Vice Dean for Education. Primary Advisor to the General Engineering Program and Chair of the General Engineering Faculty Oversight Committee.

Professors
Marc Donohue
Professor (Chemical and Biomolecular Engineering).

Andrew Douglas*
Professor (Mechanical Engineering) and Vice Dean for Faculty, Whiting School of Engineering.

Kalina Hristova*
Professor (Materials Science and Engineering).

Daniel Naiman*
Professor (Applied Mathematics and Statistics).

Ben Schafer*
Professor (Civil Engineering).

Erica Schoenberger*
Professor (Geography and Environmental Engineering).

Scott Smith
Professor (Computer Science)

Howard Weinert
Professor (Electrical and Computer Engineering).

Courses
EN.500.101. What Is Engineering?.
This is a course of lectures, laboratories, and special projects. Its objective is to introduce students not only to different fields of engineering but also to the analytic tools and techniques that the profession uses. Assignments include hands-on and virtual experiments, oral presentations of product design, and design/construction/testing of structures. Freshmen only or Permission Required.
Instructor(s): D. Smith
Area: Engineering.

EN.500.103. Hopkins Engineering Sampler Seminar.
This course provides students with an overview of the undergraduate programs in the Whiting School of Engineering. Faculty from various departments will introduce students to their discipline including aspects of their personal research. Freshmen only.
Instructor(s): E. Scheinerman
Area: Engineering.

EN.500.110. What is Engineering?-Summer.
To introduce engineering ideas, thoughts, and problem-solving to potential engineering students. The course is intended to establish the framework within which engineers typically operate. Registration Requirement: Algebra II with Trig. Open only to high school students admitted to the Engineering Innovation Summer Program. Undergraduates should refer to EN.500.101.
Instructor(s): K. Borgsmiller.

EN.500.111. Hopkins Engineering Applications & Research Tutorials.
Instructor(s): Staff
Area: Engineering.

EN.500.125. Spatial Reasoning and Visualization for Engineers.
This course will enhance students ability to imagine and mentally manipulate objects in three-dimensional space—a talent that is important in engineering. Through guided practice and fun hands-on activities, students will hone their spatial skills. This course is only for engineering freshmen. Registration is by invitation only, based on the results of the summer spatial reasoning diagnostic assessment. S/U only.
Instructor(s): A. Stephens
Area: Engineering.

EN.500.200. Computing for Engineers and Scientists.
This course introduces a variety of techniques for solving problems in engineering and science on a computer using MATLAB. Topics include structure and operation of a computer, the programming language MATLAB, computational mathematics, and elementary numerical analysis. Co-listed with EN.550.200.
Prerequisites: Prereqs: AS.110.107 OR AS.110.109
Instructor(s): J. Yoder
Area: Engineering, Quantitative and Mathematical Sciences.
EN.500.401. Research Laboratory Safety.
An introduction to laboratory safety including chemical, biological, radiation, and physical hazards. Includes information on hazard assessment techniques, laboratory emergencies, and general lab standards for Whiting School of Engineering. The class will feature hands-on exercises with real-life experiments. Intended for students who have not yet begun working in a research laboratory.
Instructor(s): D. Kuespert.

EN.500.403. Introduction to Research Laboratory Safety.
This course covers laboratory hazards including chemical, biological, radiation (non-ionizing and ionizing), and physical hazards, as well as JHU-specific procedures. This course is intended for undergraduates beginning work in a research laboratory for the first time, as well as other students with no laboratory safety background. Credit may be received for only one of these courses, EN.500.703 Research Lab Safety Review, and EN.540.490 Chemical and Laboratory Safety. Co-listed with EN.500.703, AS.360.403, and AS.360.703. ***NOTE: Most coursework is on Blackboard and must be completed before the live class meeting. A brief introduction to safety in Johns Hopkins University experimental research laboratories.
Instructor(s): D. Kuespert.

EN.500.410. Surgery For Engineers.
Perm Req'd. Students must apply for this course - contact Cynthia Ramey at cramey@jhu.edu
Instructor(s): M. Marohn; R. Kumar
Area: Engineering, Natural Sciences.

Instructor(s): E. Bouwer; J. Selinski; S. Smith.

Instructor(s): J. Katz.

EN.500.603. Academic Ethics.
Instructor(s): C. Kavanagh; C. Smith; Staff.

EN.500.703. Research Laboratory Safety Review.
This course briefly reviews hazards in the laboratory and provides information regarding JHU-specific procedures such as chemical and biological waste handling. This course is intended for incoming postdoctoral fellows with some experience in laboratory safety; those with no background should take EN.500.403 instead. Credit may be received for only one of these courses, EN.500.403 Intro to Research Lab Safety, and EN.540.490 Chemical and Laboratory Safety. Co-listed with EN.500.403, EN.360.403, and EN.360.703. ***NOTE: Most coursework is on Blackboard and must be completed before the live class meeting. A review of hazards and safety procedures specific to Johns Hopkins University laboratories.
Instructor(s): D. Kuespert.

EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

EN.500.781. Preparation for University Teaching.
This course will prepare graduate students to teach at the university level. Topics covered include large and small class teaching, characteristics of student learning, syllabus construction, grading students, and developing a teaching portfolio. Full-time EN Graduate Students only. Co-listed with AS.360.781.
Instructor(s): R. Shingles.

Cross-listed with Mechanical Engineering.
Instructor(s): J. El-Awady.

Instructor(s): Staff.

Cross Listed Courses
Civil Engineering
Why do buildings and bridges look the way they do today? Students will be provided the tools to answer this question for themselves through a study of the history of the design of buildings and bridges throughout the world from both engineering and architectural/aesthetic perspectives. Only simple mathematics is required (no calculus). Students will participate in individual and group critique of structures from engineering, architectural, and social points of view.
Instructor(s): R. Sangree
Area: Engineering, Quantitative and Mathematical Sciences.

Institute for NanoBio Technology
EN.670.495. Animation in Nanotechnology & Medicine.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

EN.670.616. Introduction to NanoBio Tutorials II.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): P. Searson.
The Department of Geography and Environmental Engineering is concerned with the improved understanding and description of environmental problems including questions of pollutant fate and transport, water resources engineering, environmental chemistry, geomorphology, drinking water and wastewater treatment, ecosystem dynamics, and technology, society, and environmental change. Drawing from a number of disciplines and approaches, elements within these systems are examined, and interconnections among elements are explored. Some broadly defined examples of subjects collaboratively studied by our faculty and students are listed below.

• Engineering processes to alleviate environmental problems. This requires knowledge of both natural processes and engineering design. The former addresses phenomena that are basic to understanding how engineering can help solve environmental problems. The latter involves the application of such understanding to problem solutions.
• Surficial, atmospheric and subsurface processes involving interactions of chemical, biological, and hydrological processes in the environment.
• Application of engineering solutions in the context of the public decision making process including economic, social, and administrative factors.
• Analysis of interrelationships between engineering and administrative decisions and cultural, institutional, and governmental sectors of society, especially in the urban environment.

Engineering designs and public decisions must rest upon a sound knowledge of fundamental scientific processes as well as economic policy and social science. Research and study are focused on both basic, and the applied aspects of environmental problems. Interdisciplinary work is necessary, combining, for example, the basic sciences, engineering, and environmental economics. Because of its diversity of interests and association with other departments of the university, the department can offer a broad range of graduate programs based on the natural, social, and engineering sciences.

Department Areas of Interest, Study, and Research

The following areas of interest help illustrate the depth and breadth of academic and research opportunities available through the Department of Geography and Environmental Engineering. The interests and expertise of students and faculty within the department are continually expanding and changing. Students are encouraged to work with their advisors to build upon these areas of interest to construct a program that best suits their interests and professional goals and includes sufficient depth and rigor. Unique combinations of course work and research experience make it possible for students to identify and address issues in new, imaginative ways.

The Environmental Engineering area of interest is concerned with issues that involve water and wastewater treatment, transport and fate of contaminants in natural and engineered environments, hazardous and solid waste management, hydrology, and environmental fluid dynamics. Current research efforts are directed to:

• applying biological, chemical, and physical processes to treatment of contaminants in drinking water or wastewaters;
• evaluating colloidal stability in natural and engineered systems;
• exploring contaminant transport and interphase transfer, and the influence of these processes on chemical or biological transformations; and
• examining heat and mass transport and scaling mechanics at the land-atmosphere interface.

The Water and Air Resources Engineering area of interest is concerned with the occurrence, movement, and management of water and air through and above the surface of the Earth. This area involves many faculty in the department and has close interactions with faculty and students throughout Hopkins including those in the Center for Environmental and Applied Fluid Mechanics. Research in this area currently deals with:

• surface hydrology and groundwater;
• the dispersion of pollutants in the atmosphere and surface and subsurface waters;
• water supply, distribution, and risk analysis;
• measurement and modeling of turbulent environmental flows;
• mathematical modeling of subsurface and atmospheric transport phenomena;
• movement of water and chemicals in the vadose zone and in water supply aquifers;
• the impact of climate change on water resources; and
• river system dynamics.

The Environmental Chemistry area of interest is devoted to understanding the chemical and biological reactions and mobility of contaminants in natural environments and engineered aquatic systems. Research is focused on:

• identifying chemical and biological constituents of aquatic environments that catalyze, inhibit, or react with organic and inorganic contaminants;
• exploring how protonation, complex formation, sorption, and partitioning affect rates of contaminant transformation;
• examining interconnections between physical, chemical, and biological phenomena affecting contaminants; and
• developing structure-property and structure-reactivity relationships that provide a basis for predicting transformation and fate.

The goal of the area of interest in **Systems Analysis and Economics for Public Decision Making** is to develop competence in the modeling and analysis of public policy alternatives and private sector responses to those policies. To achieve this goal, students typically emphasize economics or systems analysis or a blend of these two disciplines. Those emphasizing economics undertake specialized training in resource economics, microeconomic theory, cost-benefit analysis, public finance, and econometrics. Example applications include the economics of public works, water and energy pricing and regulation, demand forecasting, natural resource valuation, and public utility financing. Students focusing on systems analysis take courses in the mathematics of optimization and decision analysis, including linear and non-linear programming, integer programming, stochastic programming, simulation, Bayesian analysis, and multiobjective decision making. Example applications include water resources management, siting of urban and regional facilities for services and/or distribution, pollution management, simulation of market responses to environmental policies, and integrated assessment of climate policy and impacts.

The **Geomorphology, Hydrology, and Ecology** area of interest promotes the fundamental understanding of processes at the Earth’s surface. Research is presently focused on:
• physical dynamics of tidal freshwater wetland evolution;
• land use impacts on forest dynamics;
• sediment transport, channel dynamics, and benthic ecology in rivers;
• acquisition of metals by plants, fungi, and bacteria;
• estuarine paleoecology; and
• maintenance and flushing flows in mountainous rivers.

The **Technology, Society, and Environmental Change** area of interest focuses primarily on the relationships among social organization, technological and industrial change, the production of space and place, government policy and environmental outcomes. Substantive domains of inquiry include:
• globalization and regional/local processes of economic, political, and cultural change. In particular, this entails grappling in particular with the behavior of multinational corporations and governments and the regional/local consequences of technological changes and institutional activities and decision making. Comparative studies of industrial transformations and their social and environmental consequences are emphasized.
• urbanization and regional growth and decay. This involves the study of spatial differentiation in population distributions and their well-being arising out of the spatial mobilities of capital and labor, shifts in industrial structure, and processes of technological and cultural change. Comparative studies of urbanization processes—particularly Baltimore’s—are encouraged; and
• the dynamics of environmental and social change. This requires consideration of philosophic, economic, and broad-based cultural backgrounds to environmental problems. Issues such as environmental justice, environmental ethics, and a critical application of appropriate knowledge (scientific, economic, cultural) for environmental decision making are strongly emphasized.

**Facilities**

Student and staff offices and laboratories are located in Ames and Krieger halls. A large teaching laboratory is equipped for biological and chemical examination of water and wastewater. Laboratories for research and teaching provide opportunities for research involving chemistry and microbiology. These include a number of environmental control rooms along with research opportunities involving sediment transport as well as pilot scale process investigations. Excellent facilities and instrumentation for atmospheric field studies exist, including laser radar for aerosols, fast response turbulence instruments, and radiation meters. Students also have access to treatment plants and other municipal and state facilities that may be useful in conducting research, as well as to vehicles and boats for field trips and field research of all types. Extensive computer facilities are available both in the department and in the university as a whole.

The Department of Geography and Environmental Engineering offers:
• an undergraduate Bachelor of Science (B.S.) degree in Environmental Engineering
• four focus areas within the environmental engineering major:
  • Environmental Management and Economics
  • Environmental Engineering Science
  • Environmental Transport
  • Environmental Health Engineering
• an undergraduate Bachelor of Arts (B.A.) in Geography
• two focus areas within the Geography major:
  • Human Geography
  • Physical Geography
• three minors:
  • a minor in environmental engineering
  • a minor in environmental sciences
  • a minor in engineering for sustainable development
• a five-year combined (B.S./M.S. or B.S./M.S.E.) program.

As part of these minor programs, or as part of other programs of the student’s own design, the department offers electives in such areas as ecology, geomorphology, water and wastewater pollution treatment processes, environmental systems analysis, and environmental policy studies.

**Major in Environmental Engineering**

The mission of our undergraduate program is to provide students with a broadly based yet rigorous education in the fundamental subjects central to the field, in a milieu that fosters development of a spirit of intellectual inquiry and the problem-solving skills required to address the open-ended issues characteristic of the real world.

Our B.S. program provides a strong foundation in the physical, chemical, and biological sciences, as well as in mathematics, engineering science, and engineering design. It is broad and flexible enough to accommodate students with a variety of interests in environmental engineering. This training should provide an ideal preparation for future employment in business or industry or for subsequent training at the graduate level.
either in environmental engineering or in a field such as environmental law, public health, or medicine.

**Program Objectives**

The B.S. in Environmental Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The Program in Environmental Engineering educates students to think critically, communicate clearly, and collaborate effectively as they apply the fundamental scientific principles of engineering to environmental problems. We emphasize the importance of intellectual growth, professional ethics, and service to society. Our graduates are prepared to be successful:

- engineering professionals in private and governmental organizations, and
- students in the best graduate programs.

Our department is noted for our students’ exceptionally high pass rate of the “Fundamentals of Engineering” (FE) exam offered by the National Council of Examiners for Engineering and Surveying (NCEES).

**Focus Areas within the Environmental Engineering (EE) Major**

Students must select among four different focus areas:

- Environmental Management and Economics
- Environmental Engineering Science
- Environmental Transport
- Environmental Health Engineering

With the assistance of a faculty advisor, each student will plan a curriculum suited to his or her ultimate career goals. The program also encourages and supports individual study and research. Program requirements total 125 credits.

**Mathematics with a focus on applications (19 credits)**

**Required Courses:**

<table>
<thead>
<tr>

<tr>
<td>AS.020.315</td>
<td>Biochemistry Laboratory</td>
</tr>
<tr>
<td>AS.020.316</td>
<td>Cell Biology Lab</td>
</tr>
</tbody>
</table>

Premedical students should also take additional chemistry courses as electives, such as:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.030.205</td>
<td>Organic Chemistry I</td>
</tr>
<tr>
<td>AS.030.206</td>
<td>Organic Chemistry II</td>
</tr>
<tr>
<td>AS.030.225</td>
<td>Introductory Organic Chemistry Lab</td>
</tr>
</tbody>
</table>

**Total Credits** 22

**Humanities and Social Sciences (HS) (18 credits)**

A minimum of six courses totaling 18 credits in Humanities or Social Sciences. The six courses must include:

1. one advisor-approved course that specifically develops writing skills (e.g., a how to write class),
2. EN.570.334 Engineering Microeconomics, and
3. four additional Humanities and Social Sciences courses with at least two at the 300-level or higher. EN.570.406 Environmental History can be taken as part of these requirements.

Please note that the writing course will fulfill one of the two writing intensive courses required by the university.

**Note:** most medical schools require a year of English literature and/or composition.

**Required course:**

<table>
<thead>
<tr>

**Total Credits** 18
General Engineering (GE) (16 credits)

Required courses:
- EN.570.108 Introduction Environmental Engineering 3
- An introductory course in computing, such as:
  - EN.570.210 Computation/Math Modeling 3
- A course in thermodynamics, such as:
  - EN.540.203 & EN.510.312 Engr Thermodynamics 0
  - or EN.530.231 Mechanical Engineering Thermodynamics
- A course in Statics, such as:
  - EN.560.201 Statics & Mechanics of Materials 4
  - or EN.530.201 Statics and Mechanics of Materials
  - EN.570.351 Introduction to Fluid Mechanics 3

Total Credits 13

Design Experience and Engineering Laboratory (Senior Design) (D) (9 credits)

Required courses:
- EN.570.305 Environmental Engineering Systems Design
- EN.570.419 Environmental Engineering Design I
- EN.570.421 Environmental Engineering Design II 3

Total Credits 3

The Design and Synthesis sequence is a five-credit project course (2 credits fall semester, 3 credits spring semester) and involves a comprehensive study of the engineering design process from problem definition to final design. The course involves team projects that include written and oral presentations. Students will form small teams that will work with local companies or government agencies in executing the project. Prerequisite: senior standing in Environmental Engineering.

Environmental Engineering Requirements (26 credits)

Required courses: (15 credits)
- EN.570.239 Emerging Environmental Issues
- EN.570.301 Environmental Engineering Fundamentals I
- EN.570.302 Water & Wastewater Treatment
- EN.570.304 Environmental Engineering Laboratory
- EN.570.353 Hydrology

Total Credits 0

Environmental Engineering Electives (12 credits):

Students take at least two courses from one of the following focus areas, and at least one course from two of the other focus areas. Courses to be selected in consultation with advisor. Changes in courses must be accompanied by a Waiver/Substitution Form.

Environmental Management and Economics
- EN.570.418/.618 Multiobjective Programming and Planning
- EN.570.496 Urban and Environmental Systems
- EN.570.497 Risk and Decision Analysis
- EN.570.490 Solid Waste Engineering and Management
- EN.570.491 Hazardous Waste Engineering and Management

Environmental Engineering Science
- EN.570.411 Engineering Microbiology
- EN.570.442 Environmental Organic Chemistry
- EN.570.443 Aquatic Chemistry

Environmental Transport
- EN.530.328 Fluid Mechanics II
- EN.570.657 Air Pollution

Environmental Health Engineering
- AS.280.350 Fundamentals of Epidemiology
- PH.221.624*
- PH.182.638*
- PH.182.626*
- PH.182.640*
- PH.182.627*
- PH.182.615*
- PH.182.622*
- PH.188.680*
- PH.182.625*

* Note: 600-level courses require permission of instructor
*x These courses are offered on the Bloomberg School of Public Health campus. For more information: http://www.jhsph.edu/courses

Technical Electives (TE) (minimum of 12 credits)

(selected in consultation with an advisor)

At least three Engineering, Quantitative Studies, or Natural Sciences at or above the 300-level, subject to approval by the department totalling at least 12 credits.

Technical electives must fulfill the following requirements:

1. TEs must total 12 credits of advanced 300-level Engineering, Quantitative Studies, or Natural Sciences courses, and
2. must be approved by the department. (For ABET requirements at least one from: Solid Waste; Hazardous Waste; Air Pollution; Environmental Health Engineering, if not satisfied as part of the Environmental Engineering electives.) Up to six credits of independent study or research may be applied toward engineering requirements (e.g., EN.570.501 Undergraduate Research/EN.570.502 Undergraduate Research, EN.570.505 Undergraduate Independent Study, or Senior Thesis). Note earlier comments for premedical majors.

It is strongly recommended that students take additional advanced classes in computing and numerical methods. EE students are strongly encouraged to take at least one course in organic chemistry (e.g., AS.030.205 Organic Chemistry I). The organic chemistry course will meet the TE requirement.

Guidance for Technical Electives for the EE Major

Technical electives are intended to provide students with courses with technical content and extend mastery in appropriate subject matter.
• TEs require use of fundamental science or mathematics, have appropriate prerequisites (e.g., university-level calculus, physics, chemistry, or other N or Q courses) and generally at a 300-level or higher.

• TEs must have the appropriate level of rigor which is defined as encompassing both of the following requirements:
  • 5-10 homework assignments; and
  • a culminating project (final project, group project, paper) or final examination. Lecture-only classes (no homework or exams) will not qualify as a TE for the EE major.

• TEs require accumulation and depth of analytical skill or knowledge. In general, this precludes survey courses or courses that have no technical prerequisites that are taught by multiple professors or a series of guest lecturers, or cover a broad spectrum of a topic instead of building mastery in one area.

Exceptions are possible only with the approval of either the Departmental Chair or Director of Undergraduate Studies.

**Sample EE Program (Focus Area: Environmental Engineering Science)**

**Note:** This program is based on the assumption that students have not previously completed A.P. courses in calculus, physics, chemistry, etc.

Total Credits: 121

Math (M) = 19 credits; Humanities and Social Sciences (HS) = 18 credits; Basic Science (BS) = 24 credits; General Engineering (GE) = 16 credits; Environmental Engineering Requirement (EER) = 15 credits;
Environmental Engineering Electives (EEE) = 12 credits; Technical Electives (TE) = 12 credits; Design (D) = 9 credits

Minor in Environmental Engineering

Environmental engineers play particularly pivotal roles as professionals who bridge the gap between understanding complex scientific concepts and helping to formulate public policies that affect the environment. Environmental engineering has become an important aspect of engineering practice in most engineering fields, and the discipline spans the professional spectrum from the private sector through governmental agencies to academia. An undergraduate minor in environmental engineering allows engineering students to pursue an interest in this field and to incorporate aspects of environmental engineering into careers in other engineering disciplines.

Students in any undergraduate major in the Whiting School of Engineering are eligible for admission to the environmental engineering minor program. Students will work with an advisor in the Department of Geography and Environmental Engineering to develop a program that meets the requirements for the minor and is consistent with the educational requirements of their major field of engineering study.

Requirements of the EE minor program consist of:

- a set of required core science and mathematics courses, already common to civil and chemical engineering majors;
- four required courses in environmental engineering (total of 12 credits, listed below); and
- two elective courses, one taken at the freshman or sophomore level, and the other taken at the junior or senior level.

Core Courses (EE Minor)

Advanced placement credits and/or equivalent courses in other schools or departments are acceptable, subject to advisor approval.

Elective Courses

(Total of 6 credits) one course from each of two groups is required. Double counting of these courses with specified required courses in the student’s major is not allowed. Substitution for one required course may be possible under special circumstances, with explicit approval of the environmental engineering minor advisor. Additional course electives are possible but require approval of the environmental engineering minor advisor.

Group A

Introductory courses at the freshman and sophomore level. One course required.*

Total Credits: 6

* Engineering science courses that are developed for juniors and seniors and also introductory graduate-level courses. One course is required.

For further information, contact Dr. William P. Ball, EE Minor Coordinator, 410-516-5434, bball@jhu.edu, or Adena Rojas, Senior Academic Program Coordinator, 410-516-5533, arojas@jhu.edu.

Minor in Environmental Sciences

The environmental sciences minor has been developed to encourage and facilitate studies in environmental sciences by students completing degrees in the other science and engineering disciplines. The environmental sciences (ES) minor requires:

- completion of a set of courses in the core sciences,
- two introductory courses dealing with the environment, and
Core Sciences (ES Minor)

Because of the interdisciplinary nature of environmental science, it is important that professionals from various areas of expertise acquire a common language and set of core concepts to make discussion and cooperation possible. The following courses represent the minimum set of requirements:

Mathematics (12 credits)

AS.110.108 Calculus I
AS.110.109 Calculus II (For Physical Sciences and Engineering)

At least one of the these four courses: 4
AS.110.201 Linear Algebra
or AS.110.212 Honors Linear Algebra
AS.110.202 Calculus III
or AS.110.211 Honors Multivariable Calculus
AS.110.302 Diff Equations/Applic
EN.550.291 Linear Algebra and Differential Equations

Biology (3 credits)

One course, such as:
AS.020.151 General Biology I 3

Physics (10 credits)

AS.171.101 General Physics: Physical Science Major I 4
or AS.171.107 General Physics for Physical Science Majors (AL)
AS.171.102 General Physics: Physical Science Majors II 4
or AS.171.108 General Physics for Physical Science Majors (AL)
AS.173.111 General Physics Laboratory I
AS.173.112 General Physics Laboratory II

Chemistry (13 credits)

AS.030.101 Introductory Chemistry I
AS.030.105 Introductory Chemistry Lab I
AS.030.106 Introductory Chemistry Laboratory II

Total Credits 15

Environmental Sciences

Students must take two introductory courses dealing with the environment and three or more of the upper-level environmental science courses on the following lists:

Introductory Courses (6 credits)

EN.570.110 Introduction to Engineering for Sustainable Development
EN.570.205 Ecology
EN.570.239 Emerging Environmental Issues
AS.270.110 Freshman Seminar: Sustainable + Non-Sustainable Resources
AS.270.220 The Dynamic Earth: An Introduction to Geology
AS.270.221 The Dynamic Earth Laboratory

Upper-Level Courses (9 credits)

EN.570.239 Emerging Environmental Issues
EN.570.301 Environmental Engineering Fundamentals I
EN.570.302 Water & Wastewater Treatment
EN.570.328 Geography & Ecology of Plants
EN.570.353 Hydrology
EN.570.411 Engineering Microbiology
EN.570.441 Environmental Inorganic Chemistry
EN.570.442 Environmental Organic Chemistry
EN.570.443 Aquatic Chemistry
EN.570.445 Physical and Chemical Processes
EN.570.446 Biological Process of Wastewater Treatment
EN.570.491 Hazardous Waste Engineering and Management
AS.270.302 Aqueous Geochemistry
AS.270.311 Geobiology
AS.270.313 Isotope Geochemistry
AS.270.314 Planetary Tectonics and Geodynamics
AS.270.350 Sedimentary Geology
AS.270.369 Geochem Earth/Environment

Pairing a Major with the ES Minor

Many of the most creative and productive advances in environmental sciences in recent years have come from scientists trained in traditional disciplines (biology, chemistry, geology, physics, and engineering) who have devoted themselves to the study of environmental problems. Completion of the degree requirements of a traditional discipline provides depth and rigor that, when supplemented with additional academic training in environmental science, can be applied to professional work in a variety of environmental subjects, as the following examples show:

Biological Processes

Response of ecosystems to change, microbial degradation of pollutants, biogeochemical cycling of greenhouse gases. Illustrative majors: Biology, Biomedical Engineering, Biophysics, Biochemical Engineering.

Physical Processes

Erosion of hillslopes, rivers, and coastlines; sediment production, transport, and fate; groundwater, movement of contaminant plumes; oceanography; atmospheric physics; aerosol formation; global warming. Illustrative majors: Civil Engineering, Chemical and Biomolecular Engineering, Mechanical Engineering, Physics, Earth and Planetary Sciences.

Environmental Chemistry

Environmental Systems

Environmental modeling, risk assessment, environmental systems design, pollution control strategies. Illustrative majors: Civil Engineering, Applied Mathematics and Statistics.

Faculty Advising

A faculty advisor is assigned to each student in the environmental sciences minor program to assist in planning his/her academic program and to approve the choice of courses to satisfy the minor. Faculty advisors are available in the following areas:
Biological Processes: Edward J. Bouwer
Physical Processes: TBD
Environmental Chemistry: Alan T. Stone
Environmental Systems: Ben Hobbs
Human Geography: Erica J. Schoenberger

Minor in Engineering for Sustainable Development

Engineers will be increasingly called upon to help devise solutions to the tremendous problems of poverty, inequality, and social and environmental dislocation that afflict major parts of the globe in the 21st century. Working as an engineer in this context involves negotiating highly complex social, economic, and political realities and dealing with a wide range of institutions and actors, including national and local governments, multilateral lenders such as the World Bank, diverse non-governmental organizations (NGOs), and local communities. It also increasingly involves working in interdisciplinary teams with social scientists, public health and medical workers, humanitarian aid workers, bankers, politicians, and the like. “Sustainable” development implies a development path that is socially equitable, culturally sensitive, and environmentally appropriate over a multi-generational time frame. The minor in Engineering for Sustainable Development exposes engineering students to some of the key issues related to development, methods of information-gathering in diverse and difficult settings, and working effectively with non-engineers on complex problems.

The minor encompasses seven courses. The core course is EN.570.110 Introduction to Engineering for Sustainable Development. Five additional courses will be selected in a program devised in consultation with the minor advisor.

Of the Five Additional Courses

- Three must be grouped around a specific theme, region or within a specific discipline. Themes might include, for example, public health, environment, or economic development. Regions include Africa, Latin America, or Asia. Disciplinary concentrations might be in Anthropology, Economics, Geography, History, Political Science, Public Health, or Sociology.
- Three must be at the 300-level or above.
- One of the courses must cover methods for gathering and evaluating information in a development context.

Examples include:

- AS.070.319 Logic of Anthropological Inquiry
- AS.070.347 Anthropology and Public Action
- AS.280.345 Public Health Biostatistics
- AS.280.350 Fundamentals of Epidemiology
- AS.230.202 Research Methods for the Social Sciences

Bachelor of Arts in Geography

Geographical knowledge constitutes a vital store of information concerning the distribution over the earth’s surface of those environmental conditions (both naturally occurring and anthropogenic) essential to support an immense diversity of human life and activity. The study of Geography focuses on understanding how physical, biotic, social, and economic processes are perpetually reshaping environments and landscapes in ways either favorable or unfavorable for different life forms in general and for different and distinctive kinds of human occupancy and culture in particular. Geographical education seeks to instill a deep appreciation of the grand diversity of ways in which the peoples of the earth have learned to use and modify their environments creatively. It also focuses on the environmental problems that arise in association with such processes of modification. While geography in general looks to maintain a strong bond between physical and human dimensions of landscape formation, specialization within that general framework is also encouraged.

Human Geography is primarily concerned with the detailed specification of the economic, social, political, and cultural processes that lead to the substantive modification of natural environments through the draining of marshes, the damming of rivers, the development of agriculture, mining, and industry, and the construction of human settlements. It is also crucially concerned with the forms of interaction (trade, communications, capital flows, and migrations) between people over space and the effects of such interactions upon the people of the world. The barriers to interaction (political boundaries, for example, and the acquisition by human populations of strong senses of local, regional, and territorial identity) are likewise a key topic for examination.

Physical geography is primarily concerned with those physical processes—climatic, ecological, geological, hydrological—which have shaped which continue to shape the earth’s surface, creating distinctive physical and ecological conditions for different life forms. Training in physical geography aims to build sufficient technical expertise to handle a wide range of environmental problems concerning the atmosphere, the Earth, and the hydrosphere, with special emphases upon water, surficial processes, and ecology.

Requirements for the B.A. Degree

(See also General Requirements for Departmental Majors (p. 20) and Writing Requirement sections.)

The B.A. in geography offers a broad background in the sciences (particularly biological and ecological), the social sciences, and the humanities. All geography majors must fulfill the general university requirements and take four fundamental courses in geography. They may then choose a concentration in either physical or human geography. In addition to these courses focused on their special interest, they may freely select electives to fill the 120 credit hours required for the B.A. degree. Students work closely with their faculty advisor to create a program that fulfills their individual academic objectives and includes sufficient depth and rigor.

Focus Areas within the Geography Major

Students may select between two different focus areas within the geography major:

Human Geography

Requirements

- And knowledge of one foreign language at the intermediate level.
- at least four appropriate introductory courses (12 or more credits) are also required in such fields as anthropology, economics, humanities, political science, and sociology.
• a minimum of nine courses (about 27 credits) at or above the intermediate level in their field of major interest (in consultation with the geography advisor).

The aim here is to enable students to build their own combination of departmental courses and courses from relevant cognate disciplines. Someone specializing in economic geography, for example, might include courses on natural resources, society and environment, environmental economics, and political ecology combined with courses in anthropology, political science, sociology, or economics. A student interested in urban geography might combine course work in the department with courses in the humanities, in political science, or in urban economics, while taking advantage of the seminar-internship on urban policy in a government department or with a community organization. A student interested in environmental issues could work across the physical-human divide and combine course work in ecology and geology with seminars on environmental policy, ethics, and philosophy. Someone specializing in cultural geography could combine work on the social and geographical landscape with courses in social and cultural anthropology.

**Physical Geography**

The major with a focus area in physical geography consists of four parts:

1. mathematics,
2. the basic natural sciences,
3. those sciences directly related to the student’s area of specialization, such as environmental chemistry, physical geography, or biogeography, and
4. courses which focus on the environment itself: the atmosphere, earth, and hydrosphere.

**Requirements**

- AS.110.202 Calculus III; EN.550.310 Probability & Statistics for the Physical and Information Sciences & Engineering (or the equivalent).
- at least four appropriate introductory courses (12 or more credits) are also required in such fields as chemistry, biology, geology, or physics.
- a minimum of eight courses (about 24 credits) at the intermediate level in their field of major interest (in consultation with their geography minor advisor).

Undergraduates with an interest in environmental chemistry, for example, would take fundamental courses such as organic chemistry, biochemistry, and thermodynamics, while those oriented toward the earth sciences would take courses in petrology, thermodynamics, fluid mechanics, and other aspects of geology. For a student interested in biogeography—dealing with the spatial pattern of plants, the role of environmental factors in influencing those distributions, and the effect of changes in vegetation on the landscape—the department offers courses in plant geography, ecology, and paleoecology.

**Program in Public Decision Making**

Undergraduates majoring in geography may satisfy departmental requirements through the program in Systems Analysis and Economics for Public Decision Making. In addition to prerequisites from other departments (e.g., EN.550.361 Introduction to Optimization-EN.550.362 Introduction to Optimization II and AS.180.101 Elements of Macroeconomics-AS.180.102 Elements of Microeconomics), students in this program take at least four courses from the public decision making curriculum, including EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design and EN.570.493 Economic Foundations for Environmental Engineering and Policy Design.

The department welcomes applicants with backgrounds in the sciences, engineering, or in the liberal arts interested in applying their specialized knowledge to the pressing problems of human interaction with the environment. These fundamental backgrounds can be enlarged upon while students develop their special interests in the department. Students can select courses suited to a particular field of interest. Once fundamentals have been mastered, they have complete freedom to study in related fields. Independent study and vigorous exchange of ideas in seminars and laboratory are indispensable parts of each student’s program. The department emphasizes study in related fields of natural and social sciences because of the importance of adapting the latest scientific information and methods for research and practice, and because the fundamental sciences are most effectively mastered at an educational institution. Research and teaching are integral parts of the graduate training program.

Graduates of the department have found jobs in university departments of civil and environmental engineering, economics, biology, chemistry, geography, and geology; in federal, state, and municipal government; in private industry; and in private research and consulting organizations.

A note about counting 400 level courses as graduate level courses: many of DoGEE’s 400 level courses are graduate level courses and count as such. That said, the courses are scheduled in such a way that are accessible to be taken by advanced DoGEE undergrads with approval from their advisor. 400 level courses are generally taken by either 1st year graduate students or seniors.

**Requirements for Advanced Degrees**

Course work requirements for the master’s degree and doctorate are generally flexible. Former training and experience and the special field of interest influence the development of each student’s program of advanced study.

No 100-level or 200-level courses can be counted toward the credit requirements for master’s degrees.

Proficiency in one foreign language is required for all degree candidates in Human Geography. Based on the nature and need of students’ educational and research programs, faculty advisors may require proficiency in one foreign language for an M.A. or a Ph.D. degree. There is no language requirement for the M.S. or M.S.E. degrees.

**Ph.D. Degree**

The goals for students in the Ph.D. program are

- to develop reasoning skills that can be applied to new and unanticipated issues;
- learn how to pose questions and answer them in a logical manner;
- acquire a depth of understanding and technical knowledge in a particular study area, on par with others worldwide; and
- make a significant contribution to our understanding in this particular study area. The emphasis in the Ph.D. degree is upon a sound foundation in the fundamentals required in a given area with considerable flexibility in course selection determined by the
students can choose to follow or pull from the M.S.E. concentration and expands their interests and professional goals. Additionally, M.S. students can construct their own concentration that complements study, and research as guides and in consultation with their advisors, environmental professionals. Using the department's areas of interest, this concentration provides a broad yet rigorous background for Environmental Science.

Concentrations for the M.S. Degree

Environmental Science
This concentration provides a broad yet rigorous background for environmental professionals. Using the department’s areas of interest, study, and research as guides and in consultation with their advisors, M.S. students can construct their own concentration that complements and expands their interests and professional goals. Additionally, M.S. students can choose to follow or pull from the M.S.E. concentration tracks: Contaminant Fate & Transport, Environmental Management and Economics, Environmental Process Engineering, and Water Resources Engineering.

Environmental Science and Policy
This concentration is similar to Environmental Science but includes economics and systems courses. Four courses are recommended in environmental science, including the following:

- EN.570.445 Physical and Chemical Processes
- EN.570.446 Biological Process of Wastewater Treatment
- EN.570.448 Physical and Chemical Processes II

M.A. and M.S. students pursuing this program who do not have prior background in environmental engineering can substitute EN.570.301 Environmental Engineering Fundamentals I and EN.570.302 Water & Wastewater Treatment in lieu of the courses suggested above.

The other environmental science courses should be chosen from the following:

- EN.570.411 Engineering Microbiology
- EN.570.442 Environmental Organic Chemistry
- EN.570.443 Aquatic Chemistry
- EN.570.491 Hazardous Waste Engineering and Management

Four courses are required in environmental policy, including:

- EN.570.493 Economic Foundations for Environmental Engineering and Policy Design
- EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design

Choose one of the following:

- EN.570.496 Urban and Environmental Systems
- EN.570.497 Risk and Decision Analysis
- EN.570.607 Energy Policy and Planning Models
- EN.570.608 Data Analytics for Engineering, Policy Analysis and Management
- EN.570.657 Air Pollution
- EN.570.676 Stochastic Programming

The final two courses would be a project or electives in environmental science, engineering, policy, or systems that are appropriate to the student’s goals.

Master of Science in Engineering (M.S.E.) Degree
The M.S.E. degree is open to students with an ABET-accredited undergraduate engineering degree or demonstrated equivalent. The M.S.E. degree program includes the following requirements:

- a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
- at least 50% of the required 30 credits must come from courses within the department.
- students are permitted to apply up to two classes with a grade of “C” toward their degree.
- up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

M.S. students have the option to complete an independent research project, submitted as a formal essay. A minimum of two semesters is required to complete the M.S. degree without the research project option. Three to four semesters are typically required to complete the degree with a research project.

M.S. students are strongly recommended to take as prerequisites for the M.S.E. program mathematics through differential equations and computing skills. Additionally, M.S. students who choose to follow Contaminant Fate and Transport, Environmental Process Engineering, and Water Resources Engineering concentrations are encouraged to take an introductory fluid mechanics course. Whether introductory fluid mechanics will count towards an M.S. student’s graduation credits is decided on a case-by-case basis by the department. Each individual’s program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

Concentrations for the M.S.E. Concentration

Students can choose to follow or pull from the M.S.E. concentration and expands their interests and professional goals. Additionally, M.S. students can construct their own concentration that complements study, and research as guides and in consultation with their advisors, environmental professionals. Using the department’s areas of interest, this concentration provides a broad yet rigorous background for Environmental Science.

Environmental Science
This concentration is similar to Environmental Science but includes economics and systems courses. Four courses are recommended in environmental science, including the following:

- EN.570.445 Physical and Chemical Processes
- EN.570.446 Biological Process of Wastewater Treatment
- EN.570.448 Physical and Chemical Processes II

M.A. and M.S. students pursuing this program who do not have prior background in environmental engineering can substitute EN.570.301 Environmental Engineering Fundamentals I and EN.570.302 Water & Wastewater Treatment in lieu of the courses suggested above.

The other environmental science courses should be chosen from the following:

- EN.570.411 Engineering Microbiology
- EN.570.442 Environmental Organic Chemistry
- EN.570.443 Aquatic Chemistry
- EN.570.491 Hazardous Waste Engineering and Management

Four courses are required in environmental policy, including:

- EN.570.493 Economic Foundations for Environmental Engineering and Policy Design
- EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design

Choose one of the following:

- EN.570.496 Urban and Environmental Systems
- EN.570.497 Risk and Decision Analysis
- EN.570.607 Energy Policy and Planning Models
- EN.570.608 Data Analytics for Engineering, Policy Analysis and Management
- EN.570.657 Air Pollution
- EN.570.676 Stochastic Programming

The final two courses would be a project or electives in environmental science, engineering, policy, or systems that are appropriate to the student’s goals.

Master of Science in Engineering (M.S.E.) Degree
The M.S.E. degree is open to students with an ABET-accredited undergraduate engineering degree or demonstrated equivalent. The M.S.E. degree program includes the following requirements:

- a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
- at least 50% of the required 30 credits must come from courses within the department.
- students are permitted to apply up to two classes with a grade of “C” toward their degree.
- up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

M.S. students have the option to complete an independent research project, submitted as a formal essay. A minimum of two semesters is required to complete the M.S. degree without the research project option. Three to four semesters are typically required to complete the degree with a research project.

M.S. students are strongly recommended to take as prerequisites for the M.S.E. program mathematics through differential equations and computing skills. Additionally, M.S. students who choose to follow Contaminant Fate and Transport, Environmental Process Engineering, and Water Resources Engineering concentrations are encouraged to take an introductory fluid mechanics course. Whether introductory fluid mechanics will count towards an M.S. student’s graduation credits is decided on a case-by-case basis by the department. Each individual’s program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

Concentrations for the M.S.E. Concentration

Students can choose to follow or pull from the M.S.E. concentration and expands their interests and professional goals. Additionally, M.S. students can construct their own concentration that complements study, and research as guides and in consultation with their advisors, environmental professionals. Using the department’s areas of interest, this concentration provides a broad yet rigorous background for Environmental Science.

Environmental Science
This concentration is similar to Environmental Science but includes economics and systems courses. Four courses are recommended in environmental science, including the following:

- EN.570.445 Physical and Chemical Processes
- EN.570.446 Biological Process of Wastewater Treatment
- EN.570.448 Physical and Chemical Processes II

M.A. and M.S. students pursuing this program who do not have prior background in environmental engineering can substitute EN.570.301 Environmental Engineering Fundamentals I and EN.570.302 Water & Wastewater Treatment in lieu of the courses suggested above.

The other environmental science courses should be chosen from the following:

- EN.570.411 Engineering Microbiology
- EN.570.442 Environmental Organic Chemistry
- EN.570.443 Aquatic Chemistry
- EN.570.491 Hazardous Waste Engineering and Management

Four courses are required in environmental policy, including:

- EN.570.493 Economic Foundations for Environmental Engineering and Policy Design
- EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design

Choose one of the following:

- EN.570.496 Urban and Environmental Systems
- EN.570.497 Risk and Decision Analysis
- EN.570.607 Energy Policy and Planning Models
- EN.570.608 Data Analytics for Engineering, Policy Analysis and Management
- EN.570.657 Air Pollution
- EN.570.676 Stochastic Programming

The final two courses would be a project or electives in environmental science, engineering, policy, or systems that are appropriate to the student’s goals.
course for a recommended elective, students must receive written approval from their advisor).

- prerequisites (required) for the M.S.E. program includes mathematics through differential equations and computing skills.
- up to two semesters of AAP or EP courses can be taken and counted to receive a master's degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

The M.S.E. program is typically a two semester program based on course work alone. However, M.S.E. students have the option to complete an independent research project, submitted as a formal essay or group project report. An M.S.E. degree with significant research components will usually require three to four semesters for completion and is generally intended for those students planning to work in engineering practice. Each individual's program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor. M.S.E. students select from the concentrations below.

**Recommended Electives Note:** Students should select elective courses from the list of recommended electives appropriate for each concentration. In order to substitute an alternate course for a recommended elective, students must receive written approval from their advisor and should submit a copy of the approval to the Department for their permanent file.

### Concentrations for the M.S.E. Degree

#### Contaminant Fate and Transport

This concentration emphasizes understanding of physical, chemical, and biological phenomena that affect the movement and transformation of pollutants in the environment.

**Required courses:**

- EN.570.411 Engineering Microbiology
- EN.570.441 Environmental Inorganic Chemistry
- EN.570.442 Environmental Organic Chemistry
- EN.570.443 Aquatic Chemistry
- EN.570.452 Experimental Methods in Environmental Engineering Chemistry

One course in applied mathematics, numerical analysis, or engineering mathematics, such as:

- EN.570.495 Optimization Foundations for Environmental Engineering and Policy Design
- EN.570.496 Urban and Environmental Systems

**Recommended electives include:**

- EN.570.446 Biological Process of Wastewater Treatment
- EN.570.457 Air Pollution

#### Environmental Process Engineering

This concentration involves the analysis and design of processes of water treatment, waste treatment, and environmental remediation, and includes a solid grounding in the chemical, biological, and physical principles underlying treatment and remediation technologies.

**Required courses:**

- EN.570.411 Engineering Microbiology
- EN.570.443 Aquatic Chemistry

#### Environmental Management and Economics

This concentration focuses on using models of physical and economic systems to analyze and improve the design of public policies and environmental control systems.

**Recommended electives include:**

- EN.570.493 Economic Foundations for Environmental Engineering and Policy Design
- EN.570.497 Risk and Decision Analysis
- EN.570.443 Aquatic Chemistry
- EN.570.445 Physical and Chemical Processes
**Required courses:**

### M.A. Degree

The M.A. degree is open to students with undergraduate degrees in social sciences or the humanities. It requires:

- a minimum of 30 credits including no more than 1 credit of seminar, 1 credit of intersession course work, and 6 credits of independent research counting toward the 30 credits.
- at least 50% of the required 30 credits must come from courses within the department.
- students are permitted to apply up to two classes with a grade of “C” toward their degree.
- up to two semesters of AAP or EP courses can be taken and counted to receive a master’s degree as long as there is sufficient rigor as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

In addition to these course credits, M.A. students have the option to complete an independent research project, submitted as a formal essay. Students can focus on one of the department’s areas of interest, study, or research or construct their own program that complements and expands their undergraduate experience; three semesters are typically required to complete the degree. Each program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

### Financial Aid

Financial aid is granted on the basis of merit and availability. Criteria for consideration for these awards include academic excellence, professional or research experience, and career commitment to the field. Continued support is subject to the student’s performance, availability of research or TA funds, and requisite staffing of current projects. Ph.D. students receive priority for full financial support. Pending available funding, partial tuition fellowships are offered to qualified master’s students. Ph.D. applicants are nominated by the department for consideration for fellowships.

Furthermore, many students within the department have been awarded graduate research fellowships available to Ph.D. and Masters students through programs administered by the National Science Foundation and the Environmental Protection Agency. The Johns Hopkins Environment, Energy, Sustainability & Health Institute (E²SHI) invites applications for one-year fellowships of up to $25,000 to support Johns Hopkins University doctoral students pursuing interdisciplinary research in environment, energy, sustainability, or health topics.

For current faculty and contact information go to [http://engineering.jhu.edu/dogee/faculty.html](http://engineering.jhu.edu/dogee/faculty.html)

### Faculty

**Chair**

Edward J. Bouwer
Abel Wolman Professor of Environmental Engineering: environmental microbiology, waste treatment

**Professors**

William P. Ball
Professor: environmental engineering, physical and chemical processes, water quality

Grace S. Brush
Professor: ecology, paleoecology, plant geography

J. Hugh Ellis
Professor: environmental systems

Paul Ferraro
Bloomberg Distinguished Professor of Water and Environmental Economics: evaluation of environmental program impacts, behavioral economics

Steve H. Hanke
Professor: applied micro- and macroeconomics and finance

Benjamin F. Hobbs
Theodore K. and Kay W. Schad Professor of Environmental Management: environmental, energy, and water systems, economics

A. Lynn Roberts
Professor: environmental chemistry

Erica J. Schoenberger
Professor: economic geography, environmental history, environmental politics and policy, history of mining, history of the automobile, interdisciplinary scientific collaboration

Alan T. Stone
Professor: environmental and aquatic chemistry

### Assistant Professors

Kai Loon Chen
Assistant Professor: physiochemical processes, particle interaction, membrane processes, environmental nanotechnology

Ciaran Harman
Assistant Professor: landscape hydrology and transport

Sarah Preheim
Assistant Professor: environmental microbiology, microbial ecology, bioinformatics

### Associate Teaching Professor

Hedy V. Alavi
Associate Teaching Professor: hazardous and solid waste engineering and management
Professor Emeritus
John J. Boland
Professor Emeritus: environmental economics and policy

Research Professor Emeritus
Eugene D. Shchukin
Research Professor Emeritus: colloid and surface science

Associate Research Professor
Seth Guikema
Associate Research Professor: probabilistic systems modeling techniques, risk analysis, uncertainty modeling, infrastructure modeling, and decision making under uncertainty

Peter Wilcock
Research Professor: sediment transport, river mechanics, management and restoration

Lecturer
Justin C. Williams
Senior Lecturer: environmental and urban systems

Joint, Part-Time, and Visiting Appointments
Markus Hilpert
Senior Scientist (Environmental Health Sciences, Bloomberg School of Public Health): environmental flow and transport, groundwater contaminant hydrology, air pollution

Joseph Katz
Professor (Mechanical Engineering): experimental fluid mechanics, development of advanced diagnostics techniques

Charles Meneveau
Professor (Mechanical Engineering): environmental fluid mechanics, engineering, turbulence

Marc B. Parlange
Adjunct Professor: hydrology, environmental fluid mechanics, atmospheric interactions

Andrea Prosperetti
Professor (Mechanical Engineering): fluid mechanics, bubble mechanics, numerical simulations

Kellogg Schwab
Associate Professor (Environmental Health Engineering, Bloomberg School of Public Health): environmental public health, pathogen microbiology

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

**EN.570.110. Introduction to Engineering for Sustainable Development.**
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

**EN.570.130. Climate, Environment and Society.**
Climate change will put major stress on the environment and society. Some predict wars over water and climate-induced mass migration. What can the past teach us about how we cope or fail to cope with climate change? What do we think the future holds and what do we think we can do about it? The class involves reading, discussion, debate and research. Freshman only.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

**EN.570.147. Adam Smith & Karl Marx.**
Smith and Marx are iconic figures in the history of political economic thought, often cited, rarely read. They are positioned as polar opposites in highly consequential debates about how society should be ordered. In this class, we will read and discuss their work, closely and carefully. We concentrate on the two iconic texts - The Wealth of Nations and Capital, Vol. 1 – but also explore some of their less well-known writings. Freshmen Only.
Area: Humanities, Social and Behavioral Sciences.

**EN.570.205. Ecology.**
Introduction to processes governing the organization of individual organisms into populations, communities, and ecosystems. Interactions between individual organisms, groups of organisms, and the environment, including adaptation, natural selection, competition.
Instructor(s): G. Brush
Area: Natural Sciences.

**EN.570.210. Computation/Math Modeling.**
An introduction to the use of computers in developing mathematical models. A structured approach to problem definition, solution, and presentation using spreadsheets and mathematical software. Modeling topics include elementary data analysis and model fitting, numerical modeling, dimensional analysis, optimization, simulation, temporal and spatial models. Recommended Course Background: AS.110.108 or equivalent.
Instructor(s): M. Beaudin
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.570.221. Sustainability Science.**
What is sustainability science? What are the core questions in sustainable development of societies? How can we guide the coupled human-environment systems along more sustainable trajectories? This course lays out the fundamentals of sustainability science and discusses some of the core questions and research gaps in sustainability science. Frameworks for conceptualizing the risks and resiliency of engineered infrastructure will be discussed in the context of sustainability science.
Instructor(s): R. Nateghi; S. Guikema
Area: Engineering, Social and Behavioral Sciences.

**EN.570.222. Environment and Society.**
Humans make their living in the environment. How do we do that changes nature and changes us. This class explores human impacts on the environment, how we have thought about our relationship to nature over the millennia, and contemporary environmental discourses.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.
This course will begin with a high-level understanding of globalization, and proceed to explore sustainable development and appropriate technology through the lens of case studies of engineering projects in the developing world. The goals for students are to learn specifics of various implemented projects, to be able to critically and contextually analyze these projects, and to develop an understanding of what leads to the success or failure of a technical development project.
Instructor(s): E. Kibbe
Area: Social and Behavioral Sciences.

EN.570.239. Emerging Environmental Issues.
Scientific principles underpinning environmental issues, with an emphasis on potential impacts of anthropogenic perturbation on human and ecosystem health. Recommended Course Background: two semesters of Chemistry.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

This course combines anthropological perspectives with the discussion and examination of technology-based interventions in the field of development and aid policies, with particular focus on activities related to water resources, sanitation, and hygiene. Readings and discussions analyze some of the theoretical, historically rooted, and practical issues that challenge those who hope to provide effective aid. A key aim of this course is to provide students with better understanding of cultural, social, environmental and economic issues relevant to technical intervention in developing countries.
Instructor(s): E. Cervone; W. Ball
Area: Humanities, Social and Behavioral Sciences.

EN.570.301. Environmental Engineering Fundamentals I.
Fundamentals and applications of physical and chemical processes in the natural environment and engineered systems. This class will cover material balances, chemical equilibrium, chemical kinetics, vapor pressure, dissolution, sorption, acid-base reactions, transport phenomena, reactor design, water quality, and environmental implications of nanotechnology.
Instructor(s): K. Chen
Area: Engineering, Natural Sciences.

EN.570.302. Water & Wastewater Treatment.
Theory and design of water and wastewater treatment processes including coagulation, sedimentation, filtration, adsorption, gas transfer, aerobic and anaerobic biological treatment processes, disinfection, and hydraulic profiles through treatment units.
Prerequisites: EN.570.301 or permission required.
Instructor(s): W. Weiss
Area: Engineering, Natural Sciences.

EN.570.304. Environmental Engineering Laboratory.
Introduction to laboratory measurements relevant to water supply and wastewater discharge, including pH and alkalinity, inorganic and organic contaminants in water, reactor analysis, bench testing for water treatment, and measurement and control of disinfection by-products. Recommended Course Background: EN.570.210 or Instructor Permission; Corequisite: EN.570.302.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

Techniques from systems analysis applied to environmental engineering design and management problems: reservoir management, power plant siting, nuclear waste management, air pollution control, and transportation planning. Design projects are required.
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.314. Microbial Ecology.
This course will highlight the latest methods in biotechnology revealing ecological principles determining the diversity and dynamics of microbial communities in a variety of ecosystems. We will explore advanced topics in ecology, such as niche theory, cooperation and speciation with examples from human health, engineering and environmental microbiology. Recommended Course Background: Ecology - EN.570.205 or Microbiology - AS.020.329
Instructor(s): S. Preheim
Area: Natural Sciences.

EN.570.320. Topics on Appropriate and Sustainable Technology for Developing Communities.
Lectures, readings and discussions on general and location-specific issues related to collaborative student projects about appropriate technology-based interventions. Focus is on improving student understanding about some of the environmental, social, health, and economic issues relevant to the development of sustainable technical interventions for under-developed communities and about the role of engineers in designing, planning, implementing, and evaluating such interventions.
Instructor(s): W. Ball
Area: Engineering, Social and Behavioral Sciences.

EN.570.321. Practicum on Appropriate and Sustainable Technology for Developing Communities.
Permission required Academic and practical support for students working on engineering projects in developing countries. Readings and discussions on general and location-specific issues related to collaborative student projects about appropriate technology-based interventions.
Instructor(s): W. Ball
Area: Engineering, Social and Behavioral Sciences.

EN.570.322. Projects in Appropriate and Sustainable Technology.
Corequisite: EN.570.311
Instructor(s): W. Ball.
Area: Engineering, Social and Behavioral Sciences.

EN.570.328. Geography & Ecology of Plants.
Patterns of aquatic and terrestrial plant species; historical changes in patterns using paleobotanical techniques; emphasis on biological and physical mechanisms controlling the patterns; the role of climate and man on plant distributions; several field trips; project required, which is the basis for the final grade.
Instructor(s): G. Brush
Area: Natural Sciences.

This course uses a calculus-based approach to introduce principles of engineering economics and microeconomics (demand and production theory) and their uses in engineering decision making. Recommended Course Background: AS.110.202
Instructor(s): P. Ferraro
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.
EN.570.335. Introduction to Applied Econometrics.
This course provides an introduction to quantitative methods for the analysis of economic phenomena. Topics will include basic regression models; hypothesis testing; Ordinary Least Squares; choice of independent variables and functional form; multicollinearity; serial correlation; heteroskedasticity. Computer assignments in EViews, one of the leading econometric software packages, represent an important part of the course. Particular emphasis will be placed on applications in the field of energy economics. Prerequisite: Introduction to probability and statistics, economic theory and linear algebra.
Instructor(s): C. Lo Prete
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.351. Introduction to Fluid Mechanics.
Introduction to the use of the principles of continuity, momentum, and energy to fluid motion. Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow. Recommended Course Background: Statics, Dynamics, and AS.110.302
Instructor(s): M. Karweit
Area: Engineering.

EN.570.353. Hydrology.
The occurrence, distribution, movement, and properties of the waters of the Earth. Topics include precipitation, infiltration, evaporation, transpiration, groundwater, and streamflow. Analyzes include the frequency of floods and droughts, time-series analyzes, flood routing, and hydrologic synthesis and simulation. Recommended Course Background: AS.110.302, EN.570.351
Instructor(s): C. Harman
Area: Social and Behavioral Sciences.

EN.570.375. Groundwater.
This introductory course emphasizes the fundamental principles governing the movement of water and contaminants in groundwater systems. Topics include groundwater hydraulics, well hydraulics, groundwater recharge, and solute transport. Prerequisites: EN.550.291/AS.110.302; Corequisites: EN.570.351
Instructor(s): M. Hilpert.

EN.570.395. Principles of Estuarine Environment: Chesapeake Bay.
Topics include the physical, chemical, and biological components of the Chesapeake Bay ecosystem from the time it started to form some 10,000 to 12,000 years ago, when sea level began to rise as the continental glaciers receded; the geology, geomorphology, and biology of the watershed drained by the estuary; relationships between the watershed and the estuary through the millennia and the effect of climate, geomorphology, and humans on the ecology of the ecosystem and its economic productivity.
Instructor(s): G. Brush
Area: Engineering, Natural Sciences.

EN.570.397. Intro to Decision Analysis in Energy and Environment.
This course will provide an overview of the methods used in decision analysis by using case studies from energy and environment. Decision modeling, uncertainty modeling and preference modeling will be introduced. Emphasis will be given on structuring decision problems, identifying and evaluating alternatives, constructing and solving decision trees, and utility theory. The class will be interactive and students will work in groups to apply the decision analysis techniques covered in the class.
Instructor(s): V. Prava
Area: Engineering, Quantitative and Mathematical Sciences.
This three-day intersession class will be a high-level overview of the US energy industry. We will focus on electricity, natural gas, oil, renewables and other forms of energy. We will discuss how each commodity is produced and traded from the perspective of the producer, the distributor, and the end user. The class will provide an overview of the technologies that convert energy into useful work, as well as the market and policy structures that influence investment in production, delivery, and consumption of electricity and natural gas. The goal is to provide a basis for further study, and to motivate students to consider a career in the industry. There are no prerequisites or textbooks, and the class is open to all. The course will be a mix of economics, basic engineering, financial mathematics, and sociology.
Instructor(s): C. Liggio.

This 2 day intersession class will explore in detail the Oil and Wind industry. All facets of the oil industry will be covered from exploration and production transportation and refining to economics and trading. This section will end with a discussion of alternative and synthetic fuels. The wind section will cover the US wind industry including technologies, project development and energy renewable energy policy. There are no prerequisites or textbooks, and the class is open to all. It is highly recommended to take Energy 101. Instructors are alumni from the industry.
Instructor(s): C. Liggio
Area: Social and Behavioral Sciences.

EN.570.410. Energy 103: Energy Demand & Efficiency.
This three day intersession class will explore in detail the demand for energy in the built environment. Co-taught by the Johns Hopkins Energy Manager students will look at how buildings use energy and what steps they can take to reduce energy. The class will emphasize understanding behavior, economics and technologies and explore the meaning of sustainability. Case studies from the University will be presented. Day three will be focused on how energy (conservation, efficiency and renewable) projects can be financed.
Instructor(s): C. Liggio.

EN.570.411. Engineering Microbiology.
Fundamental aspects of microbiology and biochemistry related to environmental pollution and water quality control processes, biogeochemical cycles, microbiological ecology, energetics and kinetics of microbial growth, and biological fate of pollutants.
Area: Engineering, Natural Sciences.

EN.570.412. Landscape Hydrology and Watershed Analysis.
The purpose of this class is to understand the landscape-scale controls on the fluxes of water and waterborne materials through watersheds. This class differs from the Hydrology and Hydrologic Modeling classes in its focus on data analysis, and its embrace of the complexity of real landscapes. There will be significant quantitative components to the material taught, but emphasis will be on developing a greater sense of the way that landscapes “function”, and how this function is related to real-world issues of water resources and pollution. Students will gain an understanding of how climate, geologic and ecologic setting, and human impacts control the partitioning of water between different fates, the flowpaths through the landscape and the storage and residence time of water. They will also learn conceptual and practical tools for analyzing hydrologic and other landscape data, and integrating this data in a holistic approach to watershed analysis. The class will be of interest for students intending to go into watershed or landscape management, and anyone wishing to pursue research in hydrology, geomorphology or ecology at landscape and watershed scales. The class will include at least one field trip to an instrumented watershed. GIS skills will be an advantage but are not required.
Prerequisites: AS.270.405 or EN 570.353 or equivalent.
Instructor(s): C. Harman.

This two day intersession class will introduce basic financial aspects of the energy business. We will begin with how energy projects are financed and describe capital structures, sources of financing and typical loan covenant restrictions. Then we will go on to describe concepts of trading and risk management as applied to the various energy commodities, and discuss price and credit risk trade-offs. The goal is to provide a basis for understanding how to make financial decisions in the presence of uncertainty. Concepts that are often taught using probability theory, option pricing, and other advanced mathematical concepts will be taught intuitively using in-class games. Students desiring a more in-depth treatment of energy commodities should take EN.550.653: Commodities and Commodity Markets.
Recommended Course Background: EN.570.408
Instructor(s): C. Liggio, G. Schultz
Area: Engineering, Social and Behavioral Sciences.

Whether financing clean energy projects or setting policy, it is important to understand how different electricity sources can be compared. This intersession course economically compares renewable and energy efficiency investment options. Simple techniques for matching load with generation and clean technologies will be developed. Detailed life-cycle cost analysis will be prepared including uncertainty. Energy efficiency cost-effectiveness will be determined using basic cost tests and varying policy issues will be discussed. Avoided costs and operational impacts of renewable energy will be computed using different state requirements. The goal is to provide the basic computational and policy framework for determining the economics of a wide range of energy options and understand the limitation of various techniques. Students should bring a calculator or laptop computer.
Instructor(s): C. Bothwell.
EN.570.418. Multiobjective Programming and Planning. Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Undergraduate level of EN.570.618. Recommended Course Background: EN.570.495 or Permission Required. Instructor(s): J. Williams Area: Engineering.

EN.570.419. Environmental Engineering Design I. Through general lectures and case study examples, this course will expose students to some of the non-technical professional issues that they will face as professional engineers and in their second-semester senior design project. Instructor(s): E. Bouwer Area: Engineering.

EN.570.420. Air Pollution. The course consists of an introduction to the fundamental concepts of air pollution. Major topics of concern are aspects of atmospheric motion near the earth’s surface; basic thermodynamics of the atmosphere; atmospheric stability and turbulence; equations of mean motion in turbulent flow, mean flow in the surface boundary layer; mean flow, turbulence in the friction layer; diffusion in the atmosphere; statistical theory of turbulence; plume rise. Emphasis is placed upon the role and utility of such topics in a systems analysis context, e.g., development of large and mesoscale air pollution abatement strategies. Comparisons of the fundamental concepts common to both air and water pollution are discussed. This course meets with EN.570.657, Air Pollution. Instructor(s): J. Ellis.

EN.570.421. Environmental Engineering Design II. Engineering design process from problem definition to final design. Team projects include written/oral presentations. Students will form small teams that work with local companies or government agencies in executing the project. Recommended Course Background: EN.570.302, EN.570.352, and EN.570.419 Instructor(s): E. Bouwer; H. Alavi Area: Engineering.

EN.570.422. Principles of Geomorphology. Analysis of the factors responsible for the form of the landscape. The concept of the cycle of erosion is discussed primarily in terms of the principles that govern the processes of erosion. Climate, conditions of soil formation, and the distribution of vegetation are considered as they relate to the development of landforms. Recommended Course Background: AS.270.220 or permission required. Instructor(s): P. Wilcock Area: Natural Sciences.

EN.570.428. Problems in Applied Economics. This course focuses on a monetary approach to national income determination and the balance of payments. Money and banking, as well as commodity and financial markets, are dealt with under both central banking, as well as alternative monetary regimes. Particular emphasis is placed on currency board systems. Students learn how to properly conduct substantive economic research, utilizing primary data sources, statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers of publishable quality. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be pre-screened for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a pre-requisite. Prerequisites: EN.660.203 AND AS.180.101 AND AS.180.102 Instructor(s): S. Hanke Area: Social and Behavioral Sciences.

EN.570.432. Sediment Transport & River Mechanics. Sediment entrainment, transport, and deposition; the interaction of flow and transport in shaping river channels. Review of boundary layer flow; physical properties of sediment; incipient, bed-load, and suspended-load motion; bed forms; hydraulic roughness; velocity and stress fields in open channels; scour and deposition of bed material; bank erosion; size, shape, planform, and migration of river channels. Techniques of laboratory, theoretical, and numerical modeling are developed and applied to problems of channel design, restoration, and maintenance. Recommended Course Background: EN.570.351 Instructor(s): P. Wilcock Area: Engineering, Natural Sciences.

EN.570.441. Environmental Inorganic Chemistry. Advanced undergraduate/graduate course that explores the chemical transformations of elements of the periodic table. Thermodynamic, kinetic, and mechanistic tools needed to address the multiple chemical species and interfaces that are present in natural waters and water-based technological processes are emphasized. Ligand exchange, metal ion exchange, adsorption/desorption, precipitation/dissolution, electron and group transfer reactions, and other concepts from coordination chemistry will be covered. Applications include elemental sources and sinks in ocean waters, reactive transport in porous media, weathering and soil genesis, nutrient and toxic element uptake by organisms, water treatment chemistry, and rational design of synthetic chemicals. Instructor(s): A. Stone Area: Natural Sciences.

EN.570.442. Environmental Organic Chemistry. Advanced undergraduate/graduate course focusing on examination of processes that affect the behavior and fate of anthropogenic organic contaminants in aquatic environments. Students learn to predict chemical properties influencing transfers between hydrophobic organic chemicals, air, water, sediments, and biota, based on a fundamental understanding of intermolecular interactions and thermodynamic principles. Recommended Course Background: AS.030.104 or permission required. Instructor(s): A. Roberts Area: Engineering, Natural Sciences.
EN.570.443. Aquatic Chemistry.
Equilibrium speciation of natural waters, biofluids, and engineered systems. Electrolyte solutions, acids and bases, complex formation, precipitation and dissolution, oxidation and reduction. Recommended Course Background: One year of both Chemistry and Calculus.
Instructor(s): A. Stone
Area: Engineering, Natural Sciences.

The application of basic physical and chemical concepts to the analysis of environmental engineering problems. Principles of chemical equilibrium and reaction, reaction engineering, interphase mass transfer, and adsorption are presented in the context of process design for unit operations in common use for water and wastewater treatment. Topics addressed include mass balances, hydraulic characteristics of reactors, reaction kinetics and reactor design, gas transfer processes (including both fundamentals of mass transfer and design analysis), and adsorption processes (including both fundamentals of adsorption and design analysis).
Prerequisites: EN.570.301 AND EN.570.302 or permission of instructor
Instructor(s): W. Ball
Area: Engineering.

EN.570.446. Biological Process of Wastewater Treatment.
Fundamentals and application of aerobic and anaerobic biological unit processes for the treatment of municipal and industrial wastewater. Recommended Course Background: EN.570.411
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.448. Physical and Chemical Processes II.
Fundamentals and applications of physical and chemical processes used in water and wastewater treatment. This class will cover particle interactions, coagulation, flocculation, granular media filtration, membrane processes, and emerging water treatment processes. Recommended Course Background: EN.570.445 or Permission Required.
Instructor(s): K. Chen
Area: Engineering.

EN.570.449. Social Theory for Engineers.
Engineers work in a social context. This course addresses a number of questions about that social context. How should we understand how societies come about, how they evolve, and why the rules of the game are what they are? What is the relationship between the individual and society, what does it mean to be 'modern,' are there different forms of rationality? How might all this impinge on what it means to be an engineer?
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

An advanced laboratory covering principles of modern analytical techniques and their applications to problems in environmental sciences. Topics include electrochemistry, spectrometry, gas and liquid chromatography. The course is directed to graduate students and advanced undergraduates in engineering and natural sciences.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Prerequisite: EN.570.443
Instructor(s): A. Stone
Area: Engineering, Natural Sciences.

EN.570.460. Environmental Colloidal Phenomena.
This class will introduce fundamental concepts of colloidal and interfacial phenomena and apply them to natural and engineered aquatic systems. This course will also include topics related to the environmental applications and implications of nanotechnology. Modern measurement techniques employed in the laboratory to study colloidal behavior and interfacial interactions will be discussed. Lab demonstrations will be conducted and students will be given opportunities to review research papers related to topics covered in class. Topics include: Brownian motion and diffusion, size and surface characterization, electric double layer, electrokinetic phenomena, DLVO theory, Non-DLVO forces, aggregation, deposition, modern measurement techniques in the laboratory, fate and transport of engineered nanoparticles in the environment, and environmental applications of nanotechnology (e.g., sensors, remediation, antimicrobial agents).
Instructor(s): K. Chen.

This course focuses on company valuations, using the proprietary Hanke-Guttridge Discounted Free Cash Flow Model. Students use the model and primary data from financial statements filed with the Securities and Exchange Commission to calculate the value of publically-traded companies. Using Monte Carlo simulations, students also generate forecast scenarios, project likely share-price ranges and assess potential gains/losses. Stress is placed on using these simulations to diagnose the subjective market expectations contained in current objective market prices, and the robustness of these expectations. During the weekly seminar, students’ company valuations are reviewed and critiqued. A heavy emphasis is placed on research and writing. Work products are expected to be of publishable quality.
Prerequisites: EN.660.203 AND ( EN.570.428 OR AS.360.528)
Instructor(s): S. Hanke
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.490. Solid Waste Engineering and Management.
This course covers advanced engineering and scientific concepts and principles applied to the management of municipal solid waste (MSW) to protect human health and the environment and the conservation of limited resources through resource recovery and recycling of waste material.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.491. Hazardous Waste Engineering and Management.
This course addresses traditional and innovative technologies, concepts, and principles applied to the management of hazardous waste and site remediation to protect human health and the environment.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.492. M. Gordon Wolman Seminar.
Undergraduates only with permission of instructor.
Instructor(s): K. Chen.
This course includes an exposition of intermediate level price theory, combined with a survey of applications to the analysis of public sector decisions. Theoretical topics include demand, supply, the function and behavior of the market, and introductory welfare economics. Recommended Course Background: AS.180.101-AS.180.102, AS.110.202 or equivalent.  
Instructor(s): B. Hobbs; J. Boland  
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences. 

A collection of systems analytic techniques which are frequently used in the study of public decision making is presented. Emphasis is on mathematical programming techniques. Primarily linear programming, integer and mixed-integer programming, and multiobjective programming. Recommended Course Background: AS.110.106-AS.110.107/AS.110.109  
Instructor(s): J. Ellis  
Area: Engineering, Quantitative and Mathematical Sciences. 

EN.570.496. Urban and Environmental Systems.  
The mathematical techniques learned in EN.570.305 and EN.570.495 are applied to realistic problems in urban and environmental planning and management. Examples of such problems include the siting of public-sector and emergency facilities; natural areas management, protection and restoration; solid waste collection, disposal, and recycling; public health; the planning and design of energy and transportation systems; and cost allocation in environmental infrastructure development.  
Instructor(s): J. Williams  
Area: Engineering, Quantitative and Mathematical Sciences. 

EN.570.497. Risk and Decision Analysis.  
This class introduces the decision analysis approach to making decisions under risk and uncertainty. Topics covered include decision trees, Bayes law, value of information analysis, elicitation of subjective probabilities, multiattribute utility, and their applications to environmental and energy problems. Textbook: R.T. Clemen, Making Hard Decisions, 2014. Recommended Course Background: introductory statistics and probability.  
Instructor(s): B. Hobbs  
Area: Engineering, Quantitative and Mathematical Sciences. 

EN.570.501. Undergraduate Research.  
Instructor(s): Staff. 

EN.570.502. Undergraduate Research.  
Instructor(s): Staff. 

EN.570.504. Financial Market Research.  
This course investigates the workings of financial, foreign exchange, and commodity futures markets. Research is focused on price behavior, speculation, and hedging in these markets. Extensive research and writing of publishable quality are required. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. An approved research proposal is a pre-requisite.  
Instructor(s): S. Hanke. 

EN.570.505. Undergraduate Independent Study.  
Instructor(s): Staff. 

EN.570.506. Maryland Department of the Environment Independent Study.  
This independent study within the MDE’s Water Management Administration (WMA) will engage the student in scientific/policy literature and data research and management, field investigations, or evaluation of emerging issues and innovative approaches to surface and ground water protection and drinking water management, wastewater management, wetlands and non-point source pollution control. Each independent course will focus on a scientific, regulatory or policy topic designed to further the mission of the administration, which is to protect the public health and the aquatic environment. The student will be assigned to a WMA engineer, scientist or project manager to develop a course of study. Hours can be tailored to accommodate student’s schedule.  
Instructor(s): E. Bouwer. 

This Independent Study within Baltimore City’s Energy Office will engage students in local energy policies, energy initiatives, data and City operations. Interns will have the chance to apply optimization and modeling skills to one of many projects. These projects can include: • Measurement and verification of performance contracts with energy service contractors • Collection of data from City operated co-generation and solar plants and developing operation models • Analyzing energy usage data from City buildings and making recommendations As part of an independent student project, students will be required to submit a final report and present their findings to the City. Hours can be tailored to accommodate student’s schedule but a minimum of 10 hours per week during the semester is required. Permission required.  
Instructor(s): E. Bouwer. 

EN.570.510. Internship-Geog/Envr Eng.  
Instructor(s): E. Bouwer. 

EN.570.570. Independent Study.  
Instructor(s): E. Schoenberger; G. Brush. 

EN.570.574. Research.  
Instructor(s): E. Schoenberger. 

EN.570.576. Internship.  
The research will focus on how environmental improvements can be factored into the decision making process when consumers purchase vehicles.  
Instructor(s): B. Hobbs. 

EN.570.590. Internship-Summer.  
Instructor(s): E. Bouwer; G. Brush; S. Guikema. 

EN.570.597. Research-Summer.  
Instructor(s): Staff. 

EN.570.599. Independent Study.  
Instructor(s): A. Roberts; B. Hobbs; S. Guikema. 

This course builds on the basis gain in risk and decision analysis in 570.497. This course covers more advanced analytical methods useful in risk and decision analysis, particularly for dealing with uncertainty. This includes Bayesian methods and Bayesian updating of prior distributions, Markov Chain Monte Carlo, Bayesian belief networks and influence diagrams, and simulation for risk analysis models. The focus is both on the fundamentals of the methods and how they are used in risk and decision analysis. 570.497 is a required prerequisite.  
Instructor(s): S. Guikema.
EN.570.601. IGERT Water, Climate and Health Colloquium.
Recommended Course Background: Microeconomics, Introductory Statistics, and Optimization.
Instructor(s): G. Brush.

EN.570.602. IGERT-Water, Climate & Health-Capstone.
Instructor(s): G. Brush.

EN.570.605. Interdisciplinary Research Practice in Sustainability and Health.
Through the application of interdisciplinary research methods and skills to case studies in environmental sustainability and health, the course will provide hands-on training in the management, coordination, and practice of interdisciplinary research. The goal is to enable doctoral students to work effectively on interdisciplinary research and prepare them for professional success in an increasingly interdisciplinary funding environment. This course will be in the format of a weekly seminar and laboratory and is open to all Johns Hopkins University doctoral students from any School. No prior knowledge of sustainability or public health is required.
Instructor(s): A. Monopolis; B. Hobbs.

This course assumes a basic familiarity with programming in R. Some knowledge of probability and statistics will be a plus. The course introduces some key methods in implementing data-driven research. The course starts with a very brief review of programming in R and basics of probability and statistics and then spans into topics such as random variable generation, Monte Carlo integration, variance reduction techniques, uncertainty estimation, MCMC, probability density estimation and numerical methods. Recommend Course Background: EN.570.608 or equivalent.
Instructor(s): R. Nateghi.

Methods for optimizing operation and design of energy systems and for analyzing market impacts of energy and environmental policies are reviewed, emphasizing both theory and solution of actual models. Review of linear and nonlinear programming and complementarity methods for market simulation. Recommended Course Background: EN.570.493 and EN.570.495 or equivalent.
Instructor(s): B. Hobbs.

EN.570.608. Data Analytics for Engineering, Policy Analysis and Management.
Data analytics is the use of computational statistics and data mining to draw insights and build predictive models based on large data sets. As data becomes more prevalent in across many different areas of importance in engineering, policy analysis, and management, analytics is becoming an increasingly important topic. This course assumes a working knowledge of regression and statistics and builds from this to introduce modern data analytics. This course covers major classes of methods beyond linear regression, including additive models, tree-based models, Bayesian networks, boosting, bagging, and model averaging. The course focuses on the application and interpretation of the methods while also providing an understanding of the underlying basis and theory behind them. Assignments, exams, and the term project are primarily data-driven analytic exercises. Recommended Course Background: EN.550.420 and EN.550.430 or equivalent (by approval of instructor).
Instructor(s): S. Guikema
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.611. Natural Resource Economics.
Development of the economic theory of depletable and renewable private and common property natural resources, including those which may be recyclable or storable.
Instructor(s): J. Boland.

EN.570.612. Infrastructure Modeling, Simulation, and Analysis.
This course will be a mix of seminar-style guided discussions and student presentations and lectures on specific topics based on the current research literature in the field. It will give an overview of the infrastructure systems that form the basis for health, security, and economic prosperity in the developed world and give an overview of some of the most pressing infrastructure challenges in the developing world. The focus will be on quantitative modeling of infrastructure performance, sustainability, and resilience for supporting infrastructure management and policy decision-making. Suggested: Microeconomics, Introductory Statistics, and Optimization.
Instructor(s): S. Guikema
Area: Engineering, Natural Sciences.

EN.570.618. Multiobject Programming and Planning.
Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Graduate level of EN.570.418. Recommended Course Background: EN.570.495 or Permission Required.
Instructor(s): J. Williams
Area: Engineering.

This graduate level course will provide a practical knowledge of molecular methods used to identify microorganisms present with a sample and gain insight into their function and dynamics. It will provide theoretical background into how to identify microorganisms and infer functional capabilities from genetic material, practical knowledge of common molecular methods and computational skills needed to analyze the resulting sequence data. No background in molecular biology, computation or microbiology is necessary. Course objectives include (1) understanding key aspects of microbial community composition from literature reports; (2) recognizing major microbial taxonomic groups and understanding phylogenetic relationships; (3) developing molecular biology lab skills required to create gene amplicon libraries from an aquatic samples; (4) working knowledge of statistical methods used to associate taxonomic and functional gene information with specific environmental conditions. Recommended Course Background: Microeconomics, Introductory Statistics, Optimization
Instructor(s): S. Preheim

EN.570.633. Stochastic Simulation and Game Theory.
This course provides an introduction to stochastic simulation and game theory. It covers a mix of the theoretical background and the practical use of these two methods. The stochastic simulation portion of the covers both discrete even and time step methods. It also covers random number generators, analysis of output, comparison of systems, variance reduction techniques, and linkages between simulation and optimization. The game theory portion of the course provides an introduction to the basic types of games: static games of complete information, dynamic games of complete information, static games of incomplete information, and dynamic games of incomplete information. Several case studies are covered.
Instructor(s): S. Guikema.
EN.570.634. Foundational Literature of Risk and Decision Analysis.
This course will be a guided reading, discussion, and assessment of the foundational literature from the fields of risk and decision analysis. We will read work by authors such as Ramsey, Savage, Raiffa, Laplace, and others that have established the foundations on which the fields are built. The goal is to provide Ph.D. students with a strong foundation in the field and an understanding of the literature underlying the development of the field. PhD students or permission of instructor.
Prerequisites: EN.570.497
Instructor(s): S. Guikema.

Detailed investigation of mechanisms of abiotic and biochemical transformations of organic pollutants in natural and engineered environments. Recommended Course Background: EN.570.442.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.646. Water Quality and Treatment: Global Issues and Solutions.
This course involves extensive student participation and is intended for motivated graduate students from both engineering and non-engineering disciplines who are interested in understanding technological aspects water quality in the contexts of drinking water treatment, wastewater disposal, and sanitation for public health. The course involves extensive outside reading, in-class reflections on those readings, and a combination of instructor- and student-led in-class presentations. After this course, students should have improved understanding of: (1) Fundamental concepts of water quality and treatment as related to the application of engineering principles to the design and operation of unit operations for the removal of traditional and “emerging” contaminants; (2) Challenges to providing water of appropriate quality for drinking, sanitation, and environmental sustainability in the face of population growth and climate change; and (3) Alternative approaches for meeting these challenges, particularly as related to the design and application of technological interventions.
Instructor(s): W. Ball.

This course considers the transport of solutes and sediments by water through terrestrial landscapes, with an emphasis on the movement of nutrients and contaminants from the landscape into receiving water bodies like rivers, lakes and estuaries. The course will cover the theoretical approaches (advection-diffusion/dispersion, transport time distributions), the use of active and passive tracers to infer transport processes, analysis of water quality time series, runoff generation and flow pathways in watersheds, and the effect of climate variability on transport. Assessment is based on a semester project and in-class presentations. Seniors interested in joining the class must have Hydrology 570.353 and should contact the instructor.
Area: Engineering, Natural Sciences.

EN.570.657. Air Pollution.
The course consists of an introduction to the fundamental concepts of air pollution. Major topics of concern are aspects of atmospheric motion near the earth’s surface; basic thermodynamics of the atmosphere; atmospheric stability and turbulence; equations of mean motion in turbulent flow, mean flow in the surface boundary layer; mean flow, turbulence in the friction layer; diffusion in the atmosphere; statistical theory of turbulence; plume rise. Emphasis is placed on the role and utility of such topics in a systems analysis context, e.g., development of large and mesoscale air pollution abatement strategies. Comparisons of the fundamental concepts common to both air and water pollution are discussed.
Instructor(s): J. Ellis.

EN.570.659. Environmental Policy Analysis.
Instructor(s): J. Ellis.

EN.570.661. Applied Math For Enginee.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

EN.570.676. Stochastic Programming.
The course deals with computationally tractable methodologies for incorporating risk/uncertainty into mathematical programming (optimization) models. Focal topics include chance-constrained programming, stochastic linear programming, two-stage programming under uncertainty and stochastic dynamic programming. Some of these techniques may result in the creation of nonlinear models thus nonlinear/nonseparable optimization techniques are presented as well. Numerous applications are presented involving, for the most part, environmental (i.e., water and air resources) problems. Prerequisites: linear programming or equivalent, and introductory probability and statistics.
Instructor(s): J. Ellis.

EN.570.680. Environment and Society.
This class addresses a range of questions, including: Why do we not act in our own best interests in the environment? How are environmental discourses developed and how do they relate to environmental policies? How do environmental politics and policy in the US compare with other countries?
Instructor(s): A. Roberts
Area: Social and Behavioral Sciences.

EN.570.800. Masters Independent Study.
Instructor(s): Staff.

EN.570.801. Doctoral Research.
Instructor(s): Staff.

EN.570.803. Master’s Research.
Instructor(s): Staff.

EN.570.805. Jensen Internship.
Instructor(s): W. Ball.

EN.570.841. M. Gordon Wolman Seminar.
Instructor(s): K. Chen.

EN.570.850. Graduate Independent Study.
Instructor(s): M. Hilpert; S. Guikema; W. Ball.

Instructor(s): B. Hobbs; D. Gayme; J. Ellis; J. Williams.
Instructor(s): E. Bouwer.

Cross Listed Courses
Anthropology
This course combines anthropological perspectives with the discussion and examination of technology-based interventions in the field of development and aid policies, with particular focus on activities related to water resources, sanitation, and hygiene. Readings and discussions analyze some of the theoretical, historically rooted, and practical issues that challenge those who hope to provide effective aid. A key aim of this course is to provide students with better understanding of cultural, social, environmental and economic issues relevant to technical intervention in developing countries.
Instructor(s): E. Cervone; W. Ball
Area: Humanities, Social and Behavioral Sciences.

Public Policy
AS.195.477. Intro To Urban Policy.
Perm. Req’d. 195.477 & 195.478 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman
Area: Social and Behavioral Sciences.

195.478 & 195.477 must be taken together by undergraduates Cross-listed with Political Science, Sociology, Public Health Studies, and Geography and Environmental Engineering
Instructor(s): S. Newman.

Earth Planetary Sciences
AS.270.205. Introduction to Geographic Information Systems and Geospatial Analysis.
The course provides a broad introduction to the principles and practice of Geographic Information Systems (GIS) and related tools of Geospatial Analysis. Topics will include history of GIS, GIS data structures, data acquisition and merging, database management, spatial analysis, and GIS applications. In addition, students will get hands-on experience working with GIS software.
Instructor(s): X. Chen
Area: Engineering, Natural Sciences.

Public Health Studies
AS.280.335. The Environment and Your Health.
This course surveys the basic concepts underlying environmental health sciences (toxicology, exposure assessment, risk assessment), current public health issues (hazardous waste, water- and food-borne diseases), and emerging global health threats (global warming, built environment, ozone depletion, sustainability). Public Health Studies, Global Environmental Change and Stability, and Earth and Planetary Science majors have 1st priority for enrollment. Your enrollment may be withdrawn at the discretion of the instructor if you are not a GECS, PHS, or EPS major.
Prerequisites: (Students may not have taken AS.270.320)
Instructor(s): J. Bressler; M. Trush
Area: Natural Sciences.

Interdepartmental
AS.360.147. Freshmen Seminar: Adam Smith and Karl Marx.
This freshmen seminar examines the ideas of Smith, the greatest proponent of the free market, and Marx, his most radical critic. Freshmen only.
Instructor(s): E. Schoenberger; P. Jelavich
Area: Humanities, Social and Behavioral Sciences.

AS.360.528. Problems in Applied Economics.
This course focuses on a monetary approach to national income determination and the balance of payments. Money and banking, as well as commodity and financial markets, are dealt with under both central banking, as well as alternative monetary regimes. Particular emphasis is placed on currency board systems. Students learn how to properly conduct substantive economic research, utilizing primary data sources, statistical techniques and lessons from economic history. Findings are presented in the form of either memoraanda or working papers of publishable quality. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be pre-screened for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a requisite.
Prerequisites: EN.660.203
Instructor(s): S. Hanke
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

Information Security Institute
The Johns Hopkins University Information Security Institute (JHUISI) (isi.jhu.edu) is the University’s focal point for research and education in information security, assurance and privacy. Securing cyberspace and our national information infrastructure is more critical now than ever before, and it can be achieved only when the core technology, legal and policy issues are adequately addressed. JHUISI is committed to a comprehensive approach that includes input from academia, industry and government. The University, through JHUISI’s leadership, has thus been designated as a Center of Academic Excellence in Information Assurance Education and Research by the National Security Agency and the Department of Homeland Security, and leading experts in the field. Through our broad range of educational opportunities including a ground-breaking graduate program and leading edge research in foundational science and applied technologies, JHUISI is having a significant impact in the region and nationwide.

Our research in cryptography, networking, wireless, systems evaluation, medical privacy and electronic voting, among other areas is widely circulated among academics and policymakers. Moreover, JHUISI is instrumental in homeland security efforts across Hopkins, including emergency health preparedness, bio-terrorism and national defense.

The Johns Hopkins University Information Security Institute based in the Whiting School of Engineering provides a broad and holistic perspective to the information security and assurance field relative to both research and education. In addition to a comprehensive collection of programs related to information technology, a range of management, governance, and policy issues are integrated into the Information Security Institute agenda. The breadth of focus provided represents a strength and distinction of the Johns Hopkins University Information Security Institute. Through the involvement of the faculty and resources...
from the Whiting School of Engineering, the Krieger School of Arts and Sciences, the Bloomberg School of Public Health, the Carey Business School, and the Applied Physics Lab, a variety of innovative as well as international research and educational initiatives in information security and assurance are supported within the Information Security Institute.

Facilities

The computing facilities include a laboratory of shared servers and PC workstations, several customizable machines for student projects, and multiple high-speed laser printers. Various focused research laboratories have additional resources that provide greater specialization than the general lab. The facilities are connected to a secure high-speed network which allows access to specialized hardware in other departments and institutions. The Information Security Institute and Department of Computer Science cooperate in the use of some of these facilities.

M.S.S.I. Graduate Program

The flagship educational experience offered by Johns Hopkins University in the area of information security and assurance is represented by the Master of Science in Security Informatics (M.S.S.I.) degree. A wide range of courses is available in support of this unique and innovative graduate program.

The M.S.S.I. is a full-time day program offered on the Homewood Campus in North Baltimore. Most students complete the program in three full-time semesters though some graduate students may finish their degree part-time after completing two consecutive semesters of residency as a full-time student.

Application Requirements for the M.S.S.I. Degree

- Application to the M.S.S.I. degree is open to outstanding candidates who hold a bachelor’s degree with sufficient technical exposure to computer science that serves as preparation for the core technology courses, including intermediate programming, data structure, discrete mathematics, and computer system fundamentals.
- All applicants are obligated to take and submit the results of the Aptitude Test of the Graduate Record Examination as one of the requirements for admission.
- International students are obligated to take either the TOEFL test or the IELTS test.

The preferred scores are as follows:

<table>
<thead>
<tr>
<th>GRE General Test</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Verbal</td>
<td>153 (62%)</td>
</tr>
<tr>
<td>Quantitative</td>
<td>160 (84%)</td>
</tr>
<tr>
<td>Analytical</td>
<td>3.5</td>
</tr>
<tr>
<td>TOEFL Internet based</td>
<td>79</td>
</tr>
<tr>
<td>IELTS</td>
<td>7.0</td>
</tr>
</tbody>
</table>
- The institution code for both the GRE and TOEFL is 5332.
- The department code for the GRE is 0404. The department code for TOEFL is 78.
- These scores in the above serve as general guidelines for admission. The Admissions Committee in making its final decisions will consider the combination of professional knowledge, academic excellence, letters of recommendation, and the statement of purpose, as well as GRE, TOEFL, and IELTS scores of the applicants.
- A student is required to apply online at https://app.applyyourself.com/?id=jhu-grad.

Course Requirements for the M.S.S.I.

Upon admission to the Master of Science in Security Informatics, a student is assigned a graduate advisor from the Information Security Institute who must approve the courses to be applied to the M.S.S.I. degree.

The Master of Science in Security Informatics program has a course requirement of a minimum of 10 courses, plus a capstone project including a report and presentation. Students must choose one of two tracks - Technology & Research Track or Policy & Management Track.

All courses supporting the M.S.S.I. are categorized as one of four areas of Technology, Policy, Health, and Management. Each course is further classified into Core, Elective or Foundational category.

The Technology & Research Track program of study must satisfy the following course distribution requirements:
- Five Technology courses: at least four Core Technology courses including at least one Core Technology course in Cryptography.
- Three Core Policy/Management/Health courses: at least one Core Policy course and one Core Management course.
- Two additional courses from Core or Elective Technology categories; or when deemed appropriate relative to a student’s background, interests, and goals AND with the prior approval of the faculty advisor and the institute, from other course areas.

The Policy & Management Track program of study must satisfy the following course distribution requirements:
- Three Technology courses: at least two Core Technology courses including at least one Core Technology course in Cryptography.
- Five Core/Foundational Policy/Health/Management courses: at least one course from each of Core Policy/Management/Health categories and at least one Foundational Management course.
- Two additional courses from Core/Elective Technology or Core/Foundational Policy/Management/Health categories; or when deemed appropriate relative to a student’s background, interests, and goals AND with the prior approval of the faculty advisor and the institute, from other course areas.

Project Requirement

The students register for EN.650.736/EN.650.737/EN.650.738 for the capstone project. These courses are not counted toward the 10-course requirement.

In general, the M.S.S.I. Capstone Project will include both technology and non-technology components, and will be conducted within a team-structured environment comprised of students and faculty mentors (plus external mentors if appropriate). These projects will generally be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and contracts. They should relate to real-world problems and exhibit both theoretical and practical significance. The project must be documented by a report and presentation, as well as other applicable deliverables including but not limited to system prototypes, utility libraries, experimental
demonstrations, conference or journal submissions, and so on. It should follow the best practice of software engineering.

Students should actively initiate the project while communicating with the potential faculty mentor for technical issues and the faculty advisor for project management. They are expected to develop a project plan at the end of the second semester. The project is expected to have a proposal approved at the start of the third semester and be finished by the end of the third semester. A presentation will be scheduled when the project concludes. The faculty mentor should approve each milestone of the project with the faculty advisor being informed. When the project is completed with all the deliverables, the faculty advisor assigns a score upon the recommendation of the faculty mentor.

Additional Course Requirements

- All courses toward the degree requirement must be 400-level or above. Other courses can be used with the approval of the Institute.
- Courses not found on the area-specific lists (http://engineering.jhu.edu/jhuisi/mssi-course-distribution) can be used to meet area requirements with prior approval from the student’s advisor and the Institute.
- At most two independent study courses can be counted toward the course requirements.
- No courses with grades of P may be counted with the exception of independent study courses.
- At most two courses may be transferred from other institutions. The student’s faculty advisor and the director of Information Security Institute must approve such transfer courses.
- The overall grade point average of the courses counted towards the coursework requirements must be 3.00 or higher.
- At most two courses with grade less than B- may be counted towards the course work requirements. No courses with grade less than C- may be counted.
- A grade of D or F results in probation. A second D or F is cause for being dropped from the program.

JHUISI Courses

All courses supporting the M.S.S.I. are categorized as one of four areas of Technology, Policy, Health, and Management. Each course is further classified into Core, Elective or Foundational category.

- For seven-week course modules, e.g., several courses offered through the Whiting School of Engineering Center for Leadership Education (CLE) (http://eng.jhu.edu/wse/cle), two of them count as one course of 3 credit hours.
- Two quarter-based courses, e.g., several courses of course numbers starting with ME from the School of Medicine Division of Health Sciences Informatics (http://dhsi.med.jhmi.edu), are equivalent of one WSE course of 3 credit hours.

Concurrent Bachelor’s/Master’s Degree Program in Conjunction with the M.S.S.I.

A concurrent bachelor’s/master’s degree program including the M.S.S.I. is also available to Johns Hopkins University students. In this program, by the conclusion of the undergraduate sophomore/junior academic year, a student can apply for concurrent admission into the M.S.S.I. program. If accepted, the student during each subsequent semester partitions her/his course load into courses that will count for the undergraduate degree and courses that will count for the M.S.S.I. degree. Usually with one additional year of study, the student can simultaneously satisfy both sets of degree requirements.

Dual Master’s Program with the Department of Computer Science

Students interested in pursuing the above Dual Master’s Program (DMP) will have initially entered either the M.S.S.I. program or the M.S.E. program in Computer Science, and then apply for the DMP at a later point. A maximum of two courses (approved by the advisors) can be double counted toward each set of course requirements, thereby facilitating the feasibility of completing the DMP in two academic years plus the in-between summer. In such cases, the designation of the double counted courses would be done in conjunction with one advisor from each department and the Academic Program Administrator.

Dual Master’s Program with the Department of Applied Math and Statistics in the WSE

A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the master’s program in the Department of Applied Math and Statistics in the WSE. The details of this DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant differences. Each program should be contacted if a student is interested.

Dual Master’s Program with the School of Public Health

A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the Master of Health Sciences (M.H.S.) program in the Bloomberg School of Public Health (BSPH). The details of this M.S.S.I./M.H.S. DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant differences. Each program should be contacted if a student is interested.

Joint Program with the Certificate in National Security Studies of the School of Arts and Sciences

A joint M.S.S.I. Degree and the Certificate in National Security Studies (CNSS) (http://advanced.jhu.edu/academics/certificate-programs/national-security-studies/degree-requirements) in the Krieger School of Arts and Science is now being offered. The CNSS requires completion of five core courses. Two designated courses can be double counted for the MSSI and the CNSS. Each program should be contracted if a student is interested in completing this course of study.

For current faculty and contact information go to http://isi.jhu.edu/institute/people

Faculty

Executive Director
Anton Dahbura
Information Security Institute.

Program Director
Xiangyang Li
Master of Science in Security Informatics.

Professor

Aviel Rubin
Computer Science: Technical Director of Information Security Institute: network and systems security, applied cryptography, cryptographic key distribution, anonymity and computer privacy, electronic commerce, fire-walls and network perimeter defenses, security issues in e-voting, applying security to applications such as medical information systems, intellectual property protection.

Professor Emeritus
Gerald Masson
Computer Science: reliable computing, computer networking, real-time monitoring of software operations, computer architecture, computer networking, security informatics relative to networks and software operations.

Associate Research Professor
Giuseppe Ateniese
Computer Science: applied cryptology, cryptology and network security, security and privacy in computing, applied cryptography and network security, DNSSEC and medical information privacy protection.

Susan Hohenberger
Computer Science: theory, cryptography, computer security, algorithms, complexity theory, balancing privacy and accountability in information systems.

Assistant Professors
Matthew Green
Computer Science: applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Abhishek Jain
Computer Science: cryptography & security, theoretical computer science

**Lecturers**

William Agresti, Ph.D.
Professor, Carey Business School: system design and development, information systems architecture, and IT integration for business, software engineering, IT measurement and knowledge management.

Joel Coffman, Ph.D.
Senior Cyber Engineer, Applied Physics Laboratory: cloud computing, databases, software engineering, computer architecture

Michael Jacobs, J.D.
Computer ethics, digital rights management, intellectual property protection.

George E. Kalb
Embedded computer systems-vulnerabilities, intrusions and protection mechanisms, embedded systems security, software engineering.

Michael Kociemba
Information security, management, and infrastructure protection.

Timothy R. Leschke, Ph.D.
Computer forensics

Williams Sauers, J.D.
Digital rights management, intellectual property protection.

Lanier Watkins, Ph.D.

For current course information and registration go to https://isis.jhu.edu/classes/

**Courses**

**EN.650.401. Introduction to Information Security. 3 Credits.**
This course exposes students to the cross-disciplinary and broad information security field. It surveys a range of fundamental topics of information security principles, architecture, policy and standard, risk management, cryptography, physical, operation, system and network security mechanisms, and law and ethics, among others. This course includes lectures, case studies, and homework. Students will also complete independent study class projects. Recommended Course Background: Basic knowledge of computer system and information technology.
Instructor(s): X. Li.

**EN.650.412. Java Security.**
This course provides a comprehensive coverage of the security aspects of the Java platform. Java's security model and the VM and language features that support security are covered. Java APIs relevant to development of secure software are discussed. The course concentrates on the practical aspects of using these APIs. Use of the Java Cryptography APIs is addressed and material on security in J2EE (Java 2 Enterprise Edition) is presented. Topics covered include the java.security.* packages, the Java Cryptography Architecture and Java Cryptography Extension (JCA and JCE), Java Secure Sockets Extension (JSSE), Java Authentication and Authorization Service (JAAS), Java Generic Security Services (Java GSS-API), and the Java Certification Path API.
Instructor(s): E. Ceesay
Area: Engineering.

**EN.650.414. Rights in Digital Age.**
This course will examine various legal and policy issues presented by the tremendous growth in computer technology, especially the Internet. The rights that various parties have with respect to creating, modifying, using, distributing, storing, and copying digital data will be explored. The concurrent responsibilities, and potential liabilities, of those parties will also be addressed. The course will focus on intellectual property issues, especially copyright law, and other legal and economic considerations related to the use and management of digital data. Copyright law and its role within the framework of intellectual property law will be presented in a historical context with an emphasis on its applicability to emerging-technology issues. Specifically, the treatment of various works, such as music, film, and photography that were traditionally, analog in nature will be analyzed with respect to their treatment in the digital domain; works that are by their nature digital, such as computer software, will also be analyzed. The current state of U.S. copyright law will be presented, as will relevant international treaties and foreign laws. The goal of the course is to provide those involved or interested in digital rights management with a general awareness of the rights and obligations associated with maintaining and distributing digital data. (This course will be taught in Washington, DC and video-cast into Hodson Hall Room 213.)
Instructor(s): M. Jacobs
Area: Social and Behavioral Sciences.

**EN.650.424. Network Security.**
This course focuses on communication security in computer systems and networks. The course is intended to pro-vide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] Co-listed with EN.600.424.
Prerequisites: 600.226 and (600.344 or 600.444) or permission; 600.120 (or equivalent) recommended.
Instructor(s): A. Mishra
Area: Engineering, Quantitative and Mathematical Sciences.
EN.650.431. Ethical Hacking.
Cyber security affects every facet of industry and our government, and thus is now a threat to National Security. This course is designed to introduce students to the skills needed to defend computer network infrastructure by exposing them to the hands-on identification and exploitation of vulnerabilities in servers (i.e., Windows and Linux), wireless networks, websites, and cryptologic systems. These skills will be tested by having teams of students develop and participate in instructor lead capture-the-flag competitions. Also included are advanced topics such as shell coding, IDA Pro analysis, fuzzing, and writing or exploiting network-based applications or techniques such as web servers, spoofing, and denial of service.
Instructor(s): L. Watkins
Area: Engineering.

EN.650.432. Law & Policy Information Assurance.
Instructor(s): G. Masson; M. Lavine
Area: Engineering.

This course provides an understanding of differences in network-based computers, program mobility, current intrusion protection technologies and exploitation methods along with material relating to computer hacking and vulnerability assessment. Department Majors Only. Course taught On-line.
Instructor(s): G. Kalb
Area: Engineering.

This semester long course will teach skill of how cryptographic systems work and fail - as part of a complete hardware and software system. The skills will be taught by examples i.e., by studying and identifying flows in widely deployed crypto systems. We will place a particular emphasis on the failure of “security by obscurity” and the feasibility of reverse-engineering undocumented crypto systems. Co-listed with EN.600.454.
Instructor(s): M. Green
Area: Engineering.

This course introduces students to the field of computer forensics and it will focus on the various contemporary policy issues and applied technologies. Topics to be covered include: legal and regulatory issues, investigation techniques, data analysis approaches, and incident response procedures for Windows and UNIX systems. Homework in this course will relate to laboratory assignments and research exercises. Students should also expect that a group project will be integrated into this course.
Instructor(s): T. Leschke
Area: Engineering.

EN.650.458. Introduction to Cryptography.
Cryptography has a rich history as one of the foundations of information security. This course serves as the introduction to the working primitives, development and various techniques in this field. It emphasizes reasoning about the constraint and construction of cryptographic protocols that use shared secret key or public key. Students will also be exposed to some current open problems.
Permission of instructor only.
Instructor(s): X. Li
Area: Engineering.

EN.650.460. Software Vulnerability Analysis.
This course will examine vulnerabilities in C source, stack overflows, writing shell code, etc. Also, vulnerabilities in web applications: SQL Injection, cookies, as well as vulnerabilities in C binary fuzzing, and exploit development without source among other topics. Students should have experience in C++ Programming.
Area: Engineering.

Cloud computing promises significant cost savings via economies of scale that typically are not achievable by a single organization. This course examines cloud computing in detail and introduces the security concerns associated with cloud computing. Key topics include service models for cloud computing, virtualization, storage, management, and data processing. Fundamental security principles are introduced and applied to cloud computing environments. The format of this course includes lectures and hands-on assignments. Students will complete a project and present it as part of the course.
Instructor(s): J. Coffman
Area: Engineering, Natural Sciences.

A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication: How can we ensure the privacy of messages? Coding theory studies how to make communication reliable: How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow. Students should have computing experience. Recommended Course Background: AS.110.201
Prerequisites: EN.550.171 or permission
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

EN.650.621. Critical Infrastructure Protection.
This course focuses on understanding the history, the vulnerability, and the need to protect our Critical Infrastructure and Key Resources (CIKR). We will start by briefly surveying the policies which define the issues surrounding CIKR and the strategies that have been identified to protect them. Most importantly, we will take a comprehensive approach to evaluating the technical vulnerabilities of the 18 identified sectors, and we will discuss the tactics that are necessary to mitigate the risks associated with each sector. These vulnerabilities will be discussed from the perspective of ACM, IEEE or other technical journals/articles which detail recent and relevant network-level CIKR exploits. We will cover well known vulnerable systems such the Internet, SCADA or PLC and lesser known systems such as E911 and industrial robot. Also, a class project is required. Recommended Course Background: EN.650.424 or equivalent or permission by instructor.
Instructor(s): L. Watkins
Area: Engineering, Natural Sciences.

This course will study information security and assurance methodologies from the perspective of implementation and performance on reduced instruction set architectures. All 1st year MSSI students entering after Fall ’08 will be required to take this course.
Instructor(s): G. Masson.
EN.650.640. Moral & Legal Foundations of Privacy.
This course explores the ethical and legal underpinnings of the concept of privacy. It examines the nature and scope of the right to privacy by addressing fundamental questions such as: What is privacy? Why is privacy morally important? How is the right to privacy been articulated in constitutional law?
Instructor(s): M. Jacobs; W. Sauer.

The course will address information security in the public health and medical fields, with special emphasis on clinical care, research and the role of the academic medical center. In many respects, the course builds on EN.650.651 Health Information, Privacy, Law and Policy’s treatment of privacy and how such privacy is protected in the health and medical arena, including but not limited to HIPAA. Open to MSSI students or Permission required.
Instructor(s): D. Lacey.

This course addresses the risks (financial, reputation, business, and third party), costs, ROI, and other business issues concerned in planning and managing a secure operation. Topics include disaster recovery, outsourcing issues; service level agreements; evaluating external security service providers; assessing security total cost of ownership; audit procedures; financial integrity; cost/benefit analyses; back-up and recovery provisions; insurance protection; contingency and business continuity plans; qualitative and quantitative risk analysis; monitoring the security of the enterprise; information economics; performance reporting; automated metrics reporting; responses to threats; effects of security policies and practices on business and customers; preparing a business case for information security investments; and developing cost-effective solutions given constraints in money, assets, and personnel. Case studies and exercises will be used to illustrate financial planning and evaluation of security operations.
Instructor(s): W. Agresti.

Intrusion detection supports the on-line monitoring of computer system activities and the detection of attempts to compromise normal services. This course starts with an overview of intrusion detection tasks and activities. Detailed discussion introduces a traditional classification of intrusion detection models, applications in host-centered and distributed environments, and various intrusion detection techniques ranging from statistical analysis to biological computing. This course serves as a comprehensive introduction of recent research efforts in intrusion detection and the challenges facing modern intrusion detection systems. Students will also be able to pursue in-depth study of special topics of interest in course projects.
Instructor(s): X. Li
Area: Engineering, Natural Sciences.

This course focuses on the personnel, legal, regulatory and privacy issues that comprise the basic security management areas that must be considered when developing and implementing an effective information security program. Specific topics include security-related legislation, government and industry security frameworks, the identification and management of risk, security controls, defense in depth, critical infrastructure protection, development and implementation of an enterprise wide security strategy, and organizational roles and responsibilities.
Instructor(s): M. Kociemba.

This course will analyze advanced topics and state of the art issues in the field of digital forensics. The course will be run in a research seminar format and students will be given both basic and applied research projects in such areas as: intrusion analysis, network forensics, memory forensics, mobile devices, and other emerging issues.
Instructor(s): T. Leshcke.

The human factor is critical to any successful computer security solution since users are very often the weakest link in such systems. This course will examine a variety of human behaviors ranging from micro to macro cybernetic levels that are relevant to making the best case for information security. It is delivered through lectures on relevant findings in different disciplines of human computer interaction, human factors engineering, cognitive science, and product design; studies of useful user and security modeling frameworks and tools; and term research projects to explore security oriented topics in human machine systems. Its goal is to improve security informatics through informed decisions by the knowledge of the good and bad human characters in computer and cyber security.
Instructor(s): X. Li
Area: Engineering.

Topics vary but mainly focus on recent advances in exploitation techniques and defenses for software including software running on embedded systems software, browsers, and nontraditional devices such as microcontrollers in PCs. Recommended Course Background: EN.600.460 or EN.650.442 or permission of instructor
Instructor(s): S. Checkoway.

All MSSI programs must include a project involving a research and development oriented investigation focused on an approved topic addressing the field of information security and assurance from the perspective of relevant applications and/or theory. There must be project supervision and approval involving a JHUISI affiliated faculty member. A project can be conducted individually or within a team-structured environment comprised of MSSI students and an advisor. A successful project must result in an associated report suitable for on-line distribution. When appropriate, a project can also lead to the development of a so-called “deliverable” such as software or a prototype system. Projects can be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and Contracts. Required course for any full-time MSSI student. Open to MSSI students. Permission required for non-MSSI students.
Instructor(s): A. Dahbura; X. Li.
Open to MSSI students Permission Required for non-MSSI students
All MSSI programs must include a project involving a research and

Cross Listed Courses
Computer Science
EN.600.415. Databases.
Graduate level version of EN.600.315 [Systems]. Students may receive
credit for EN.600.315 or EN.600.415, but not both. Recommended
Course Background: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.600.421. Object Oriented Software Engineering.
Graduate level version of EN.600.321 [Systems or Applications].
Students may receive credit for EN.600.321 or EN.600.421, but not
both. Recommended Course Background: EN.600.226 and EN.600.120
Instructor(s): S. Smith
Area: Engineering.

This course focuses on communication security in computer systems
and networks. The course is intended to provide students with an
introduction to the field of network security. The course covers network
security services such as authentication and access control, integrity
and confidentiality of data, firewalls and related technologies, Web
security and privacy. Course work involves implementing various
security techniques. A course project is required. [Systems] EN.600.120
(or equivalent) recommended. Recommend Course Background:
600.120, 600.226, 600.344, 600.444 or permission.
Prerequisites: 600.226 and (600.344 or 600.444) or permission;
600.120 (or equivalent) recommended.
Instructor(s): S. Nielson
Area: Engineering.

Graduate version of 600.333. Students may receive credit for 600.333
or 600.433, but not both. [Systems]
Instructor(s): P. Froehlich
Area: Engineering.

EN.600.442. Modern Cryptography.
This course focuses on cryptographic algorithms, formal definitions,
hardness assumptions, and proofs of security. Topics include number-
theoretic problems, pseudo-randomness, block and stream ciphers,
public-key cryptography, message authentication codes, and digital
signatures. Recommended Course Background: EN.600.226 and a 300-
level or above systems course; EN.600.271/EN.600.471 and EN.550.171
or equivalent.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

Lecture topics will include computer security, network security, basic
cryptography, system design methodology, and privacy. There will be
a heavy work load, including written homework, programming
assignments, exams and a comprehensive final. The class will also
include a semester-long project that will be done in teams and will
include a presentation by each group to the class. [Applications]
Recommended Course Background: A basic course in operating systems
and networking, or permission of instructor.
Instructor(s): M. Green
Area: Engineering.

EN.600.444. Computer Networks.
This course considers intersystem communications issues. Topics
covered include layered network architectures; the OSI model;
bandwidth, data rates, modems, multiplexing, error detection/
correction; switching; queuing models, circuit switching, packet
switching; performance analysis of protocols, local area networks; and
congestion control. Recommended Course Background: EN.600.120
and EN.600.233. Students can only receive credit for EN.600.344 or
EN.600.444, not both.
Prerequisites: Students can only receive credit for EN.600.344
or EN.600.444, not both.
Instructor(s): A. Rubin
Area: Engineering.

This course is an introduction to fundamental concepts of networked
embedded systems and wireless sensor networks. It is intended for
juniors, seniors and first year graduate students in Computer Science
and other engineering majors with the prerequisite background.
Covered topics include: embedded systems programming concepts,
low power and power aware design, radio technologies, communication
protocols for ubiquitous computing systems, and some of the
mathematical foundation of sensor behavior. Laboratory work consists
of a set of programming assignments that consider a set of the issues
described in class. Recommended Course Background: EN.600.226,
EN.600.120, and EN.600.344/EN.600.444
Instructor(s): M. Chang
Area: Engineering.
EN.600.451. Introduction to Bitcoin and Other Cryptocurrencies.
This course covers the basics of Bitcoin and the underlying technologies driving it. The course is intended for students interested in the cryptographic techniques devised to make digital currencies and payment systems secure. Topics include Bitcoin transactions, the blockchain, mining, and decentralized consensus. The course will include a brief introduction to public-key cryptography, digital signatures, hash functions, proof of work-space, multisignatures, and elliptic curve cryptography. The course concludes with an overview of the Bitcoin scripting language and Bitcoin 2.0 platforms. [Systems] Recommended Course Background: EN.600.344/444 (Computer Networks) and EN.550.171 (Discrete Math)
Prerequisites: EN.600.226
Instructor(s): G. Atienese
Area: Engineering.

EN.600.460. Software Vulnerability Analysis.
This course will examine vulnerabilities in C source, stack overflows, writing shell code, etc. Also, vulnerabilities in web applications: SQL injection, cookies, as well as vulnerabilities in C binary fuzzing, and exploit development without source among other topics. Co-listed with EN.650.460
Instructor(s): S. Checkoway
Area: Engineering.

EN.600.463. Algorithms I.
Graduate version of EN.600.363. Students may receive credit for EN.600.363 or EN.600.463, but not both. Recommended Course Background: EN.600.226 and EN.550.171 or instructor permission required.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

This is a graduate-level course studying the theoretical foundations of computer science. Topics covered will be models of computation from automata to Turing machines, computability, complexity theory, randomized algorithms, inapproximability, interactive proof systems and probabilistically checkable proofs. Students may not take both EN.600.271 and EN.600.471, unless one is for a undergrad degree and the other for grad. [Analysis]Recommended Course Background: EN.550.171 or instructor permission required.
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.

EN.600.642. Advanced Topics in Cryptography.
This course will focus on advanced cryptographic topics with an emphasis on open research problems and student presentations.
Instructor(s): A. Jain.

Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class. There will be homework assignments and a course project.
Prerequisites: EN.600.443 OR EN.600.424 or permission of instructor.
Instructor(s): A. Rubin.

Center for Leadership Education

Competitions and Other Educational Opportunities:

- **The Annual JHU Business Plan Competition**: Students compete for cash prizes for best business plans in several different categories. The competition is open to students from all divisions of the university. The Medical Technology Category has separate tracks for Undergraduate and Graduate Students and accepts national and international competitors that meet the eligibility requirements. [Link: http://bpc.jhu.edu]

- **The Oral Presentation Contest**: In an effort to provide a venue for JHU students to demonstrate their creativity, problem-solving ability and persuasive oratory skills, the CLE holds an annual Oral Presentation Contest where competitors are provided a specific topic to address for the contest.

- **Elevator Pitch Competition**: Students have the opportunity to compete for cash prize for the best elevator pitch. The competition is open to undergraduates from the Homewood Campus. Students will submit their 90 second video pitch. The selected finalists will then present before a judging panel.

- **Internships**: Students can apply for sponsorship for academic credit of unpaid business-related internships during the spring, summer or fall semester.

- **Intersession Courses**: including P.R. and Media in the Big Apple, featuring a two-day visit to P.R. firms in NYC.
• **CLE Speaker Series**: Prominent and successful business professionals and entrepreneurs speak on campus.

**Professional Associations:**

• **Alpha Kappa Psi**: Students run a chapter of this national co-ed business fraternity. [http://akpsi.johnshopkins.edu](http://akpsi.johnshopkins.edu)

• **American Advertising Federation JHU Chapter**: Students run a chapter of this national advertising organization. [https://www.facebook.com/AAFJHU](https://www.facebook.com/AAFJHU)

• **American Marketing Association Student Chapter**: Students run a chapter of this national marketing organization. [http://jhu.edu/ama/](http://jhu.edu/ama/)

• **Golden Key International Honour Society**: An international, interdisciplinary honor society which recognizes the top 15% of sophomores, juniors and seniors at JHU. [http://jhu.goldenkey.org/](http://jhu.goldenkey.org/)

**Social Entrepreneurship:**

• **Save the Future**: STF leverages the brainpower of business-savvy, socially-minded college undergraduates from Hopkins to teach personal money management skills to high school students.

• **Building Bright Ideas**: This intensive 10-week entrepreneurship course designed for Baltimore City high school students is taught by hand-selected and trained JHU students.

• **Hopkins AND1**: A student run program that partners Hopkins student athletes with students from area Baltimore City High Schools to help prospective athletes in Baltimore meet their NICAA academic eligibility requirements. The group provides SAT prep and academic tutoring.

• **Social Investment Outreach**: SIO provides people of underprivileged communities and developing countries with a means of helping themselves escape poverty through microcredit and sustainable community development. [http://sio.johnshopkins.edu](http://sio.johnshopkins.edu)

• **Students Consulting for Non-Profit Organizations**: A national organization of undergraduate students committed to developing communities through pro bono consulting engagements with non-profit organizations. [http://web1.johnshopkins.edu/scno](http://web1.johnshopkins.edu/scno)

**Other Experiential Opportunities**

• **Business in China Association**: BCA was created with a mission to bridging the east and west and improving our community’s understanding of business in China. [https://www.facebook.com/jhubca](https://www.facebook.com/jhubca)

• **Hopkins Student Enterprises**: Students have the ability start and manage businesses that provide services to the campus and surrounding communities. HSE currently has 8 successful student run business serving the Homewood Campus. [http://hse.jhu.edu](http://hse.jhu.edu)

• **JHUTAMID**: JHUTAMID provides undergraduate students with an education on the Israeli and American economies. Members of JHUTAMID will have the unique opportunity to consult for major Israeli tech firms and help run an investment fund that specializes in the Tel Aviv Stock Exchange. [http://jhutamid.johnshopkins.edu](http://jhutamid.johnshopkins.edu)

• **Marshal Salant Student Investment Team**: The team was founded with a generous $100K donation by alumnus Marshal L. Salant. The team portfolio is currently valued at over $250K. Profits from the portfolio are used to fund student scholarships. [http://www.jhu.edu/salant](http://www.jhu.edu/salant)

For current faculty and contact information go to [http://eng.jhu.edu/wse/cle/page/our_people](http://eng.jhu.edu/wse/cle/page/our_people)

**Faculty**

**Director**

Timothy Weihs
Director of CLE, Professor of Materials Science & Engineering

**Program Directors**

Lawrence Aronhime
Senior Lecturer & Director of Entrepreneurship & Management Program: accounting, finance, entrepreneurship, technology commercialization.

Julie Reiser
Senior Lecturer & Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice
Senior Lecturer & Director of Graduate Programs: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Pamela Sheff
Senior Lecturer & Director of Master of Science in Engineering Management Program: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, higher education in prisons, community-based learning, entrepreneurship.

**Full Time Faculty**

Bob Graham
Lecturer: entrepreneurship, professional communications, oral presentations

Illysa Izenburg
Lecturer: engineering management

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing.

Annette Leps
Senior Lecturer: accounting, finance, management.

Charlotte O’Donnell
Lecturer: oral presentations, professional communication, visual rhetoric

William Smedick
Senior Lecturer: leadership

**Part Time Faculty**

Michael Agronin
Lecturer: product development.

Jennifer Bernstein
Lecturer: professional communication.

Laura Davis
Lecturer: marketing.

Marci DeVries
Lecturer: professional communication for ESL.

Kevin Dungey
Senior Lecturer: oral presentations.
Courses

EN.660.100. Hopkins Leadership Challenge Seminar.
The Hopkins Leadership Challenge is a one credit pass/fail seminar and is designed specifically for first year undergraduates at JHU who are interested in developing their leadership skills and applying those skills to Hopkins life. The seminar includes both a classroom component and an experiential component. The classroom content includes leadership topics, discussions with university leaders and serves as an introduction to the history, services and involvement opportunities at Hopkins. The experiential component includes programs such as JHU history, faculty student interaction, visits to other JHU campuses and more! Interested students should register early, as there is limited space available in each section of the seminar. Freshmen only. S/U only.
Instructor(s): J. Beauchamp; T. Sanchez
Area: Social and Behavioral Sciences.

Seminar is designed specifically for second year undergraduates at JHU and is limited to that population. An eight-week seminar and experiential program designed to provide the following learning outcomes for students enrolled: 1. Understand self-others and how to work effectively in communities 2. Understand the importance of integrity, moral purpose, and positive change. 3. Understand how change occurs and why people resist or promote change. 4. Understand the importance of enhancing and applying individual team strengths, developing greater levels of well being for you and in others, and thriving together as individuals and organizations. 5. Form positive connections and relationships with upper class students and alumni in areas of career interests. Sophomores only. S/U only.
Instructor(s): Staff; W. Smedick.

In a rapidly globalizing world, business leaders find increasing numbers of development opportunities in emerging markets. This new class explores opportunities for the private sector particularly when coupled with development aid and assistance from the public sector. Each session will focus on building out a toolkit of mechanisms and strategies to unlock private finance for development goals, and reviews both large-scale projects and microfinance/impact investing. Topics to be covered include bonds and capital markets; constraints in access to finance in developing countries; understanding the main players in development finance; project finance for development; innovations in development finance; and impact investing. Recommended Course Background: EN.660.105 Introduction to Business prior to this course.
Instructor(s): Staff.

EN.660.370. Multinational Firms in the International Economy.
This course on international business focuses on relationships between multinational firms and national governments throughout the world. We will read historical and contemporary authors’ conceptualizations of these relationships in the US and around the world. Students will apply concepts from the readings to real-world situations. The course is capped at 25 to allow discussion. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Heisenberg.

EN.660.604. Business of Bioengineering Innovation & Design I.
This course comprises two distinct, but related, components. The first is a broad introduction to the terms, concepts, and values of business and management. Particular emphasis will be placed on the economic, financial, and corporate contexts of our business culture, and how they impact the organization, strategy, and decision-making of business firms. The second component is an introduction to the sociological and economic forces that shape the development and diffusion of new technologies. This part is primarily designed to provide a framework for determining the commercial viability of new medical devices and the best path for realizing their value, including how to develop a compelling value proposition, analyze markets and competitors, and protect intellectual property. Throughout, the course utilizes individual exercises, case analyses, and team projects. CBID MSE Students Only
Instructor(s): L. Aronhime.
This course comprises two distinct, but related, components. The first is a broad introduction to the terms, concepts, and values of business and management. Particular emphasis will be placed on the economic, financial, and corporate contexts of our business culture, and how they impact the organization, strategy, and decision-making of business firms. The second component is an introduction to the sociological and economic forces that shape the development and diffusion of new technologies. This part is primarily designed to provide a framework for determining the commercial viability of new medical devices and the best path for realizing their value, including how to develop a compelling value proposition, analyze markets and competitors, and protect intellectual property. Throughout, the course utilizes individual exercises, case analyses, and team projects. CBID MSE students only.
Instructor(s): L. Aronhime.

EN.660.665. Technology Entrepreneurship.
The goal of the course is to provide a strategic framework (technological, market, regulatory, and financial) for determining the commercial value of new technologies and the best path for realizing that value. Through lectures, exercises, and case studies, students will develop and advance their own innovations and inventions, culminating in a business plan. No audits.
Area: Engineering, Natural Sciences.

EN.661.301. Writing for the Law.
This course teaches students to communicate effectively in various modes of legal discourse that are fundamental to the practice of law. Students will engage in writing nearly every session and will learn the basics of legal writing, editing (both the student’s and others’ work), and written/oral advocacy skills. Students can expect to work with litigation-related documents such as pleadings, preliminary and dispositive motions, and appellate briefs as well as non-litigation-related documents such as opinion articles, publications, essays, and various business-related contracts.
Instructor(s): D. Sandhaus; M. Franceschini.

Students enrolled in this independent study will work as writers and editors for the student-run magazine. They will collaborate with the editorial team to produce content, develop magazine policies, and ensure that student work adheres to those policies. They may also create/direct artwork as needed.
Instructor(s): C. O’Donnell.

EN.662.643. The Practice of Consulting.
MSEM students only.
Instructor(s): L. Aronhime; P. Sheff; R. Graham.

EN.663.615. Building Effective Posters and Slides.
This course teaches techniques in visual communication geared to suit emerging scientists. Students will learn the fundamentals of visual design, including theories of form, color and visual perception. The course will cover principles of typography, grid systems and other methods of establishing visual hierarchy. There will also be a short unit on commercial photography. Students will put this knowledge to work in the classroom to produce slides, conference posters and data visualizations. GRADING: P/F for most students; letter grades for MSEM students.
Instructor(s): C. O’Donnell.

Introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses and contracts. GRADING: P/F for most students; letter grades for MSEM students.
Instructor(s): G. Galvez.

Arranged in modules and taught largely through the case method, the course features the following topics: intellectual property; principal-agent relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. GRADING: P/F for most students; letter grades for MSEM students.
Instructor(s): C. Jeffers.

EN.663.640. Writing Proposals that Win.
Graduate students only.
Instructor(s): E. Rice.

EN.663.643. Science Outreach: Communicating Science to the Public.
This course teaches graduate students to communicate effectively with a non-specialized audience including the “voting public” and high school students. Possible projects include an article for mainstream science news outlet and a hands-on presentation. Class emphasizes writing clearly for a non-technical audience, creating appropriate visuals and manipulatives, developing oral presentation skills, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Graduate students only.

EN.663.645. Improving Presentation Skills for Scientists and Engineers.
This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course and is not open to undergraduates.
Instructor(s): R. Graham.

EN.663.646. Improving Presentation and Interview Skills for Humanities Students.
This course is designed to give Humanities students an opportunity to refine their lecturing and interviewing skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both expert and non-expert audiences, and create clear, compelling PowerPoint presentations (if appropriate). All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course that begins halfway through the semester and is not open to undergraduates. Second 7 Weeks, Wednesday 4 – 6:30 pm.
EN.663.647. Academic Writers' Workshop.
Do you struggle with writers’ block? Do you have trouble setting writing goals and sticking to them once the hustle and bustle of the semester begins? This module is for academic writers of all stripes and persuasions—dissertation students, creative writers, post-docs, and new faculty—who would like to work with other academic writers on setting writing goals, strategizing how to overcome individual obstacles that are impeding the writing process, and getting feedback on work in a positive, supportive atmosphere of non-specialists/non-experts. The module emphasizes productivity rather than critique. Suggested readings: How to Write a Lot by Daniel Silvia, The Now Habit by Neil Fiore.
Instructor(s): J. Reiser.

EN.663.648. Introduction to Dissertation Writing.
This course is designed to help students in any discipline and in any phase of the dissertation process move their work forward. Whether you are a beginning student who has no idea what your topic is or an advanced student facing the submission process in a few months, you will be able to use this workshop to help you focus your efforts more effectively and find out best practices for doing dissertation writing here at JHU. Phd students only.
Instructor(s): H. Parker
Area: Engineering, Natural Sciences.

This workshop provides continuing dissertation writers with the structure of a traditional classroom environment to help facilitate work on the dissertation and to provide a framework of personal accountability in meeting personal writing goals. This course is only open to students who have taken EN.663.648 Introduction to Dissertation Writing. Graduate and Postdocs Only.
Prerequisites: Prereq: EN.663.648
Instructor(s): H. Parker
Area: Engineering, Natural Sciences.

EN.663.650. Finding a Job and Building Your Career.
Finding a job often is hard work – a task that takes time, energy and skills. Moreover, advancing in your career requires planning and attention to issues and opportunities at work. This module is designed to assist you in sharpening skills required for your efforts in these regards. Among topics of concern are building a resume, writing letters of application, interviewing effectively, engaging a mentor, managing initial personal finance issues and adjusting to current trends in the workplace. Expect to produce a polished resume, an effective letter of application and a set of practiced interviewing skills and a personalized career development plan through the time period of the class. Graduate students only. This is a 7-week course and is not open to undergraduates.
Instructor(s): R. Graham.

EN.663.651. The Entrepreneurial Cycle and Developing Effective Business Plans.
So you have an idea for a business – now what? How do you convert your idea to a plan? What factors must you consider and how should you do that? How do you think about customers and competition? How much money do you need and where can you find it? How do you pitch your idea for maximum impact? Answers to these questions and more are the topics of concern for this module. Expect to build at least several sections of a business plan for your idea with the time period of the class. Graduate students only.
Instructor(s): C. Jeffers; E. Rice.

EN.663.652. EQ vs. IQ: Achieving Emotional Intelligence and Understanding Diversity.
We live in increasingly diverse society and an increasingly connected world. Times require new skills and awareness; “smarts” as defined by IQ is no longer sufficient for success. Instead, an understanding of other cultures, a willingness to explore the positions of various stakeholders in situations, the capacity and willingness to exercise empathy, and the ability to identify and work with the feelings of self and others are keys to successful participation in the workforce. This Module addresses these skills in theoretical and practical ways so as to expand the awareness and capacities of participants.
Instructor(s): Staff.

EN.663.654. Commercializing Your Invention or Idea.
It is one thing to have an idea and quite another to move the idea from idea and basic research to use in the world of business or manufacturing. This course addresses the process and skills required to make that transition. Among the topics addressed in this class are the following: recognizing the potential of ideas, addressing the patent landscape, understanding markets, determining resource requirements, design and prototypes, and finding financing. Graduate and Post Doc Only.
Instructor(s): J. Reiter.

EN.663.655. Social Media Integration for Entrepreneurship.
Graduate students only.

EN.663.656. Developing and Managing Websites.
Explore how to develop and manage a website that supports an organization’s goals and objectives. This holistic approach to websites will include case studies, application-oriented exercises, and group assignments. Each student will develop a professional WordPress website, employing strategies for meeting organizational goals and customer needs, using best practices for engagement and design, and creating systems for successful management and revision. GRADING: P/F for most students; letter grades for MSEM students.
Instructor(s): R. Graham.

EN.663.660. Managing People and Resolving Conflicts.
Have you ever had to deal with a difficult person at work or in the lab? Have you been a member of a team on which team dysfunction was so bad that it makes television sitcoms look normal? Why are some companies much more productive and pleasant to work with than others? Do you understand techniques of persuasion and how to participate effectively in negotiations? These topics are among the ideas we develop and practice in this class, using a combination of seminar style reading and discussion, lecture and in-class activity. Graduate students only.
Prerequisites: Students cannot have taken EN.663.663.
Instructor(s): E. Rice
Area: Engineering, Natural Sciences.

EN.663.661. Searching the Academic Marketplace.
The academic job search can be especially vexing, given the fewer graduates that actually enter that market as opposed to private industry. This class offers opportunities to generate search strategies and skills to help you find that academically based position. Among the topics you will explore are building your CV, interviewing, networking, and search listings.
Instructor(s): H. Parker.

EN.663.663. The People Side of Work: Management, Conflict Resolution and Negotiation.
Graduate and Post Doc Only.
EN.663.666. Managing Personal Finances.
The class in Managing Personal Finance is designed to familiarize the student with the basic concepts and quantitative techniques of personal financial planning and financial literacy. The course begins with a discussion of budgeting and the time value of money and moves on to the basic principles of financial planning in the areas of taxation, consumer credit, housing decisions, insurance, investing fundamentals and retirement planning. Graduate students only. No undergrads.
Instructor(s): A. Leps.

EN.663.670. Project Management.
Projects are temporary activities devised to achieve very specific goals in a designated timeframe for a specified amount of resources. Often they involve disparate activities, frequently separated by distance and sometimes involving different staff and materials. For the project to successfully meet its objectives, all these items must be planned, coordinated and orchestrated. This module explores the processes and tools available to those who must manage projects to optimize outcomes within the primary constraints of time, quality, scope and budget. Class time involves presentations, examples and discussion.
Instructor(s): E. Rice.

EN.663.671. Leading Change.
Change happens, like it or not! It is necessary for progress and the result of innovation, yet change makes individuals and organizations so uncomfortable that most people and groups within organizations vigorously resist change. So the questions become how to cause, how to embrace and how to lead constructive change in our selves, our organizations and our communities – in ways that colleagues and would-be colleagues support and contribute toward success. The primary format for learning in this course is seminar style with reading, researching and sharing of information as well as structured, experiential activities designed to build skills through practice and interpersonal exchange. Class time is devoted to discussion, observation, feedback, additional exercises and presentation. Additionally, participants engage in reflection and explanation of their considerations as the course progresses. GRADING: P/F for most students; letter grades for MSEM students. No undergrads allowed except enrolled MSEM combined bachelor’s/master’s students.
Instructor(s): W. Smedick

EN.663.673. Leading Teams in Virtual, International and Local Settings.
Graduate and Postdocs Only.
Instructor(s): W. Smedick
Area: Engineering, Natural Sciences.

EN.663.674. Fundamentals of Management.
Managers must juggle knowledge of and tasks associated with operations, finance, information technology, strategy, and projects. Much of managerial success, however, depends less on managers’ direct input – the sweat of their brows— than on their ability to enlist the active involvement of others: direct reports, other managers, other team members, and those above them on the organizational chart. It is imperative that managers be adept at influencing those over whom they have no formal authority as well as guiding and directing those who report to them. In this course, you will learn and practice the concepts and skills necessary to manage, direct, and guide others as well as content associated with building strategy and structure in organizations.
Instructor(s): I. Izenberg.

Cross Listed Courses

Entrepreneurship and Management

This one credit, four session course offered as preparation for the JHU Business Plan Competition, will cover the fundamentals of creating and delivering a business plan for a new venture. Topics to include: organizing the business plan, market analysis, competitive analysis, financial projections, strategies to meet the expectations of varied investors, identification of necessary resources and developing and delivering a persuasive, well-articulated pitch. No audits.

EN.660.103. The Promise and Peril of Microfinance.
Microcredit, microlending and microfinance are relatively new tools, potentially useful to help alleviate poverty, contribute to local economies, earn a living and make profit. The promise and publicity has generated practices, experiments and businesses worldwide; microcredit even generated a Nobel Prize for Muhammad Yunus and the Grameen Bank in 2006. So too, the spread of the concept has produced excesses and controversy and more recently, scholarship in the practices and ideas. In this course we will explore the theory, practice and possibilities of the ideas with emphasis on both the developing world and western economies. The course uses lecture, discussion, case study and community investigation to explore the content. No audits.
Instructor(s): E. Rice.

EN.660.105. Introduction to Business.
This course is designed as an introduction to the terms, concepts, and values of business and management. The course comprises three broad categories: the economic, financial, and corporate context of business activities; the organization and management of business enterprises; and, the marketing and production of goods and services. Topic specific readings, short case studies and financial exercises all focus on the bases for managerial decisions as well as the long and short-term implications of those decisions in a global environment. No audits.
Instructor(s): I. Izenberg; L. Aronhime
Area: Social and Behavioral Sciences.

The course will teach basic to advanced level financial modeling techniques within the Excel environment. Students will be exposed to several real-world examples and asked to create models to solve these problems. Some Excel topics include Formulas, Formatting, Charting, Filters, Toolpaks, VLOOKUP, Data Importing, Pivot Tables, IF statements, Macros, VBA.
Instructor(s): M. Kitt.

EN.660.150. Media and P.R. in the Big Apple.
Gain insight into trends and career opportunities in public relations, advertising and media through one week of in-class learning (Jan. 5-9 half days) followed by a three-day trip to New York (Jan. 13-15) to network with and learn from executives from leading P.R., advertising and media firms.
Instructor(s): L. Kendrick.

Through case studies and an applied group project (developing and presenting a marketing plan for a new product launch), students will gain an understanding (from the Lecturer who is a former Procter & Gamble marketer) of the fundamentals of brand marketing. Learn how to make marketing strategy choices, how to evaluate advertising, and how to hone and perfect oral and written communication skills.
EN.660.154. The Art of the Pitch.
Donald Trump, Sergey Brin, and Steve Jobs know how to do it and so will you. “The Art of the Pitch” explores the principles of persuasive dialogue. Getting a job, raising money or selling a product: the basics of a successful pitch are the same. Guest speakers will share their best and worst pitches and what motivates them to act. Together students will craft two pitches, one for themselves and one real-time, real-world example for an outside business.
Instructor(s): J. Pennington.

EN.660.156. Social Media Strategy and Measurement.
Go beyond the textbook and develop a “real-world” social media strategy. Learn how to develop social media goals, align strategies, evaluate social media tactics and measure your results. This step-by-step method can be used for any organization or company and gives you a competitive advantage when looking for your first job. Taught by Nichole Kelly, blogger for Social Media Examiner (ranked #4 in AdAge’s top marketing blogs) and CEO of Full Frontal ROI Consulting.
Instructor(s): L. Kelly; L. Kendrick.

EN.660.160. Location, Location, Location.
Taught by a professional in the field and a Hopkins graduate, this course explores the basic principles of real estate development and finance. A special feature for this year encourages student participation in the analysis and project selections of an internationally focused real estate impact investment fund in the global South.
Instructor(s): J. Gorelick.

The course in Financial Accounting is designed for anyone who could be called upon to analyze and/or communicate financial results and/or make effective financial decisions in a for-profit business setting. No prior accounting knowledge or skill is required for successful completion of this course. Because accounting is described as the language of business, this course emphasizes the vocabulary, methods, and processes by which all business transactions are communicated. The accounting cycle, basic business transactions, internal controls, and preparation and understanding of financial statements including balance sheets, statements of income and cash flows are covered. No audits.
Instructor(s): A. Leps; L. Aronhime; S. Furlong.

This course explores the role of marketing in society and within the organization. It examines the process of developing, pricing, promoting and distributing products to consumer and business markets and shows how marketing managers use the elements of the marketing mix to gain a competitive advantage. Through interactive, application-oriented exercises, case videotapes, a guest speaker (local marketer), and a group project, students will have ample opportunity to observe key marketing concepts in action. The group project requires each team to research the marketing plan for an existing product of its choice. Teams will analyze what is currently being done by the organization, choose one of the strategic growth alternatives studied, and recommend why this alternative should be adopted. The recommendations will include how the current marketing plan will need to be modified in order to implement this strategy and will be presented to the instructor in written form and presented to the class. No audits.
Instructor(s): D. Sullivan; L. Kendrick; M. Furst; Staff.

EN.660.300. Managerial Finance.
This course is designed to familiarize the student with the basic concepts and techniques of financial management practice. The course begins with a review of accounting, securities markets, and the finance function. The course then moves to discussion of financial planning, financial statement analysis, time value of money, interest rates and bond valuation, stock valuation, and concludes with capital budgeting and project analysis and decision making. A combination of classroom discussions, problem sets, and case studies will be used. No audits.
Prerequisites: EN.660.203
Instructor(s): M. Priolo.

EN.660.303. Managerial Accounting.
This course introduces management accounting concepts and objectives including planning, control, and the analysis of sales, expenses, and profits. Major topics include cost behavior, cost allocation, product costing (including activity based costing), standard costing and variance analysis, relevant costs, operational and capital budgeting, and performance measurement. Note: not open to students who have taken EN.660.204 Managerial Accounting. No audits.
Prerequisites: EN.660.203
Instructor(s): A. Leps.

This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will access firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. No audits.
Prerequisites: EN.660.203 Financial Accounting
Instructor(s): A. Leps.

EN.660.306. Law and the Internet.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. No audits.
Prerequisites: EN.660.205
Area: Social and Behavioral Sciences.

EN.660.307. Business Law II.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. Not open to students who have taken EN.660.206 Business Law II. No audits.
Prerequisites: EN.660.205 Business Law I; Not open to students who’ve taken EN.660.206 Business Law II
Area: Social and Behavioral Sciences.
EN.660.308. Business Law I.
This course is designed to provide students an introduction to legal reasoning and analysis. Content distinguishes forms of business, civil versus criminal law, and agency principles; intellectual property concepts, contract Law, the UCC (Uniform Commercial Code) and consumer protection are explored and discussed in the context of assigned legal cases which are intended to develop a student’s ability to analyze and apply law. Note: not open to students who have taken EN.660.205 Business Law I. No audits.
Prerequisites: EN.660.105
Instructor(s): C. Jeffers; D. Fisher; L. Monti; W. Rakes
Area: Social and Behavioral Sciences.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings—both global and personal in nature. Students will learn the reasoning and analytical skills needed to apply ethical concepts to their own decision-making, to identify moral issues involved in the management of specific problem areas in business and society, and to understand the social and natural environments which give rise to moral issues. The course focus is on performance articulated by clear reasoning and effective verbal and written communication concerning ethical issues in business and society. Not open to students who have taken EN.660.231 Case Studies in Business Ethics. No audits.
Prerequisites: EN.660.105
Instructor(s): D. Sandhaus
Area: Humanities.
EN.660.311. Law and the Internet.
Sometimes called “Cyber law,” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. Note: not open to students who have taken EN.660.306 Law and the Internet. No audits.
Prerequisites: EN.660.205| OR EN.660.308
Instructor(s): M. Franceschini
Area: Social and Behavioral Sciences.
This course focuses on preparing students to engage in and lead social enterprises as we explore the options for creating social value. Using a combination of lecture, case study and project work, we investigate both for-profit and non-profit models for creating social value with special emphasis on the non-profit community. Particular emphasis is placed on the management challenges of social enterprises such as creating and conveying their message, options for dealing with finances, relationships within communities, and methods for building constituencies. Additionally, we address critical issues such as measures of success, scale, replication and failure. The class requires contact with organizations in the community as well as one long weekend away from campus. Recommended Course Background: EN.660.105 or EN.660.333 or EN.660.220/EN.660.340. No audits.
EN.660.331. Leading in Teams.
This course will allow students to develop the analytical skills needed to effectively lead and work in teams. Students will learn tools and techniques for problem solving, decision-making, conflict resolution, task management, communications, and goal alignment in team settings. They will also learn how to measure team dynamics and performance, and assess methods for building and sustaining high-performance teams. Students will also explore their own leadership, personality and cognitive styles and learn how these may affect their performance in a team. The course will focus on team-based experiential projects and exercises as well as provide opportunities to individually reflect and write about the concepts explored and skills gained throughout the course. No Audits. Recommended Couse Background: EN.660.332 or EN.660.333.
Instructor(s): W. Smedick.
EN.660.332. Leadership Theory.
Students will be introduced to the history of Leadership Theory from the “Great Man” theory of born leaders to Transformational Leadership theory of non-positional learned leadership. Transformational Leadership theory postulates that leadership can be learned and enhanced. The course will explore the knowledge base and skills necessary to be an effective leader in a variety of settings. Students will assess their personal leadership qualities and develop a plan to enhance their leadership potential. Recommended Course Background: EN.660.105 or EN.660.220/EN.660.340. No audits.
Instructor(s): W. Smedick
Area: Social and Behavioral Sciences.
EN.660.333. Leading Change.
In this course, we will use a combination of presentation, discussion, experiential learning, research and self-reflection to investigate issues surrounding leadership and change in communities and the economy. While considering both for-profit and non-profit entities, we will pursue topics including understanding and using theories of change; finding competitive advantage and creating strategic plans; making decisions, even in uncertain times; valuing differences; employing leadership styles; giving and receiving feedback; understanding employee relations; creating performance measures; and developing organizational cultures; and using the dynamics of influence. Not open to students who have taken EN.660.235. No audits. Recommended Course Background: EN.660.105
Instructor(s): W. Smedick
EN.660.335. Negotiation and Conflict Resolution.
The focus of this class is the nature and practice of conflict resolution and negotiation within and between individuals and organizations. The primary format for learning in this class is structured experimental exercises designed to expose students to different aspects of negotiation and to build tangible skills through interpersonal exchange. While some class time is devoted to presentations on theories and approaches, the class method primarily relies on feedback from fellow classmates on their observations of negotiation situations and on personal reflections by students after each structured experience. Topics include conflict style, negotiation, and group conflict. No audits. Recommended Course Background: EN.660.105, an additional course in the Entrepreneurship and Management Program or in the social sciences.
Instructor(s): E. Rice.
So many big and seemingly intractable problems inhibit progress and diminish quality of life especially in and around urban communities. Surely there are ways to begin to tackle some of these problems, if we approach them from a multi-disciplinary perspective. This course provides that opportunity as students, who work primarily in teams, apply theory and ingenuity to investigate problems, propose solutions or invent devices that address some of these problems. Class time is spent in lecture, discussion, and applied community projects to master content. Time will be spent participating on teams and working in community organizations in addition to class.
Area: Social and Behavioral Sciences.

This course introduces the student to the management process. The course takes an integrated approach to management by examining the role of the manager from a traditional and contemporary perspective while applying decision-making and critical-thinking skills to the challenges facing managers in today's globally diverse environment. The course examines the techniques for controlling, planning, organizing resources and leading the workforce. Open to students who have taken EN.660.220 Principles of Management. No audits.
Prerequisites: EN.660.105
Instructor(s): I. Izenberg.

This course focuses on both quantitative and qualitative analytical skills and models essential to operations process design, management, and improvement in both service and manufacturing oriented companies. The objective of the course is to prepare the student to play a significant role in the management of a world-class company which serves satisfied customers through empowered employees, leading to increased revenues and decreased costs. The material combines managerial issues with both technical and quantitative aspects. Practical applications to business organizations are emphasized. Recommended Course Background: EN.660.105 Introduction to Business or EN.660.241 IT Management. No audits
Instructor(s): J. Reiter.

EN.660.351. Product and Brand Management.
Consumers love those little bits of crunchy orange goodness called Cheetos®. But when Frito-Lay decided that consumers might also like Cheetos®-flavored lip balm, they reacted with a hailstorm of derision. This may be proof that our free market economy is just a rudderless, if hilarious, contraption. More likely, Cheetos® Lip Balm was an example of the challenges marketers face in product and brand management. This course is a conceptual and practical exploration of how marketers deliver products and build brands that translate into competitive advantage for their companies. Among the critical concepts typically addressed in the course are developing and positioning a brand, assembling the marketing mix media into a whole, establishing price, creating packaging, and tracking the customer experience. The course uses readings, lecture, exercises, cases and examples to explore these concepts. No audits.
Prerequisites: EN.660.250
Instructor(s): D. Crane.

New product development is the ultimate interdisciplinary entrepreneurial art, combining marketing, technical, and managerial skills. A successful product lies at the intersection of the user’s need, a technical solution, and compelling execution. This class will bootstrap your experience in the art through exercises and team projects. We will examine products and services, consumer and industrial, simple and technologically complex. Case studies will feature primary sources and the instructor’s personal experiences as an inventor for a major consumer products company. Topics will span the product development cycle: identifying user needs, cool-hunting, brainstorming, industrial design, prototyping techniques, market research to validate new ideas, and project management -- especially for managing virtual teams and foreign manufacturers. No audits.
Prerequisites: EN.660.250
Instructor(s): M. Agronin.

EN.660.354. Consumer Behavior.
This course will explore how and why consumers make choices in the marketplace—the “buy-ology” of their behavior. We will learn the psychological, social, anthropological, and economic underpinnings of consumer behavior as well as the brain chemistry that affects choices in the marketplace. Students will learn how consumer behavior can and is influenced and the sometimes-unintended consequences of marketing campaigns designed to produce a particular behavior. Students will analyze how consumers solve problems, assess tradeoffs and make choices; how they integrate and react to retail surroundings, smells, product displays, brand, pricing strategies, social pressures, market structures and a myriad of other influences and motivations to buy. Students will also explore how marketers incorporate what is known about consumer behavior into advertising and promotional campaigns, market segmentation and positioning, pricing strategies and new product introductions. Student experiential projects will include ethnographic observations and analyses of real-world consumer behavior. No audits.
Instructor(s): R. Graham.

This course will allow students to apply marketing principles and concepts to the sports marketing environment while gaining an understanding of how event sponsorships, endorsements, licensing and naming rights are used to achieve business objectives. Through case studies and a group project, students will be exposed to a broad range of sports entities including professional sports teams, governing organizations and sports media.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): L. Kendrick.

Uncover the process of creative thinking for innovation and conceiving “big ideas” in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. No audits.
Instructor(s): Staff.
EN.660.358. International Marketing.
This course covers product, pricing, promotion, distribution, market research, organization and implementation and control policies relating to international marketing. It also explores the economic, cultural, political and legal aspects of international marketing. Through interactive and application-oriented assignments and cases, students will gain hands-on experience in analyzing and developing marketing strategies for organizations that market both consumer and business products/services internationally. A group project will involve the development of an international marketing plan for a specific product. One or more local international marketers will be invited to speak to the class. No audits.
Prerequisites: EN.660.250
Instructor(s): L. Kendrick.

EN.660.361. Engineering Business and Management.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): I. Izenberg; M. Agronin
Area: Engineering, Natural Sciences.

EN.660.363. Leadership & Management in Materials Science and Engineering.
In this course, you will learn about leadership, social responsibility, strategy, finance, project management and people management specifically in the materials science and engineering fields. You will practice writing concise persuasive analyses and action plans and verbally defending your ideas. You will learn the ethical guidelines for the materials science profession, to resolve team conflicts and co-lead self-managed work teams, and determine how materials science supports society’s sustainability goals and the social responsibilities of materials scientists. Our class time will feel like a business meeting, and we will refer to class periods as meetings. When you complete this course, you will be prepared to be a working professional. Your Teaching Team looks forward to seeing you develop into a career engineer, scientist, manager, entrepreneur, professor or other professional over the years.
Instructor(s): I. Izenberg
Area: Engineering, Natural Sciences.

EN.660.401. Advanced Corporate Finance.
The advanced course in corporate finance is designed to provide the upper level business student with a background in the more complex applications of financial management practice. Students will be exposed to advanced financial management concepts through a pedagogy combining classroom instruction, problem solution, business case analysis and work on a group project with coverage of the topics of capital markets, risk and portfolio theory, cost of capital, raising capital, capital structure, corporate dividend policy, real property valuation, merger and acquisition analysis, working capital management, commercial leasing strategies, international finance and derivatives analysis. No audits.
Prerequisites: EN.660.302 Corporate Finance OR EN.660.300 Managerial Finance OR 180.366 Corporate Finance.

EN.660.404. Business Law II.
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. No audits.
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): D. Fisher
Area: Social and Behavioral Sciences.

This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations. The course addresses critical issues such as the various types of intellectual property, the protection and commercialization of intellectual property by business and legal means, and the valuation of intellectual property. In addition, the tension between exclusive rights in intellectual property and free competition will be discussed throughout this course. Through interactive class discussions and a group project, students will have ample opportunity to develop a better understanding pertaining to the different types of intellectual property and to develop an intellectual property strategic plan for protecting an intellectual property portfolio. Specifically, the group project requires each team to research a selected Maryland based company’s intellectual property, its plan for protection and commercialization and its business goals, products and services. Each team will then analyze how well the company’s current business goals relate to its intellectual property portfolio, and recommend changes to better meet these company’s goals. Not open to students who have taken EN.660.305 Intellectual Property Law. No audits.
Prerequisites: EN.660.205 Business Law I
Area: Social and Behavioral Sciences.

This course is designed to give students in CS the requisite skills to generate and screen ideas for new venture creation and then prepare a business plan for an innovative technology of their own design. These skills include the ability to incorporate into a formal business case all necessary requirements, including needs identification and validation; business and financial models; and, market strategies and plans. Student teams will present the business plan to an outside panel made up of practitioners, industry representatives, and venture capitalists. In addition, this course functions as the first half of a two course sequence, the second of which will be directed by CS faculty and focus on the actual construction/programming of the business idea. Restricted to Juniors and Seniors majoring in Computer Science or by permission of instructor.
Prerequisites: Co-requisite: EN.660.321 OR EN.660.421;EN.660.226 AND EN.660.120
Instructor(s): L. Aronhime.
**EN.660.414. Financial Statement Analysis.**
This course is designed to increase a student’s ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will assess firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. Not open to students who have taken EN.660.304 Financial Statement Analysis. No audits.
**Prerequisites: EN.660.203**
**Instructor(s): A. Leps.**

**EN.660.420. Marketing Strategy.**
This writing intensive course helps students develop skills in formulating, implementing, and controlling a strategic marketing program for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization and support these decisions with quantitative analyses. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations, including financial projections, and presenting them to the class. No audits.
**Instructor(s): L. Kendrick.**

**EN.660.450. Advertising & Integrated Marketing Communication.**
This course builds on the promotional mix concepts covered in Principles of Marketing (EN.660.250)—advertising, public relations, sales promotion and personal selling. Students will learn how marketers are changing the ways they communicate with consumers and the ways in which promotional budgets are allocated—and how this impacts the development of marketing strategies and tactics. Working with a client (provided by EdVenture Partners) that has chosen this JHU class as its “advertising agency” and an actual budget provided by the firm, the class will form small teams to mirror the functional organization of an actual ad agency (market research, media strategy/planning, copywriting/design, public relations, etc.). Student teams will then develop a promotional plan and corresponding budget to reach the desired target market (JHU undergrads who meet the client’s criteria), implement the plan and then evaluate its effectiveness through pre- and post campaign market research conducted on the target consumer. 
**Note: Not open to students who have taken EN.660.450 as Advertising and Promotion. No audits. (Formerly Advertising and Promotion.)**
**Prerequisites: EN.660.250**
**Instructor(s): L. Kendrick.**

**EN.660.453. Social Media and Marketing.**
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. No Audits. 
**Instructor(s): M. DeVries; Staff.**

**EN.660.456. Marketing Communication Law & Ethics.**
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.661.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
**Instructor(s): K. Quesenberry.**

**EN.660.460. Entrepreneurship.**
This course provides students with a solid introduction to the entrepreneurial process of creating new businesses. Students will gain an appreciation for the investors’ perspective in assessing opportunities, evaluating strategies, and valuing the new enterprise. The course will cover the principal components of building a successful venture including management, market analysis, intellectual property protection, legal and regulatory issues, operations, entrepreneurial financing, and the role of the capital markets. Course work will include case studies and creation of investor marketing materials. Open to Juniors and Seniors. No Audits. Recommended Course Background: EN.660.203
**Prerequisites: EN.660.105 OR EN.660.250**
**Instructor(s): E. Rice.**

**EN.660.461. Engineering Business and Management.**
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
**Area: Engineering.**

**EN.660.500. Business Internship.**
Students may qualify for an internship with one of the many local employers with whom CLE works or they may arrange a non-local internship on their own. For non-paid internships only, students may apply for sponsorship for academic credit through CLE. Applications must include a resume, transcript and written essay and will be evaluated on the basis of work experience, GPA, writing sample, and course work. Students are expected to complete two reports assigned by the internship coordinator. S/U only.
**Instructor(s): L. Kendrick.**
Students work on an existing business or marketing plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students must apply by submitting a cover letter, resume, unofficial transcript, and essay describing the business concept/marketing plan. Applications must be approved by both the faculty member and director of CLE. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. Permission required. S/U only.
Instructor(s): L. Aronhime; P. Sheff.

The course will teach basic to advanced level financial modeling techniques within the Excel environment. Students will be exposed to several real-world examples and asked to create models to solve these problems. Some Excel topics include Formulas, Formatting, Charting, Filters, Toolpaks, VLOOKUP, Data Importing, Pivot Tables, IF statements, Macros, VBA.
Instructor(s): M. Kitt.

Professional Communication

EN.661.110. Professional Writing and Communication.
This course teaches students to communicate effectively with a wide variety of specialized and non-specialized audiences. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business and Industry or EN.661.120 Business Communication. No audits.
Prerequisites: Not open to students who have taken EN.661.110 as Technical Communication or Business and Industry or EN.661.120 Business Communication.
Instructor(s): C. Wilkins; J. Thompson; L. Pepitone.

EN.661.111. Professional Writing and Communication for International Students.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Note: not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. No audits.
Prerequisites: Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication.
Instructor(s): L. Davis.

EN.661.150. Oral Presentations.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. No audits.
Instructor(s): J. Reiser; L. Davis.

EN.661.160. Online Media and Society.
This online course takes a comprehensive and critical view of the history, roles and responsibilities of media in society. It explores the organization, creation, economics, control and effects of mass communications in the United States and the world. Students will learn how both traditional and new digital media has come to play such an integral role in our society while exploring the exciting career opportunities in journalism, public relations, advertising, radio, film, TV and the Internet. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through writing assignments. No on-campus components required. No audits.

EN.661.250. Oral Presentations.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. No audits. Not open to students that have taken EN.661.150.
Prerequisites: Not open to students who have taken EN.661.150.

This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. No audits. Not open to students that have taken EN.661.151.
Prerequisites: Not open to students that have taken EN.661.151.
Instructor(s): L. Davis.
EN.661.306. Freelance Travel Writing: Destination Mid-Atlantic.

In this course, students will learn the fundamentals of magazine and travel writing as well as best practices for working as a freelance writer. After gaining familiarity with the genre by reading several “classics” of travel writing and a selection of exemplary magazine articles, students will learn how to brainstorm ideas, plan research, interview skillfully, take useable photos with smartphones, polish pitches to editors, and write/revise/submit work for publication. Students will also have the opportunity to meet with important executives from travel magazines and publishing houses. We will use Washington, DC, and Baltimore as the basis for most of our work, but the course might also include day trips to Philadelphia and New York. At the end of the course, students will create an ePortfolio to showcase their articles, profiles, reviews, trade placements, blog entries, and pitches/queries to potential editors. Recommended: one prior course in writing but may be waived with instructor’s permission.

Instructor(s): J. Reiser.

EN.661.315. Culture of the Engineering Profession.

This course focuses on building understanding of the culture of engineering while preparing students to communicate effectively with the various audiences with whom engineers interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students will engage in discussion, argument, case study and project work to investigate: the engineering culture and challenges to that culture, the impacts of engineering solutions on society, the ethical guidelines for the profession, and the ways engineering information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. No audits. WSE sophomores, juniors and seniors or by instructor approval.

Instructor(s): E. Rice; P. Sheff; R. Graham.

EN.661.317. Culture of the Medical Profession.

This course builds understanding of the culture of medicine as well as the ways in which different strata within society have access to and tend to make decisions about health and health related services while preparing students to communicate effectively with the various audiences with whom medical professionals interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students engage in discussion, argument, case study and project work to investigate topics such as the medical culture, the ways medicine is viewed by different segments of society, issues associated with access to health care, ethical dilemmas and guidelines for medical decisions, the impacts of medical and engineering solutions on society, decision making within client/patient groups, social and cultural differences that effect behavioral change, and the ways medical information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication through a series of short papers and presentations associated with analysis of the writings and cases. For sophomores, juniors, and seniors or by permission of instructor. No audits.

Instructor(s): J. Bernstein

Area: Social and Behavioral Sciences.
EN.661.400. Practical Applications of Business Analytics.
With higher transparency and increased sophistication in data collection, modern technology has become a central component in decision-making in all sectors of business. Unfortunately, most casual observers of this critical data are ill-equipped to meaningfully analyze this new information. This course will provide students with an overview of best practices in the field coupled with real-world examples and case studies. Recommended Course Background: EN.661.203 Business Analytics or a statistics based course prior to this course.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.661.410. Research Writing for ESL.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provides intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. Undergraduates must be conducting research with a faculty member or must obtain special permission of instructor to register for the course. S/U grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.610. No audits.

EN.661.425. Ethics of Biomedical Innovation.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Co-listed with EN.580.425.
Area: Social and Behavioral Sciences.

EN.661.453. Social Media and Marketing.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits.
Prerequisites: EN.660.250 Principles of Marketing.

EN.661.454. Blogging and Digital Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: Prereq. EN.660.250-Principles of Marketing.

EN.661.456. Marketing Communication Law & Ethics.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.660.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Undergraduates are required to be conducting research with a faculty member or by special permission of instructor. Co-listed with EN.661.687. No audits.

EN.661.610. Research Writing for International Students.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). No audits.
Instructor(s): D. Link-Farajali
Writing Intensive.
EN.661.611. Professional Communication for ESL.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.411.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that “edge” you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester, Financial Math students only. P/F only. No audits.

Instructor(s): D. Link-Farajali.

EN.661.654. Blogging, Editing, and Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars). Co-listed with EN.661.454. No audits.

Prerequisites: Prereq. EN.660.250-Principles of Marketing.
Recommended prerequisite: one writing course in any discipline (professional communication, expository writing or writing seminars). Co-listed with EN.661.454. No audits.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the “real world.” Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Co-listed with EN.661.487. No audits.

EN.661.710. Dissertation Writing Workshop.
This course is designed to introduce students to the dissertation writing process, explain JHU-specific rules and regulations regarding dissertation work, and facilitate the completion of new work or work already in progress. Open to students in any discipline and in any stage of the dissertation process, this course will begin with a selection of speakers from relevant JHU departments, The Graduate Board, the MSE Library and the Commercial Binding Office, the Counseling Center’s Dissertation Support Group, professors, and recently graduated students (among others). During the second half of the course, students will designate one component of the dissertation and work to bring it to completion in a supportive workshop environment. This “component” could include a prospectus, a literature review, a chapter, an introduction, an overall plan for completion, or preparation for the defense. Topics will be geared toward the individual needs of the students registered in the course but will, in general, emphasize goal setting, project planning, developing strategies for working with readers/advisors/committees, learning how to emphasize “the big picture,” working with research tools such as Refworks or Zotero, building a daily writing practice, exploring strategies to deal with the isolation/depression common to dissertation writers, navigating the submission process, and, in general, supporting the overall dissertation writing process through its various stages. Course is taught pass/fail only. No-native speakers are encouraged to take EN.661.610 Research Writing for ESL before taking this course. No audits.

EN.661.651. Oral Presentations for ESL.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. Co-listed with EN.661.151.

This workshop is for dissertation writers who have already completed the Dissertation Writing Workshop, EN.661.710. This class provides a venue for students to hold themselves accountable, to set weekly goals, to workshop drafts, and to present work-in-progress to the whole group. Course is taught pass/fail only. Course may be repeated. No audits.

Prerequisites: Prereq: EN.661.710.
Engineering Management

**EN.662.611. Strategies: Accounting & Finance.**
This course includes a review of financial accounting with an emphasis on the implications of GAAP selections and other managerial decisions on the financial statements. Historic financial performance is assessed using ratio analysis. Relevant cash flows are used in capital budgeting situations; projects are analyzed using discounted cash flow techniques as a measure of valuation. Managerial accounting topics of financial forecasting, cost accumulation, cost allocation, product costing, and variance analysis are used in decision making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): A. Leps.

**EN.662.620. Professional Presentations.**
This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. MSEM students only. This is a 7-week course and is not open to undergraduates. Suggested readings: The Art of Explanation by Lee Lever, Presentation Zen by Garr Reynolds
Instructor(s): J. Reiser.

**EN.662.632. Business Law and Intellectual Property.**
Business Law and Intellectual Property introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses; contracts; intellectual property; principal-agent relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. For M.S. in Engineering Management only; no audits.
Instructor(s): G. Galvez.

**EN.662.642. Management and Leadership.**
Management and Leadership is a case, experiential and research based course intended to introduce participants to issues and solutions related to growing and managing businesses with an emphasis on entrepreneurial enterprises. The course focuses on managerial decision-making and organization building through topics that include planning and managing strategic change; finding competitive advantage; making informed decisions; dealing with uncertainty; negotiating collaborative settlements; managing/leading projects, teams and professionals; networking and forming strategic alliances; valuing differences; creating and maintaining organizational cultures; and devising performance measures. Additionally, participants master aspects of management communication as they address course content. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): E. Rice.

**EN.662.650. Marketing Communications.**
Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. MSEM students only, no undergrads.
Instructor(s): R. Graham.

**EN.662.651. Marketing Communication and Strategy.**
This course is designed to introduce students to key marketing, communications, and strategic issues surrounding the process of bringing new products to the marketplace. Through cases, readings, discussion and hands-on team projects, students develop a flexible approach to thinking about marketing problems, maximizing resources and creating strategic solutions. Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. For M.S. in Engineering Management only; graded (not P/F); no audits.

**EN.662.692. Strategies for Innovation & Growth.**
This course involves the assessment of a student's internship experience via a report and oral presentation. The questions and general format of the report and presentation will be provided by the instructor. The report and presentation will be evaluated by the instructor and both must be approved to obtain credit for this course. Students must be enrolled simultaneously in the internship experience.
Instructor(s): W. Smedick.

**EN.662.611. M.S. in Engineering Management Seminar.**
Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): S. Ozdemir.

**EN.662.812. M.S. in Engineering Management (MSEM) Seminar.**
Professional development seminar for engineering management students featuring outside speakers with engineering management experience. For M.S. in Engineering Management only; P/F only; no audits.
Instructor(s): P. Sheff.

**EN.662.815. CAD for MSEM.**
MSEM students only or permission of instructor.
Instructor(s): M. Boyle.
Marketing and Communications

The Marketing & Communications (M&C) program offers Johns Hopkins Arts & Sciences, Engineering and Peabody students a broad array of courses designed to equip them to lead in the marketing and communications fields, and complements major courses of study in departments across campus. Students who opt to declare the minor will choose between two tracks: the Marketing Management track and the Integrated Marketing Communications track. Courses are also open to students who choose not to declare the minor.

The Marketing Management track is geared towards students who wish to pursue a career in product or marketing management at a large-scale enterprise. This track emphasizes learning how to manage both the message and the financial impact of marketing campaigns, as well as how to manage a product line from development to launch.

The Integrated Marketing Communications track is designed for students who want to be more involved in the creative side of the marketing field, including areas such as advertising, public relations and social media. This track emphasizes forming marketing messages, and the production of creative content and deliverables for a variety of different industries.

See the Undergraduate tab above for specific requirements for the minor.

To complete the Marketing and Communications minor, student must complete:

• Three core courses
• One or two foundational courses, depending on the track selected
• Four upper-level courses in the desired track; one course must be at the 400-level.

Core courses; all three required

EN.660.105 Introduction to Business 4
EN.660.250 Principles of Marketing 3
EN.661.110 Professional Writing and Communication 3

Foundational courses

Marketing Management Track (one course required)
EN.660.203 Financial Accounting 3
or EN.661.380 Business Analytics

Integrated Marketing Communications Track (two courses required)
EN.661.250 Oral Presentations 3
or EN.661.251 Oral Presentations for International Students
EN.661.370 Visual Rhetoric 3

Upper-level electives; four courses required, at least one at 400-level

Please note that there are several new upper-level courses in development for the tracks listed below. Check the website for any changes when the new courses have been activated.

Marketing Management Track

EN.660.352 New Product Development 3
EN.660.354 Consumer Behavior 3
EN.660.355 Sports Marketing 3
EN.660.358 International Marketing 3
EN.660.420 Marketing Strategy 3
EN.660.450 Advertising & Integrated Marketing Communication 3
EN.660.456 Marketing Communication Law & Ethics 3
EN.661.361 Corporate Communications & P.R. 3
EN.661.453 Social Media and Marketing 3
EN.661.454 Blogging and Digital Copywriting 3

Integrated Marketing Communications Track

EN.660.310 Case Studies in Business Ethics 3
EN.660.357 Copywriting and Creative Strategy 3
EN.660.450 Advertising & Integrated Marketing Communication 3
EN.661.301 Writing for the Law 3
EN.661.315 Culture of the Engineering Profession 3
EN.661.317 Culture of the Medical Profession 3
EN.661.361 Corporate Communications & P.R. 3
EN.661.390 Catalyst: A Student-Run Magazine 3
EN.661.453 Social Media and Marketing 3
EN.661.454 Blogging and Digital Copywriting 3

Course and Grade Rules and Limitations

The Marketing and Communications minor requires 25 credits for the Marketing Management track and 28 credits for the Integrated Marketing Communications track.

A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the M&C minor.

A maximum of three credits may be taken on an S/U basis.

All courses applied to the M&C minor must be completed with a grade of C- or above.

Faculty

Director
Timothy Weihs
Director of CLE, Professor of Materials Science & Engineering.

Program Directors
Lawrence Aronhime
Senior Lecturer & Director of Entrepreneurship & Management Program: accounting, finance, entrepreneurship, technology commercialization.
Full Time Faculty

Bob Graham
Lecturer: entrepreneurship, professional communication, oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing, internships.

Annette Leps
Senior Lecturer: accounting, finance, management.

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric.

William Smedick
Senior Lecturer: leadership theory, leadership in teams.

Part Time Faculty

Michael Agronin
Lecturer: new product development.

Jennifer Bernstein
Lecturer: professional communication.

Laura Davis
Lecturer: professional communication for ESL and Oral presentations for ESL.

Marci DeVries
Lecturer: marketing.

Kevin Dungey
Senior Lecturer: oral presentations.

David Fisher
Lecturer: business law.

Mark Franceschini
Senior Lecturer: business law, business ethics, Internet law.

Sean Furlong
Lecturer: financial accounting.

Mary Beth Furst
Lecturer: principles of marketing.

Jason Heiserman
Lecturer: oral presentations.

Andrew Kulanko
Senior Lecturer: oral presentations.

Denise Link-Farajali
Lecturer: professional communication: financial math for ESL, research writing for ESL.

Bryan Rakes
Lecturer: business law.

Joshua J. Reiter
Senior Lecturer: business process management, total quality management, information technology management, Internet-based business applications, creativity and innovation, entrepreneurship.

Douglas Sandhaus
Senior Lecturer: business law, business ethics, Internet law.

Jay Thompson
Lecturer: professional communication.

Caroline Wilkins
Lecturer: professional communication.

Materials Science and Engineering

Materials are essential to the construction of any engineering structure, from the smallest integrated circuit to the largest bridge. In almost every technology, the performance, reliability, or cost is determined by the materials used. As a result, the drive to develop new materials and processes (or to improve existing ones) makes materials science and engineering one of the most important and dynamic engineering disciplines.

The central theme of materials science and engineering is that the relationships among the structures, properties, processing, and performance of materials are crucial to their function in engineering structures. Materials scientists seek to understand these fundamental relationships and use this understanding to synthesize new materials or develop new processes for producing existing ones. Materials engineers design or select materials for particular applications and develop improved processing techniques. Since materials scientists and engineers must understand the properties of materials as well as their applications, the field is inherently interdisciplinary and draws on aspects of almost every other engineering discipline as well as physics, chemistry, and, most recently, biology. Because the field encompasses so many different areas, it is often categorized according to types of materials (metals, ceramics, polymers, and semiconductors) or to their applications (biomaterials, electronic materials, magnetic materials, or structural materials).

The department prepares students for successful careers in materials science and engineering, for advanced study in science or engineering, and for professional education in other fields. The goal of the undergraduate program is to provide a rigorous and comprehensive curriculum in materials science and engineering as well as in mathematics, basic sciences, humanities, and social sciences. Our
low student-to-faculty ratio allows students close contact with faculty in both classroom and research environments, as well as with other students and researchers in the department. The student is encouraged to proceed at his or her own rate and to participate in interdisciplinary, interdepartmental, and interschool programs. In the tradition of Johns Hopkins, all of our undergraduate students participate in research, often beginning in their sophomore year, working closely with faculty and graduate students.

In recognition that biomaterials and nanotechnology represent two of the most rapidly developing areas of materials science and engineering, the Department of Materials Science and Engineering offers challenging specializations in biomaterials or nanotechnology within its undergraduate program.

The field of biomaterials is concerned with the science and engineering of materials in biology and medicine. Engineering materials are increasingly used in applications such as drug delivery and gene therapy, scaffolds for tissue engineering, replacement body parts, and biomedical and surgical devices. Biomaterials is an inherently interdisciplinary field that requires deep understanding of the properties of materials in general, and the interactions of materials with the biological environment. The Biomaterials Track is designed to provide a firm grounding in the physics, chemistry, and biology of materials, as well as breadth in general engineering, mathematics, humanities, and social science. In addition, students are encouraged to gain hands-on experience in biomaterials research laboratories. The program seeks to educate students to reach the forefront of leadership in the field of biomaterials engineering. While the fundamental principles of materials science still apply, a complete understanding of biomaterials and their interactions with biological environments requires a greater degree of specialization than the standard undergraduate curriculum provides. In recognition of completion of the Biomaterials Track, a student may elect to have his or her academic transcript annotated to indicate a specialty in biomaterials.

Nanotechnology advances the utilization of materials and devices with extremely small dimensions. Nanotechnology is a visionary field, as micro and nanostructured devices impact all fields of engineering, from microelectronics (smaller, faster computer chips) to mechanical engineering (micromotors and actuators) to civil engineering (“smart,” self-healing nanocomposite materials for buildings and bridges) to biomedical engineering (biosensors and tissue engineering). Materials science is central to nanotechnology because the properties of materials can change dramatically when things are made extremely small. This observation is not simply that we need to measure such properties or develop new processing tools to fabricate nanodevices. Rather, our vision is that the wide (and sometimes unexpected!) variety of phenomena associated with nanostructured materials allows us to envision radically new devices and applications that can only be made with nanostructured materials. The Nanotechnology Track encompasses a curriculum designed to train students in the fundamental interdisciplinary principles of materials science including physics and chemistry, and also to expose students to the forefront of nanomaterials research through elective classes as well as research laboratories. Students in the Nanotechnology Track will be well-prepared for successful careers in materials engineering across a wide range of disciplines. In recognition of completion of the Nanotechnology Track, a student may elect to have his or her academic transcript annotated to indicate a specialty in nanotechnology.

The graduate curriculum provides students with a broad yet thorough grounding in the fundamentals of materials science and engineering. After completing the core curriculum, students pursuing master and Ph.D. degrees take advanced courses that will allow them to work at the forefront of knowledge in their chosen specialty. Those desiring to conduct original research and advance the frontiers of knowledge pursue a master’s essay and/or Ph.D. thesis. To this end, the department has an outstanding and wide-ranging research program, with particular emphasis on nanomaterials, thin films, metastable materials, biomaterials, computational materials science, and materials characterization.

Facilities

The teaching and research facilities of the Department of Materials Science and Engineering are located in Maryland and Krieger halls on the Homewood campus. Our central facilities include the Surface Analytical Laboratory, with advanced tools for the chemical characterization of solid surfaces; the Scanning Electron Microscopy Laboratory; the X-Ray Diffraction Laboratory; the Laboratory for Thin Film Deposition; and facilities for sample preparation, optical microscopy, and mechanical testing. Individual research groups have established laboratories with advanced facilities for materials processing, nanotechnology, and materials characterization. Through collaboration with other departments and national laboratories, students and faculty also have access to a variety of other facilities necessary for world-class research.

Mission Statement

Materials play a central role in the performance and reliability of virtually every technology and living organism. The central theme of materials science and engineering is that the relationships between the structure, properties, processing, and performance of materials are crucial to their function. Materials scientists seek to understand these fundamental relationships, synthesize new materials, develop improved processes for making materials, and understand the role of materials in the functioning of biological organisms. The wide range of problems addressed makes materials science one of the most highly interdisciplinary and dynamic engineering disciplines.

The Materials Science & Engineering faculty strives to maintain the Johns Hopkins University tradition of training a small number of students of the highest quality. We measure our success by the impact our graduates have on the scientific and engineering communities. Our program is designed to provide a solid foundation for future career development for students with diverse career aspirations.

Program Objectives

Our current program educational objectives are stated as follows:

Graduates of the Materials Science and Engineering Program:

1. Pursue careers that include advanced graduate studies in materials science and engineering or careers in related areas of science and engineering or professional disciplines that benefit from an understanding of materials science and engineering such as medicine, business or law.

2. Employ elements of the research process in their careers including the use of:
   - critical reasoning to identify fundamental issues and establish directions for investigation
• creative processes to define specific plans for problem solution
• analytical thought to interpret results and place them within a broader context.

**Student Outcomes**

At completion of the degree program, students in Materials Science and Engineering will have:

1. an ability to apply knowledge of mathematics, science and engineering (to solve problems related to materials science and engineering)
2. an ability to design and conduct experiments, as well as to analyze and interpret data (using statistical, computational or mathematical methods)
3. an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability - the design process
4. an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical and health and safety, manufacturability, and sustainability - recognition of constraints within design
5. an ability to function on multidisciplinary teams
6. an ability to identify, formulate and solve engineering problems
7. an understanding of professional and ethical responsibility
8. an ability to communicate effectively (writing)
9. an ability to communicate effectively (oral presentation)
10. the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental and societal context
11a recognition of the need for and an ability to engage in life-long learning
12a knowledge of contemporary issues
13a ability to use the techniques, skills, and modern engineering tools necessary for engineering practice
14 the ability to apply advanced science (such as chemistry and physics) and engineering principles to materials systems
15 the ability to integrate understanding of the scientific and engineering principles underlying the four major elements: structure, properties, processing, and performance related to material systems appropriate to the field
16 the ability to apply and integrate knowledge from each of the above four elements of the field to solve materials selection and design problems
17 the ability to utilize experimental, statistical and computational methods consistent with the program educational objectives

An anticipated individual program of study designed to meet the university and department requirements for the B.S. degree, as well as to reflect the student’s interest, should be filed as early as possible during the student’s residence. The faculty advisor’s signature is required on all course registration and course change forms. As changes are made in the program, it shall be the student’s responsibility to see that a revised program is filed with the advisor. Each student must have an approved program on file no later than the semester before he/she expects to graduate.

General university requirements include (see also General Requirements for Departmental Majors for more information):

• Complete program of study outlined by track or concentration (standard track, biomaterials concentration, or nanotechnology concentration).
• Fulfill the university writing requirement two writing intensive courses, at least 3 credits each.
• Fulfill 75 credits earned in courses coded Engineering, Quantitative Studies, or Natural Science.
• At least 30 credits of this must be counted Natural Science or Quantitative Studies with no course counted twice.
• At least 30 additional credits must be taken outside of Engineering area, excluding prerequisites for the major.
• Fulfill a minimum of six courses coded Humanities or Social and Behavioral Sciences, at least 3 credits each, for a minimum of 18 credits.
• Take a minimum of 128 credits.

To meet the course requirements for the B.S. degree in Materials Science and Engineering, the student must complete a minimum of 128 credits, distributed as follows:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Materials Science *</td>
<td>42</td>
</tr>
<tr>
<td>Basic Natural Sciences **</td>
<td>22</td>
</tr>
<tr>
<td>Mathematics</td>
<td>20</td>
</tr>
<tr>
<td>Humanities and Social Sciences **</td>
<td>18</td>
</tr>
<tr>
<td>Basic Engineering and Computer Programming **</td>
<td>11</td>
</tr>
<tr>
<td>Electives ***</td>
<td>15</td>
</tr>
<tr>
<td><strong>Total Credits</strong></td>
<td>128</td>
</tr>
</tbody>
</table>

* The 42 credits of materials science courses must be passed with a letter grade of C or higher.
** All courses must be passed with a letter grade of C- or higher
*** Of these electives, 6 credits must be in natural sciences, mathematics, or engineering, and 9 credits are open electives to be chosen by the student. All courses must be passed with a letter grade of D or higher.

In addition to the degree program in Materials Science and Engineering, students may elect to complete specialized concentrations in biomaterials or nanotechnology. Whether a student chooses to pursue studies following the standard track, the Biomaterials concentration or the Nanotechnology concentration, the course work specified for the degree will provide a firm grounding in the principles of materials science and engineering.

**Requirements for the B.S. Degree**

The Department of Materials Science and Engineering offers a program leading to the Bachelor of Science Degree. The B.S. for the Materials Science and Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org). The student must meet the general university requirements for the chosen degree as well as the departmental requirements, and must complete the program approved by the student’s advisor.
Three B.S. Degree Options are Offered by the Department of Materials Science and Engineering

Standard Track
The Standard Track is intended for those students with general materials science interests. It permits the student to tailor the degree program to specific interests by allowing a broad range of choices for upper-level science and engineering electives.

Biomaterials Concentration
Biomaterials is an exciting and rapidly developing field. Engineered materials are increasingly used in medical applications (such as drug delivery, gene therapy, scaffolds for tissue engineering, replacement body parts, and biomedical and surgical devices) while an understanding of structure-property relationships in natural biomaterials may lead to improved interventions for a wide variety of diseases and injuries. Because it is highly interdisciplinary (involving elements of materials science, engineering, biology, chemistry and medicine), biomaterials as a discipline requires a deep understanding of the properties of materials in general, and the interactions of materials with the biological environment in particular.

The biomaterials concentration is designed to provide a broad basis in the fundamentals of materials science and engineering, as well as a particular emphasis on the principles and applications of biomaterials. While the fundamental principles of materials science still apply, a complete understanding of biomaterials and their interactions with biological environments requires a greater degree of specialization than the standard undergraduate curriculum provides. The biomaterials curriculum includes topics such as biomimetic materials, natural biomaterials, host responses to biomaterials, biocompatibility, and applications of biomaterials, particularly in tissue engineering, drug delivery, and medical devices and implants. Our goal is to train students who can apply these principles to the development of novel materials that benefit human health.

To receive commendation for completion of the Biomaterials concentration, the student must complete three electives, whose subject matter is some aspect of Biomaterials, and complete a biomaterials lab course and a biomaterials-related senior design project. Approval of electives must be made by a student’s academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.

Nanotechnology Concentration
Nanotechnology advances the utilization of materials and devices with extremely small dimensions. Nanotechnology is a visionary field, as micro- and nano-structured devices impact all fields of engineering, including microelectronics (smaller, faster computer chips), mechanical engineering (micromotors and actuators), civil engineering (“smart”, self-healing nanocomposite materials for buildings and bridges), and biomedical engineering (biosensors and tissue engineering).

Materials science is central to nanotechnology because the properties of materials can change dramatically when things are made extremely small. This observation is not simply that we need to measure such properties or develop new processing tools to fabricate nanodevices. Rather, our vision is that the wide (and sometimes unexpected) variety of phenomena associated with nanostructured materials allow us to envision radically new devices and applications that can only be made with nanostructured materials. The nanotechnology concentration encompasses a curriculum designed to train students in the fundamental interdisciplinary principles of materials science, including physics and chemistry, and also to expose students to the forefront of nanomaterials research through elective classes and research laboratories. In recognition of completion of the Nanotechnology concentration, a student may elect to have his or her academic transcript annotated to indicate a concentration in nanotechnology.

To receive commendation for completion of the Nanotechnology concentration, the student must complete three electives, whose subject matter is some aspect of Nanotechnology, and complete a nanomaterials lab course and a nanotechnology-related senior design project. Approval of electives must be made by a student’s academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.

* Students are encouraged to take the 1-credit introductory 510.109 Materials Science & Engineering for the 21st Century. Students must take EN.510.101 Introduction to Materials Chemistry or both AS.030.101 Introductory Chemistry I/AS.030.102 Introductory Chemistry II to fulfill the introductory chemistry lecture requirement.

Information about scholarships and other sources of financial assistance for undergraduates is available from Student Financial Services (http://pages.jhu.edu/~finaid). In addition, the faculty employs a number of undergraduates as laboratory assistants to help with various aspects of their individual research programs.

The Department of Materials Science and Engineering (DMSE) offers three graduate degrees: the Ph.D. (Doctor of Philosophy), the M.S.E. (Master of Science in Engineering), and the M.M.S.E. (Master of Materials Science and Engineering). The Ph.D. and the M.S.E. can be completed on either a full-time or part-time basis. Financial aid is available only for students admitted to the full-time Ph.D. program. The M.S.E. degree may be completed either with or without an essay, as described below.

Hopkins undergraduate students are encouraged to consider completing both the B.S. degree and the M.S.E. degree in a total of five years. This five-year, dual degree option offers additional preparation for the pursuit of Ph.D. programs and careers in materials science and engineering. Students are encouraged to consult their undergraduate advisors to gain information on M.S.E. programs at Hopkins, as well as third- and fourth- year course selections best suited to the pursuit of the M.S.E. degree.

The M.M.S.E. is a terminal master’s degree offered through Johns Hopkins Engineering for Professionals (EP) of the Whiting School of Engineering. The degree program consists of 10 courses offered primarily in the evening. Students interested in this program should apply through the EP Office, 410.516.2300 or www.ep.jhu.edu.

Admission

To be admitted to graduate study in the Department of Materials Science and Engineering, students must submit credentials sufficient to convince the faculty that they have the potential to successfully complete the program requirements. Under the new GRE test, applicants should take the General Test package containing the Mathematical Reasoning test.

Hopkins undergraduate students who plan to pursue a M.S.E. degree in their fifth year are encouraged to submit an application early in their fourth year of study.

A graduate student pursuing a Ph.D. degree with the Department of Materials Science and Engineering who is funded by the department as a teaching assistant or research assistant may not enroll simultaneously in a master’s program in another department, unless he or she receives written approval from his or her advisor, the DMSE Graduate Program Committee, and the department chairman.

Advising and Review of Student Performance

Each graduate student will normally have one or more faculty advisors. Students who are entering the M.S.E. program and plan to pursue a degree without an essay will be assigned an academic advisor. Students who are entering the M.S.E. program and plan to pursue a degree with an essay will be advised by their research advisor. Students who are entering the Ph.D. program will be advised by their research advisor. Students with a research advisor in another department will be advised by their research advisor. Students who are entering the M.S.E. program and plan to pursue a degree without an essay will be assigned an academic advisor from among the full-time faculty in the department. Student progress will be assessed regularly by the faculty advisor(s) and the Graduate Program Committee. Students...
are expected to remain in regular communication with their faculty advisor(s).

Each student’s progress will be reviewed annually by the Graduate Program Committee, in consultation with the student’s advisor(s). To assist in this evaluation, students are required to submit a form (available from the academic program coordinator) detailing progress toward completion of the degree requirements. This form must be signed by the student’s advisor(s) and filed with the Graduate Program Committee each year. The department must be convinced that all academic requirements have been satisfied by the candidate before a recommendation to confer a graduate degree is passed on to the University Graduate Board.

Grade requirements for graduate course work differ according to the degree program, as described below. All graduate students are required to maintain an overall grade point average (GPA) of 3.0 or higher; failure to do so will ordinarily be cause for dismissal from the program. Independent research courses will not be counted toward completion of course requirements.

The department believes that teaching experience is important to professional growth; therefore, a student may be required to serve as a teaching assistant during his or her academic career.

**Requirements for the M.S.E. Degree with Essay**

(8 courses)

The degree of Master of Science in Engineering (M.S.E.) with Essay is awarded subject to the recommendation of the student’s advisor and departmental approval, based on satisfactory completion of the following requirements:

Three core courses in Materials Science and Engineering

Four advanced (400 level or higher) elective courses in materials science and engineering or related fields *

A master’s essay or journal publication is required

* Elective courses in materials science and engineering or related fields, subject to the following rules:
  * Up to two of the elective courses may be taken from within the Engineering for Professionals (EP) program.
  * Up to two of the elective courses can be business courses.
  * Any elective taken from outside the department (including EP courses) requires prior approval of the Graduate Program Committee.
  * With approval of the Graduate Program Committee, the student can transfer up to two graduate courses from another institution. Students desiring such credit must make the request in writing to the Graduate Program Committee by the end of the first semester after matriculation. This request must include a description of the course, a course syllabus, and documentation of the grade received. Please note that transfer coursework grades do not count towards calculation of the GPA.
  * With approval of the Graduate Program Committee, current or former Hopkins undergraduates can count two courses (400 level or higher) to both their B.S. and M.S.E. requirements.
  * A grade of C or better must be achieved in each course to obtain credit.
  * A overall grade point average of 3.0 must be maintained, and a grade point average of a 3.0 is required to earn the degree at the end of the program.
  * Attendance is required at the weekly Graduate Student Seminar and the Department of Materials Science and Engineering Seminar.

** A master’s essay or journal publication is required. A Master’s essay must be approved by one faculty reader and conform to the requirements of the Graduate Board. For a journal publication a student must submit to the Graduate Program Committee an article describing his or her original research that has been published (or accepted for publication) in an archival, peer-reviewed technical journal. The student must be the primary author of the article.

Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 21 months. The student’s transcript will reflect a “Master of Science in Engineering with Essay.”

**Requirements for the M.S.E. Degree without Essay**

(10 courses)

The degree of Master of Science in Engineering (M.S.E.) is awarded subject to the recommendation of the student’s advisor and departmental approval, based on satisfactory completion of the following requirements:

Six advanced (400-level or higher elective courses in materials science and engineering or related fields *
Six advanced (400-level or higher) elective courses in materials science and engineering or related fields, subject to the following rules:

- Up to two of the elective courses may be taken from within the Engineering for Professionals (EP) program.
- Up to two of the elective courses can be business courses.
- Any elective taken from outside the department (including EP courses) requires prior approval of the Graduate Program Committee.
- With approval of the Graduate Program Committee, the student can transfer up to two graduate courses from another institution. Students desiring such credit must make the request in writing to the Graduate Program Committee by the end of the first semester after matriculation. This request must include a description of the course, a course syllabus, and documentation of the grade received. Please note that transfer coursework grades do not count towards calculation of the GPA.
- All electives will need prior approval from the Graduate Program Committee.

A grade of C or better must be achieved in each course to obtain credit.

An overall GPA of 3.0 must be maintained, and a GPA of 3.0 is required to earn the degree at the end of the program.

Attendance is required at the weekly Graduate Student Seminar and the Department of Materials Science and Engineering Seminar.

Up to two of the elective courses may be Graduate Research in Materials Science (EN.510.807), which may be taken in any session (Fall, January, Spring, or Summer). Note that 117 hours or research per course are required for credit.

Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 12 months. The student’s transcript will reflect a “Master of Science in Engineering.”

Requirements for the Ph.D. degree

To receive the degree of Ph.D., the candidate must fulfill the requirements below. The department must be satisfied that all academic requirements have been satisfied by the candidate before a recommendation will be made to the University Graduate Board to confer the Ph.D. degree.

1. Successful completion of four required courses in materials science and engineering.
   - EN.510.601: Structure of Materials
   - EN.510.602: Thermodynamics of Materials
   - EN.510.603: Phase Transformations of Materials
   - EN.510.615: Physical Properties of Materials

   Each of the four required courses must be passed with a letter grade of B- or higher. If a student receives a grade of C+ or lower in a required course, the student may retake the course once to achieve a grade of B- or higher. Receipt of grades of C+ or lower in two or more required courses will ordinarily be cause for dismissal from the program without the opportunity to re-take those courses.

   In addition, the student must maintain an overall GPA of 3.0 or better in the four required courses. If the student’s GPA falls below 3.0, the student must re-take one or more of the required courses and earn higher grade(s). Upon doing so the prior grade(s) in those course(s) are replaced and not counted toward the GPA.

   The four required courses must be successfully completed (meeting the grade and GPA requirements above) no later than the start of the student’s third year after matriculation; failure to do so will result in dismissal from the program. Exception: A student who fails to meet the requirements above due to a low grade in a single required course, and who has not had an opportunity to re-take that course during the first two years, will be permitted to re-take that one course in the third year.

   Students who have completed prior graduate-level coursework similar to EN.510.601 Structure of Materials, EN.510.602 Thermodynamics of Materials or EN.510.603 Phase Transformations of Materials may petition the Graduate Program Committee to waive one of these required courses. Alternatively, students with undergraduate degrees in Materials Science may petition the Graduate Program Committee to waive the Physical Properties course. However, only one of the four required courses can be waived. If approved, the course that has been waived will not be counted toward calculation of the GPA as described above. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation. Please note that transfer coursework grades do not count towards calculation of the GPA.

2. Successful completion of three advanced (600-level or higher) elective courses in materials science and engineering or a related field.

   Elective courses must be completed with a grade of C or higher, but there is no cumulative GPA requirement. A list of approved electives is available from the Academic Program Coordinator. Students wishing to use a course not on this list must submit a request to the Graduate Program Committee no later than the end of the first week of the semester in which the course is taken. Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses.

   Graduate research (EN.510.807-EN.510.808), part-time graduate courses (from Engineering for Professionals in WSE or Advanced Academic Programs in KSAS), and seminars (courses with less than three contact hours per week) will not be counted toward completion of PhD course requirements. Undergraduate courses (400-level or lower) will not be counted unless they are cross-listed as graduate level, 600 or higher. Independent study courses may be used with prior approval of the Graduate Program Committee.

   Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation.

   In some cases an advisor may require a student to complete additional coursework, beyond the four required courses and three electives described above.

3. Teaching Assistant Requirement.

   Students in their second year in the department will be required to act as teaching assistant for two courses.

4. Successful completion of a comprehensive oral examination covering fundamentals of materials science and engineering.

   The comprehensive examination tests knowledge in each of the subjects listed below:

   - Structure of materials
In each of the three subject areas, students may be asked questions related to the properties of materials. The depth of required knowledge regarding properties of materials will match the level of knowledge presented in the Physical Properties of Materials class.

Successful completion of the comprehensive exam requires satisfactory performance on all areas tested; there are no partial or conditional passes.

The comprehensive exam is offered semiannually, usually immediately prior to the fall and spring semesters. A student who fails the exam on the first try may make a second attempt, but the exam must be successfully completed no later than the start of the third year following matriculation. Failure to do so will result in dismissal from the program.

The dissertation proposal must be presented at a department seminar no later than the end of the third year following matriculation. A written version of the dissertation proposal must be submitted to a faculty committee consisting of the student’s faculty advisor and two other faculty members (to be selected in consultation with the advisor) no later than two weeks prior to the oral presentation. A brief closed session between the student and the committee will follow the presentation, at which the committee members will ask questions about and provide comments on the proposed plan of research. Additional private discussions may be required by one or more committee members. The thesis proposal is also an examination, with the committee testing the candidate’s depth of knowledge in his or her area of specialization (and not simply on the specific proposed research).

The committee may impose certain conditions (e.g., changes to the dissertation) for the candidate to meet prior to final certification that he or she has passed the exam. For this reason, the thesis defense must be scheduled for a date at least two months prior to any personal or university deadline for graduation. A complete draft of the dissertation must be submitted to all committee members no later than two weeks prior to the defense.

The dissertation in its final form must be read and approved in writing by two members of the committee (the advisor and one other member to be chosen by the committee as a whole).

### Financial Aid

Fellowships of various forms are available for full-time graduate students, including tuition remission fellowships, teaching fellowships, and additional stipend fellowships.

Research assistantships are available to support full-time graduate students who work with individual professors on their research contracts and grants.

For current faculty and contact information go to http://materials.jhu.edu/index.php/people/

### Faculty

**Chair**

Jonah Erlebacher  
Professor: Nanostructured materials, self-organization and pattern formation, computational materials science, kinetics of shape change, ultra-high vacuum processing, nanoporous metals, fuel cells and energy.

**Professors**

Robert C. Cammarata  
Structure, properties, and processing of thin films and nanostructured materials, thermodynamics and mechanics of surfaces, mechanical behavior of materials, nanoindentation testing, stresses in thin films, novel electrochemical deposition methods, computer simulations, transport and assembly of nanowires in solution.

Michael Falk  
Professor: Theoretical and computational research investigating materials processes far from equilibrium: deformation, failure and fracture in non-crystalline materials such as metallic glasses; reactive materials, interactions of stress and diffusion in energy storage materials; mixing processes that accompany frictional sliding and wear

Kalina Hristova  
Biomolecular materials, structure and function of cellular membranes, membrane proteins, self-assembly of biological amphiphiles, protein-lipid interactions, protein synthesis, X-ray diffraction, fluorescence.

Todd C. Hufnagel  
Structure and properties of amorphous alloys; mechanical behavior of metals, polymers, and biomaterials; use of synchrotron radiation for in situ studies of deformation and phase transformations in materials; electron microscopy.

Howard E. Katz  
Professor: organic, hybrid, nanostructured, and interfacial materials in electronic and photonic devices; organic materials synthesis, thin film fabrication and patterning; novel architectures for devices, sensors, and circuits; host-guest chemistry, material responses to high electric fields; organic nonlinear optics; nanoparticles in biosystems; materials for physical science education.

Evan Ma  
Nonequilibrium processing and metastable materials, thermodynamics and kinetics of phase transformations, atomic level structures and polymorphs in metallic glasses and chalcogenide glasses, mechanical
properties of amorphous and nanocrystalline metals, mechanics of small-volume materials, in situ TEM, phase-change alloys for data storage and memory applications.

Hai-Quan Mao
Professor: Nanomaterials, electrospinning, nanofibers, biomimetic matrix, stem cell expansion and differentiation, nerve regeneration, micellar nanoparticle, therapeutic delivery, biodegradable polymers.

Peter C. Searson
Biomaterials, nanomedicine.

James B. Spicer
Ultrafast phenomena, laser interactions with materials, nanostructured composite materials, sensor physics, laser-based materials processing, elastic and anelastic materials properties, intelligent materials processing, near-field optical and microwave techniques.

Timothy P. Weihs
The study of exothermic reactions in layered materials and their applications, processing and characterization of thin films, mechanical testing of metals and biological materials, nanoindentation studies.

**Assistant Professors**

Margarita Herrera-Alonso
Structure-property relationships of biodegradable polymers, polymer synthesis, graft copolymers, nanoparticles and nanomaterials, kinetics of self-assembly, delivery of drugs and imaging agents.

Tim Mueller
Computational materials discovery and design.

Martin Ullschneider
Assistant Professor: Protein assembly and function in lipid bilayer membranes; Algorithm and parameter development for atomic detail molecular simulation; Synthetic biology and the de novo design of membrane active peptides and proteins

**Professor Emeritus**

Robert E. Green Jr.
Materials science, nondestructive characterization, ultrasonics, acoustic emission, X-ray diffraction, radiography, topography and tomography, synchrotron radiation, electro-optical systems, light-sound interactions, mechanical properties, thermography, sensors, process control.

**Research Professor**

Theodore O. Poehler
Electronically conducting polymers, organic charge transfer compounds, materials for optical Information processing, and semiconductors.

**Associate Research Professor**

Patricia M. McGuigan
Adhesion, tribology, tribocharging, atomic force microscopy, interfacial phenomena, wetting, interferometry, polymer and ceramic materials.

**Assistant Research Professor**

John Baty
Paper conservation, heritage science.

**Lecturer**

Orla Wilson

Synthesis of nanostructured materials, specifically metallic and bimetallic nanoparticles in the 2-20 nm size range; electron, confocal and scanning-probe microscopies as characterization tools; applications of nano-structured materials as homogeneous and heterogeneous catalysts, novel optical security devices, and nanovectors for targeted drug delivery.

**Joint, Part-Time, and Visiting Appointments**

Kit Bowen
E. Emmet Reid Professor (Chemistry): experimental chemical physics-photoclectron spectroscopy of negative ions, structure and dynamics of gas phase, weakly bound molecular clusters.

Collin Broholm
Gerhard H. Dieke Professor (Director, Institute for Quantum Matter)
Physics & Astronomy: experimental condensed matter physics

Chia-Ling Chien
Jacob L. Hain Professor of Physics (Physics & Astronomy): Fabrication of experimental studies of structural, electronic, magnetic, and superconducting properties of nanostructured solids; magneto-electronics, manipulation of small entities in low Reynolds number regime, biosensing.

Michael Edidin
Professor (Biology): membrane organization and dynamics, immunology studied with nanoparticles and advanced microscopy.

Jaafar El-Awady
Assistant Professor: Multiscale materials modeling, damage and fracture mechanisms of materials in mechanical design, material degradation in extreme environments, nano-materials and structures, impact dynamics and wave propagation.

Jennifer H. Elisseeff
Professor (Biomedical Engineering): tissue engineering, biomaterials, cartilage regeneration.

D. Howard Fairbrother
Professor (Chemistry): surface chemistry, electron induced deposition of nanostructured materials, environmental health and safety of nanomaterials.

Sharon Gerecht
Associate Professor (Chemical and Biomolecular Engineering): biomaterials, stem cells, biomimetic hydrogels, vascular differentiation, angiogenesis, regenerative medicine, hypoxia, microfluidics.

Somnath Ghosh
Professor (Civil Engineering): computational mechanics with focus on materials analysis, characterization and processing, including simulation and design.

David Gracias
Professor (Chemical & Biomolecular Engineering): micro and nanotechnology, surface science, metamaterials, complex systems, nanoelectrics, nanomedicine, regenerative medicine, drug delivery and microfluidics.

Warren Grayson
Assistant Professor (Biomedical Engineering): Tissue engineering, stem cells, bioreactors, biomaterials, orthopaedics

Jordan Green
Assistant Professor (Biomedical Engineering): cellular engineering, nanobiotechnology, biomaterials, controlled drug delivery and gene delivery.

Kevin J. Hemker
Professor (Mechanical Engineering): mechanical behavior of materials, transmission on electron microscopy, high temperature alloys, thermal barrier coatings, nanocrystalline materials and materials for MEMS.

Robert Ivkov
Visiting Assistant Professor, Radiation Oncology (JHU School of Medicine): development, characterization, and use of nanomaterials to target cancer and to enhance the effectiveness of other therapies such as radiation. A specific area of research includes the study and development of selective heating with magnetic nanoparticles

Lynne Jones
Associate Professor (Orthopaedic Surgery, School of Medicine): biomaterials, osteonecrosis pathogenesis and treatment, total joint arthroplasty, bone graft materials

Thao (Vicky) Nguyen

K.T. Ramesh
Alonzo G. Decker Jr. Professor of Science and Engineering (Mechanical Engineering): Nanomaterials, planetary impact, dynamic failure mechanisms, shock, impact, and wave propagation, high-strain-rate behavior of materials, injury biomechanics, constitutive and failure modeling.

John D. Tovar
Professor (Chemistry): materials-oriented synthetic organic chemistry, electrochemistry, pi-conjugated and conducting polymers, supramolecular chemistry, organic electronics, biomimetic electronic materials.

Tza-Huei (Jeff) Wang
Professor (Mechanical Engineering): BioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Denis Wirtz
Theophilus Halley Smoot Professor (Chemical and Biomolecular Engineering): cell adhesion and migration, cell mechanics, cysto-
skeleton physics, receptor-ligand interactions, cancer bioengineering, progeria, particle tracking methods.

For current course information and registration go to https://isis.jhu.edu/classes

Courses

Basic principles of chemistry and how they apply to the behavior of materials in the solid state. The relationship between electronic structure, chemical bonding, and crystal structure is developed. Attention is given to characterization of atomic and molecular arrangements in crystalline and amorphous solids: metals, ceramics, semiconductors, and polymers (including proteins). Examples are drawn from industrial practice (including the environmental impact of chemical processes), from energy generation and storage (such as batteries and fuel cells), and from emerging technologies (such as biomaterials). Students may receive credit for AS.030.103 or EN.510.101, but not both.
Prerequisites: Students may receive credit for AS.030.103 or EN.510.101, but not both.
Instructor(s): P. Mcguiggan
Area: Natural Sciences.

EN.510.103. Foundations of Nanotechnology.
This course will be a survey of the rapidly developing field of nanotechnology from an interdisciplinary point of view. Topics covered will include a general introduction to the nanoworld, fabrication, characterization and applications of hard and soft nanomaterials, as well as examining nanotechnology in terms of its societal, ethical, economic and environmental impact.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

This course will introduce students to some basic concepts in materials science including phase diagrams, crystallization, and various characterization techniques, all through the close examination of chocolate. Students will have the opportunity to try some of their own experiments to see these processes in action. This course is directed toward freshman or sophomore engineering and natural science students with no background in these topics. Love of chocolate is a must.
Instructor(s): J. Dailey
Area: Natural Sciences.

Can you really turn lead into gold? Converting common substances into useful materials that play important roles in today’s technologies is the goal of many modern scientists and engineers. In this course, we will survey selected topics related to modern materials, the processes that are used to make them as well as the inspiration that led to their development. Topics will include the saga of electronic paper, the sticky stuff of gecko feet and the stretchy truth of metal rubber.
Instructor(s): J. Spicer
Area: Engineering, Natural Sciences.
Through this course, students are introduced to the basic tenants of the field of materials science and engineering and important aspects of career development. Discussions will cover the range of career options in the field, the opportunities to engage with cutting edge research and technology at JHU, the skills that practitioners require and the ethical conundrums that engineering professionals navigate. Only available to Materials Science & Engineering freshmen and engineering undecided freshmen.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.201. Introductory Materials Science for Engineers.
An introduction to the structure, properties, and processing of materials used in engineering applications. After beginning with the structure of materials on the atomic and microscopic scales, this course explores defects and their role in determining materials properties, the thermodynamics and kinetics of phase transformations, and ways in which structure and properties can be controlled through processing. Previously: Introduction to Engineering Materials.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

This course will introduce students to the basics of programming in the MATLAB environment. Students will build skills in algorithmic problem solving by programming assignments regarding a range of biological and non-biological materials systems. Students will learn to write function definitions and deploy basic operations of selection and iteration as well as MATLAB specific vectorization methods and the construction of graphical user interfaces. Applications may include materials structure, phase equilibrium, propagating reactions, and other relevant scientific and engineering applications.
Instructor(s): M. Ulmschneider
Area: Engineering, Natural Sciences.

EN.510.311. Structure of Materials.
First of the Introduction to Materials Science series, this course seeks to develop an understanding of the structure of materials starting at the atomic scale and building up to macroscopic structures. Topics include bonding, crystal structures, crystalline defects, symmetry and crystallography, microstructure, liquids and amorphous solids, diffraction, molecular solids and polymers, liquid crystals, amphiphilic materials, and colloids.
Prerequisites: ( ( AS.110.106 AND AS.110.107 ) OR ( AS.110.108 AND AS.110.109 ) ) AND ( ( EN.510.101 ) OR ( AS.030.101 AND AS.030.102 ) ) AND ( ( AS.171.101 AND AS.171.102 ) OR ( AS.171.103 AND AS.171.104 ) ) AND EN.510.202 or another programming course or permission of instructor.
Instructor(s): J. Erlebacher
Area: Engineering, Natural Sciences.

EN.510.312. Thermodynamics/Materials.
Second of the Introduction to Materials Science series, this course examines the principles of thermodynamics as they apply to materials. Topics include fundamental principles of thermodynamics, equilibrium in homogeneous and heterogeneous systems, thermodynamics of multicomponent systems, phase diagrams, thermodynamics of defects, and elementary statistical thermodynamics.
Prerequisites: ( ( AS.110.106 AND AS.110.107 ) OR ( AS.110.108 AND AS.110.109 ) ) AND ( ( EN.510.101 ) OR ( AS.030.101 AND AS.030.102 ) ) AND ( ( AS.171.101 AND AS.171.102 ) OR ( AS.171.103 AND AS.171.104 ) ) AND EN.510.202
Instructor(s): M. Ulmschneider
Area: Engineering, Natural Sciences.

Third of the Introduction to Materials Science series, this course is devoted to a study of the mechanical properties of materials. Lecture topics include elasticity, anelasticity, plasticity, and fracture. The concept of dislocations and their interaction with other lattice defects is introduced.
Prerequisites: EN.510.311 AND EN.510.202 or another programming course, or permission of instructor.
Instructor(s): T. Weihl
Area: Engineering, Natural Sciences.

Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena.
Prerequisites: EN.510.311 AND EN.510.202 or another programming course, or permission of instructor.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.315. Physical Chemistry of Materials II.
Fifth of the Introduction to Materials Science series, this course covers diffusion and phase transformations in materials. Topics include Fick’s laws of diffusion, atomic theory of diffusion, diffusion in multicomponent systems, solidification, diffusional and diffusionless transformations, and interfacial phenomena.
Prerequisites: EN.510.311 AND EN.510.312 AND EN.510.202 or another programming course, or permission of instructor.
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.316. Biomaterials I.
Sixth of the Introduction to Materials Science series, this course offers an overview of principles and properties of biomedical materials. Topics include properties of materials used in medicine, synthesis and properties of polymeric materials, polymeric biomaterials, natural and recombinant biomaterials, biodegradable materials, hydrogels, stimuli-sensitive materials, and characterizations of biomaterials.
Prerequisites: Prereqs: AS.030.205 AND (EN.510.202 OR EN.580.200) or permission of instructor.
Instructor(s): H. Mao
Area: Engineering, Natural Sciences.
EN.510.335. MSE Design Team I.
This course is the first half of a two-semester course sequence for freshmen, sophomores, and juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen, sophomores, and juniors, working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. *The team will meet 150 minutes per week at a time to be designated by the instructor. Recommended Course Background: EN.510.101, EN.510.109, or equivalent courses.
Instructor(s): H. Mao; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.336. MSE Design Team II.
This course is the second half of a two-semester course sequence for freshmen, sophomores, and juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen, sophomores, and juniors, working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman, Sophomore & Juniors Only. Recommended Course Background: EN.510.101, EN.510.109, or equivalent courses.
*The team will meet 150 minutes per week at a time to be designated by the instructor.
Prerequisites: EN.510.335
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

This course examines the science and engineering of contemporary and cutting-edge energy technologies. Materials Science and Mechanical Engineering fundamentals in this area will be complemented by case studies that include fuel cells, solar cells, lighting, thermoelectrics, wind turbines, engines, nuclear power, biofuels, and catalysis. Students will consider various alternative energy systems, and also to research and engineering of traditional energy technologies aimed at increased efficiency, conservation, and sustainability. Recommended Course Background: undergraduate course in thermodynamics.
Instructor(s): J. Erlebacher
Area: Engineering, Natural Sciences.

EN.510.407. Biomaterials II: Host response and biomaterials applications.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Also listed as EN.510.607.
Instructor(s): H. Mao
Area: Engineering, Natural Sciences.

EN.510.409. Melting, Smelting, Refining and Casting.
This is a laboratory class on metal formation, an area that underlies almost all other technologies. We will examine extraction of metals from ore, refining of metals. The kinetics of melting and solidification will be explored in the context of casting and forming.
Prerequisites: EN.510.311 AND EN.510.312 AND EN.510.313 AND EN.510.315
Instructor(s): T. Hufnagel
Area: Engineering, Natural Sciences.

EN.510.412. Introduction to and Application of Scanning Probe Microscopy.
Scanning Probe Microscopy has emerged as one of the premier techniques to characterize surfaces. This course will give an overview of the family of SPM techniques including scanning tunneling microscopy (STM), atomic force microscopy (AFM), scanning near field optical microscopy (SNOM) and Kelvin probe microscopy. In each of these applications, the theory of operation, measurement and imaging techniques, and experimental limitations will be discussed. Also listed as 510.632.
Instructor(s): P. Mcguiggan
Area: Engineering, Natural Sciences.

This course will present the basic principles of statistical mechanics and apply them to problems concerning the behavior of materials. Topics include: basic principles of statistical mechanics; time averages and ensembles; connection to macroscopic thermodynamics; fluctuations; classical and quantum particles statistics; lattice statistics; statistical thermodynamic models of gases, liquids, crystals, crystalline defects, linear chain polymers, and surfaces; phase transitions and critical phenomena; kinetic and transport phenomena; thermodynamics of irreversible processes. Recommended Course Background: EN.510.312 or undergraduate course in thermodynamics. Also listed as EN.510.613
Instructor(s): R. Cammarata
Area: Engineering, Natural Sciences.
EN.510.415. The Chemistry of Materials Synthesis.
Many of the latest breakthroughs in materials science and engineering have been driven by new approaches to their synthesis, which has allowed the preparation of materials with fanciful structures and fascinating properties. This advanced course will explore synthetic approaches to multifunctional and nanostructured materials, ranging from opals to complex polymers to nanowires and quantum dots. Applications include electronics, energetics, and drug delivery. Participants will gain sufficient familiarity with synthesis options to be able to design research programs that rely on them. Emphasis will be placed on broad strategies that lead to material functionality, rather than detailed step-by-step sequences. Some topics will be selected "on the fly" from the most exciting current literature.
Prerequisites: Prereq:: AS.030.205 AND ( EN.510.312 or EN.580.321 or equivalent Thermodynamics course.)
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.418. Electronic and Photonic Processes and Devices.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.419. Physical Metallurgy.
This course examines the relationship between microstructure and mechanical properties of metals and alloys. Starting from fundamentals (phase diagrams and phase transformation kinetics), we will explore how the structure of metals and alloys can be manipulated by thermomechanical processing to achieve desired properties. Detailed examples will be drawn from several alloy systems, including steels, aluminum, and titanium. A theme of the course will be the impact of materials processing and materials selection on the environment, including considerations of lightweight materials and processing techniques for minimizing energy consumption.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

The goal of stealth engineering is the creation of objects that are not easily detected using remote sensing techniques. To achieve this end, engineered systems of materials are arrayed to alter the signature of objects by reducing energy returned to remote observers. This course will provide an introduction to the general principles behind signature reduction by examining the mathematics and science behind basic electromagnetic and acoustic transport processes. Specific topics will include energy absorbing materials, anti-reflection coatings, wave guiding and scattering, metamaterials and adaptive screens.
Instructor(s): J. Spicer
Area: Engineering, Natural Sciences.

Nanoparticles - one-dimensional materials with diameters of nearly atomic dimension - are one of the most important classes of nanostructured materials because their unusual properties that often differ significantly from bulk materials. This course will explore the synthesis, structure and properties of nanoparticles. Applications of nanoparticles in medicine, optics, sensing, and catalysis will be discussed, with an emphasis on metal nanoparticles and semiconductor quantum dots.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

Almost every material's property changes with scale. We will examine ways to make micro- and nano-structured materials and discuss their mechanical, electrical, and chemical properties. Topics include the physics and chemistry of physical vapor deposition, thin film patterning, and microstructural characterization. Particular attention will be paid to current technologies including computer chips and memory, thin film sensors, diffusion barriers, protective coatings, and microelectromechanical (MEMS) devices.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

An exploration of paper's past, present, and possible future from the physical science and engineering perspectives. Includes an in-depth analysis of the defining physical, chemical, and electronic properties of paper since its origins in China as early as 202 BCE and the periodic technological innovations that improved quality, lowered price, and expanded use. Applications include paper as a medium for historic and artistic works, packaging, transformer insulation, architectural elements, medical diagnostics, and printed sensors. Topics include technologies such as email and e-books which may disrupt traditional paper formats, environmental concerns of industrial manufacture, transferrable knowledge from pulping such as the manufacture of feeds and fuels from cellulosic biomass, and paper's legacy as found in cultural heritage artifacts and their conservation. Recommended: AS.030.205 Organic Chemistry I
Prerequisites: EN.510.101 OR (AS.030.101 AND AS.030.102)
Instructor(s): J. Baty
Area: Engineering, Natural Sciences.

This course will examine the fundamental structure, interactions, and function relationship for biological macromolecules. The course will emphasize experimental methods and experimental design, and the physics behind human disease. Topics will include micellization, protein folding and misfolding, and macromolecular interactions. Recommended Course Background: EN.580.221 Co-listed with EN.510.621
Instructor(s): K. Hristova; M. Herrera-Alonso
Area: Engineering, Natural Sciences.
EN.510.428. Material Science Laboratory I.
This course focuses on characterizing the microstructure and mechanical properties of structural materials that are commonly used in modern technology. A group of Al alloys, Ti alloys, carbon and alloy steels, and composite materials that are found, for example, in actual bicycles will be selected for examination. Their microstructures will be studied using optical metallography, scanning electron microscopy, X-ray diffraction, and transmission electron microscopy. The mechanical properties of these same materials will be characterized using tension, compression, impact, and hardness tests. The critical ability to vary microstructure and therefore properties through mechanical and heat treatments will also be demonstrated and investigated in the above materials.
Prerequisites: EN.510.311 and EN.510.313
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.429. Materials Science Laboratory II.
This laboratory concentrates on the experimental investigation of electronic properties of materials using basic measurement techniques. Topics include thermal conductivity of metal alloys, electrical conductivity of metals/metal alloys and semiconductors, electronic behavior at infrared wavelengths, magnetic behavior of materials, carrier mobility in semiconductors and the Hall effect in metals and semiconductors. Lab Assignment is by Professor. Recommended Course Background: EN.510.311 or Permission Required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.430. Biomaterials Lab.
This laboratory course concentrates on synthesis, processing and characterization of materials for biomedical applications, and characterization of cell-materials interaction. Topics include synthesis of biodegradable polymers and degradation, electrospinning of polymer nanofibers, preparation of polymeric microspheres and drug release, preparation of plasmid DNA, polymer-mediated gene delivery, recombinant protein synthesis and purification, self-assembly of collagen fibril, surface functionalization of biomaterials, cell culture techniques, polymer substrates for cell culture, and mechanical properties of biological materials. Recommended Course Background: EN.510.407
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.

EN.510.433. Senior Design Research.
This course is the first half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of the weekly departmental research seminar. Co-listed with EN.510.438 and EN.510.440
Prerequisites: Prereq: EN.510.311 and 510.312 and EN.510.428 and 510.429
Instructor(s): O. Wilson
Area: Engineering.

EN.510.434. Senior Design/Research II.
This course is the second half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 Meets with EN.510.439, EN.510.441, EN.510.446, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.435. Mechanical Properties of Biomaterials.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic systems will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.635.
Instructor(s): T. Welsh
Area: Engineering, Natural Sciences.

Recent advances in biosensor technology are poised to revolutionize health care, enabling faster and more personalized diagnoses and recommendations. Biosensors are also increasingly important to public health, security, industry, and environmental science. This course will cover the materials, processes, and signaling mechanisms in use and anticipated for future developments in biosensors. Techniques such as electrochemistry, fluorescence, plasmonics, and enzymatic amplification will be discussed, and materials including nanowires, nanoparticles, organic semiconductors, and templated materials will be covered. Detection of nucleic acid sequences, proteins, carbohydrates, and microorganisms will be emphasized. Same course as EN.510.637.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.438. Biomaterials Senior Design I.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.440 and EN.510.433
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.
EN.510.439. Biomaterials Senior Design II.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, verbal reporting of project activities and status is emphasized, culminating in student talks presented to a special session of students and faculty. Students also prepare a poster and a written final report summarizing their design and research results. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 or 510.438 or 510.440 Meets with EN.510.434, EN.510.441, EN.510.446, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.440. Nanomaterials Senior Design I.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.433 and EN.510.438
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.441. Nanomaterials Senior Design II.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. During this semester, verbal reporting of project activities and status is emphasized, culminating in student talks presented to a special session of students and faculty. Students also prepare a poster and a written final report summarizing their design and research results. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 or 510.438 or 510.440 Meets with EN.510.434, EN.510.439, EN.510.446, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

EN.510.442. Nanomaterials Lab.
The objective of the laboratory course will be to give students hands on experience in nanotechnology based device fabrication through synthesis, patterning, and characterization of nanoscale materials. The students will use the knowledge gained from the specific synthesis, characterization and patterning labs to design and fabricate a working nanoscale/nanostructured device. The course will be augmented with comparisons to microscale materials and technologies. These comparisons will be key in understanding the unique phenomena that enable novel applications at the nanoscale. DMSE Seniors or permission of the instructor.
Instructor(s): E. Ma; J. Erlebacher; O. Wilson; P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.443. Chemistry and Physics of Polymers.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.643. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.445. MSE Design Team II.
This course is the first half of a two-semester course sequence for senior students majoring or double majoring in MSE. This course provides a broad experience to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE seniors, working with a team leader and a group of freshmen, sophomores, and seniors, apply their knowledge in their track area to generate the solution to open-ended problems encountered in MSE. Recommended Course Background: EN.510.101, EN.510.311, EN.510.312, EN.510.428, EN.510.429.
Instructor(s): H. Mao; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.446. MSE Design Team II.
This course is the second half of a two-semester course sequence for senior students majoring or double majoring in MSE. This course provides a broad experience to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE seniors, working with a team leader and a group of freshmen, sophomores, and seniors, apply their knowledge in their track area to generate the solution to open-ended problems encountered in MSE. Materials Science & Engineering Seniors Only. Recommended Course Background: EN 510.101, EN 510.311, EN 510.312, EN 510.428, EN 510.429. Meets with EN.510.434, EN.510.439, EN.510.441 and EN.510.448.
Prerequisites: EN.510.445
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.447. MSE Design Team Leader.
This course is the first half of a two-semester course sequence for students majoring or double majoring in MSE. This course provides a leadership experience to various aspects of planning and conducting independent research in a team setting. In this course, MSE seniors assemble and lead a student team consisting of 3 to 6 students, apply their knowledge in their track area, and develop leadership skills to generate the solution to open-ended problems encountered in MSE. Recommended Course Background: EN.510.101, EN.510.311, EN.510.312, EN.510.428, EN.510.429.
Instructor(s): H. Mao; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.
EN.510.448. MSE Design Team Leader.
This course is the second half of a two-semester course sequence for students majoring or double majoring in MSE. This course provides a leadership experience to various aspects of planning and conducting independent research in a team setting. In this course, MSE seniors assemble and lead a student team consisting of 3 to 6 students, apply their knowledge in their track area, and develop leadership skills to generate the solution to open-ended problems encountered in MSE.
Prerequisites: EN.510.447
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.456. Introduction to Surface Science.
Introduction to the structure and properties of solid surfaces. Topics include Gibbsian and gradient thermodynamics of surfaces; crystallography and structure of free solid surfaces; characterization methods; surface mobility and phase transitions; gas-solid interactions; crystal growth; electronic structure; solid-solid surfaces; thin film epitaxy. Co-listed with EN.510.656. Recommended course background: EN.510.311, EN.510.312, EN.510.313, EN.510.314, EN.510.315 or instructor permission.
Instructor(s): R. Cammarata
Area: Engineering, Natural Sciences.

The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Co-listed with EN.510.657
Instructor(s): R. Cammarata
Area: Engineering, Natural Sciences.

This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of low dimensional nanomaterials. Subject matter will include a detailed and comprehensive discussion of the physics and physical properties of solids confined in either one, two or three directions. Features examined for these low dimensional materials will include electronic structure, electrical transport, vibrational and thermal transport in low dimensional systems such as graphene, carbon nanotubes, quantum wires, semiconductor and metal nanoparticles. Co-listed with EN.510.659.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Instructor(s): Staff.

Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Instructor(s): Staff.

EN.510.503. Independent Study/Materials Science.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): R. Cammarata; Staff.

EN.510.504. Independent Study.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): P. Searson; R. Cammarata; T. Hufnagel
Area: Engineering, Natural Sciences.

EN.510.511. Research/Materials Science.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group. This section has a weekly research group meeting that students are expected to attend.
Instructor(s): Staff.

EN.510.574. Research-Intersession.
Instructor(s): Staff.

EN.510.597. Research-Summer.
Instructor(s): Staff.

An introduction to the structure of inorganic and polymeric materials. Topics include the atomic scale structure of metals, alloys, ceramics, and semiconductors; structure of polymers; crystal defects; elementary crystallography; tensor properties of crystals; and an introduction to the uses of diffraction techniques (including X-ray diffraction and electron microscopy) in studying the structure of materials. Recommended Course Background: undergraduate chemistry, physics, and calculus or permission of instructor.
Instructor(s): T. Hufnagel.

An introduction to the classical and statistical thermodynamics of materials. Topics include the zeroth law of thermodynamics; the first law (work, internal energy, heat, enthalpy, heat capacity); the second law (heat engines, Carnot cycle, Clausius inequality, entropy, absolute temperature); equilibrium of single component systems (free energy, thermodynamic potentials, virtual variations, chemical potential, phase changes); equilibrium of multicomponent systems and chemical thermodynamics; basics of statistical physics (single and multiple particle partition functions, configurational entropy, third law; statistical thermodynamics of solid solutions); and equilibrium composition-temperature phase diagrams. Recommended Course Background: undergraduate calculus, chemistry, and physics or permission of instructor.
Instructor(s): M. Falk.
This course presents a unified treatment of the thermodynamics and kinetics of phase transformations from phenomenological and atomistic viewpoints. Phase transformations in condensed metal and nonmetal systems are discussed. Recommended Course Background: EN.510.601 and EN.510.602
Instructor(s): J. Erlebacher.

An introduction to the properties and mechanisms that control the mechanical performance of materials. Topics include mechanical testing, tensor description of stress and strain, isotropic and anisotropic elasticity, plastic behavior of crystals, dislocation theory, mechanisms of microscopic plasticity, creep, fracture, and deformation and fracture of polymers. Recommended Course Background: EN.510.601
Instructor(s): T. Hufnagel.

An overview of electrical, optical and magnetic properties arising from the fundamental electronic and atomic structure of materials. Continuum materials properties are developed through examination of microscopic processes. Emphasis will be placed on both fundamental principles and applications in contemporary materials technologies. Recommended Course Background: EN.510.601
Instructor(s): J. Spicer.

EN.510.606. Polymer Chemistry & Biology.
An introduction to the chemical and biological properties of organic and inorganic materials. Topics include an introduction to polymer science, polymer synthesis, chemical synthesis, and modification of inorganic materials, biomineralization, biosynthesis, and properties of natural materials (proteins, DNA, and polysaccharides), structure-property relationships in polymeric materials (synthetic polymers and structural proteins), and materials for biomedical applications. Recommended Course Background: undergraduate chemistry and biology or permission of instructor.
Instructor(s): M. Herrera-Alonso.

EN.510.607. Biomaterials II: Host response and biomaterials applications.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Recommended Course Background: EN.510.606. Also listed as EN.510.407
Instructor(s): H. Mao.

EN.510.608. Electrochemistry.
Thermodynamics of electrochemical interfaces, including electrochemical potential, the Nernst equation, ion-solvent interactions, and double layer theory. Charge transfer kinetics for activation and diffusion controlled processes. Analysis of kinetics at various electrodes, including redox reactions, metal-ion electrodes, and semiconductor electrodes. Electroanalytical techniques are discussed, including those related to bioelectrochemistry and semiconductor electrochemistry. Selected reactions of technological importance are evaluated, including the hydrogen evolution reaction, oxygen reduction, electrodeposition, and energy generation and storage. Recommended Course Background: introductory chemistry or permission of instructor.
Instructor(s): P. Searson.

An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering.
Instructor(s): T. Poehler.

Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611
Instructor(s): T. Poehler.

This course will present the basic principles of statistical mechanics and apply them to problems concerning the behavior of materials. Topics include: basic principles of statistical mechanics; time averages and ensembles; connection to macroscopic thermodynamics; fluctuations; classical and quantum particles statistics; lattice statistics; statistical thermodynamic models of gases, liquids, crystals, crystalline defects, linear chain polymers, and surfaces; phase transitions and critical phenomena; kinetic and transport phenomena; thermodynamics of irreversible processes. Recommended Course Background: EN.510.312 or undergraduate course in thermodynamics. Also listed as EN.510.413
Instructor(s): R. Cammarata.

A detailed survey of the relationship between materials properties and underlying microstructure. Structure/property/processing relationships will be examined across a wide spectrum of materials including metals, ceramics, polymers and biomaterials, and properties including electrical, magnetic, optical, thermal, mechanical, chemical and biocompatibility.
Instructor(s): P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.618. Electronic and Photonic Processes and Devices.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

In this course, we will review the current synthetic methods for preparing biopolymers of both synthetic and natural origin. The class will focus mainly on polypeptides and polysaccharides, but natural polysters and polynucleotides (DNA and RNA) will be covered as well. Some of the main topics are; solid phase peptide synthesis, ring-opening polymerization for polypeptide synthesis, recombinant DNA and bacterial protein synthesis, bacterial production of biodegradable polyester, and chemical and biological engineering of polysaccharides.
Instructor(s): M. Yu
Area: Engineering, Natural Sciences.

EN.510.624. X-Ray Scattering, Diffraction and Imaging.
An introduction to the uses of X-rays for structural characterization of materials. Topics include: X-ray scattering by atoms; kinematic and dynamical theories of diffraction; Fourier series and transform methods; scattering by liquids and amorphous solids; coherent X-ray diffraction, scattering, and imaging; and modern X-ray sources (synchrotron radiation and X-ray free-electron lasers). Recommended Course Background: EN.510.601 or permission of the instructor. Instructor(s): T. Hufnagel.

Learn the fundamentals necessary to design and implement computer simulations on the molecular level. This course focuses on two widely used techniques: molecular-dynamics and Monte Carlo simulation. Both are introduced in the context of a review of the basic theoretical background. This class will cover the specifics of handling molecular interactions using empirical potentials, applying proper boundary conditions and simulating various equilibrium ensembles and non-equilibrium systems. Lectures will address how to extract transport coefficients, atomic scale correlations and local stresses and strains from simulation data, and computational issues such as algorithmic complexity and efficiency. The final weeks of the course will focus on new and cutting-edge advances in these methods. Instructor(s): M. Falk Area: Engineering, Natural Sciences.

This course examines the relationship between microstructure and mechanical properties of metals and alloys. Starting from fundamentals (phase diagrams and phase transformation kinetics), we will explore how the structure of metals and alloys can be manipulated by thermomechanical processing to achieve desired properties. Detailed examples will be drawn from several alloy systems, including steels, aluminum, and titanium. A theme of the course will be the impact of materials processing and materials selection on the environment, including considerations of lightweight materials and processing techniques for minimizing energy consumption. Prerequisite: EN.510.311-312 Same course as EN.510.419. Instructor(s): E. Ma.

EN.510.632. Introduction to and Applications of Scanning Probe Microscopy.
Scanning Probe Microscopy has emerged as one of the premier techniques to characterize surfaces. This course will give an overview of the family of SPM techniques including scanning tunneling microscopy (STM), atomic force microscopy (AFM), scanning near field optical microscopy (SNOM) and Kelvin probe microscopy. In each of these applications, the theory of operation, measurement and imaging techniques, and experimental limitations will be discussed. Also listed as EN.510.412 Instructor(s): P. Mcguiggan Area: Engineering, Natural Sciences.

This course will cover the use of computational methods to discover and design materials for new technologies. Topics addressed will include structure prediction, materials informatics, and the calculation of material properties from first principles using methods such as density functional theory. Participants will gain hands-on experience with modern computational techniques. Instructor(s): T. Mueller Area: Engineering, Natural Sciences.

EN.510.634. Simulation of Biomolecules and Membranes.
This class will provide an overview of methods for molecular simulation of biomolecules and membranes. We will study methods for atomic detail molecular dynamics and Monte Carlo simulations. After discussing basic algorithms such as integrators, thermostats, and barostats, we will study how biomolecules are chemically parameterized to accurately capture their conformational equilibria. This knowledge will then be used to build, simulate, and analyse a molecular model of a membrane protein embedded in a lipid bilayer. The simulation will be used to understand how these methods can be used to obtain insights into the molecular mechanisms of protein function. Instructor(s): M. Ulmschneider Area: Engineering, Natural Sciences.

EN.510.635. Mechanical Properties of Biomaterials.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic systems will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.435 Instructor(s): T. Weihl Area: Engineering, Natural Sciences.

Recent advances in biosensor technology are poised to revolutionize health care, enabling faster and more personalized diagnoses and recommendations. Biosensors are also increasingly important to public health, security, industry, and environmental science. This course will cover the materials, processes, and signaling mechanisms in use and anticipated for future developments in biosensors. Techniques such as electrochemistry, fluorescence, plasmonics, and enzymatic amplification will be discussed, and materials including nanowires, nanoparticles, organic semiconductors, and templated materials will be covered. Detection of nucleic acid sequences, proteins, carbohydrates, pharmaceuticals, and microorganisms will be emphasized. Same course as EN.510.437. Instructor(s): H. Katz Area: Engineering, Natural Sciences.
EN.510.643. Chemistry and Physics of Polymers.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.443. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics. Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.656. Introduction to Surface Science.
Introduction to the structure and properties of solid surfaces. Topics include Gibbsonian and gradient thermodynamics of surfaces; crystallography and structure of free solid surfaces; characterization methods; surface mobility and phase transitions; gas-solid interactions; crystal growth; electronic structure; solid-solid surfaces; thin film epitaxy. Co-listed with EN.510.456. Recommended course background: EN.510.311, EN.510.312, EN.510.313, EN.510.314, EN.510.315 or instructor permission. Instructor(s): R. Cammarata.

The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Co-listed with EN.510.457
Instructor(s): R. Cammarata.

This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of low dimensional nanomaterials. Subject matter will include a detailed and comprehensive discussion of the physics and physical properties of solids confined in either one, two or three directions. Features examined for these low dimensional materials will include electronic structure, electrical transport, vibrational and thermal transport in low dimensional systems such as graphene, carbon nanotubes, quantum wires, semiconductor and metal nanoparticles. Co-listed with EN.510.459
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

The Graduate Research Seminar in the Department of Materials Science and Engineering provides a forum for students to present their latest research results in a formal seminar setting. The course encourages discussion between students in varying disciplines in order to establish new collaborations and develop the shared vocabulary required for interdisciplinary materials science research. Permission Required. Instructor(s): J. Erlebacher.

Instructor(s): J. Erlebacher.

The Materials Science Seminar exposes students to a wide array of internationally recognized speakers who discuss topics of cutting-edge Materials Science research. Speakers are selected both to overlap research interests within the department and to expose students to broader trends in contemporary Materials Science. Instructor(s): J. Erlebacher.

Meets with EN.510.434, EN.510.439, EN.510.441, EN.510.446, and EN.510.448. Instructor(s): J. Erlebacher.

EN.510.807. Graduate Research In Materials Science.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component. Instructor(s): J. Erlebacher.

EN.510.808. Graduate Research.
Instructor(s): J. Erlebacher.

Cross Listed Courses

Physics Astronomy
Topics include space astronomy, remote observing of the earth, space physics, planetary exploration, human space flight, space environment, orbits, propulsion, spacecraft design, attitude control and communication. Crosslisted by Departments of Earth and Planetary Sciences, Materials Science and Engineering and Mechanical Engineering. Recommended Course Background: AS.171.101-AS.171.102 or similar; AS.110.108-AS.110.109.
Instructor(s): J. MacKenty; S. McCandliss
Area: Engineering, Natural Sciences.

Electrical Computer Engineering
EN.520.627. Photovoltaics and Energy Devices.
This course provides an introduction to the science of photovoltaics and related energy devices. Topics covered include basic concepts in semiconductor device operation and carrier statistics; recombination mechanisms; p-n junctions; silicon, thin film, and third generation photovoltaic technologies; light trapping; and detailed balance limits of efficiency. Additionally, thermophotovoltaics and electrical energy storage technologies are introduced. A background in semiconductor device physics (EN.520.485, or similar) is recommended. Instructor(s): S. Thon.

Institute for NanoBio Technology
This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.

**Mechanical Engineering**

The Department of Mechanical Engineering offers undergraduate and graduate programs of instruction and research. Undergraduate programs are offered in Mechanical Engineering and in Engineering Mechanics. The B.S. in the Mechanical Engineering and Engineering Mechanics degree programs are accredited by the Engineering Accreditation Commission of ABET, [http://www.abet.org](http://www.abet.org). Graduate programs are offered leading to the M.S.E. and the Ph.D. degrees. A five-year accelerated B.S./M.S.E. program is also available.

Mechanical Engineering is of great importance in most contemporary technologies. Examples include aerospace, power generation and conversion, fluid machinery, design and construction of mechanical systems, transportation, manufacturing, production, biomechanics, and others. This wide range of applications is reflected in the four main stems of the undergraduate curriculum-thermal and fluid systems, mechanics and materials, robotics and control systems, and biomechanics. Engineering Mechanics is a more flexible program that enables students to pursue particular interests while centering on a smaller core of courses. Students may use this flexibility to follow specific interests in physics, mathematics, economics, biology, and other disciplines while receiving an engineering degree.

Design is a major component of both undergraduate programs. In the two-semester Engineering Design Project course taken by undergraduates during their senior year, students work in teams of three or four to design, construct, and test a mechanical device or system for an industrial sponsor.

A major effort of the department is directed toward the creation of a stimulating intellectual environment in which both undergraduate and graduate students can develop to their maximum potential. Faculty members encourage undergraduate students to participate in both fundamental and applied research along with the graduate students. In most junior and senior undergraduate classes, and in graduate classes, small enrollments permit close contact with faculty members. Students have excellent opportunities to participate actively in the classroom and laboratories and to follow special interests within a subject area.

**Facilities**

Most teaching and research facilities of the department, as well as the departmental office, are located in Latrobe, Krieger, Wyman, Maryland, and Hackerman Halls. The undergraduate laboratories are equipped with sophisticated data acquisition and analysis systems. Students have access to a manual machine shop, which includes a wire EDM for the purpose of fabricating parts for special projects, a computer-controlled CO₂ laser cutter, and 3-D printers. The Mechatronics laboratory allows students to design and build their own robots for a class competition. The Senior Design laboratories are used by seniors to construct and test their prototypes in the yearlong design project course. Computer facilities are readily available throughout the department and the Whiting School.

Research facilities include laboratories in several disciplines. The Laboratory for Impact Dynamics and Rheology includes facilities for the study of failure, instabilities, impact and dynamic phenomena. The Hopkins Extreme Materials Institute addresses fundamental science issues associated with materials under extreme conditions, such as dynamic environments, human tissues, and impacts on planets and asteroids. The Laboratory for Active Materials and Biomimetics contains facilities for the characterization of tissues, active materials and biomaterials. These, coupled with electron microscopy facilities, enable innovative research on the mechanical properties of materials.

The Microspecimen Testing Laboratory has special tensile test machines for specimens as thin as 60 nanometers. The Computational Solid Mechanics Laboratory uses state-of-the-art finite-element techniques to study the physics of impact, wear, and more generally, the behavior of materials under high deformation and high-deformation rates. The calculations are conducted at length scales ranging from the nanoscale up to the macroscale.

A large hydrodynamics laboratory is the home of laser-based flow simulation and analysis research, and the Corsin Wind Tunnel is equipped with modern instrumentation for turbulence research. The heat transfer laboratory is equipped for research using holographic interferometry to study heat transfer in complex geometries with single- and two-phase flows.

The Photonics for Quantitative Biology and Medicine laboratory focuses diverse spectroscopic modalities that exploit intrinsic contrast in biological media to provide information on pathological conditions. In the BioMEMS and Single Molecule Dynamics Lab, engineering innovation in microfluidics, single molecule spectroscopy, and functional nanoparticles drive the development of biomarker-based diagnostics and monitoring of disease. The SXS Lab explores quantitative questions in cellular biomechanics to explain cell movement, cell division, and biological force generation.

The Laboratory for Computational Sensing and Robotics consists of numerous laboratories and collaborating research centers covering multiple domains. The robotics and mechatronics laboratory is fully equipped for the construction and testing of prototypes of novel robotic systems. The Dynamical Systems and Control laboratory is equipped for design, fabrication, and testing of advanced robotic arms and underwater robots. Experimental equipment includes a test-bed remotely operated underwater vehicle. The Locomotion in Mechanical and Biological Systems (LIMBS) laboratory is equipped with an industrial six-axis manipulator, and as well as the facilities for the development of mobile and medical robots.

**Financial Aid**

Scholarships and other forms of financial assistance for undergraduates are described under Admissions and Finances (p. 9). In addition, selected undergraduates may be employed as laboratory assistants on research projects. Assistance in various forms is available for graduate students, including tuition fellowships, fellowships with stipend, research assistantships, and competitively-awarded hourly teaching assistant positions. Applications for graduate study must be received by October 15 for the Spring semester and December 15 for the Fall semester for consideration.

Research assistantships support graduate students who work with professors on their research contracts and grants.

The Department of Mechanical Engineering offers two undergraduate programs: the Bachelor of Science in Mechanical Engineering and the Bachelor of Science in Engineering Mechanics. Both programs are accredited by ABET, the Accreditation Board for Engineering and Technology. The department offers concentrations in biomechanical engineering and aerospace engineering. For additional information regarding both the mechanical engineering and engineering mechanics academic programs, please consult the undergraduate advising
manuals which are available on the departmental website at http://www.me.jhu.edu/advise.html. For details and an explanation of ABET requirements, visit www.abet.org.

Requirements for the Bachelor’s Degree
See also General Requirements for Departmental Majors (p. 20); Writing Requirement, and the department’s undergraduate advising manuals.

The Mechanical Engineering Program
The mission of the B.S. in mechanical engineering degree program is to provide a rigorous educational experience that prepares a select group of students for leadership positions in the profession and a lifetime of learning. The faculty is committed to maintaining a modern and flexible curriculum which, building on a foundation of basic sciences and mathematics, develops a solid education in the mechanical engineering sciences. The aim of the Mechanical Engineering program is to build competence in the design and development of thermal, fluid, and mechanical systems, to promote a broad knowledge of the contemporary social and economic context, and to develop the communication skills necessary to excel.

The program provides a basic background in thermal and mechanical systems. Laboratory instruction, as well as the senior design project, gives the student hands-on experience. Each student’s program of study is planned in consultation with his or her faculty advisor. Students are encouraged to develop depth in one or two areas of focus within mechanical engineering chosen from fluid mechanics, mechanics of solids and design, heat transfer and energy, robotics, and biomechanics. The choice of focus is decided in the junior year after consultation with the student’s faculty advisor.

The objectives for the B.S. in mechanical engineering degree program are designed to provide a high-quality educational experience that is tailored to the needs and interests of the student. The program will educate an exceptional group of engineers who, after graduation, will be:

• ...successful and on track to become leaders among their peers in industry, government laboratories and other organizations, and
• ...advanced students in the best graduate programs.

Students graduating from the B.S. in mechanical engineering will have demonstrated the ability to:

• understand and apply the fundamentals of mathematics (through linear algebra and multivariate calculus), numerical methods, statistical analysis, and physical sciences (physics and chemistry) necessary to attain competence in the mechanical engineering disciplines.
• design, conduct, evaluate, and report experiments including analysis and statistical interpretation of data.
• identify, formulate, and solve engineering problems in the areas of thermo-fluid and mechanical systems.
• use basic concepts from the mechanical engineering sciences, modern engineering tools (machine-tools, laboratory instrumentation, and computer hardware and software), and related subjects to design mechanical engineering components and processes, taking into account constraints such as manufacturability, cost, safety, environmental, and socio-political impacts.
• enter professional practice and/or graduate school, with the recognition of the need for life-long learning and the ability to pursue it.
• use effective communication, multidisciplinary teamwork, and possess awareness of professional and ethical responsibilities, and an appreciation of the societal, economic, and environmental impacts of engineering.

The Mechanical Engineering Curriculum is Structured as Follows

Mathematics (19 credits)
(Grades below C- not accepted)
AS.110.108  Calculus I  4
AS.110.109  Calculus II (For Physical Sciences and Engineering)  4
AS.110.202  Calculus III  4
or AS.110.211  Honors Multivariable Calculus  4
EN.550.291  Linear Algebra and Differential Equations  4
or AS.110.211  Honors Multivariable Calculus  4
or AS.110.201  Linear Algebra & AS.110.302  and Diff Equations/Applic
Statistics Elective at 300-level or above:  3-4
EN.560.348  Probability & Statistics for Engineers
or EN.550.310  Probability & Statistics for the Physical and Information Sciences & Engineering
Other qualified statistics courses can be taken upon advisor’s approval.

Science (12 Credits)
(Grades below C- are not accepted)
EN.530.103  Introduction to Mechanics I  4
& EN.530.104  and Introduction to Mechanics II  4
AS.171.102  General Physics: Physical Science Majors II  4
or AS.171.108  General Physics for Physical Science Majors (AL)  4
AS.173.112  General Physics Laboratory II  1
EN.510.101  Introduction to Materials Chemistry  3
or AS.030.101  Introductory Chemistry I

Humanities (18 credits)
Six humanities and/or social science electives, of which one must specifically teach writing (either AS.220.105, AS.060.113 or AS.060.114).*

Required Engineering Courses (51 credits)
(Grades below C- are not accepted)
& EN.530.102  and Freshman Experiences in Mechanical Engineering  4
EN.530.105  Mechanical Engineering Freshman Laboratory I
& EN.530.106  and Mechanical Engineering Freshman Laboratory II  2
EN.530.201  Statics and Mechanics of Materials  4
EN.530.202  Mechanical Engineering Dynamics  4
EN.530.215  Mechanics-Based Design  3
EN.530.216  Mechanics Based Design Laboratory  1
EN.530.231  Mechanical Engineering Thermodynamics  3
EN.530.232  Mechanical Engineering Thermodynamics Laboratory  1
Elective requirements in the general Mechanical Engineering program:

A student may specialize in aerospace engineering once a solid background in the fundamentals of mechanical engineering has been developed through the basic Mechanical Engineering courses. This background in the fundamentals of mechanical engineering has been developed through the core Mechanical Engineering or Engineering Mechanics courses. The essence of mechanics is the interplay between forces and motion. In biology, mechanics is important at the macroscopic, cellular, and subcellular levels.

Biomechanics Track

A student may specialize in biomechanics once a solid background in the fundamentals of mechanical engineering has been developed through the core Mechanical Engineering or Engineering Mechanics courses. The essence of mechanics is the interplay between forces and motion. In biology, mechanics is important at the macroscopic, cellular, and subcellular levels.

Aerospace Track

A student may specialize in aerospace engineering once a solid background in the fundamentals of mechanical engineering has been developed through the basic Mechanical Engineering courses. This track requires knowledge and background in several fields including advanced dynamics, flight mechanics, propulsion, aerospace materials and structures, signal processing, control systems, astrophysics and space systems. Students pursuing the Aerospace Engineering Track are required to take at least five of the following courses (which can be counted toward the Mechanical Engineering elective and Technical Elective requirements in the general Mechanical Engineering program):

Any five of the courses listed below are required. A sixth course from this list, though not required is highly recommended.

### Notes

- **x** Prerequisite: EN.530.101 Introductory Chemistry I
- **xx** Prerequisite: EN.580.221 Molecules and Cells, EN.580.222 Systems and Controls, and AS.110.302 Diff Equations/Applic

Students may not use the satisfactory/unsatisfactory option for required courses, including Humanities and Social Studies. Exceptions can be considered and approved by their faculty advisors. Further, the Department of Mechanical Engineering requires that grades of C- or better be obtained in all required engineering, mathematics, and science courses (i.e. grades of D, D+ or D-, or F will not be accepted). The department will accept D, D+ or D- grades only up to a maximum of 10 credits for Humanities and Social Sciences courses.
of mechanics or engineering science to more specialized programs in a variety of areas, such as robotics, fluid dynamics, environmental engineering, mechanics of solids, experimental mechanics, dynamical systems, mechanics of materials, or biomechanics.

This flexibility makes the program ideal for double-majors and for those wishing to tailor a strong foundation for graduate work in a wide range of disciplines. All mathematics elective and technical elective courses must be at the 300-level or higher, unless approved by their faculty advisor.

<tr>
<td>&amp; EN.530.106</td>
<td>and Mechanical Engineering Freshman Laboratory II (provide the necessary engineering and computing instruction for freshmen and are strongly recommended.)</td>
</tr>
</tbody>
</table>

Alternate introductory courses are available. If EN.530.101-EN.530.102 and EN.530.105-EN.530.106 are not taken, students must take one course from each of the engineering and computing course lists below:

Introductory Engineering:
EN.500.101  What Is Engineering?
EN.510.101  Introduction to Materials Chemistry
EN.520.137  Introduction To Electrical & Computer Engineering
EN.570.108  Introduction Environmental Engineering
EN.580.202  BME in the Real World

Computing:
EN.500.200  Computing for Engineers and Scientists (recommended)
EN.510.202  Computation and Programming for Materials Scientists and Engineers
EN.580.200  Introduction to Scientific Computing in BME using Python, Matlab, and R
EN.600.112  Introductory Programming for Scientists and Engineers
EN.600.107  Introductory Programming in Java

Any other computing course approved by the faculty advisor. EN.600.107 should be taken as a last resort if none of the other computing options fits the student’s schedule, as it is important to learn MATLAB and Intro to Java does not offer that program.

Other Required Engineering Courses
EN.530.201  Statics and Mechanics of Materials 4
EN.530.231  Mechanical Engineering Thermodynamics 3
EN.530.327  Introduction to Fluid Mechanics 3
EN.530.405  Mechanics of Advanced Engineering Structures 3 or EN.530.215  Mechanics-Based Design
EN.560.202  Dynamics 4

Capston Design (8 credits)
(Grades below C- are not accepted)
EN.530.403  MechE Senior Design Project I 8
& EN.530.404  Engineering Design Project II

Engineering Science Electives (12 credits)
(Grades below C- are not accepted)
12
One course in the mechanics of solids (see below)
One course in the mechanics of fluids (see below)
One additional course in the mechanics of either solids or fluids (see below)
One course in either materials or dynamics (see below)

Engineering Mechanics Electives (6 credits)
(Grades below C- are not accepted)
6
Two additional elective courses in the same area of engineering mechanics (solid mechanics, fluid mechanics, or dynamics, see below).

Technical Electives (minimum of 18 credits) ++
(Grades below C- are not accepted)
18
Engineering, Quantitative Studies, or Natural Science courses at or above the 300-level, chosen in consultation with the student’s advisor from any combination of courses in engineering, basic sciences, or mathematics.

Total Credits 116-118

Fluid mechanics courses may be chosen from courses such as:
EN.530.328  Fluid Mechanics II
EN.530.425  Mechanics of Flight
EN.530.426  Biofluid Mechanics
EN.530.444  Computer-Aided Fluid Mechanics and Heat Transfer
EN.570.301  Environmental Engineering Fundamentals I

Dynamics courses may be chosen from courses such as:
EN.530.343  Design and Analysis of Dynamical Systems
EN.530.420  Robot Sensors/Actuators
EN.530.424  Dynamics of Robots and Spacecraft
EN.550.391  Dynamical Systems

Solid mechanics courses may be chosen from courses such as:
EN.530.215  Mechanics-Based Design
EN.530.405  Mechanics of Advanced Engineering Structures
EN.530.414  Computer-Aided Design
EN.530.416  Advanced Mechanical Design
EN.530.448  Biosolid Mechanics
EN.530.730  Finite Element Methods
EN.560.320  Structural Design I
EN.560.330  Foundation Design

Students may not use the satisfactory/unsatisfactory option for required courses, including Humanities and Social Sciences, unless approved by their faculty advisor. The department will accept D or D+ grades only up to a maximum of 10 credits except where indicated. All undergraduate students must follow a program approved by a faculty member in the department who is selected as the student’s advisor.

Biomechanics Track

Engineering Mechanics (EM) is a highly flexible program offered by the Department of Mechanical Engineering, which is ideal for students who want to specialize in any area of mechanics, including biomechanics. The essence of mechanics is the interplay between forces and motion.

In biology, mechanics is important at the macroscopic, cellular, and subcellular levels. At the macroscopic length scale biomechanics of both soft and hard tissues plays an important role in computer-integrated surgical systems and technologies (e.g., medical robotics). At the cellular level, issues such as cell motility and chemotaxis can be modeled as mechanical phenomena. At the subcellular level, conformational transitions in biological macromolecules can be modeled using molecular dynamics simulation (which is nothing more than
computational Newtonian mechanics), statistical mechanics, or using coarse-grained techniques that rely on principles from the mechanics of materials. In addition, much of structural biology can be viewed from the perspective of Kinematics (e.g., finding spatial relationships in data from the Protein Data Bank).

Each student who pursues the biomechanics track within the EM major will, in consultation with his or her EM advisor, choose the set of technical and EM electives that best matches the student’s interests. Many electives from other departments are acceptable. The electives for the EM major are structured as follows:

**Engineering Science Electives (12 credits)**
One course in solid mechanics
One course in fluid mechanics
One additional course in mechanics of either solids or fluids
One course in either materials or dynamics

**Engineering Mechanics Electives (6 credits)**
Two additional courses in the same area of mechanics (i.e., fluids, solids, or dynamics)

**Technical Electives (18 credits)**
Chosen from 300-level courses in engineering and the sciences in consultation with the student’s faculty advisor.

Examples of bio-oriented courses which can be applied to the above three categories include (but are not limited to):

<table>
<thead>

</tbody>
</table>

This is not a complete list of possible courses that can be taken, and not all of these courses must be taken. Rather, students who wish to pursue the biomechanics track will take at least five courses such as those listed above. These five should be concentrated either at the cellular/subcellular length scale or in macroscopic biomechanics. Note that given the flexibility of the EM program, it would be possible for students to satisfy both of these kinds of tracks simultaneously if they apply all 12 of their elective courses toward this end.

</table>
The Mechanical Engineering Department offers a concurrent five-year bachelor’s/master’s program for mechanical engineering and engineering mechanics majors. Applications to the B.S./M.S.E. program should be submitted by December 15 for consideration of spring admission and June 15 for possible fall admission, during applicant’s junior (third) year.

To apply for admission, students must submit an application, plus a statement of purpose, college transcript, and three letters of recommendation, two of which should be from Mechanical Engineering faculty.

Upon acceptance into the program, students will be asked to develop an outline of their proposed academic program with their advisor.

Admission and Advising

To be admitted to graduate study in the Department of Mechanical Engineering, applicants must submit credentials sufficient to convince the faculty that they will thrive in a program of advanced course work and/or research. No academic degree is required, but the applicant should have at least two years of relevant undergraduate training, or the equivalent, and should have achieved very high marks or have given other evidence of outstanding ability. Graduate Record Examination scores must be submitted.

Upon arrival, each graduate student is assigned to a faculty advisor to help map a tentative program for the first year and enter the intellectual life of the department. The student will remain in regular communication with the advisor. The advisor may use a variety of methods to assess the student’s progress, sometimes including special oral or written examinations. It is not necessary that a student have the same advisor in successive years. After serious research for a dissertation has begun, the research supervisor will automatically function as advisor. All Ph.D. students are required, and master’s students are strongly encouraged to attend the weekly Mechanical Engineering Graduate Seminars.

Requirements for the M.S.E. Degree

**Essay Option**: For the Master of Science in Engineering degree at least eight one-semester courses are required. At least half of them must be selected among those listed as graduate courses in this catalog. The remaining courses can be chosen from 300- and 400-level courses in this catalog, with the advisor’s approval. 50% of all substantive courses must be offered by Mechanical Engineering (EN.530.xxx), including at least two courses at the 600-level or 700-level. A completed piece of research conducted under the guidance of a full-time faculty member of the department and reported as a master’s essay is required. All students must follow a course of study approved by their individual advisor.

**Non-Essay Option**: The student must successfully complete a coordinated sequence of ten courses, which requires one year of full-time resident graduate study. At least six of the ten courses must be selected amongst the graduate courses of this catalog. 50% of all substantive courses must be offered by Mechanical Engineering (EN.530.xxx), including at least two courses at the .600-level or .700-level. The intent of this program is to provide the student with an intensive exposure to fundamental and advanced topics within mechanical engineering and engineering mechanics. Students must follow a course of study approved by their individual advisor.

Details on grade requirements and other departmental academic policy for the M.S.E. degree can be found here: http://me.jhu.edu/wp-content/uploads/sites/38/2015/07/GradAdvMnl2015-16-MSE.pdf.

Requirements for the Ph.D. Degree

As soon as the student is prepared to do so, he/she should fulfill the requirements for candidacy. In addition to general university requirements, the student must pass two exams. The first is an oral Departmental Qualifying Exam based on core courses. This exam is usually taken after the third semester. The second is a preliminary Graduate Board Oral examination satisfying the Graduate Board requirements. This is a comprehensive examination in which students must demonstrate proficiency at the graduate level in their field of specialization.

Although there are no formal course requirements, students are presumed to be prepared by studies equal to six 600-level courses in their field of specialization and six courses in related fields. All candidates for the doctorate must complete two semesters as a teaching assistant as part of their training. All students are required to follow a course of study approved by their individual advisor.

The final and principal requirement for the doctorate is a piece of original research worthy of publication. Candidates must write a dissertation describing their work in detail and successfully defend it in a final oral presentation and examination.

Additional details on Ph.D. requirements and departmental academic policy for the Ph.D. degree can be found here: http://me.jhu.edu/wp-content/uploads/sites/38/2015/07/GradAdvMnl2015-16-PhD.pdf

For current faculty and contact information go to http://www.me.jhu.edu/faculty.html

Faculty

**Chair**

Louis L. Whitcomb
Professor: Control Systems: adaptive and model-based control of linear and nonlinear systems, observers, nonlinear systems analysis, with focus on problems arising in mechanical systems, robots, and robotic vehicles. Underwater Robotics: dynamics, control, instrumentation, and navigation of underwater vehicles and inhabited submersibles—with focus on deep submergence oceanographic vehicles. Industrial and Medical Robotics: dynamics, control, instrumentation, and operation of precision robotics for novel medical and industrial applications.

**Full Time Professors**

Ishan Barman
Assistant Professor: elucidation of morphological and chemical information of different patho-physiological states through an
interdisciplinary approach featuring novel optical, spectroscopic and
to microfluidic measurements, mechanistic modeling and advanced
numerical methods for analysis and interpretation of the acquired data.

Gregory S. Chirikjian
Professor: computational structural biology (in particular, computational
mechanics of large proteins), conformational statistics of biological
macromolecules, developed theory for ‘hyper-redundant’ (snakelike)
robot motion planning, designs and builds hyper-redundant robotic
manipulator arms, applied mathematics (applications of group theory in
engineering), self-replicating robotic systems.

Noah J. Cowan
Associate Professor: robot dynamics, animal biomechanics, and
sensorimotor control; theory and application of control systems
and system identification techniques for closed-loop systems
-especially biological systems); biological motor control and systems
neuromechanics; medical robotics.

Andrew S. Douglas
Professor (Vice Dean for Academic Affairs, Whiting School of
Engineering): nonlinear mechanics of solids, mechanical response of
compliant biological tissues, finite deformation elasticity, Static and
dynamic fracture of ductile materials.

Jaafar El-Awady
Assistant Professor: multiscale materials modeling, damage and fracture
mechanisms of materials in mechanical design, material degradation in
extreme environments, nano-materials and structures, impact dynamics
and wave propagation.

 Dennice Gayme
Assistant Professor: Dynamics and control of nonlinear, networked
and spatially distributed systems such as the electric power grid, and
wind farms. Modeling of turbulence and transition to turbulence in wall
bounded shear flows and wind farms. Grid integration of renewable
energy sources.

Kevin J. Hemker
Professor, Alonzo G. Decker, Jr. Chair in Mechanical Engineering:
Professor Hemker and his students seek to identify the underlying
atomic-scale processes that govern the mechanical behavior of
advanced material systems. They are making key observations and
discoveries that define the way the mechanics and materials community
thinks about and understands the properties of: nanocrystalline
materials, MEMS and micro-lattice materials, thermal barrier coatings,
armor ceramics, and high temperature structural materials.

Cila Herman
Professor: experimental heat transfer and fluid mechanics, optical
measurement techniques, image processing. Thermoacoustic
refrigeration, influence of electric fields on boiling in terrestrial
conditions and microgravity, heat exchangers, heat transfer in boiling,
optical tomography, holographic interferometry, cooling of electronic
equipment, digital image processing, heat transfer augmentation.

Sung Hoon Kang
Assistant Professor: Complex behaviors of material systems and
structures with novel properties based on inspiration from nature;
rational design followed by rapid prototyping using a 3D printer;
designing experimental model systems and/or using computational
models to identify key design parameters of systems to make desired
structures and properties by tailoring behaviors of systems.

Joseph M. Katz
Professor, Whiting School Mechanical Engineering Chaired Professor,
Gilman Scholar: cavitation phenomena, attached partial cavitation,
cavitation in turbulent shear flows, jets and wakes. Multiphase flows:
interaction between bubbles and flow structure, mixing mechanisms
and droplet formation in water-fuel stratified shear flows, transport
of microscopic particles and droplets in turbulent flows. Development
of optical flow diagnostics techniques, including Particle Image
Velocimetry (PIV) and Holographic Particle Image Velocimetry (HPIV).
Applications of PIV and HPIV for measuring the characteristics of
turbulence and addressing turbulence modeling issues. Complex flow
structure and turbulence within turbo-machines: Wake-wake and
blade-wake interactions in multistage axial turbomachines, flow and
rotating stall in centrifugal pumps, development of optical diagnostics
techniques for measurements in turbomachines. Oceanography: flow
structure and turbulence in the bottom boundary layer of the coastal
ocean; measurement of spatial distributions of plankton, particles
and bubbles in the ocean; development of optical instrumen-tation,
including submersible holography and PIV systems. Prevention of
nozzle wear in abrasive water suspension jets (AWSJ) using porous
lubricated nozzles. Flow-induced vibrations and noise, mechanisms of
noise generation in turbulent separated flows and in turbomachines.

Marin Kobilarov
Assistant Professor: developing intelligent robotic vehicles that can
perceive, navigate, and accomplish challenging tasks in uncertain,
dynamic, and highly constrained environments. Performing research in
analytical and computational methods for mechanics, control, motion
planning, and reasoning under uncertainty, and in the design and
integration of novel mechanisms and embedded systems. Application
areas include mobile robots, aerial vehicles, and nanosatellites.

Charles Meneveau
Professor, Louis M. Sardella Chair in Mechanical Engineering, Director of
the Center for Environmental and Applied Fluid Mechanics: theoretical,
experimental, and numerical studies in turbulence, large-eddy-
simulation, turbulence modeling, fractals and scaling in complex
systems, small-scale structure of turbulence and velocity gradient
dynamics, applications of LES to environmental flows, wind energy,
development of data-intensive science tools to study turbulence.

Rajat Mittal
Professor: computational fluid dynamics, low Reynolds number
aerodynamics, biomedical flows, active flow control, LES/DNS, immersed
boundary methods, fluid dynamics of locomotion (swimming and flying),
biomimetics and bioinspired engineering, turbomachinery flows.

Andrea Prosperetti
Professor, Charles A. Miller Jr. Chair in Mechanical Engineering:
multiphase flow: theoretical and computational fluid mechanics and
acoustics; gas and vapor bubbles.

K. T. Ramesh
 Professor, Alonzo G. Decker, Jr. Professor of Science and Engineering,
Director of the Center for Advanced Metallic and Ceramic Systems
(CAMCS) and the Hopkins Extreme Materials Institute (HEMI):
Nanomaterials, planetary impact, dynamic failure mechanisms, shock,
impact, and wave propagation, high-strain-rate behavior of materials,
injury biomechanics, constitutive and failure modeling.

Sean Sun
Vice Chair, Associate Professor: mechanobiology of the cell, molecular biomechanics and biophysics, molecular motors and muscle, statistical mechanics and nonlinear phenomena.

Jeff Tza-Huei Wang
Associate Professor: bioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Tamer Zaki
Associate Professor: Transitional and turbulent shear flows: receptivity, linear and non-linear instability waves, secondary instability, breakdown to turbulence, direct numerical simulations, transition modelling. Two-fluid shear flows: linear and non-linear instability methods, interface tracking, the interaction of vortical disturbances with interfaces, direct numerical simulations, laminar-to-turbulence transition. Turbulence: boundary layer turbulence, separation, stratification, drag reduction, turbulence structures, direct numerical simulations, large-scale high-performance computing.

Secondary Faculty Appointments

Stephen Belkoff
Joint, Part-Time, and Research Appointments: Associate Professor (Orthopedic Surgery): biomechanics, orthopaedic implants, fracture fixation in osteoporotic bone, mechanism of injury, vertebroplasty.

Robert C. Cammarata
Joint, Part-Time, and Research Appointments: Professor (Materials Science and Engineering): structure, properties, and processing of thin films and nanostructured materials, thermodynamics and mechanics of surfaces, mechanical behavior of materials, nonindentation testing, stresses in thin films, novel electrochemical deposition methods, computer simulations.

Gregory L. Eyink

Lori Graham-Brady
Professor, Civil Engineering: stochastic finite element methods, probabilistic mechanics, stochastic simulation of material properties, micromechanics.

Daniel Naiman

Mark Robbins
Joint, Part-Time, and Research Appointments: Professor (Physics and Astronomy): Connecting and contrasting atomistic and macroscopic descriptions of non-equilibrium processes including friction, adhesion, large-strain mechanical deformation, fracture, heat flow, fluid flow, and boundary conditions at interfaces between different materials. Techniques include molecular simulations, continuum calculations and multiscale modeling approaches that bridge the two.

Dan Stojanovici
Joint, Part-Time, and Research Appointments: Professor (Brady Urological Institute): urology, medical robotics.

Russell H. Taylor
Joint, Part-Time, and Research Appointments: Professor (Computer Science): medical robotics, computer-assisted surgery.

Nitish V. Thakor
Joint, Part-Time, and Research Appointments: Professor (Biomedical Engineering): medical instrumentation and medical micro and nanotechnologies, neurological instrumentation, signal processing, computer applications.

Rene Vidal
Joint, Part-Time, and Research Appointments: Associate Professor (Biomedical Engineering): biomedical image analysis, computer vision, machine learning, dynamical systems, signal processing.

Senior Lecturer

David Kraemer
Associate Teaching Professor: Fluid-structure interaction; dynamic systems; ocean wave energy conversion, engineering pedagogy.

Steven Marra
Senior Lecturer: Soft and hard tissue biomechanics, nonlinear mechanics of solids, mechanics of tissue damage.

Nathan Scott
Senior Lecturer: Principles and practice of engineering design education.

Professor emeritus

William N. Sharpe Jr.
Professor Emeritus: experimental solid mechanics; microelectromechanical systems (MEMS), microsample testing.

Associate Research Professor

Mehran Armand
Associate Research Professor (Applied Physics Laboratory).

Juan I. Arvelo Jr.
Assistant Research Professor (Applied Physics Laboratory).

Lester Su
Associate Research Professor: (Stanford University).

Liming Voo
Associate Research Professor (Applied Physics Laboratory).

Research Scientist

Alan Brandt

Research Professor

Ilene Busch-Vishniac
Research Professor (University of Saskatchewan).

Shiyi Chen
Research Professor (Peking University).

Allison Okamura
Research Professor (Stanford University).

Alexander Spector
Research Professor, Biomedical Engineering: biosolid mechanics, cell mechanics and biophysics, molecular motors, mathematical and computational modeling.

Pazhayannur Swaminathan
Research Professor (Applied Physics Laboratory).

David Van Wie
Research Professor (Applied Physics Laboratory).

Assistant Research Professor

Nitin Daphalapurkar
Assistant Research Professor.

Iulian Iordachita
Assistant Research Professor: robotics, medical robotics and instrumentation, mechanisms and mechanical transmissions for robots, advance electro-mechanical design, biologically-inspired mechanisms.

John Thomas
Assistant Research Professor (Applied Physics Laboratory).

Adjunct Associate Professor

Thomas Dragone
Adjunct Associate Professor: aerospace structures and materials, airframe structure design and development, materials science.

Adjunct Assistant Professors

Ryan Eustice
Adjunct Assistant Professor (Department of Naval Architecture and Marine Engineering, University of Michigan).

Jian Sheng
Adjunct Assistant Professor (University of Minnesota).

Adjunct Professor

Gabor Fichtinger
Adjunct Professor, Computer Science and Radiology: Director of Computer Integrated Surgical Systems and Technology (CISST).

Associate Research Scientist

Tihomir Hristov
Associate Research Scientist.

Xiaofeng Liu
Assistant Research Scientist.

Adjunct Associate Research Scientist

Edwin Malkiel
Adjunct Associate Research Scientist.

Adjunct Research Professor

Thomas Wright
Adjunct Research Professor: theoretical solid mechanics, wave propagation, dynamic failure, adiabatic shear localization, instabilities.

Lecturer

Yury Ronzhes
Joint, Part-Time, and Research Appointments: Lecturer.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

An overview of the field of mechanical engineering along with topics that will be important throughout the mechanical engineering program. This one-year course includes applications of mechanics, elementary numerical analysis, programming in Matlab, use of computer in data acquisition, analysis, design, and visualization, technical drawing, the design process and creativity, report preparation, teamwork, and engineering ethics. Corequisites: EN.530.103 and EN.530.105.
Instructor(s): S. Marra
Area: Engineering.

EN.530.102. Freshman Experiences in Mechanical Engineering.
An overview of the field of mechanical engineering along with topics that will be important throughout the mechanical engineering program. This is the second half of a one-year course that includes applications of mechanics, elementary numerical analysis, programming in Matlab, use of computer data acquisition, analysis, design, and visualization; technical drawing, the design process and creativity, report preparation, teamwork, and engineering ethics.
Prerequisites: EN.530.101
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.103. Introduction to Mechanics I.
This is the first half of a one-year course offering in-depth study of elements of mechanics, including linear statics and dynamics, rotational statics and dynamics, thermodynamics, fluids, continuum mechanics, transport, oscillations, and waves. This is an alternate to AS.171.101, designed specifically for Mechanical Engineering and Engineering Mechanics students taking EN.530.101 concurrently. Restricted to Mechanical Engineering, Engineering Mechanics, Civil Engineering, Undecided Engineering Majors, or permission of instructor.
Instructor(s): J. Thomas
Area: Engineering, Natural Sciences.

EN.530.104. Introduction to Mechanics II.
This is the second half of a one-year course offering in-depth study of elements of mechanics, including linear statics and dynamics, rotational statics and dynamics, thermodynamics, fluids, continuum mechanics, transport, oscillations, and waves. This is an alternate to AS.171.101, designed specifically for Mechanical Engineering and Engineering Mechanics students taking EN.530.102 concurrently.
Prerequisites: EN.530.103
Instructor(s): J. Thomas
Area: Engineering, Natural Sciences.
EN.530.105. Mechanical Engineering Freshman Laboratory I.
Hands on laboratory complementing EN.530.101 and EN.530.103, including experiments, mechanical dissections, and design experiences distributed throughout the year. Experiments are designed to give students background in experimental techniques as well as to reinforce physical principles. Mechanical dissections connect physical principles to practical engineering applications. Design projects allow students to synthesize working systems by combining mechanics knowledge and practical engineering skills. Corequisites: EN.530.101 and EN.530.103.
Instructor(s): S. Marra
Area: Engineering.

EN.530.106. Mechanical Engineering Freshman Laboratory II.
Hands on laboratory complementing EN.530.102 and EN.530.104, including experiments, mechanical dissections, and design experiences distributed throughout the year. Experiments are designed to give student background in experimental techniques as well as to reinforce physical principles. Mechanical dissections connect physical principles to practical engineering applications. Design projects allow students to synthesize working systems by combining mechanics knowledge and practical engineering skills.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
EN.530.105
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.110. Chair’s Dialogue on Grand Engineering Challenges.
The purpose of this course is to allow the ME Chair and students to engage in a meaningful dialog about grand engineering challenges facing the world today. Based on the premise that these challenges constitute the opportunity of a lifetime disguised as a series of unsolvable problems, the course will explore the technical, scientific, political, and societal facets of these challenges and the opportunities for engineers to engage in topics such as: energy, the environment, medical health and national security.
EN.530.140. Introduction to Computer-Aided Design.
This online course covers the use of computer-aided design (CAD) and finite element analysis (FEA) in performing mechanical design and engineering, using PTC’s Creo Parametric. By the end of this course, you will be able to model parts and assemblies in 3D, interpret and create engineering drawings, and perform structural analyses. Additionally, following the completion of the requisite material, additional content will be made available to students. Students should note: you can either install Creo on your personal computer or use one of the University’s computer labs. Creo is Windows based. Please know that getting Creo running on a Mac is possible, but troublesome.
Instructor(s): M. Boyle
Area: Engineering.

EN.530.114. Introduction to Computer-Aided Design.
This online course covers the use of computer-aided design (CAD) and finite element analysis (FEA) in performing mechanical design and engineering, using PTC’s Creo Parametric. By the end of this course, you will be able to model parts and assemblies in 3D, interpret and create engineering drawings, and perform structural analyses. Additionally, following the completion of the requisite material, additional content will be made available to students. Students should note: you can either install Creo on your personal computer or use one of the University’s computer labs. Creo is Windows based. Please know that getting Creo running on a Mac is possible, but troublesome.
Instructor(s): M. Boyle
Area: Engineering.

EN.530.119. The Science of Oil Spills.
Oil spills like the 2010 Deepwater Horizon disaster damage the environment, the economy, and human health. In this one-credit introductory course, we will examine how and where oil spills occur, the behavior and fate of oil in the environment, various methods of oil spill cleanup, and the impact of spilled oil on organisms and human health. We will illustrate these concepts with lab demonstrations using real crude oil in the Oil Spill Lab.
Instructor(s): D. Murphy
Area: Engineering, Natural Sciences.

EN.530.150. Engineering Design Graphics, Visualization, and Fundamentals of CAD.
This course will serve as an introduction to the foundational representational techniques for design, and help students to develop design literacy and three-dimensional visualization skills. Students will explore the range of tools utilized in design practice, beginning with the skills of hand-drawing, exploring ways to articulate visual ideas, and concluding with the standards of presentation and CAD tools typical in professional practice. This class will enable students to better develop, express and communicate their ideas as engineers.
Instructor(s): C. Phinney; S. Marra
Area: Engineering.

EN.530.164. Introduction to Wind Energy.
Global energy demands and the threat of climate change have lead to significant investment in wind energy. Despite these advances, only 5 of U.S. electricity came from wind in 2013. In this one-credit introductory course, we will examine the complex challenges facing engineers, developers, policy makers, and economists as they seek to meet the U.S. goal of 20 wind power by the year 2030.
Area: Engineering, Natural Sciences.

Equilibrium of rigid bodies, free-body diagrams, design of trusses. One-dimensional stress and strain, Hooke’s law. Properties of areas. Stress, strain, and deflection of components subjected to uniaxial tension, simple torsion, and bending. Co-listed with EN.560.201. Recommended Course Background: AS.171.101 or EN.530.103 and EN.530.104 or Permission Only.
Instructor(s): R. Sangree
Area: Engineering.

Basic principles of classical mechanics applied to the motion of particles, system of particles and rigid bodies. Kinematics, analytical description of motion; rectilinear and curvilinear motions of particles; rigid body motion. Kinetics: force, mass, and acceleration; energy and momentum principles. Introduction to vibration. Includes laboratory experience.
Prerequisites: (EN.530.201 or EN.560.201 ) AND (AS.171.101 OR AS.171.107 or AS.171.105 or (EN.530.103 AND EN.530.104 ) ) AND AS.110.109; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): D. Kraemer
Area: Engineering.

Prerequisites: EN.530.201 OR EN.560.201
Instructor(s): K. Ramesh
Area: Engineering.

EN.530.216. Mechanics Based Design Laboratory.
This is the laboratory that supports EN.530.215 Mechanics Based Design.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Corequisites: EN.530.215
Instructor(s): S. Marra
Area: Engineering.
EN.530.231. Mechanical Engineering Thermodynamics.
Prerequisites: Co-requisites: (AS.171.102 or AS.171.108) and EN.530.232;AS.110.109
Instructor(s): J. Katz
Area: Engineering.

EN.530.232. Mechanical Engineering Thermodynamics Laboratory.
This course is the complementary laboratory course and a required corequisite for EN.530.231. Corequisite: EN.530.231 There will be four lab sessions, days and times TBA.
Instructor(s): S. Marra
Area: Engineering, Natural Sciences.

Introduction to basic analog electronics and instrumentation with emphasis on basic electronic devices and techniques relevant to mechanical engineering. Topics include basic circuit analysis, laboratory instruments, discrete components, transistors, filters, op-amps, amplifiers, differential amplifiers, power amplification, power regulators, AC and DC power conversion, system design considerations (noise, precision, accuracy, power, efficiency), and applications to engineering instrumentation.
Prerequisites: AS.171.102 or AS.171.108 or AS.171.106;Students must have completed Lab Safety training prior to registering for this class.;Co or Pre-requisites: EN.550.291 OR ( AS.110.201 AND AS.110.302 ) OR ( AS.110.212 AND AS.110.302 )
Instructor(s): D. Kraemer
Area: Engineering.

This course gives JHU students an opportunity to interact with and explain the engineering design process to middle-school students at a local school. The JHU students will learn to lead an in-class engineering design challenge and share with the youth the rigorous process that is engineering design. This is an opportunity to inspire young students from disadvantaged backgrounds, show them the excitement of being an engineer and gain professional development in teaching and communication.
Instructor(s): M. Hart
Area: Engineering.

EN.530.319. Molecular Modeling and Simulation for Engineers.
Nano-sized engineering materials and devices behave in ways that are profoundly different from their traditional macroscopic counterparts. This course will provide students with an introduction to this exciting and rapidly evolving field. Through a combination of lectures, case-studies, and hands-on applications, students will (i) develop an understanding of the principles that govern the performance of nanoscale engineering systems, and (ii) learn how molecular modeling tools can assist in the design and analysis of such systems. Recommended Course Background: AS.110.107/AS.110.109, General Physics II
Area: Engineering.

EN.530.327. Introduction to Fluid Mechanics.
This course introduces the fundamental mathematical tools and physical insight necessary to approach realistic fluid flow problems in engineering systems. The topics covered include: fluid properties, fluid statics, control volumes and surfaces, kinematics of fluids, conservation of mass, linear momentum, Bernoulli’s equation and applications, dimensional analysis, the Navier-Stokes equations, laminar and turbulent viscous flows, internal and external flows, and lift and drag. The emphasis is on mathematical formulation, engineering applications and problem solving.
Prerequisites: Co-requisite: EN.530.329;Prerequisites: EN.530/560.202 and either AS.110.302 or EN.550.291 or AS.110.306
Instructor(s): D. Gayme
Area: Engineering.

EN.530.328. Fluid Mechanics II.
Instructor(s): C. Meneveau
Area: Engineering.

EN.530.329. Introduction to Fluid Mechanics Laboratory.
This course is the complementary laboratory course and a required corequisite for EN.530.327. Corequisite: EN.530.327 There will be four lab sessions, days and times TBA.
Instructor(s): S. Marra
Area: Engineering.

EN.530.334. Heat Transfer.
Prerequisites: EN.530.231AND EN.530.327
Instructor(s): C. Herman
Area: Engineering.

EN.530.335. Heat Transfer Laboratory.
This is the laboratory that supports EN.530.334 Heat Transfer.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Corequisites : EN.530.334
Instructor(s): S. Marra
Area: Engineering.
Design and Analysis of Dynamical Systems.  
Modeling and analysis of damped and undamped, forced and free vibrations in single and multiple degree-of-freedom linear dynamical systems. Introduction to stability and control of linear dynamical systems. 
Prerequisites: Prereq: (110.108 and 110.109 and (110.202 or 110.211) and ((550.291) or (110.201 and 110.302) or (110.201 and 110.306)), and C- or better or concurrent enrollment in 530.202 or 560.202. MechE Majors must also have taken 530.241; Students must have completed Lab Safety training prior to registering for this class. 
Instructor(s): S. Marra 
Area: Engineering.

Materials Selection.  
An introduction to the properties and applications of a wide variety of materials: metals, polymers, ceramics, and composites. Considerations include availability and cost, formability, rigidity, strength, and toughness. This course is designed to facilitate sensible materials choices so as to avoid catastrophic failures leading to the loss of life and property. 
Prerequisites: Prereq: EN.530.215 or permission of instructor 
Instructor(s): K. Hemker 
Area: Engineering.

Manufacturing Engineering.  
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Special Notes: Labs and field trips will be scheduled with class separately. Mechanical Engineering and Engineering Mechanics Sophomores and Juniors only. 
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. 
Instructor(s): Y. Ronzhes 
Area: Engineering.

Quantitative Applications in Mechanical Engineering. 3 Credits.  
Solution of practical mechanical engineering problems with differential equations and linear algebra using numerical tools. Applications include topics like ballistics with viscous drag, fluid flow, solid mechanics, and kinematics. Numerical exercises with Matlab and other tools are used to reinforce concepts. Laboratory sessions will be scheduled in place of lectures a few times during the semester. 
Prerequisites: EN.550.291 OR ( AS.110.201 AND AS.110.302) 
Instructor(s): D. Kraemer 
Area: Engineering, Quantitative and Mathematical Sciences.

Cost and Optimization Engineering.  
Cost and Optimization Engineering is an area of engineering concerned with economic decision analysis. Practicing engineers often must decide between various complex alternatives. While the decision criteria include technical considerations, they always include and are often driven by financial considerations. Selecting between two proposed highway locations, whether to built a concrete or steel bridge, and whether to lease or purchase a new punch press are decisions which require careful analysis. Professional engineers are expected to have a command of economic decision analysis. A significant portion of the Professional Engineer Licensing Exam concerns material covered in this course. Material covered in the course has professional and personal implications. Even if you are never confronted with the choice between purchasing or leasing a piece of production machinery, you most likely will choose between buying or renting a home. 
Instructor(s): S. Belkoff 
Area: Engineering.

Engineering Design Process.  
This course is to get you into the world of Senior Design, which means into our spaces, into the machine shop and into the mind set of doing design-build-test work. You will be assigned to be an assistant to one of our Senior Design teams. In industrial design practice this is absolutely typical and project teams grow or shrink as the need demands. It is also a good way for younger engineers to learn the ropes. You will have your own portfolio of design work to do, but it will be in the context of a large project where there has already been a lot of progress. You will have to fit in with that larger context – as usual for engineers – while also making your own contributions. There will be a lecture series which will introduce some key ideas and tools of the engineering designer. Rapid sketching of design ideas; more careful hand drawings that are like fast technical drawings; how to generate ideas and then develop the ideas into workable, feasible, affordable, desirable solutions; how to identify prototypes that will show the way forward, and then actually make them; how to work with a team and negotiate about time, deliverables and design detail; how to find parts from commercial suppliers, size them, order them and get them delivered; how to document design work in a fast and effective way. Some of the lectures will be in the form of case studies of excellent design work, and will be student-driven i.e. you will prepare a case study to present to the class which we then discuss. 
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. 
Instructor(s): N. Scott 
Area: Engineering.
EN.530.389. Appropriate Technology.
In an era of concern over reliance on fossil fuels to power society and the economy, the course is intended to give students physical intuition for how much energy is needed to perform tasks of daily life, while emphasizing fundamental engineering concepts. Students will use analytical and design skills to evaluate sustainable technologies such as sterling engines, ram pumps, wind mills, solar heaters, and various machines powered by humans and biofuels. Students will design and build “low tech” machines, for which they will also design and conduct experiments to measure the machine’s energy consumption, performance and efficiency. Life cycle costs and environmental and societal impact will also be evaluated and compared with competing “high tech” alternatives. Students should have a working knowledge of solid mechanics, heat transfer, fluids, materials selection, statistical analysis, chemistry, MATLAB, and engineering economics. Practical skills, such as construction, welding, machining, and design are also covered.
Instructor(s): S. Belkoff
Area: Engineering.

Scientific discovery and computing capability have progressed inseparably for more than the last century, but few theoretically-focused courses find time to discuss this important connection. Guided by various examples borrowed from physics and engineering courses, we will interactively explore methods of solving problems numerically using contemporary computational tools. Example problems will draw from the following fields: dynamical systems, continuum mechanics, molecular dynamics, and robotics.
Prerequisites: Prereqs: (AS.110.106 OR AS.110.108) AND ((AS.110.201 AND AS.110.302) OR EN.550.291)
Instructor(s): A. Sierakowski
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.403. MechE Senior Design Project I.
This senior year “capstone design” course is intended to give some practice and experience in the art of engineering design. Students working in teams of two to four will select a small-scale, industry suggested design problem in the area of small production equipment, light machinery products, or manufacturing systems and methods. A solution to the problem is devised and constructed by the student group within limited time and cost boundaries. Preliminary oral reports of the proposed solution are presented at the end of the first semester. A final device, product, system, or method is presented orally and in writing at the end of the second semester. Facilities of the Engineering Design Laboratory (including machine shop time) and a specified amount of money are allocated to each student design team for purchases of parts, supplies, and machine shop time where needed. Recommended Course Background: ME Majors: EN.530.215, EN.530.327; EM & BME Majors: EN.530.215 or EN.530.405, and EN.530.327.
Instructor(s): N. Scott
Area: Engineering.

EN.530.404. Engineering Design Project II.
The Senior Design Project, a unique two-semester course, is the capstone of Johns Hopkins’s Mechanical Engineering Program. In the class, students working in small teams tackle specific design challenges presented by industry, government, and nonprofit organizations. The sponsors provide each team with a budget, access to world-class resources, and technical contacts. Ultimately, each team conceptualizes a novel solution to the sponsor’s problem and then designs, constructs, and tests a real-world prototype before presenting the finished product and specifications to the sponsor. The course requires students to draw upon the four years of knowledge and experience they’ve gained in their engineering studies and put it to practical use. Throughout the year, they produce progress reports as they design, build, and test the device they are developing. Combining engineering theory, budget and time management, and interactions with real clients, the senior design project is critical to students’ transition from the school to the workplace.
Prerequisites: EN.530.403
Instructor(s): N. Scott
Area: Engineering.

This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and structures. We will begin with the mathematical preliminaries used in continuum mechanics: vector and tensor calculus, then introduce kinematics and strain measures, descriptions of stress in a body, frame indifference, conservation laws: mass, momentum, energy balance, and entropy. These concepts will be applied to develop the constitutive equations for solids and fluids, methods for solving boundary values problems that occur in engineering structures, energy methods and foundations of the finite element method.
Area: Engineering, Natural Sciences.

EN.530.410. Biomechanics of the Cell.
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. Discussion of the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models.
Instructor(s): S. Sun
Area: Engineering, Natural Sciences.

The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the “Pro/E” package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stoianovici
Area: Engineering.
EN.530.416. Advanced Mechanical Design.
A continuation of EN.530.215 expanding on topics such as fatigue, fracture, and various mechanical components and including linkage systems and cams. Student teams will be assigned different experimental and/or computational projects. Recommended Course Background: EN.530.215
Prerequisites: EN.530.215
Instructor(s): M. Dehghani
Area: Engineering.

The “Fabricatology” is a course that students can learn how to make desired shapes, structures, and surfaces across various length scales. It will introduce rich scientific and engineering knowledge related to fabrication at multiple length scales and the generated materials and mechanical systems can be utilized for studying diverse topics including energy harvesting, metamaterials, wetting, and information storage. From this course, students can learn principles and technologies to control shapes at various length scales and processes to control internal structures or surface properties for desired properties/functions. They will be also introduced to exciting recent development in the field so that they can have a comprehensive knowledge about the subject. Recommended Course Background: coursework in introduction to materials chemistry or engineering materials.
Instructor(s): S. Kang
Area: Engineering.

An introduction to the design of aircraft and spacecraft structures and components. This course will build on skills learned in EN.530.215 and EN.530.352. Recommended Course Background: EN.530.352 or instructor permission.
Instructor(s): T. Dragone
Area: Engineering.

EN.530.420. Robot Sensors/Actuators.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and (110.108 and 110.109, and 110.202 or 110.211), and (EN.550.291 or AS.110.302) and (EN.530.241 or EN.520.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.421. Mechatronics.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or EN.520.240 or permission of instructor; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.

EN.530.424. Dynamics of Robots and Spacecraft.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton’s principle.
Instructor(s): G. Chirkjian
Area: Engineering.

Instructor(s): K. Phillips
Area: Engineering.

Course will cover selected topics from physiological fluid dynamics, including respiratory flow patterns, blood flow and pulse propagation, aerodynamics of phonation and speech, rheology of blood flow in the microcirculation, aquatic animal propulsion, and animal flight.
Instructor(s): R. Mittal
Area: Engineering.

EN.530.430. Applied Finite Element Analysis. 3 Credits.
This course will introduce finite element methods for analysis of solids, structures and heat transfer problems. Following topics will be considered. Procedure to defining a mechanics problem: governing equations, constitutive equations, boundary and initial value problems. Theory and implementation of the finite element methods for static analysis using linear elasticity. Finite element analysis (FEA) using ABAQUS software. Verification and validation, understanding uncertainty. Introduction to other FEA topics: structural elements, dynamic analysis, heat transfer and thermodynamics using ABAQUS. The course will include assignments and a term project. The term project is mandatory for graduate students and will involve applying FEA to an engineering problem or a research problem, interpretation of results and documenting a term paper.
Prerequisites: Prerequisite: EN.550.291 OR AS.110.302, and matrix analysis / algebra and programming recommended.
Instructor(s): N. Daphalapurkar
Area: Engineering.

The course covers associated aircraft and spacecraft and power generation. The first part reviews the relevant thermodynamics and fluid mechanics, including isentropic compressible flow, Rayleigh and Fanno lines, shock and expansion waves. Subsequently, the performance of various forms of aviation gas turbines, including turbo-jet, turbo-fan, turbo-prop and ram-jet engines are discussed, followed by component analyses, including inlet nozzles, compressors, combustion chambers, turbines and afterburners. Axial and centrifugal turbomachines are discussed on detail, including applications in aviation, power generation and liquid transport. The section on foundations of combustion covers fuels, thermodynamics of combustion, and energy balance. The last part focuses on rockets, including classification, required power for space flight, chemical rocket components, and combustion involving liquid and solid fuels.
Prerequisites: Prereqs: EN.530.231 AND EN.530.327
Instructor(s): J. Katz
Area: Engineering.
This course focuses on topics of current and developing energy sources and their impact on the environment. It is an upper-level multidisciplinary course that draws on science and engineering topics from the core curriculum related to dynamics, thermodynamics, fluid mechanics and heat transfer, electrical and environmental engineering, and requires integration of understanding achieved in core studies. After the general introduction, the course will begin with a review of energy, energy conversion and thermodynamics related topics to provide a framework for the understanding of current and modern future technologies. After the discussion of fossil fuels and related energy and environmental topics, special attention will be devoted to modern trends in nuclear energy generation (generation IV nuclear reactors), renewable energy with emphasis on solar energy and hydrogen as energy carrier. Topics of sustainability and the environmental impact of energy consumption will be addressed.
Instructor(s): C. Herman
Area: Engineering, Natural Sciences.

EN.530.441. Introduction to Biophotonics.
The primary aim for this course is to explore the unique and diverse properties of light that makes it suited for diagnosis, imaging, manipulation and control of biological structure and function from the nanoscale to the tissue level. The course will focus on different optical spectroscopic and microscopic modalities that provide biochemical and morphological information, while introducing new ideas on analysis and interpretation of the acquired data. We will also discuss manipulation methods, including optical tweezers and laser scanners, and low-level light therapy. In all of these areas, the idea is to develop a basic understanding of the subject and to use it for finding solutions to real-world problems in healthcare. Discussions and open exchanges of ideas will be strongly emphasized.
Instructor(s): I. Barman
Area: Engineering.

Computer simulation has become an essential part of science and engineering and this course introduces the student to the use of computer simulation in the disciplines of heat transfer and fluid mechanics. The commercial software COMSOL is used a wide variety of problems, ranging from simple models for which analytical solutions are available, to complex, unsteady, multiphysics real-life problems. Problems will be solved by identifying proper governing equations and boundary conditions first, and then implementing these in the COMSOL environment. Applications will include heat conduction, convection and radiation, internal and external flows, with applications ranging from mechanical to biomedical and aerospace engineering.
Instructor(s): C. Herman
Area: Engineering.

EN.530.445. Introduction to Biomechanics.
An introduction to the mechanics of biological materials and systems. Both soft tissue such as muscle and hard tissue such as bone will be studied as will the way they interact in physiological functions. Special emphasis will be given to orthopedic biomechanics. Recommended Course Background: EN.530.215/EN.530.216 and Lab or equivalent. If you have not taken this course or an equivalent, please contact the instructor before registering to ensure you have the appropriate background knowledge to succeed in this course.
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.446. Experimental Methods in Biomechanics.
An introduction to experimental methods used in biomedical research. Standard experimental techniques will be applied to biological tissues, where applicable and novel techniques will be introduced. Topics include strain gauges, extensometers, load transducers, optical kinematic tracking, digital image correlation, proper experimental design, calibration and error analysis. Of particular emphasis will be maintained native tissue temperature and hydration. Laboratory will include “hands-on” testing.
Area: Engineering, Natural Sciences.

This class will introduce fundamental concepts of statics and solid mechanics and apply them to study the mechanical behavior bones, blood vessels, and connective tissues such as tendon and skin. Topics to be covered include concepts of small and large deformation, stress, constitutive relationships that relate the two, including elasticity, anisotropy, and viscoelasticity, and experimental methods. Recommended Course Background: AS.110.201 and AS.110.302, as well as a class in statics and mechanics
Instructor(s): C. Herman
Area: Engineering.

Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn basic cell culture procedures and specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Co-listed with EN.580.451. Senior and Graduate students only; others Permission Required. Lab Fee: $100
Instructor(s): E. Haase; J. Wang
Area: Engineering.

EN.530.452. Cell & Tissue Engineering Laboratory.
This laboratory course will consist of three experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. $100 lab fee will be charged. Co-listed with EN.580.452
Instructor(s): E. Haase; J. Wang
Area: Engineering.

EN.530.454. Manufacturing Engineering.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Open only to seniors in Mechanical Engineering and Engineering Mechanics and other majors at all levels.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.457. Intro To Acoustics.
This course is an introduction to the science of sound and its applications to music, speech communication, science, and engineering. Topics will include hearing, speech, wave propagation, microphones and loudspeakers, noise control, underwater sound, and room acoustics.
Recommended Course Background: EN.530.327
Area: Engineering, Natural Sciences.
This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required.
Instructor(s): D. Gayme
Area: Engineering.

This course deals with processes, systems, instruments, and equipment for aerospace systems. Issue of energy conversion and thermal design are emphasized. Topics include thermodynamic concepts and heat transfer processes for aerospace systems (with emphasis on radiation), the space environment, influence of gravity on heat transfer, power generation for space systems (energy sources, solar cell arrays, energy storage), thermal control (analysis techniques, design procedures, active versus passive design, heating and refrigeration), environmental effects.
Area: Engineering.

EN.530.470. Space Vehicle Dynamics & Control.
In this course we study applied spacecraft orbital and attitude dynamics and their impact on other subsystems. In the orbital dynamics part of the course, we discuss some the issues associated with orbital insertion, control and station keeping. Focus is on the two-body problem regime where conic solutions are valid. Orbit perturbations are also considered. For attitude dynamics, different attitude representations such as of direction cosines, quaternions, and angles are introduced. Then we look at the forces and moments acting on space vehicles. Attitude stability and control considerations are introduced.
Instructor(s): M. Ozimek; T. McGee
Area: Engineering.

EN.530.473. Molecular Spectroscopy and Imaging.
The overarching objective of this course is to understand, employ and innovate molecular spectroscopy and optical imaging tools. The emphasis will be to bridge the domain between molecular spectroscopy, which provides exquisite chemical information, and the imaging capabilities of microscopy to seamlessly traverse between structural and biochemical spaces. The course will build on the foundational principles of light-matter interactions and an understanding of light sources, geometrical and wave optics, and detectors. Using vibrational and fluorescence spectroscopy as the tools of choice, we will discuss the design and fabrication of molecular reporters that offer unprecedented sensitivity, specificity and multiplexing capabilities in imaging of live biological specimen. Finally, we will learn about spectral and image-processing algorithms that have fundamentally changed the nature and quantity of useful information and have directly lead to breakthroughs in super-resolution imaging and multi-modal image fusion. All through the course, the focus will be on the underlying concepts and physical insights as we navigate through a diverse array of biophotonics applications.
Instructor(s): I. Barman
Area: Engineering.

EN.530.476. Locomotion in Mechanical and Biological Systems.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information.
Instructor(s): C. Li
Area: Engineering.

The complex mechanisms of living systems cannot be reduced to a set of base pairs: genes are only one part of mystery of life. Rather, organisms must develop, move, interact, and function in their natural environment, and thus are constrained by the laws of physics. For example, during locomotion an animal must accelerate according to Newton’s laws by applying forces between itself and the environment. Beyond physical principles alone, biological systems extensively use feedback to enhance stability and facilitate adaptation in the presence of a changing world. This course examines the critical roles that physical principles and feedback mechanisms play in life, with special emphasis on animal locomotion and its control. Juniors and Seniors only.
Instructor(s): N. Cowan
Area: Engineering.

EN.530.489. The Kalman Filter.
Since its advent, the Kalman filter has been the workhorse for estimation of dynamical systems spanning virtually all engineering disciplines: spacecraft, airplanes, submarines, automobiles, factory automation, electronics, and more. This one credit course teaches the derivation of the Kalman filter from first principles. It covers the necessary basic probability theory and culminates with a discussion of Dr. Kalman's seminal paper on the subject, written while he was living in Baltimore in 1960.
Instructor(s): M. Sasidharan Madhav; S. Sefati
Area: Engineering.

EN.530.494. Engineering Design Outreach.
This course gives JHU students an opportunity to interact with and explain the engineering design process to middle-school students at a local school. The JHU students will learn to lead an in-class engineering design challenge and share with the youth the rigorous process that is engineering design. This is an opportunity to inspire young students from disadvantaged backgrounds, show them the excitement of being an engineer and gain professional development in teaching and communication.
Area: Engineering.

EN.530.495. Microfabrication Laboratory.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprised of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Permission Required.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.
This 1-credit undergraduate level course introduces the students to the topics of energy and climate change. Climate and environmental issues associated with conventional energy generation are addressed in the course. Alternative, renewable, energy sources, such as solar and wind energy, biofuels, hydroelectric and tidal power and ocean wave power are discussed.
Instructor(s): C. Herman
Area: Engineering, Natural Sciences.

EN.530.525. Independent Research.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research independently as possible.
Instructor(s): Staff.

EN.530.526. Independent Study.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible.
Instructor(s): Staff.

EN.530.527. Independent Study.
Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible.
Instructor(s): N. Cowan.

EN.530.597. Research-Summer.
Instructor(s): Staff.

EN.530.599. Independent Study.
Instructor(s): Staff.

EN.530.600. MSE Graduate Research.
Instructor(s): Staff.

The course focuses on the optimal control of dynamical systems subject to constraints and uncertainty by studying analytical and computational methods leading to practical algorithms. Topics include calculus of variations, nonlinear local optimization, global stochastic search, dynamic programming, linear quadratic (gaussian) control, numerical trajectory optimization, model-predictive control. Advanced topics include approximate dynamic programming and optimal control on manifolds. The methods and algorithms will be illustrated through implementation of various simulated examples. Recommended Course Background: AS.110.201 and AS.110.302; experience with control systems; programming in MATLAB.
Instructor(s): M. Kobilarov.

This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and materials. We will begin with the mathematical preliminaries of continuum mechanics: vectors and tensors calculus, then introduce the kinematics of deformation and descriptions of stress in a continuum: Eulerian and Lagrangian descriptions, followed by conservation laws: mass, momentum, and energy balance, and entropy. These concepts will be applied to develop the concepts of constitutive relations: frame invariance, material symmetry, and dissipation. The second half of the class will be devoted to elasticity, both classical and finite elasticity, and solution methods for boundary value problems.
Instructor(s): J. El-Awady.

EN.530.606. Mechanics of Solids and Materials II.
An overview of the area of the mechanics of solids and materials, with the intent of providing the foundation for graduate students interested in research that involves these disciplines. The course is based on the principles of continuum mechanics, and covers the fundamental concepts of elasticity, plasticity, and fracture as applied to materials. One objective is to get graduate students to the point that they can understand significant fractions of research seminars and papers in this area. This mathematically rigorous course emphasizes the setup and solution of boundary value problems in mechanics, and attempts to integrate the primary behaviors with deformation and failure mechanisms in materials. Special topics covered may include (depending on the interests of the student body) wave propagation, viscoelasticity, geomechanics or biomechanics.
Instructor(s): J. El-Awady
Area: Engineering.

EN.530.610. Statistical Mechanics in Biological Systems.
Application of equilibrium and nonequilibrium concepts in statistical mechanics to biology is presented in some detail. Topics include many-body dynamics and equilibrium ensembles, thermodynamics and phase transitions, free energy functionals, computer simulations of biological systems, nonequilibrium model such as the Langevin equation and the Fokker-Planck equation, kinetic models of biochemical networks, Markov models of stochastic systems and pattern formation in nonequilibrium systems. Emphasis will be on quantitative understanding of biological problems.
Instructor(s): S. Sun.

This course teaches in-depth and hands-on understanding of numerical methods for solid mechanics problems. The course begins with a review of the fundamental concepts of the finite element method for linear boundary value problems (BVP) and initial boundary value problems (IBVP) in solid mechanics. Then more advance methods for nonlinear BVPs are presented and applied to problems of material inelasticity and finite elasticity. Topics covered include the strong and weak statements of the BVP, weighted residual methods, time integration, Newton-type methods for nonlinear problems, and error estimation and convergence.
Instructor(s): T. Nguyen.

EN.530.616. Statistical Mechanics and Extreme Value Distributions. 1. Thermodynamic phase transitions Credit.
The course will explore a collection of statistical mechanics minimal models and approaches that are been used in several topics of materials science and engineering. An introduction to the basics of statistical mechanics will be followed by focus on specific models, one each week or so. While lectures will focus on the basic theory and applications of the model, the homework sets will guide the students to develop a code of the model in Python or Matlab, test its accuracy, and investigate specific aspects of the model’s predictions. Through the study of these models, statistical properties and distributions will be explored in situ, as well as their connections to extreme value statistics. In the span of the semester, it is expected to investigate models of:
Prerequisites: 6. Rigidity percolation
Corequisites : 7. Jamming of repulsive spheres
Instructor(s): B. Crowd dynamics
Area: 4. Amorphous solid plasticity
5. Percolation.
EN.530.618. Fabricatology - Advanced Materials Processing. The "Fabricatology" is a course that students can learn how to make desired shapes, structures, and surfaces across various length scales. It will introduce rich scientific and engineering knowledge related to fabrication at multiple length scales and the generated materials and mechanical systems can be utilized for studying diverse topics including energy harvesting, metamaterials, wetting, and information storage. From this course, students can learn principles and technologies to control shapes at various length scales and processes to control internal structures or surface properties for desired properties/functions. They will be also introduced to exciting recent development in the field so that they can have a comprehensive knowledge about the subject. Recommended Course Background: coursework in introduction to materials chemistry or engineering materials. Instructor(s): S. Kang.

EN.530.624. Dynamics of Robots and Spacecraft (Graduate). An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton's principle. Instructor(s): G. Chirikjian.

EN.530.628. Nonlinear Dynamical Systems - Mechanics and Biology. Nonlinear dynamical systems theory are discussed in the context of mechanics, engineering and biological problems. Concepts such as stability, bifurcations, limit cycles and chaos are illustrated using simple analytic theories as well as practical examples. Emphasis are placed on developing intuition using analytic approaches and simple numerical calculations. The course is appropriate for graduate students with foundational knowledge of solid and fluid mechanics, and some notions of statistical mechanics and biological concepts. Instructor(s): D. Gayme; S. Sun.

EN.530.630. Applied Finite Element Analysis. This course will introduce finite element methods for analysis of solids, structures and heat transfer problems. Following topics will be considered. Procedure to defining a mechanics problem: governing equations, constitutive equations, boundary and initial value problems. Theory and implementation of the finite element methods for static analysis using linear elasticity. Finite element analysis (FEA) using ABAQUS software. Verification and validation, understanding uncertainty. Introduction to other FEA topics: structural elements, dynamic analysis, heat transfer and thermodynamics using ABAQUS. The course will include assignments and a term project. The term project is mandatory for graduate students and will involve applying FEA to an engineering problem or a research problem, interpretation of results and documenting a term paper. Recommended Course Background: Course(s) in Linear Algebra, Differential Equations required; matrix analysis / algebra and programming. Instructor(s): N. Daphalapurkar.

EN.530.631. Conduction and Radiation of Heat. In the first part of the course, the focus is on steady and transient two- and three-dimensional heat conduction. Energy balances and the energy equation are reviewed, and mathematical methods for solving partial differential equations are discussed. Heat transfer with a phase change, and contemporary conduction problems are discussed. In the second part of the course radiative properties and thermal radiation exchange are reviewed. The equation of transfer for participating media is developed, and simplification is discussed. Instructor(s): C. Herman.

EN.530.632. Convection. This course begins with a review of the phenomenological basis of the constitutive models for energy and mass flux. Then, using the transport theorem, general conservation and balance laws are developed for mass, species, energy, and entropy. Scaling analysis is used to determine when simplifications are justified, and simplified cases are solved analytically. Experimental results and correlations are given for more complex situations. Free, mixed, and forced internal and external convection are studied, and convection with a phase change is also explored. Instructor(s): C. Meneveau.

EN.530.633. Mechanics of the Biological Systems and Biophysical Methodologies. Introduction to the following topics and tools used in these subfields: 1. The hierarchical structure of biological systems. 2. The dynamical nature of the biological systems. 3. Quantitative characterization of biological behaviors. 4. The modern tools used to measure biophysical parameters Recommended Course Background: Introductory Physics, Calculus, and Linear Algebra Instructor(s): Y. Chen.

EN.530.637. Energy and the Environment. This course focuses on advanced topics related to energy and thermodynamics. The objective of this course is to provide a thorough understanding of the environmental impacts related to energy conversion systems. The use of the second law of thermodynamics is introduced to quantify the performance of energy conversion systems. Topics such as global warming, alternative energy sources (solar, wind power, geothermal, tides, etc.) and new technology (fuel cells and hydrogen economy) and resources and sustainable development are addressed. A section of the course is devoted to current trends in nuclear energy generation and environmental issues associated with it. Instructor(s): C. Herman.
EN.530.642. Plasticity.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations. Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises. Instructor(s): N. Cowan.

Graduate-level introduction to adaptive identification and control. Emphasis on applications to mechanical systems possessing unknown parameters (e.g., mass, inertia, friction). Topics include stability of linear and nonlinear dynamical systems, Lyapunov stability, input-output stability, adaptive identification, and direct and indirect adaptive control. Recommended Course Background: AS.110.106, AS.110.107/AS.110.109, AS.110.202: Physics I, II; AS.110.201, AS.110.302, Equations, linear control theory, and Matlab. Instructor(s): L. Whitcomb.

This course is a survey of group theory with an emphasis on applications in mechanical design research. In particular, the representation theory of finite groups, compact Lie groups, and certain noncompact unimodular groups is reviewed, and Fourier analysis on these groups is applied as a tool in design problems. The concentration is on applications in CAD, discrete and computational geometry, and robotics. Specific applications include modern interpolation, deformation of solid models, and pattern matching. Instructor(s): G. Chirikjian.

EN.530.649. System Identification.
This course will cover several fundamental approaches system identification, including spectral, prediction error, subspace, and "online" (adaptive) identification methods. The emphasis will be on LTI systems, but some time will be devoted to system identification for classes of nonlinear dynamical systems, such as those that are linear in parameters. Instructor(s): N. Cowan.

EN.530.653. Advanced Systems Modeling.
This course covers the following topics at an advanced level: Newton's laws and kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion: structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Langrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research. Instructor(s): G. Chirikjian.

EN.530.654. Advanced Systems Modeling II.
A continuation of EN.530.653, this course covers the following topics at an advanced level: Newton's laws of kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion; structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Langrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which relates the topics of this course to his or her research. Instructor(s): G. Chirikjian.

An advanced course on the theoretical treatment and modeling of the mechanisms of deformation in solids at intermediate and high temperatures. Topics include diffusion of point defects; vacancy migration; diffusion of solutes; cooperative and diffusion-less transformations; dislocation obstacle interactions; dislocation climb and cross-slip; friction forces in metals, alloys and covalent crystals. Instructor(s): J. El-Awady.

EN.530.660. Computational Analysis of Stochastic Processes.
This class will cover stochastic processes (including both discrete and continuous time, and including both discrete and continuous state), leading to a rigorous treatment of stochastic differential equations and filtering, emphasizing computation. The class will draw from examples relevant to engineering, such as the Kalman filter. The course will comprehensively, but rapidly review all needed material in probability and statistics. Prerequisites: 580.616 or 530.616 Linear Dynamical Systems.
EN.530.661. Applied Mathematics for Engineering.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required.
Instructor(s): J. Bohren.

EN.530.666. Introduction to Robot Software Frameworks.
This course aims to give students a breadth-first awareness of robot software tools that are available today for building complex experimental and fieldable robotic systems. At the same time, students should get some experience working with large-scale software frameworks that are necessitated by such complex robotic software systems. The course is grouped into three sections, each of which building on the previous in increasing complexity and specificity. We will introduce various tools and frameworks in the following order: Tools and Frameworks Supporting Robotics Research, Robotics-Specific Software Frameworks, and Integrating Complete Robotic Systems.
Instructor(s): D. Gayme.

EN.530.671. Statistical Mechanics in Biological Systems.
Principles of statistical physics are discussed in the context of biological problems. After an introduction, topics covered will include equilibrium theory of liquids and polymers, theory of chemical reactions in complex environments, stochastic models, dynamics of membranes and channels, theory of biological motors, computer simulations of liquids and proteins.
Instructor(s): S. Sun.

EN.530.672. Biosensing & BioMEMS.
The course discusses the principles of biosensing and introduces micro- and nano-scale devices for fluidic control and molecular/cellular manipulation, measurements of biological phenomena, and clinical applications.
Instructor(s): J. Wang.

EN.530.676. Locomotion in Mechanical and Biological Systems.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information.
Instructor(s): C. Li.

EN.530.678. Nonlinear Control and Planning in Robotics.
The course starts with a brief introduction to nonlinear systems and covers selected topics related to model-based trajectory planning and feedback control. Focus is on applications to autonomous robotic vehicles modeled as underactuated mechanical systems subject to constraints such as obstacles in the environment. Topics include: nonlinear stability, stabilization and tracking, systems with symmetries, differential flatness, backstepping, probabilistic roadmaps, stochastic optimization. Recommended Course Background: multi-variable/differential calculus, AS.110.302, AS.110.201, undergraduate linear control, basic probability theory.
Instructor(s): M. Kobilarov.

EN.530.681. TEM: Practice and Applications.
A lab and lecture course covering the practical aspects of transmission electron microscopy. Electron diffraction, image formation, and analytical techniques are explained, and students are given an opportunity to gain hands-on microscopy experience.
Instructor(s): K. Hemker.

EN.530.682. Haptic Applications.
An introduction to the required theoretical and practical background in the design and development of haptic applications. Haptic technology enables users to touch and/or manipulate virtual or remote objects in simulated environments or tele-operation systems. This course aims to cover the basics of haptics through lectures, lab assignments, a term project, and readings on current topics in haptics. Through lab assignments, students learn to create haptic-enabled virtual environments using software development toolkits and a haptic device. Students will be required to complete a project with approval of the instructor. Recommended course background: ME, CS, and ECE graduate and senior undergraduate students who are being enthusiastic to learn about haptics and knowledgeable in basic C++ programming. Students with experience with other programming languages (Python, Java, etc.) should be able to self-tutor themselves to complete lab assignments.
Instructor(s): M. Zadeh.

Recent advances in instrumental capabilities are fast making it routine to acquire large 2D and 3D datasets and maps of crystalline materials. SEM-based orientation imaging microscopy (OIM) and transmission Kikuchi diffraction (TKD) and TEM-based precession-assisted crystal orientation mapping (PACOM) provide the means to characterize intra- and inter-granular details such as grain: orientation, size, shape, neighborhoods and GND distributions. This course will cover the science that underpins these technologies and provide practical experience in gathering, filtering, quantifying and displaying such information. It is motivated by the fact that emergent advances based on the practice of Integrated Materials Science and Engineering (ICMSE) and the Materials Genome Initiative (MGI) are predicated on the availability of physics-based, multi-scale models that are based on such detailed quantitative experimental observations of polycrystalline materials.
Instructor(s): K. Hemker.
EN.530.701. Uncertainty Analysis and Downscaling.
This course will describe several approaches used to infer small- scale information from large-scale observations (downscaling). Downscaling is especially useful for multi-scale phenomena characterized with power-law spectra or fractal geometry. Topics: Self- consistency conditions across length-scales to determine model parameters in coarse-grained simulations. Tools for characterizing scale-invariant (fractal) processes. Sample applications of downscaling as practiced today: (i) multi-scale transport phenomena in fluids, (ii) rainfall modeling in hydrology. The process of inferring small-scale information from large-scale observations is most often inherently uncertain. The second part of this course will explore uncertainty models in the analytical context of downscaling. Topics: assimilation of data and models (Kalman filtering and related methods for nonlinear models and vary large data sets), statistical analysis of spatial-temporal data (independent components analysis, kernel methods). Applications to downscaling in atmospheric data.

EN.530.707. Robot System Programming.
This course seeks to introduce students to open-source software tools that are available today for building complex experimental and fieldable robotic systems. The course is grouped into four sections, each of which building on the previous in increasing complexity and specificity: tools and frameworks supporting robotics research, robotics-specific software frameworks, integrating complete robotic systems, and culminates with an independent project of the student’s own design using small mobile robots or other robots in the lab. Students will need to provide a computer or a virtual-box (with at least a few GB of memory and a few tens of GB of disc space) running Ubuntu 14.04 LTS Trusty Tahr (http://releases.ubuntu.com/14.04 or one of its variants such as Xubuntu 14.04 LTS) and ROS Indigo Igloo (http://wiki.ros.org/indigo) - note that these specific versions of Linux and ROS are required! Students should have an understanding of intermediate programming in C/C++ (including data structures and dynamic memory allocation) Familiarity with Linux programming. Familiarity with software version control systems (e.g. subversion, mercurial, git), linear algebra. Recommended Course Background: EN.530.646 Robot Devices, Kinematics, Dynamics, and Control and EN.600.636 Algorithms for Sensor Based Robotics. Students should see the course homepage http://dsci.lcsr.jhu.edu/EN530707_2016 for more information and to get started with the course. Recommended Course Background: EN.530.646 and EN.600.436. Instructor(s): L. Whitcomb.

EN.530.710. Optical Measurement Techniques.
Optic-based techniques are being utilized as measurement and data transmission tools in a growing number of applications. The objective of this course is to introduce graduate students with limited background in optics (but with background in graduate-level mathematics) to the fundamentals of optics and their implementation. Topics covered include reflection, refraction, fluorescence, phosphorescence and diffraction of light; review of geometric optics, lenses, lens systems (microscope, telescope), mirrors, prisms; aberrations, astigmatism, coma, and methods to correct them; light as an electromagnetic wave; Fourier optics; spectral analysis of optical systems; coherent and incoherent imaging, holography, interferometry, diffraction grating; lasers, polarization, light detectors; elements of non-linear optics, birefringence; optical fibers, data transmission, and networking. Instructor(s): J. Katz.

Hydrodynamic linear stability theory is developed and applied to a variety of flow problems using analytical techniques and numerical methods. Necessary and sufficient conditions for flow stability are derived. Canonical examples are used to introduce various concepts including, e.g. temporal and spatial analyses, asymptotic and transient flow response, convective and absolute instability, global methods, and direct stability analysis.
Prerequisites: EN.530.621 AND EN.530.622 or equivalent course with permission of instructor.

EN.530.730. Finite Element Methods.
Variational methods and mathematical foundations, Direct and Iterative solvers, 1-D Problems formulation and boundary conditions, Trusses, 2-D/3D Problems, Triangular elements, QUAD4 elements, Higher Order Elements, Element Pathology, Improving Element Convergence, Dynamic Problems. Instructor(s): S. Ghosh.

An advanced examination of fracture mechanisms in ductile and brittle materials. Both the mechanics and the materials aspects are covered with importance placed on the synthesis of the two approaches. Topics include linear elastic fracture mechanics, ductile fracture, the J-integral, atomistic aspects of fracture in polycrystalline materials, fracture in ceramics and polymers, influence of the material microstructure on fracture toughness and ductility in FCC and BCC materials. Instructor(s): K. Ramesh.

EN.530.748. Stress Waves, Impacts and Shockwaves.

The course provides a basic understanding of nanomaterials and nanomechanics. Develops the necessary background in mechanics, mechanical properties and modeling to understand the mechanics of nanomaterials and related problems in nanomechanics and nanotechnology. We will also examine the mechanics of nanoscale assemblies and microscale structures used for investigating nanoscale phenomena. Each student will be expected to complete a paper on a research topic chosen together with the instructor. A mechanics background is NOT required to take this course.

EN.530.759. Research Seminar in Plasticity and Failure.
A weekly research seminar featuring ongoing research as well as reviews of new papers of interest in the general areas of plasticity and failure. The course will have an emphasis on dynamic phenomena, but will consider both engineering materials and biological systems. Students will be expected to make two presentations during the semester. Permission of instructor and advisor required.

EN.530.761. Mathematical Methods of Engineering I.
This course is a fast-paced overview of some fundamental topics in applied mathematics: analytic functions, matrix theory, vector analysis, ordinary differential equations, Bessel functions, fundamental properties of the delta distribution, elements of partial differential equations, two-sided and one-sided Fourier transforms, Laplace transform. Instructor(s): A. Prosperetti.
EN.530.762. Advanced Math Methods for Engineers.
Instructor(s): A. Prosperetti.

Elementary introduction to numerical methods for the solution of fundamental problems in engineering. Computer assignments requiring programming.
Instructor(s): T. Zaki.

EN.530.767. Computational Fluid Dynamics.
Advanced introduction to finite-difference and finite-volume approaches to modeling incompressible flows. Computer project requiring programming.
Instructor(s): J. Seo.

EN.530.772. Non-Linear Finite Elements.
This course will discuss state of the art theoretical developments and modeling techniques in nonlinear computational mechanics, for problems with geometric and material nonlinearities. Large deformation of elastic-plastic and visco-plastic materials, contact-friction and other heterogeneous materials like composites and porous materials will be considered. A wide variety of applications in different disciplines, e.g. metal forming, composite materials, polycrystalline materials will be considered. Co-listed with EN.560.772.

EN.530.773. Topics in Applied Mathematics Engineering.
Instructor(s): A. Prosperetti.

Instructor(s): A. Prosperetti.

EN.530.790. Advanced Finite Element Methods and Multi-Scale Methods.

EN.530.800. Independent Study.
Instructor(s): Staff.

EN.530.801. Graduate Research.
Instructor(s): Staff.

EN.530.802. Graduate Research.
Department approval required to enroll in 01.
Instructor(s): Staff.

EN.530.803. Mechanical Engineering Seminar.
Instructor(s): S. Sun.

EN.530.804. Mechanical Engineering Seminar.
Instructor(s): S. Sun.

Instructor(s): J. Katz.

EN.530.808. Graduate Seminar in Fluid Mechanics.
Instructor(s): J. Katz.

Instructor(s): J. El-Awady.

EN.530.897. Research-Summer.
Instructor(s): Staff.

EN.530.899. Independent Study-Summer.
Instructor(s): Staff.

Cross Listed Courses

General Engineering

Instructor(s): J. Katz.

EN.500.745. Seminar in Computational Sensing and Robotics.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

Cross-listed with Mechanical Engineering.
Instructor(s): J. El-Awady.

Electrical Computer Engineering

EN.520.353. Control Systems.
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).
Prerequisites: Prereqs: EN.530.343 AND EN.520.214
Instructor(s): D. Tarraf
Area: Engineering.

EN.520.773. Advanced Topics In Microsystem Fabrication.
Graduate-level course on topics that relate to microsystem integration of complex functional units across different physical scales from nano to micro and macro. Topics will include emerging fabrication technologies, micro-electromechanical systems, nanolithography, nanotechnology, soft lithography, self-assembly, and soft materials. Discussion will also include biological systems as models of microsystem integration and functional complexity. Perm. Req’d.
Instructor(s): A. Andreou; J. Wang.
Civil Engineering

Basic principles of classical mechanics applied to the equilibrium of particles and rigid bodies at rest, under the influence of various force systems. In addition, the following topics are studied: free body concept, analysis of simple structures, friction, centroids and centers of gravity, and moments of inertia. Includes laboratory experience. Co-listed with EN.530.201. Recommended Course Background: AS.171.101, or EN.530.103/EN.530.104 or instructor permission.
Instructor(s): R. Sangree
Area: Engineering.

EN.660.461. Engineering Business and Management.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Area: Engineering.

NanoBio Technology

The Institute for NanoBioTechnology (INBT) is a Johns Hopkins University center for integrated nanobiotechnology research, education, and outreach. Launched in May 2006 with funding from NASA, the National Science Foundation, and the Howard Hughes Medical Institute, INBT aims to revolutionize healthcare and medicine by bringing together internationally renowned faculty expertise, students, and world-class research facilities in engineering, the physical sciences, medicine, and public health to create groundbreaking technologies. Supportive funding also has been provided by the Johns Hopkins School of Medicine, Whiting School of Engineering, Krieger School of Arts and Sciences, and Bloomberg School of Public Health. INBT collaborates with industry through its Corporate Partnership Program, which is open to companies involved in all aspects of nanobiotechnology. INBT headquarters are located in 100 Croft Hall on the Homewood campus. Laboratory facilities and faculty are located at several Johns Hopkins locations. Examples of INBT research include the development of new tools and techniques to probe biological systems at the molecular, cellular, and tissue levels, that will provide new insight into the mechanisms of disease, and the development of new diagnostic and therapeutic platforms for improved diagnosis, prevention, and treatment of disease.

Education programs at INBT are designed to foster the next wave of nanobiotechnology innovation. Goals include training a new generation of scientists and engineers who are better able to work between physical sciences/engineering fields and life sciences/medical fields and creating an entrepreneurial environment for students. INBT facilitates a Nano-Bio predoctoral training program that offers a Certificate of Advanced Study in Nanobiotechnology for students who complete 13 lecture/tutorial/laboratory courses along with at least eight semesters of research from their home department. The Cancer Engineering Predoctoral program trains students to study and model cancer motility and the biophysical forces involved in metastasis. Additional nanobiotechnology research opportunities exist through INBT’s summer Research Experience for Undergraduates (REU) and International Research Experience for Students (IRES), both funded by NSF. Students from any major may learn the techniques of science writing or animation for nanotechnology and medicine through independent study.

The Nano-Bio Graduate Training program is recognized by the National Institutes of Health and the National Science Foundation as an innovative new approach to multidisciplinary training, integrating research and education. It combines traditional disciplinary coursework and laboratory training with peer-to-peer teaching, co-advising and professional development.

- earn an accredited Certificate of Advanced Study in Nanobiotechnology (for students who complete 13 lecture/tutorial/laboratory courses along with at least eight semesters of research from their home department)
• obtain a PhD from participating departments such as Biomedical Engineering, Materials Science and Engineering, and Physics. All Science and Engineering students are encouraged to apply.
• be co-advised by faculty experts from outside as well as inside your specialty
• work in a variety of lab setting and build collaborative skills

Program Requirements
Nano-Bio graduate training students take two core courses and one lab course. They learn alongside other INBT-sponsored students in cross-disciplinary journal clubs. To enhance their graduate experience, they attend professional development seminars and present research at the annual Nano-Bio Symposium. Students are given the opportunity to participate in research collaborations with industry partners.

Course Requirements. Students must complete the Nanobiotechnology graduate training program course requirements.

PhD Thesis Research. A student’s PhD thesis research combines nanosciences and biology/medicine. Students must submit a thesis proposal to the INBT Educational Administrator at the start their thesis research. The thesis proposal must be approved. Since student are encouraged to have two faculty research advisors with complimentary expertise in physical sciences/engineering and biology/medicine, it is likely that the student will have desk space in both research groups.

Other Program Requirements. Students are expected to present their research at the annual INBT research symposium.

Home Department Requirements. Students must complete the PhD requirements in their home departments.

Eligibility / How to Apply
Prospective students must apply to and be accepted by a participating department before pursuing this predoctoral program. For additional information, contact Camille Bryant cbryant@jhu.edu or (410)516-6572. Women and minorities are encouraged to apply.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses
EN.670.495. Animation in Nanotechnology & Medicine.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

EN.670.497. Animation in Nanotechnology & Medicine.
This course involves the use of animation to visualize scientific processes in nanotechnology and medicine. Animation is becoming an increasingly important tool in both research and education, especially in fields such as nanobiotechnology that involve complex processes and occur at multiple length scales. Understanding of the subject matter is gained through interaction with faculty and graduate students in research groups in the Institute for NanoBioTechnology at Hopkins. The course follows the basic animation pipeline from concept to post production.
Instructor(s): M. Rietveld.

Using digital video and recording equipment, students learn to communicate science and engineering research news to non-technical audiences, such as the mass media. Lectures focus on rationale behind and best practices for effective communication and include guest presentations by media professionals. Students learn methods of presenting scientific research to a variety of audiences and how to prepare themselves for interviews with journalists. Student will work in groups to write, film, and edit a video news release on a scientific or engineering topic aimed at general audience.
Instructor(s): M. Spiro.

Students in the INBT training grant programs study and present topics in nanotechnology applied to biology from the scientific literature.
Instructor(s): P. Searson.

EN.670.616. Introduction to NanoBio Tutorials II.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): P. Searson.

As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.670.616
Instructor(s): P. Searson.

This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.
EN.670.620. Fundamental Laboratory Principles of Nanobiotechnology.
This laboratory course introduces students to fundamental concepts of materials science and cell engineering required for research in biological nanoscience. Topics covered include cell culture, quantitative light microscopy, and synthesis of nanoparticles. This laboratory course is a prerequisite for EN.500.621.
Instructor(s): P. Searson
Area: Engineering.

EN.670.621. NanoBio Laboratory.
This course introduces students to concepts and laboratory techniques in nanobiotechnology. The focus of the laboratory is on nanoparticle carriers for drug delivery and markers for imaging. The laboratory involves the synthesis of nanoparticles using solution phase techniques and characterization by optical techniques such as dynamic light scattering and absorbance spectroscopy. Strategies for functionalization of nanoparticles are covered with focus on methods for attaching biomolecules. The basic aspects of cell culture and optical microscopy techniques will be covered. Nanoparticles functionalized with a drug or gene will be used to perform transfection experiments and compared to standards.
Instructor(s): P. Searson.

As a follow-up to NanoBio Tutorials, INBT training grant students will present scientific articles and reviews related to their current research project. Topics will also be related to nanotechnology applied to biology from scientific literature. At this time all students should be assigned a project and be able to engage participating students in their field of study. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, and Introduction to NanoBio Tutorials and NanoBio Tutorials.
Instructor(s): P. Searson.
Area: Engineering, Natural Sciences.

EN.670.623. Advanced NanoBio Tutorials II.
INBT training grant students only. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, and EN.670.619
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

This course is to allow students pursuing a certificate in nanobiotechnology the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623. Certificate of Advanced Studies in Nanobiotechnology only.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

This course is to allow INBT training grant fellows the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.627. Commercializing Emerging Technologies.
This course will provide “hands-on” experience for pre-doctoral students in identifying viable translational commercialization pathways and establishing credible business plans for new technologies. Students will be challenged to identify possible commercial opportunities associated with their own research, to complete a market analysis, develop a project plan and to draft a business plan suitable for presentation to potential investors. While key elements of each step will be described briefly by experts in the field the focus will be on executing the critical steps rather than on business theory. Although each student will be expected to work on an individual project, the course structure will encourage class support and feedback. At the end of the course students will be expected to develop a business plan and funding proposal suitable to present to a panel of venture experts.
Instructor(s): P. Searson; T. Fekete.

EN.670.628. NanoBio Tutorials II.
As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.500.615 and EN.670.616/EN.500.616
Instructor(s): P. Searson.

EN.670.629. Cancer Nanotechnology Training Center (CNTC) Tutorial.
This course is to allow CNTC fellows the opportunity each week to review and present on cancer research topics. The papers and discussions covered will be on areas of human cancers and nanotechnology and include the latest developments from studies of model organisms.
Instructor(s): P. Searson.

EN.670.630. Cancer Nanotechnology Training Center (CNTC) Tutorial.
This course is to allow CNTC fellows the opportunity each week to review and present on cancer research topics. The papers and discussions covered will be on areas of human cancers and nanotechnology and include the latest developments from studies of model organisms.
Instructor(s): P. Searson.

This intense course is for NTCR fellows with a background in the life sciences. This course covers the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles and patterned surfaces for biological applications. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles are reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microrheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography is discussed. Electron and scanning probe microscopy are reviewed. Examples applications in cancer is drawn directly from research in participating NTCR research labs.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.
This course introduces fellows with a physics/engineering graduate background to modern concepts in molecular and cellular biology with examples taken from cancer immunology and cancer cell biology. Fundamentals and topics covered in this course include, but are not limited to: (i) molecular biology: control of gene expression, microarray technology and modern mol. biol. techniques, (ii) cancer cell transformation; metastasis; cancer genetics; (iii) cell membrane and organelles; (iv) evolution of lipid diversity; membrane structure and dynamics; (v) organization, dynamics, and function of the nucleus; (vi) the cytoskeleton and cancer cell migration; and (viii) ER-Golgi trafficking; traffic through the endosomal process; the fusion machinery; specificity and regulation of trafficking. Recommended Course Background: AS.020.306.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

EN.670.642. Lab Course in Nanobiotechnology.
This lab course is a cornerstone of the training that all NTCR fellows acquire. The main objective of the lab course is to reveal the basics of biological systems to engineers in the physical sciences and of physical systems to biologists. This lab course takes place in new state-of-the-art facilities that have been equipped with funding from the HHMI and the NSF. Lab skills learned include: (i) physical and chemical tools to characterize and manipulate the properties of surfaces and nanoparticles; (ii) synthesis, ligand-functionalization, characterization, and targeted cell intake of multi-functional nanoparticles (nanowires and quantum dots); and (iii) atomic force microscopy and quantitative fluorescence microscopy for biological and materials applications. For fellows coming with a physics/engineering background, they learn basics of mammalian cell culture, molecular biology, cell transfection/transformation, and blotting techniques. The course captain is Denis Wirtz (Depts. Chemical and Biomolecular Engineering, Oncology, Pathology and Director of the previously NCI-funded NTCR program and PSOC center). Recommended Course Background: EN.670.620 or EN.670.400
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

Students in the NTCR training grant program study and present topics in nanobiotechnology applied to biology from the scientific literature. For NTCR Fellows only.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

EN.670.695. Animation in Nanotechnology & Medicine.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

This course involves the use of animation to visualize scientific processes in nanotechnology and medicine. Animation is becoming an increasingly important tool in both research and education, especially in fields such as nanobiotechnology that involve complex processes and occur at multiple length scales. Understanding of the subject matter is gained through interaction with faculty and graduate students in research groups in the Institute for NanoBioTechnology at Hopkins. The course follows the basic animation pipeline from concept to post production.
Instructor(s): M. Rietveld.

This independent design course presents students with engineering needs in developing countries. Teams of students will work together to design solutions for the proposed needs that are defined in part with our global partners. Students will have to rigorously research the local community and cultural context of the proposed problems to design solutions. Prototypes will be built and some teams may test prototypes in the local community to optimize solution. Permission of Instructor.
Instructor(s): J. Elisseeff
Area: Engineering.

Professional Communication

Strong communication skills are the key to success in any discipline. The Professional Communication Program (PCP) offers Johns Hopkins undergraduates a variety of hands-on courses designed to develop their abilities to research, write, speak, and display data persuasively. Starting with the highly popular foundation courses Professional Writing and Communication and Oral Presentations, the program expands to specialized workshops and seminars on topics ranging from science and research writing, engineering culture and ethics to entrepreneurship, public relations and social media. PCP students create journals, write blogs, present pitches and posters, and conduct multimedia PR campaigns. All PCP courses are small—19 or fewer students—ensuring that everyone receives the skilled attention necessary to grow as a writer and presenter. Since many of our students are international, PCP offers English as a Second Language (ESL) sections of Professional Writing and Communication and Oral Presentations as well as free ESL tutoring.

For current faculty and contact information go to http://eng.jhu.edu/wse/cle/page/our_people

Faculty

Program Director
Julie Reiser
Senior Lecturer, Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Full Time Faculty
Lawrence Aronhime
Senior Lecturer: accounting, finance, entrepreneurship, technology commercialization.

Bob Graham
Lecturer: entrepreneurship, professional communications, oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing.

Annette Leps
Senior Lecturer & Director of Entrepreneurship & Management Program: accounting, finance, management.

Charlotte O’Donnell
Lecturer: oral presentations, professional communication, visual rhetoric.

Keith Quesenberry
Lecturer: integrated marketing communications, advertising, social media marketing, online blogging and copywriting, creative strategy, digital media, communications law and ethics.

Eric Rice
Senior Lecturer & Director of Graduate Programs: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Pamela Sheff
Senior Lecturer & Director of Master of Science in Engineering Management Program: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, higher education in prisons, community-based learning, entrepreneurship.

William Smedick
Senior Lecturer: leadership theory, leadership in teams.

Part Time Faculty

Michael Agronin
Lecturer: product development.

Jennifer Bernstein
Lecturer: professional communication.

Laura Davis
Lecturer: professional communication for ESL and oral presentations for ESL.

Marc DeVries
Lecturer: marketing.

Kevin Dungey
Senior Lecturer: oral presentations.

David Fisher
Lecturer: business law.

Mark Franceschini
Senior Lecturer: business law, business ethics, internet law.

Sean Furlong
Lecturer: financial accounting.

Mary Beth Furst
Lecturer: principles of marketing.

Jason Heiserman
Lecturer: oral presentations.

Chris Jeffers
Lecturer: intellectual property law.

Nicole Jerr
Lecturer: professional communication.

Theresa Jones
Lecturer: marketing.

Andrew Kulanko
Senior Lecturer: oral presentations.

Denise Link-Farajali
Lecturer: professional communication, financial math for ESL, research writing for ESL.

Kimberly Manns
Lecturer: marketing.

Bryan Rakes
Lecturer: business law.

Joshua Reiter
Senior Lecturer: business process management, total quality management, information technology management, internet-based business applications, creativity and innovation, entrepreneurship.

Douglas Sandhaus
Senior Lecturer: business law, business ethics, internet law.

Jay Thompson
Lecturer: professional communication.

Caroline Wilkins
Lecturer: professional communication.

For current course information and registration go to https://isis.jhu.edu/classes/

Courses

**EN.661.110. Professional Writing and Communication.**
This course teaches students to communicate effectively with a wide variety of specialized and non-specialized audiences. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business and Industry or EN.661.120 Business Communication. No audits.

**Prerequisites: Not open to students who have taken EN.661.110 as Technical Communication or Business and Industry or EN.661.120 Business Communication.**
Instructor(s): C. Wilkins; J. Thompson; L. Pepitone.
EN.661.111. Professional Writing and Communication for International Students.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Note: not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. No audits.
Prerequisites: Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication.
Instructor(s): L. Davis.

EN.661.150. Oral Presentations.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience's attention. No audits.
Instructor(s): J. Reiser; L. Davis.

EN.661.154. Blogging and Online Writing.
This course will teach students how to develop, write, and manage content for social media. In this highly experiential course, students will design, create, and market their own blog; and manage the content creation process for a collaborative class project. The course will emphasize best practices for search engine optimization (SEO), intuitive visual design, social media metrics, and content management strategies appropriate for publishing, marketing, and other relevant environments.
Instructor(s): J. Reiser.

EN.661.160. Online Media and Society.
This online course takes a comprehensive and critical view of the history, roles and responsibilities of media in society. It explores the organization, creation, economics, control and effects of mass communications in the United States and the world. Students will learn how both traditional and new digital media has come to play such an integral role in our society while exploring the exciting career opportunities in journalism, public relations, advertising, radio, film, TV and the Internet. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through writing assignments. No on-campus components required. No audits.

EN.661.250. Oral Presentations.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience's attention. No audits. Not open to students that have taken EN.661.150.
Prerequisites: Not open to students that have taken EN.661.150.
Instructor(s): Staff.

This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience's attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. No audits. Not open to students that have taken EN.661.151
Prerequisites: Not open to students that have taken EN.661.151.
Instructor(s): L. Davis.

EN.661.306. Freelance Travel Writing: Destination Mid-Atlantic.
In this course, students will learn the fundamentals of magazine and travel writing as well as best practices for working as a freelance writer. After gaining familiarity with the genre by reading several “classics” of travel writing and a selection of exemplary magazine articles, students will learn how to brainstorm ideas, plan research, interview skillfully, take useable photos with smartphones, polish pitches to editors, and write/review/submit work for publication. Students will also have the opportunity to meet with important executives from travel magazines and publishing houses. We will use Washington, DC, and Baltimore as the basis for most of our work, but the course might also include day trips to Philadelphia and New York. At the end of the course, students will create an ePortfolio to showcase their articles, profiles, reviews, trade placements, blog entries, and pitches/queries to potential editors. Recommended: one prior course in writing but may be waived with instructor’s permission.
Instructor(s): J. Reiser.
EN.661.315. Culture of the Engineering Profession.
This course focuses on building understanding of the culture of engineering while preparing students to communicate effectively with the various audiences with whom engineers interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students engage in discussion, argument, case study and project work to investigate: the engineering culture and challenges to that culture, the impacts of engineering solutions on society, the ethical guidelines for the profession, and the ways engineering information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. No audits. WSE sophomores, juniors and seniors or by instructor approval.
Instructor(s): E. Rice; P. Sheff; R. Graham.

EN.661.317. Culture of the Medical Profession.
This course builds understanding of the culture of medicine as well as the ways in which different strata within society have access to and tend to make decisions about health and health related services while preparing students to communicate effectively with the various audiences with whom medical professionals interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students engage in discussion, argument, case study and project work to investigate topics such as the medical culture, the ways medicine is viewed by different segments of society, issues associated with access to health care, ethical dilemmas and guidelines for medical decisions, the impacts of medical and engineering solutions on society, decision making within client/patient groups, social and cultural differences that effect behavioral change, and the ways medical information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. For sophomores, juniors, and seniors or by permission of instructor. No audits.
Instructor(s): J. Bernstein
Area: Social and Behavioral Sciences.

Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.660.357. No audits.
Prerequisites: EN.660.250 Principles of Marketing.

EN.661.361. Corporate Communications & P.R..
This course focuses on the ways that organizations, both for-profit and non-profit, manage their communications to deliver strategic, coherent and compelling messages to their varied stakeholders. Using case studies and team-based, real world projects, we will explore topics including public and media relations, corporate image, branding, advertising, internal and external communications, crisis management, investor relations, ethics and social responsibility. In the process, we will consider issues ranging from organizational culture and leadership styles to defining strategy, managing conflict, defending positions and disagreeing agreeably. No audits. Recommended Course Background: AS.220.105, EN.661.110, AS.060.113 or AS.060.114, AS.060.215, EN.660.250, EN.660.105, and EN.661.250
Instructor(s): P. Sheff.

In this course students learn the procedures and processes that researchers use to determine answers to questions such as how to price a product, how to differentiate one product from another, and how to evaluate customer response to an offering. The materials combine fundamentals of research design with statistics procedures to answer the questions that entrepreneurs and marketing managers must answer as they write business plans, develop their product mix, set prices, create advertising and test products. The course combines case study, simulated situations, lecture, discussion and real-time projects to produce answers using the techniques, tools and procedures typically used in North American enterprises.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

Catalyst is a student-run magazine that focuses on research, technology, entrepreneurship and design. Students enrolled in this course will learn the fundamental principles of journalism through producing content for the online magazine. The class will cover basic journalistic writing and interviewing techniques. Students will get a primer on media law, newsroom ethics and procedure. As their skills progress, they will learn to pitch, write and edit a variety of stories types - from basic news stories, to profiles, features and reviews. All students will publish at least one piece of writing in the magazine at the end of the semester.
Instructor(s): C. O’Donnell.
EN.661.400. Practical Applications of Business Analytics.
With higher transparency and increased sophistication in data collection, modern technology has become a central component in decision-making in all sectors of business. Unfortunately, most casual observers of this critical data are ill-equipped to meaningfully analyze this new information. This course will provide students with an overview of best practices in the field coupled with real-world examples and case studies. Recommended Course Background: EN.661.212 Business Analytics or a statistics based course prior to this course.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.661.410. Research Writing for ESL.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provides intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. Undergraduates must be conducting research with a faculty member or must obtain special permission of instructor to register for the course. S/U grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). Co-listed with EN.661.610. No audits.

EN.661.425. Ethics of Biomedical Innovation.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Co-listed with EN.580.425.
Area: Social and Behavioral Sciences.

EN.661.453. Social Media and Marketing.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits.
Prerequisites: EN.660.250 Principles of Marketing.

EN.661.454. Blogging and Digital Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: Prereq. EN.660.250-Principles of Marketing.

EN.661.456. Marketing Communication Law & Ethics.
This course focuses on the legal and ethical constraints of advertising and promotion marketing practice. Federal laws, media standards and professional ethics establish what can or cannot be said or done in marketing. Beyond that corporate and personal social responsibility must also be considered. Topics such as deception, copyright, publicity, comparative advertising and social media standards will be covered. Students will apply concepts to current practical examples through a course blog and delve more deeply into subjects through a series of writing assignments. Co-listed with EN.660.456. No audits. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars).
Prerequisites: EN.660.250
Instructor(s): K. Quesenberry.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Undergraduates are required to be conducting research with a faculty member or by special permission of instructor. Co-listed with EN.661.687. No audits.

EN.661.610. Research Writing for International Students.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). No audits.
Instructor(s): D. Link-Farajali
Writing Intensive.
EN.661.611. Professional Communication for ESL.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.411.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that “edge” you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester, Financial Math students only. P/F only. No audits.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. EN.661.654. Blogging, Editing, and Copywriting.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars). Co-listed with EN.661.454. No audits.

Prerequisites: Prereq. EN.660.250-Principles of Marketing. Recommended prerequisite: one writing course in any discipline (professional communication, expository writing or writing seminars). Co-listed with EN.661.454. No audits.

This course helps students build advanced communication skills that are critical for leveraging their academic experience in the "real world." Course emphasizes reporting information, polishing CVs and resumes, presenting conference papers, participating in poster sessions, tailoring information to both specialist and non-specialist audiences, and writing grant proposals for funding. Co-listed with EN.661.487. No audits.

EN.661.710. Dissertation Writing Workshop.
This course is designed to introduce students to the dissertation writing process, explain JHU-specific rules and regulations regarding dissertation work, and facilitate the completion of new work or work already in progress. Open to students in any discipline and in any stage of the dissertation process, this course will begin with a selection of speakers from relevant JHU departments, The Graduate Board, the MSE Library and the Commercial Binding Office, the Counseling Center’s Dissertation Support Group, professors, and recently graduated students (among others). During the second half of the course, students will designate one component of the dissertation and work to bring it to completion in a supportive workshop environment. This “component” could include a prospectus, a literature review, a chapter, an introduction, an overall plan for completion, or preparation for the defense. Topics will be geared toward the individual needs of the students registered in the course but will, in general, emphasize goal setting, project planning, developing strategies for working with readers/advisors/committees, learning how to emphasize “the big picture,” working with research tools such as Refworks or Zotero, building a daily writing practice, exploring strategies to deal with the isolation/depression common to dissertation writers, navigating the submission process, and, in general, supporting the overall dissertation writing process through its various stages. Course is taught pass/fail only. No audits. Specific prerequisite: EN.661.610 Research Writing for ESL before taking this course. No audits.

This workshop is for dissertation writers who have already completed the Dissertation Writing Workshop, EN.661.710. This class provides a venue for students to hold themselves accountable, to set weekly goals, to workshop drafts, and to present work-in-progress to the whole group. Course is taught pass/fail only. Course may be repeated. No audits. Prerequisites: Prereq: EN.661.710.
Robotics and Computational Sensing

Laboratory for Computational Sensing and Robotics

The Laboratory for Computational Sensing and Robotics (LCSR) is one of the most technologically advanced robotics research centers worldwide, and is an international leader in the areas of medical robotics, autonomous systems, and bio-inspiration. Within Johns Hopkins, a premiere research university, the LCSR is a hub for innovative and interdisciplinary robotics engineering, research, and development. The LCSR brings a core group of scholars and students from the Whiting School of Engineering together with researchers from the Johns Hopkins School of Medicine, the Bloomberg School of Public Health, the Krieger School of Arts and Sciences, the Johns Hopkins University Applied Physics Laboratory and the Kennedy Krieger Institute to focus on the common purpose of creating knowledge and fostering innovation.

Minor in Robotics

The field of robotics integrates sensing, information processing, and movement to accomplish specific tasks in the physical world. As such, it encompasses several topics, including mechanics and dynamics, kinematics, sensing, signal processing, control systems, planning, and artificial intelligence. Applications of these concepts appear in many areas including medicine, manufacturing, space exploration, disaster recovery, ordinance disposal, deep-sea navigation, home care, and home automation.

The faculty of the Laboratory for Computational Sensing and Robotics (LCSR), in collaboration with the academic departments and centers of the Whiting School of Engineering, offers a robotics minor in order to provide a structure in which undergraduate students at Johns Hopkins University can advance their knowledge in robotics while receiving recognition on their transcript for this pursuit. The minor is not “owned” by any one department, but rather it is managed by the LCSR itself. Any student from any department within the university can work toward the minor.

Robotics is fundamentally integrative and multidisciplinary. Therefore, any candidate for the robotics minor must develop a set of core skills that cut across these disciplines, as well as obtain advanced supplementary skills.

Core Skills Include the Following

- Robot kinematics and dynamics (R)
- Systems theory, signal processing and control (S)
- Computation and sensing (C)

Supplementary advanced skills may be obtained in specialized applications, such as space, medicine, or marine systems; or in one of the three core areas listed above.

The full minor course listing, provided below and available at [https://www.lcsr.jhu.edu/Robotics_Minor](https://www.lcsr.jhu.edu/Robotics_Minor), specifies which courses fulfill these requirements. Note that ALL core areas must be covered, but that ANY advanced/supplementary courses can be chosen from the list. This allows students to strike a balance between breadth and depth.

Requirements

An undergraduate qualifies for the minor provided he or she has taken at least 18 credits (at the 300-level or above, with a C- or above) from an approved list of courses available below and at [https://www.lcsr.jhu.edu/Robotics_Minor](https://www.lcsr.jhu.edu/Robotics_Minor) with the following requirements and restrictions:

- Between 6 and 12 credits chosen to cover the three core skills (R, S, C).
- At least 6 credits chosen from advanced supplementary skills (Sup).
- At least 3 credits of the 18 must be a laboratory course (Lab) (at least 15 hours of laboratory time that includes working with physical hardware and/or real data).
- At most 3 credits of the 18 can be an independent research or individual study with a faculty member on the list of approved faculty advisers.
- At least 6 credits must be primarily listed in a department other than the student’s home department (it is acceptable if such a course is cross-listed in the student’s home department).
- At most one course up to 3 credits (including independent research or individual study) may be taken S/U, but all other courses must be taken for a letter grade.

The minor is continually monitored by a standing governance/oversight committee, currently comprised of the following faculty:

- Noah Cowan, Program Coordinator
- Greg Chirikjian, Program Committee Member
- Ralph Etienne-Cummings, Program Committee Member
- Gregory D. Hager, Program Committee Member
- Russ Taylor, Program Committee Member

The oversight of this minor, including curricular updates, falls to this committee. The minor is managed by the [faculty of the] Laboratory for Computational Sensing and Robotics (LCSR) [in collaboration with the academic departments and centers of the Whiting School of Engineering]

The minor is managed by faculty of the LCSR in collaboration with academic departments and centers of the Whiting School of Engineering. If you have suggestions/questions regarding the minor, please direct them to Prof. Noah Cowan.

### Minor in Computer Integrated Surgery

The Whiting School of Engineering offers a minor in Computer Integrated Surgery (CIS) for full-time, undergraduate students at Johns Hopkins. The minor is particularly well suited for students interested in computer integrated surgery issues who are majoring in a variety of disciplines including biomedical engineering, computer science, computer engineering, electrical engineering, and mechanical engineering. The minor provides formal recognition of the depth and strength of a student’s knowledge of the concepts fundamental to CIS beyond the minimal requirements of his/her major.

In order to minor in CIS, a student will require a minor adviser from the Engineering Research Center in Computer Integrated Surgical Systems and Technology (CISST ERC) in the Laboratory for Computational Sensing and Robotics. Current faculty members available as advisers include Professors Russell Taylor (CS), Greg Hager (CS), Jerry Prince (ECE), Ralph Etienne-Cummings (ECE), Louis Whitcomb (ME), Noah Cowan (ME), Marin Kobilarov (ME), Peter Kazanzides (CS), Iulian Iordachita (ME), and Emaid Docto (Radiology).

To satisfy the requirements for the minor in CIS, a student must have a fundamental background in computer programming and computer science, sufficient mathematical background, and also take a minimum of six courses (with a total of at least 18 credits, earning at least a C- in each course) directly related to the concepts relevant to CIS. These six CIS courses must include two fundamental CIS core courses, and four approved upper-level courses (300-level or above) to allow the student to pursue an advanced CIS topic in depth. The additional four upper-level courses must include at least one course designated as an "imaging" course or one course designated as a "robotics" course, as discussed below.

### Required Fundamental Computer Science Courses

AS.110.109  Calculus II (For Physical Sciences and Engineering)  4
or AS.110.107  Calculus II (For Biological and Social Science)

AS.110.202  Calculus III  4
or AS.110.211  Honors Multivariable Calculus

EN.550.291  Linear Algebra and Differential Equations  4
or AS.110.201  Linear Algebra
or AS.110.212  Honors Linear Algebra

Each math requirement listed above may be satisfied by one of the specific courses listed, or by an equivalent course as determined by CIS advisor.

**Required Fundamental Computer Integrated Surgery Courses**

- EN.600.445 Computer Integrated Surgery I
- A design course in CIS. Either EN.600.446 Computer Integrated Surgery II or a design course in biomedical engineering, electrical and computer engineering, or mechanical engineering with substantial CIS content approved by the student’s faculty adviser in the CIS minor.

**Required Four Other Courses Related to CIS**

Students must also complete at least four other courses related to CIS. Of these, AT LEAST ONE must be in EITHER the Imaging Subgroup or the Robotics Subgroup.

**Robotics M.S.E. Program**

For complete M.S.E. information, visit https://www.lcsr.jhu.edu/MSE

Most students will complete the program in three or four full-time semesters.

Goals of robotics research and education are to conduct engineering and science teaching and research to develop next generation, intelligent devices, platforms, vehicles, and other products, and to create new understandings of the world, with emphasis on biological systems. These applications appear in many areas including medicine, manufacturing, space exploration, disaster recovery, ordinance disposal, deep-sea navigation, home care, and home automation.

**Application Requirements for the M.S.E. in Robotics degree**

- Bachelor’s degree in engineering, science, or math. (Or demonstrated knowledge or accomplishment in these fields.)
- Graduate application
- Statement of Purpose
- Transcripts: unofficial ones uploaded; officials ones sent to the following address:
  
  Johns Hopkins University  
  The Graduate Admissions Office  
  Full time Graduate Studies in Arts and Sciences  
  28 Shriver Hall  
  3400 North Charles Street  
  Baltimore, MD 21218

- Graduate Record Examination (GRE). Current JHU students may request that this requirement be waived. Such requests will be judged on a case-by-case basis.
- TOEFL or IELTS for international applicants.
- Three letters of reference

The Admissions Committee, in making its final decisions, will consider the combination of professional knowledge, academic excellence, letters of reference, and the statement of purpose, as well as GRE, TOEFL, and IELTS scores of the applicants.

**M.S.E. Program Prerequisites**

**Math and Physics Proficiency Prerequisites**

Proficiency in undergraduate mathematics and physics is expected for all M.S.E. students in the robotics program. This will include the following:

- Multivariable integral and differential calculus
- Linear algebra
- Ordinary differential equations
- Physics – undergraduate calculus-based mechanics, electricity, and magnetism.
- Probability and statistics

This proficiency will be assumed in the prerequisites for the core courses.

**Computing Proficiency Prerequisites**

Proficiency in computer programming is expected for all M.S.E. students in the robotics program. This will include the following:
• Basic numerical methods using existing programming environments.
• The ability to write well-structured and documented programs in a standard programming language such as C++, Java, or MATLAB.

M.S.E. Degree Requirements
All incoming M.S.E. students will be assigned an M.S.E. Academic Advisor.

• Course Requirements:
  • Course Option: 10 credit-bearing courses that total at least 30 credit-hours.
  • Essay Option: 8 credit-bearing courses that total at least 24 credit-hours and a Master’s Essay supervised by a WSE faculty member who has been approved by the Robotics M.S.E. Curriculum Committee to serve as a faculty advisor.

No more than 2 of these courses may be at the undergraduate level as defined by the offering department/center. All courses counted toward the M.S.E. degree requirements must be at the 300-level or above. Non-credit courses such as the weekly seminar courses offered by LCSR and Departments may not count toward this course requirement.

• Foundation Course Requirements: Two core courses, weekly seminar course, and systems/implementation requirement.
• Track Course Requirement: Four courses fulfilling one of the following track requirements:
  • Track in Medical Robotics and Computer Integrated Surgical Systems
  • Track in Perception and Cognitive Systems
  • Track in Automation Science and Engineering
  • Track in Control and Dynamical Systems

Courses counted toward the track requirement may not be used to satisfy the elective requirement.

• Elective Course Requirement: Four courses, or two courses and a M.S.E. Essay, fulfilling the elective requirement. Courses may be any engineering or quantitative (designated E or Q in the course catalog) course, subject to the degree requirement limitations, as approved by the student’s M.S.E. academic adviser. Courses counted toward the elective requirement may not be used to satisfy the track requirements.

• Academic Ethics: online tutorial required for all incoming M.S.E. students.

AS.360.625 Responsible Conduct of Research (online); Online tutorial required for all incoming MSE students.

AS.360.625 Responsible Conduct of Research (in-person); may be required for certain research projects. More information: (http://eng.jhu.edu/wse/page/conduct-of-research-training).

• Course Grade Requirement: A course is satisfactorily completed if a grade from A+ to C- is obtained. No more than one C+, C, or C- can be counted toward the degree requirements. A grade of D or F or second C+, C, or C- grade results in probation. A second D or F, or a third C+, C, or C- grade results in termination from the program.

• Transfer Courses: Standard WSE policy and limitations on M.S.E. transfer credits apply (http://eng.jhu.edu/graduate-studies/academic-policies-procedures-graduate). In addition, use of each transfer course toward satisfaction of a specific Robotics M.S.E. degree requirement must be approved in writing by both the student’s faculty advisor and the Robotics M.S.E. Curriculum Committee.

• Double Counting: Standard WSE policy and limitations on double counting apply (http://eng.jhu.edu/wse/page/graduate-double-counting).
• Duration: Students must complete degree within 5 years from matriculation in the M.S.E. program. University-approved leave of absence does not count toward this limit.

• Graduate Research Courses: No more than one 1-semester graduate research course (e.g., EN.530.600 MSE Graduate Research) may be counted toward degree requirements.

• No more than 2 WSE Engineering for Professionals (EP) Courses may count toward the M.S.E. degree elective requirements if they are approved in writing by the student’s faculty advisor.

• Residency Requirement: Minimum residency of two full-time academic terms at WSE.

For complete M.S.E. information, visit https://www.lcsr.jhu.edu/MSE

Courses
AS.080.810. Readings/Systems Neuro I.
This is a graduate-level seminar series on current literature in systems neuroscience. It also serves as a discussion group/journal club for students and faculty at the Krieger Mind/Brain Institute, and is open to the wider systems/cognitive neuroscience community at Homewood and other Hopkins campuses. Each week, a student or faculty member will present a recent article selected in consultation with the course directors. The selected readings will focus on the neural mechanisms of perception, attention, motor behavior, learning and memory. Pass/Fail only. Permission required for undergraduate students.
Instructor(s): E. Niebur; V. Stuphorn.

AS.110.106. Calculus I.
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, applications for systems of linear differential equations, probability distributions. Many applications to the biological and social sciences will be discussed.
Instructor(s): J. Zhu
Area: Quantitative and Mathematical Sciences.

AS.110.107. Calculus II (For Biological and Social Science).
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, and applications for systems of linear differential equations, probability distributions.
Instructor(s): B. Dodson
Area: Quantitative and Mathematical Sciences.

AS.110.108. Calculus I.
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor’s theorem and applications, infinite sequences and series.
Instructor(s): J. Bernstein
Area: Quantitative and Mathematical Sciences.
AS.110.109. Calculus II (For Physical Sciences and Engineering). Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor's theorem and applications, infinite sequences and series. Some applications to the physical sciences and engineering will be discussed, and the courses are designed to meet the needs of students in these disciplines. Instructor(s): J. Gell-redman Area: Quantitative and Mathematical Sciences.

AS.110.202. Calculus III. Calculus of functions of more than one variable: partial derivatives, and applications; multiple integrals, line and surface integrals; Green's Theorem, Stokes' Theorem, and Gauss' Divergence Theorem. Prerequisites: Grade of C- or better in AS.110.107 OR AS.110.109 OR AS.110.113, or a 5 or better on the AP BC exam. Instructor(s): V. Pingali Area: Quantitative and Mathematical Sciences.

AS.110.211. Honors Multivariable Calculus. This course includes the material in AS.110.202 with some additional applications and theory. Recommended for mathematically able students majoring in physical science, engineering, or especially mathematics. AS.110.211-AS.110.212 used to be an integrated yearlong course, but now the two are independent courses and can be taken in either order. Prerequisites: Pre/Co-Requisite: 110.201 or 110.212 Instructor(s): Y. Zhang Area: Quantitative and Mathematical Sciences.

AS.110.212. Honors Linear Algebra. This course includes the material in AS.110.201 with some additional applications and theory. Recommended for mathematically able students majoring in physical science, engineering, or mathematics. AS.110.211-AS.110.212 used to be an integrated yearlong course, but now the two are independent courses and can be taken in either order. This course satisfies a requirement for the math major that its non-honors sibling does not. Prerequisites: Grade of B+ or better in 110.107 or 110.109 or 110.113, or a 5 on the AP BC exam. Instructor(s): S. Zucker Area: Quantitative and Mathematical Sciences.

EN.500.410. Surgery For Engineers. Perm Req'd. Students must apply for this course - contact Cynthia Ramey at cramey@jhu.edu Instructor(s): M. Marohn; R. Kumar Area: Engineering, Natural Sciences.

EN.500.745. Seminar in Computational Sensing and Robotics. Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and biomechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering. Instructor(s): L. Whitcomb; N. Cowan; P. Kazanzides; R. Etienne Cummings; R. Vidal.

EN.520.353. Control Systems. Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode). Prerequisites: Prereqs: EN.530.343 AND EN.520.214 Instructor(s): D. Tarraf Area: Engineering.

EN.520.414. Image Processing & Analysis. The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course. Prerequisites: EN.520.214. Instructor(s): J. Goutsias Area: Engineering.

EN.520.415. Image Process & Analysis II. This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation. Prerequisites: EN.520.414 Instructor(s): J. Goutsias Area: Engineering.

EN.520.427. Product Design Lab. This project-based course is designed to help students learn how to turn their ideas into commercial products. In the first half of the course, emphasis will be placed on the product development process; student teams will gradually build up a complete “contract book” including a mission statement, competitive analysis, patent review, product specifications, system schematics, economic analysis, development schedule, etc. In the second half of the course, each team will be expected to implement its design and demonstrate a prototype of their product’s core functionality. At the end of the semester, a final written report will be submitted in the form of a utility patent. Students are encouraged to take this course in conjunction with Electronic Design Lab (ECE 520.448) in the Spring semester and leverage the groundwork developed here to enable production of a fully functional and marketable prototype by the end of the academic year. Instructor(s): P. Poulquin Area: Engineering.

EN.520.432. Medical Imaging Systems. An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Co-listed as EN.580.472 Prerequisites: EN.580.222 OR EN.520.214 Instructor(s): J. Prince Area: Engineering.
EN.520.433. Medical Image Analysis.
This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include, interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: EN.520.432 OR EN.580.472 OR EN.550.310 OR EN.550.311
Instructor(s): J. Prince
Area: Engineering.

Methods for processing discrete-time signals. Topics include signal and system representations, z-transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.448. Electronics Design Lab.
An advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microprocessors, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. Recommended:
EN.600.333, EN.600.334, EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: EN.520.345 or equivalent Recommended:
600.333, 600.334, 520.216, 520.349, 520.372, 520.490 or 520.491.; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Etienne Cummings
Area: Engineering, Natural Sciences.

EN.520.454. Control Systems Design.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.

EN.520.491. CAD Design of Digital VLSI Systems I (Seniors/Grads).
Seniors and Graduate Students Only
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.761. Large Scale Analog Compt.
Instructor(s): A. Andreou; R. Etienne Cummings.

EN.530.343. Design and Analysis of Dynamical Systems.
Modeling and analysis of damped and undamped, forced and free vibrations in single and multiple degree-of-freedom linear dynamical systems. Introduction to stability and control of linear dynamical systems.
Prerequisites: Prereq: (110.108 and 110.109 and (110.202 or 110.211) and ((550.291) or (110.201 and 110.302) or (110.201 and 110.306)), and C- or better or concurrent enrollment in 530.202 or 560.202. MechE Majors must also have taken 530.241; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): S. Marra
Area: Engineering.

The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the “Pro/E” package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stoianovici
Area: Engineering.

EN.530.420. Robot Sensors/Actuators.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and 110.108 and 110.109, and (110.202 or 110.211), and (550.291 or AS.110.302) and (EN.530.241 or EN.530.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.421. Mechatronics.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or EN.520.240 or permission of instructor; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.
EN.530.424. Dynamics of Robots and Spacecraft.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton's principle.
Instructor(s): G. Chirikjian
Area: Engineering.

EN.530.420. Robot Sensors/Actuators.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: (171.101 and 171.102 or 530.103 and 530.104), and 110.108 and 110.109, and (110.202 or 110.211), and (EN.550.291 or AS.110.302) and (EN.530.241 or EN.520.345)
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.454. Manufacturing Engineering.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Open only to seniors in Mechanical Engineering and Engineering Mechanics and other majors at all levels.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.495. Microfabrication Laboratory.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprised of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Permission Required.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations.
Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.
Instructor(s): N. Cowan.

This course is a survey of group theory with an emphasis on applications in mechanical design research. In particular, the representation theory of finite groups, compact Lie groups, and certain noncompact unimodular groups is reviewed, and Fourier analysis on these groups is used as a tool in design problems. The concentration is on applications in CAD, discrete and computational geometry, and robotics. Specific applications include modern interpolation, deformation of solid models, and pattern matching.
Instructor(s): G. Chirikjian.

EN.530.653. Advanced Systems Modeling.
This course covers the following topics at an advanced level: Newton's laws and kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion: structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Langrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics; Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research.
Instructor(s): G. Chirikjian.

EN.530.660. Computational Analysis of Stochastic Processes.
This class will cover stochastic processes (including both discrete and continuous time, and including both discrete and continuous state), leading to a rigorous treatment of stochastic differential equations and filtering, emphasizing computation. The class will draw from examples relevant to engineering, such as the Kalman filter. The course will comprehensively, but rapidly review all needed material in probability and statistics.
Prerequisites: 580.616 or 530.616 Linear Dynamical Systems.

EN.530.661. Applied Mathematics for Engineering.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

EN.530.676. Locomotion in Mechanical and Biological Systems.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information.
Instructor(s): C. Li.
EN.550.291. Linear Algebra and Differential Equations.
An introduction to the basic concepts of linear algebra, matrix theory, and differential equations that are used widely in modern engineering and science. Intended for engineering and science majors whose program does not permit taking both AS.110.201 and AS.110.302.
Prerequisites: (AS.110.106 OR AS.110.108) AND (AS.110.107 OR AS.110.109)
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

Study in depth of a special mathematical or computational area of operations research, or a particular application area. Recent topics: decision theory, mathematical finance, optimization software.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.550.493. Mathematical Image Analysis.
This course gives an overview of various mathematical methods related to several problems encountered in image processing and analysis, and presents numerical schemes to address them. It will focus on problems like image denoising and deblurring, contrast enhancement, segmentation and registration. The different mathematical concepts shall be introduced during the course; they include in particular functional spaces such as Sobolev and BV, Fourier and wavelet transforms, as well as some notions from convex optimization and numerical analysis. Most of such methods will be illustrated with algorithms and simulations on discrete images, using MATLAB.
Prerequisites: linear algebra, multivariate calculus, basic programming in MATLAB. Recommended Course Background: Real analysis
Prerequisites: (AS.110.202 OR AS.110.211) AND (EN.550.291 OR AS.110.201 OR AS.110.212)
Instructor(s): N. Charon
Area: Engineering, Quantitative and Mathematical Sciences.

This course considers algorithms for solving various nonlinear constrained optimization problems and, in parallel, develops the supporting theory. Topics include: necessary and sufficient optimality conditions for constrained optimization; projected-gradient and two-phase accelerated subspace methods for bound-constrained optimization; simplex, interior-point, Bender’s decomposition, and the Dantzig-Wolfe decomposition methods for linear programming; duality theory; penalty, augmented Lagrangian, sequential quadratic programming, and interior-point methods for general nonlinear programming. In addition, we will consider the Alternating Direction Method of Multipliers (ADMM), which is applicable to a huge range of problems including sparse inverse covariance estimation, consensus, and compressed sensing.
Instructor(s): S. Arguillere.

This core design course will cover lectures and hands-on labs. The material covered will include fundamentals of biomedical sensors and instrumentation, FDA regulations, designing with electronics, biopotentials and ECG amplifier design, recording from heart, muscle, brain, etc., diagnostic and therapeutic devices (including pacemakers and defibrillators), applications in prosthetics and rehabilitation, and safety. The course includes extensive laboratory work involving circuits, electronics, sensor design and interface, and building complete biomedical instrumentation. The students will also carry out design challenge projects, individually or in teams (examples include “smart cane for blind,” “computer interface for quadriplegic”). Students satisfying the design requirement must also register for EN.580.571.
Lab Fee: $150. Recommended Course Background: EN.520.345
Instructor(s): N. Thakor
Area: Engineering, Natural Sciences.

An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): J. Prince
Area: Engineering.

EN.600.226. Data Structures.
This course covers the design and implementation of data structures including collections, sequences, trees, and graphs. Other topics include sorting, searching, and hashing. Course work involves both written homework and Java programming assignments. Recommended Course Background: AP CS, EN.600.107, EN.600.111, EN.600.112 or equivalent.
Instructor(s): B. Langmead; S. More
Area: Engineering.

EN.600.226. Data Structures.
This course covers the design and implementation of data structures including collections, sequences, trees, and graphs. Other topics include sorting, searching, and hashing. Course work involves both written homework and Java programming assignments. Recommended Course Background: AP CS, EN.600.107, EN.600.111, EN.600.112 or equivalent.
Instructor(s): B. Langmead; S. More
Area: Engineering.

EN.600.435. Artificial Intelligence.
Students may receive credit for EN.600.335 or EN.600.435, not both. Graduate level version of EN.600.335 [Applications]. Prerequisite: EN.600.226, EN.550.171; Recommended: linear algebra, prob/stat.
Instructor(s): P. Koehn
Area: Engineering.
This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis] Formerly EN.600.336. Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Prerequisites: EN.600.226 and Linear Algebra and Probability; Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): S. Leonard
Area: Engineering.

This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Required Course Background: AS.110.201 or permission of instructor. Recommended Course Background: EN.600.226, EN.600.457, EN.600.461, image processing.
Prerequisites: EN.600.226
Instructor(s): R. Taylor
Area: Engineering.

EN.600.446. Computer Integrated Surgery II.
This weekly lecture/seminar course addresses similar material to EN.600.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis of presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.600.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. Students may also take this course as EN.600.646. The only difference between EN.600.446 and EN.600.646 is the level of project undertaken. Typically, EN.600.646 projects require a greater degree of mathematical, image processing, or modeling background. Prospective students should consult with the instructor as to which course number is appropriate. [Applications] Students may receive credit for EN.600.446 or EN.600.646, but not both.
Prerequisites: Prereq for EN.600.446: EN.600.445 or EN.600.645 or permission
Instructor(s): R. Taylor
Area: Engineering.

EN.600.461. Computer Vision.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modelling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. Students may receive credit for at most one of EN.600.361 or EN.600.461 or EN.600.661. [Applications] Prerequisites (soft): intro programming, linear algebra, and prob/stat.
Prerequisites: If you have completed EN.600.361 OR EN.600.661 you cannot enroll in EN.600.461.
Instructor(s): A. Reiter
Area: Engineering, Quantitative and Mathematical Sciences.

This course takes an application driven approach to current topics in machine learning. The course covers supervised learning (classification/structured prediction/regression/ranking), unsupervised learning (dimensionality reduction, bayesian modeling, clustering) and semi-supervised learning. Additional topics may include reinforcement learning and learning theory. The course will also consider challenges resulting from learning applications, such as transfer learning, multitask learning and large datasets. We will cover popular algorithms (naive Bayes, SVM, perceptron, HMM, winnow, LDA, k-means, maximum entropy) and will focus on how statistical learning algorithms are applied to real world applications. Students in the course will implement several learning algorithms and develop a learning system for a final project. [Applications] Recommended Course Background: multivariate calculus.
Instructor(s): I. Shpitser
Area: Engineering.

Graduate level version of EN.600.436 (see description above). Formerly EN.600.436. Students may receive credit for only one of EN.600.336, EN.600.436 or EN.600.636. Recommended Course Background: EN.600.226, AS.110.106, and Prob/Stat.
Prerequisites: Students may receive credit for only one of EN.600.336, EN.600.436 and EN.600.636.
Instructor(s): S. Leonard.

EN.600.646. Computer Integrated Surgery II.
Students may receive credit for EN.600.446 or EN.600.646, but not both. Advanced version of EN.600.446. [Applications]
Prerequisites: EN.600.445 OR EN.600.645 OR PERMISSION OF INSTRUCTOR
Instructor(s): R. Taylor.

EN.600.660. FFT in Graphics & Vision.
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariances, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations.
Instructor(s): M. Kazhdan.
EN.600.661. Computer Vision.
Graduate version of EN.600.461. Students may receive credit for at most one of EN.600.361 or EN.600.461 or EN.600.661. [Applications]
Prerequisites (soft): intro programming, linear algebra, and prob/stat.
Prerequisites: If you have completed EN.600.361 OR EN.600.461 you cannot enroll for EN.600.661.
Instructor(s): A. Reiter.

Faculty

Professors

Gregory Chirikjian

Ralph Etienne-Cummings
Professor (Electrical and Computer Engineering): Neuromorphic Computational Sensing and Integrated Microsystems; Courses: CAD Design of Digital VLSI Systems, Electronics Design Laboratory, Product Design Laboratory, Large Scale Analog Computation.

Gregory Hager
Professor (Computer Science): Computer Vision, Human-Machine Systems, Medical Applications; Courses: Computer Vision, Artificial Intelligence, Algorithms for sensor-based robotics.

Nassir Navab
Professor (Computer Science): Robotics, Vision and Graphics Group

Jerry Prince
Professor (Electrical and Computer Engineering): Medical Imaging and Computer Vision; Courses: Medical Imaging Systems.

Russell Taylor
Professor (Computer Science): Medical Robotics and Computer-Integrated Interventional Systems, Medical Imaging and Modeling; Courses: Computer Integrated Surgery I & II.

Louis Whitcomb

Associate Professors

Mehran Armand
Robotics Faculty with Secondary Appointments in the Whiting School of Engineering: Associate Research Professor (Applied Physics Laboratory): Medical Robotics and Computer-Integrated Interventional Systems; Biomechanics; Courses: Kinematics and Dynamics of Robots, Robot Control.

Noah Cowan
Associate Professor (Mechanical Engineering): Robotics, Dynamics, Controls, Locomotion, System Identification.

Rene Vidal
Associate Professor (Biomedical Engineering): Biomedical Imaging, Computer Vision and Machine Intelligence; Courses: Introduction to Linear Systems, Advanced Topics in Computer Vision, Advanced Topic in Machine Learning.

Assistant Professors

Emad Docteur
Robotics Faculty with Secondary Appointments in the Whiting School of Engineering: Assistant Professor (Radiology): Interventional Ultrasound.

Deniece Gayme
Assistant Professor (Mechanical Engineering): Dynamics and control of nonlinear, networked and spatially distributed systems. Applications include: the electric power grid, wall turbulence and wind farms. Courses: Nonlinear Dynamical Systems, Energy Systems Analysis.

Marin Kobilarov
Assistant Professor (Mechanical Engineering): Computational Dynamical Systems, Robot Control and Motion Planning; Courses: Nonlinear control and planning in robotics.

Suchi Saria
Assistant Professor (Computer Science): Computational healthcare; machine learning; probabilistic graphical models; human-centric dynamical systems.

Research Professor

Peter Kazanzides
Research Professor (Computer Science): Medical Robotics; Space Robots; Software Systems and Architectures; Robot Control Systems.

Associate Research Professor

Iulian Iordachita
Associate Research Professor (Mechanical Engineering): Medical Robotics; Mechanical Design

Assistant Research Professor

Austin Reiter
Assistant Professor (Computer Science)

Assistant Professor, Economics
M.Sc. 2007, Universidad Nacional de La Plata
M.A. 2008, Yale University; M.Phil. 2009; Ph.D. 2012

Laurence Ball (1/1994)
Professor, Economics
B.A. 1980, Amherst; Ph.D. 1986, M.I.T.

Bruce Barnett (1976)
Professor, Physics and Astronomy
B.A. 1965, Harvard
Ph.D. 1970, University of Maryland

Olivier Barnouin (2010)
Associate Research Professor, Earth and Planetary Sciences

Douglas Barrick (1997)
Professor, Biophysics; Biology
B.A. 1986, University of Colorado
Ph.D. 1993, Stanford

Francesco Bausi (2015)
Visiting Professor, German and Romance Languages and Literatures
Ph.D. 1993, University of Florence

Karen Beemon (1981)

Professor, Biology; Biophysics
B.S. 1969, University of Michigan
M.A. 1972, UC Berkeley, Ph.D. 1974

Charles Bennett (1/2005)
Professor, Physics and Astronomy
Alumni Centennial Professor
B.S. 1978, University of Maryland
Ph.D. 1984, M.I.T.

Jane Bennett (2004)
Professor, Political Science
B.A. 1979, Siena College
Ph.D. 1986, University of Massachusetts

Jacob Bernstein (2012)
Assistant Professor, Mathematics
B.A. 2005, University of Michigan
Ph.D. 2009 Massachusetts Institute of Technology

Trent Bertrand (2012)
Adjunct Professor, Economics

Sara S. Berry (2012)
Academy Professor
B.A. 1961, Radcliffe
M.A. 1965, University of Michigan, Ph.D. 1967

Richard Bett (1991)
Professor, Philosophy, Classics
B.A. 1980, Oxford
Ph.D. 1986, University of California

Luciana Bianchi (2006)
Research Professor, Physics and Astronomy

Wayne Biddle (1999)
Visiting Associate Professor, The Writing Seminars

William Blair (12/1993)
Research Professor, Physics and Astronomy

Barry Blumenfeld (1981)
Professor, Physics and Astronomy
M.Phil. 1973, Ph.D. 1974

Hilary Bok (2000)
Associate Professor, Philosophy
Henry R. Luce Professor of Bioethics and Moral and Political Theory

John Boland (2005)
Research Professor, Earth and Planetary Sciences

Doreen Bolger (3/1998)
Adjunct Professor, History of Art

Alex Bortvin (2004)
Adjunct Assistant Professor, Biology

Kit H. Bowen (1980)
Professor, Chemistry
E. Emmet Reid Professor of Chemistry
B.S. 1970, University of Mississippi
Faculty Listings

Ph.D. 1978, Harvard

Gregory Bowman (2005)
Assistant Professor, Biophysics; Biology
B.S. 1994, University of North Carolina
Ph.D. 2001, Princeton University

Arthur Bragg (2010)
Assistant Professor, Chemistry
B.A. 1999, Albion College
Ph.D. 2004, University of California, Berkeley

Ludwig Brand (2012)
Academy Professor
A.B. 1955, Harvard; Ph.D. 1960, Indiana University

Philip Brendese (2013)
Assistant Professor, Political Science
B.A. 1998, Siena College
M.A. 2000, University of Albany
Ph.D. 2005, Duke University

Collin Broholm (1990)
Professor, Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
M.Sc. 1985, University of Copenhagen, Ph.D. 1986

Jeffrey P. Brooks (1990)
Professor, History
B.A. 1965, Antioch; Ph.D. 1972, Stanford

Donald D. Brown (1969)
Adjunct Professor, Biology; Carnegie Institution

Rebecca Brown (2008)
Associate Professor, History of Art
B.A. 1993, Pomona College; M.A. 1995, University of Minnesota; Ph.D.
1999

Betsy Bryan (1986)
Professor, Near Eastern Studies; History of Art

Alexander Badawy Professor of Egyptian Art and Archaeology
B.A. 1971, Mary Washington College
M.A. 1975, Yale, M.Phil. 1976, Ph.D. 1980

Tamas Budavari (2011)
Associate Research Professor, Physics and Astronomy

Julia Burdick-Will (2014)
Assistant Professor, Sociology
Angus Burgin (2010)
Assistant Professor, History
B.A. 2002; Ph.D. 2009, Cambridge University

Ryan Calder (2014)
Assistant Professor, Sociology
B.A. 2001, Harvard University; M.A 2008, University of California,
Berkeley, Ph.D. 2014

Sharon Cameron (1978)
Professor, English

William R. Kenan Jr. Professor of English
B.A. 1968, Bennington College

M.A. 1969, Brandeis, Ph.D. 1973

Stephen Campbell (2002)
Professor and Chair, History of Art

Henry M. and Elizabeth P. Wiesenfeld Professor
B.A. 1985, Trinity College
M.A. 1988, University of North Carolina
Ph.D. 1993, Johns Hopkins University

Marc Caplan (2006)
Assistant Professor, German and Romance Languages and Literatures
Zelda and Myer Tandetnik Professor in Yiddish Language, Literature and
Culture
M.A. 1997 New York University, Ph.D. 2003

Adjunct Assistant Professor, Physics and Astronomy

Christopher Carroll (1995)
Professor, Economics

Victoria Cass (2010)
Visiting Associate Professor, Humanities Center

Sara Castro-Klarén (1987)
Professor, German and Romance Languages and Literatures
B.A. 1962, UCLA, M.A. 1965, Ph.D. 1968

Christopher Celenza (2005)
Professor and Chair, German and Romance Languages and
Literature's,Classics; History; Humanities Center

Charles Homer Haskins Professor of History
B.A. 1998, SUNY; M.A. 1989
Ph.D. 1995, Duke University
D.Phil 2001, University of Hamburg

Emma Cervone (2007)
Assistant Professor, Anthropology

Associate Director Program in Latin American Studies
A.B. 1987 Instituto Universitario Orientale
M.A. 1990 University of St. Andrews, Ph.D. 1997

Samuel Chambers (2008)
Associate Professor, Political Science
B.A. 1993 Pomona College
M.A. 1994 Vanderbilt University
Ph.D. 1998 University of Minnesota

Xin Chen (2008)
Assistant Professor, Biology

B.S. 1996 University of Science and Technology, Hefei, China
Ph.D. 2002 University of Texas

Andrew J. Cherlin (1976)
Professor and Chair, Sociology; Institute for Policy Studies
Public Policy Program
Benjamin H. Griswold III Professor of Public Policy
B.S. 1970, Yale; M.S. 1974, UCLA, Ph.D. 1976

Chia-Ling Chien (1976)
Professor, Physics and Astronomy

Jacob L. Hain Professor in Arts and Sciences
B.S. 1965, Tunghai University, M.S., 1968
Ph.D. 1973, Carnegie Mellon

Chenghao Chu (2008)
J.J. Sylvester Assistant Professor, Mathematics
M.S. 2003, B.S. 2000, University of Science and Technology of China
Ph.D. 2008, Northwestern University

Associate Professor, Political Science, Director of East Asian Studies and Co-Director of Racism, Immigration and Citizenship Program
B.A. 1991, University of California; M.A. 1994, University of Washington;
Ph.D. 2003, Northwestern University

Orna Cohen-Fix (2012)
Adjunct Professor, Biology

James Coleman (2010)
Visiting Assistant Professor, German and Romance Languages and Literatures

Richard A. Cone (1969)
Professor, Biophysics; Biology

Nathan Connolly (2008)
Assistant Professor, History; Co-Director of the Racism, Immigration and Citizenship Program
B.A. 1999 Thomas University
M.A. 2000, University of Chicago
M.A. 2004, University of Michigan, Ph.D. 2008

William E. Connolly (1985)
Professor, Political Science
Krieger-Eisenhower Professor
B.A. 1960, University of Michigan, Flint
M.A. 1962, University of Michigan, Ann Arbor
Ph.D. 1965

Caterina Consani (2005)
Professor, Mathematics
B.S. 1986, University of Genoa
Ph.D. 1993, Universities of Genoa-Turin
Ph.D. 1996, University of Chicago

Joseph Cooper (2012)
Academy Professor

Victor Corces (2009)
Adjunct Professor, Biology

Susan Courtney (1/1999)
Professor, Psychological and Brain Sciences
B.A. 1988, Williams, M.S. 1990
Ph.D. 1993, University of Pennsylvania

Matthew Crenson (1969)
Professor, part-time, Political Science
B.A. 1963, Johns Hopkins University
M.A. 1965, University of Chicago, Ph.D. 1969

Jennifer Culbert (2001)
Associate Professor, Political Science
B.S. 1986, Georgetown
M.S. 1987, London School of Economics and Political Science

Kyle Cunningham (8/1994)
Professor, Biology
B.A. 1984, Johns Hopkins University
Ph.D. 1989, UCLA

Annalisa Czeczulin, M.A.
Adjunct Assistant Professor, Center for Language Education-Russian

Paul Dagdigian (1974)
Professor, Chemistry

Arthur D. Chambers Professor of Chemistry
B.A. 1967, Haverford
Ph.D. 1972, University of Chicago

Andrew Daniel (2007)
Associate Professor, English
A.B. 1993, University of California, Berkeley
A.B. 1995, Oxford University
Ph.D. 2006, University of California, Berkeley

Ronald Daniels (3/2009)
Professor, Political Science
President, Johns Hopkins University

Veena Das (2000)
Professor, Anthropology, Humanities Center
Krieger-Eisenhower Professor
B.A. 1964, University of Delhi, M.A. 1966, Ph.D. 1970

Steven R. David (1981)
Professor, Political Science
Vice Dean for Undergraduate Education-8/2010, Zanvyl Krieger School of Arts and Sciences
B.A. 1972, Union College; M.A. 1975, Stanford

Carlos Del Castillo (2008)
Associate Research Professor, Earth and Planetary Sciences

Lisa DeLeonardis (2001)
Visiting Associate Professor, History of Art
Austen-Stokes Professor in the Art of the Ancient Americas

Paul Delnero (2008)
Assistant Professor, Near Eastern Studies
B.A. 1994, Purdue University
Ph.D. 2006, University of Pennsylvania

Stefanie DeLuca (2002)
Associate Professor, Sociology
B.A. 1997, University of Chicago
Ph.D. 2002, Northwestern

Daniel Deudney (1998)
Associate Professor, Political Science
Ph.D. 1989, Princeton

Hent de Vries (2003)
Professor, Humanities Center; Philosophy (2004)
Russ Family Professor of the Humanities
M.A. 1983, University of Leiden, Ph.D. 1989
Jocelyne DiRuggiero (2008)
Associate Research Professor, Biology,

Toby Ditz (1982)
Professor, History
B.A. 1972, Northwestern; M.A. 1975, Columbia
M.Phil. 1976, Ph.D. 1982

Thomas Dolby (2014)
Homewood Professor of the Arts and Artistic Director of the Program in
Sound on Film, Film and Media Studies

Gabor Domokos (1968)
Professor, part-time, Physics and Astronomy
M.A. 1956, Eotvos Lorand University (Budapest)
Doctor of Physical and Mathematical Sciences 1963, Joint Institute of
Nuclear Research, Dubna, Russia

David Draper (1980)
Professor, Chemistry; Biophysics; Biology
Vernon K. Krieble Professor of Chemistry
B.A. 1971, UC Berkeley
Ph.D. 1977, University of Oregon

Stephen Drigotas, Ph.D.
Teaching Professor (2010), Psychological and Brain Sciences

Gregory Duffee (2008)
Professor, Economics
Carl Christ Professor of Economics
B.A. 1983, Macalester College
Ph.D. 1990, Harvard University

Michael Edidin (1966)
Professor, Biology
B.S. 1960, University of Chicago
Ph.D. 1963, University of London

Kathryn Edin (2014)
Bloomberg Distinguished Professor, Sociology and Bloomberg School of
Public Health
B.A. 1984, North Park University; M.A. 1989, Northwestern University,
Ph.D. 1991

Howard Egeth (1965)
Professor, Psychological and Brain Sciences, Cognitive Science
A.B. 1961, Rutgers
Ph.D. 1966, University of Michigan

William Egginton (2006)
Professor and Chair, German and Romance Languages and Literatures
Andrew W. Mellon Professor of the Humanities
A.B. 1991, Dartmouth University
M.A. 1994, University of Michigan
A.M. 1996, Stanford University, Ph.D. 1999

Doris Entwisle (1/2003)
Research Professor, Sociology

Joyce Epstein (1975)
Research Professor, Sociology

Hülya Eraslan (2008)
Associate Professor, Economics
B.S. 1991, Bilkent University
M.A. 1994, State University of New York

Ph.D. 2001, University of Minnesota

D. Howard Fairbrother (1997)
Professor, Chemistry
B.A. 1989, Brasenose College, Oxford
Ph.D. 1994, Northwestern

S. Michael Fall (1/2002)
Adjunct Professor, Physics and Astronomy

Christopher Falzone (2007)
Teaching Professor, Chemistry; Biophysics

Chen-Ming Fan (1997)
Adjunct Professor, Biology

Steven Farber (2004)
Adjunct Assistant Professor, Biology

Jon Faust (1/2006)
Professor, Economics

Louis J. MacCinn Professor
B.S. 1981, University of Iowa
M. Phil. 1985, Oxford University
Ph.D. 1988, University of California, Berkeley

Lisa Feigenson (2003)
Associate Professor, Psychological and Brain Sciences; Cognitive
Science
B.A. 1997, Cornell University
Ph.D. 2003, New York University

Paul D. Feldman (1967)
Research Professor, Physics and Astronomy
A.B. 1960, Columbia College
Ph.D. 1964, Columbia University

Henry Ferguson (2002)
Adjunct Professor, Physics and Astronomy

Research Professor, Earth and Planetary Sciences
B.S. 1971, Stanford, M.S. 1971
Ph.D. 1975, Harvard

Ann Finkbeiner (1999)
Visiting Associate Professor, part-time, The Writing Seminars

Michael Finkenthal (2003)
Research Professor, Physics and Astronomy

Karen Fleming (2000)
Associate Professor, Biophysics; Biology
B.A. 1987, University of Notre Dame
Ph.D. 1993, Georgetown

Jonathan Flombaum (2008)
Assistant Professor, Psychological and Brain Sciences
A.B. 2002, Harvard
M.S. 2004, M. Phil. 2005
Ph.D. 2008, Yale University

Caroline Fohlin (2004)
Research Professor, Economics
Holland Ford (1988)
Research Professor, Physics and Astronomy
B.S. 1962, University of Oklahoma
Ph.D. 1970, University of Wisconsin

Pier Massimo Forni (1985)
Professor, German and Romance Languages and Literatures
B.A. 1974, University of Pavia
M.A. 1977, Catholic University, Milan
Ph.D. 1981, UCLA

Eckart Förster (2001)
Professor, Philosophy
Humanities Center, German and Romance Languages and Literatures (2002)
B.Phil 1979, Oxford, D.Phil. 1982

Caroline Fowler (2014)
Visiting Assistant Professor, History of Art
B.A. 2005, New York University; Ph.D. 2012, Princeton University

Ernesto Freire (1986)
Professor, Biology; Biophysics
Henry A. Walters Professor in Biology
B.S. 1972, University Pervana Cayetano Heredia
Medical School, M.S. 1973
Ph.D. 1977, University of Virginia

Michael Fried (1975)
Professor, Humanities Center; History of Art
James R. Herbert Boone Professor of Humanities
B.A. 1959, Princeton; Ph.D. 1969, Harvard

Yulia Frumer (2012)
Assistant Professor, History of Science and Technology
B.A. 2002, Tel Aviv University
M.A. 2004; Ph.D. 2012, Princeton

Francois Furstenberg (2014)
Associate Professor, History
B.A. 1994 Columbia University; Ph.D. 2003 Johns Hopkins University
Louis P. Galambos (1971)
Professor, History; Editor of the Eisenhower Papers
B.A. 1955, Indiana University
M.A. 1957, Yale, Ph.D. 1960

Joseph G. Gall (1983)
Adjunct Professor, Biology; Carnegie Institution

Michela Gallagher (1996)
Professor, Psychological and Brain Sciences
Krieger-Eisenhower Professor
B.A. 1969, Colgate
Ph.D. 1977, University of Vermont

Bertrand García-Morenó E. (1992)
Professor and Chair of Biophysics; Biology
A.B. 1981, Bowdoin; Ph.D. 1986, Indiana University

Mark Gersovitz (1994)
Professor, Economics
B.A. 1971, McGill
M.A. 1972, Yale, M.Phil. 1973, Ph.D. 1975

Riccardo Giacconi (1982)
University Professor, Physics and Astronomy

Benjamin Ginsberg (1992)
Professor, Political Science

David H. Bernstein Professor of Political Science
B.A. 1968, University of Chicago, M.A. 1970
Ph.D. 1973

Oliver Gjoneski (2011)
J.J. Sylvester Assistant Professor, Mathematics

Anand Gnanadesikan (2011)
Associate Professor, Earth and Planetary Sciences
A.B. 1988, Princeton University
Ph.D. 1994, Massachusetts Institute of Technology

Patrick Godon (2010)
Visiting Assistant Research Professor, Physics and Astronomy

David Goldberg (1998)
Professor, Chemistry
B.A. 1989, Williams
Ph.D. 1995, M.I.T

Eduardo González (1982)
Professor, German and Romance Languages and Literatures
B.A. 1965, University of South Florida, M.A. 1967
Ph.D. 1975, Indiana University

Linda Gorman, Ph.D.
Teaching Professor (2010), Psychological and Brain Sciences

Marc Greenberg (2002)
Professor, Chemistry
B.S. 1982, New York University; B.E. 1982
The Cooper Union School of Engineering
Ph.D. 1988, Yale University

Carol Greider (2014)
Bloomberg Distinguished Professor, Biology
B.A. 1983, University of California, Santa Barbara; PhD. 1987, University of California, Berkeley

Meredith Greif (2014)
Assistant Professor, Sociology

Andrei Gritsan (2005)
Associate Professor, Physics and Astronomy
B.S. 1994, Novosibirsk State University, Russia
M.S. 1996
Ph.D. 2000, University of Colorado

Steven Gross (2006)
Associate Professor, Philosophy
Cognitive Science; PBS-(2012)
A.B. 1987, Harvard University, Ph.D. 1998

Jane Guyer
Professor, Anthropology; History
B.A. 1965, London School of Economics and Political Science
Ph.D. 1972, University of Rochester

Nilofar Haeri (1990)
Professor and Chair, Anthropology

Thomas Haine (1999)
Professor and Chair, Earth and Planetary Sciences
Morton K. Blaustein Professor and Chair of Earth and Planetary Sciences
B.A. 1988, St. Catharines College, University of Cambridge
Ph.D. 1992, University of Southhampton

Justin Halberda (2003)
Associate Professor, Psychological and Brain Sciences, Cognitive Science
College of Charleston
Ph.D. 2001, New York University

Bruce Hall (2012)
Assistant Professor, History
B.A. 1994, University of Toronto
M.A. 1995, Queens University-Canada
Ph.D. 2005, University of Illinois

Marnie Halpern (1994)
Adjunct Professor, Biology

Bruce Hamilton (1973)
Professor part-time, Economics
B.A. 1968 Grinnell College
Ph.D. 1972, Princeton University

Clara Han (2007)
Assistant Professor, Anthropology
B.A. 1997, Princeton University
M.D. 2007, Harvard University, Ph.D. 2007

Michael Hanchard (2006)
Professor, Political Science
Society of Black Alumni Presidential Professor
A.B. 1981, Tufts University
M.A. 1985, New School for Social Research
Ph.D. 1991, Princeton University

Lingxin Hao (1996)
Professor, Sociology
B.A. 1982, South China Teachers University
M.A. 1985, Zhongshan University
Ph.D. 1990, University of Chicago

Michel Harrower (2010)
Assistant Professor, Near Eastern Studies
Earth and Planetary Sciences-(2011)
B.A. 1998, Simon Frazier University
M.A. 2001; Ph.D. 1990, Ohio State University

Samer Hattar (2004)
Associate Professor, Biology
B.S. 1991, Yarmouk University
M.S. 1993, American University of Beirut
Ph.D. 2000, University of Houston

Michael Hauser (1/1997)
Adjunct Professor, Physics and Astronomy

Professor, Physics and Astronomy
A. Hermann Pfund Professor
B.A. 1973, Harvard
Ph.D. 1978, University of Washington

Edward M. Hedgecock (1988)
Professor, Biology
B.S. 1974, California Institute of Technology
Ph.D. 1976, UC Santa Cruz

Richard C. Henry (1968)
Academy Professor (2012)
Research Professor, Physics and Astronomy
B.Sc. 1961, University of Toronto, M.A. 1962
Ph.D. 1967, Princeton

Jared Hickman (2008)
Assistant Professor, English
B.A. 2001, Bowdoin College
Ph.D. 2008, Harvard University

Vincent Hilser (2010)
Professor and Chair, Biology; Biophysics
B.S. 1987, St. Johns University
M.S. 1991, Manhattan College
Ph.D. 1995, Johns Hopkins University

Linda Hinnov (2004)
Research Professor, Earth and Planetary Sciences

Paul Hofer (1988)
Adjunct Assistant Professor, Psychological and Brain Sciences

Peter Holland (2001)
Professor, Psychological and Brain Sciences
Krieger-Eisenhower Professor
B.S. 1972, Michigan State University
Ph.D. 1976, Yale

Mark Holzer (2014)
Visiting Associate Professor, Earth and Planetary Sciences
B.Sc. 1984, Simon Fraser University; Ph.D. 1990

Sarah Horst (2014)
Assistant Professor, Earth and Planetary Sciences
B.S. 2004, California Institute of Technology; Ph.D. 2011, The University of Arizona
M. Andrew Hoyt (1/1988)
Professor, Biology
B.S. 1977, State University of New York at Stony Brook
Ph.D. 1983, UC Berkeley

Yingyao Hu (2011)
Associate Professor, Economics
B.E. 1994, Tsinghua University, Beijing
M.A. 1997, Fudan University, Shanghai
M.S.E., M.A. 2001, Johns Hopkins University, Ph.D. 2003

Ru-Chih Huang (1965)
William David McElroy Research Professor, Biology
B.S. 1953, National Taiwan University
M.S. 1956, VPI; Ph.D. 1960, Ohio State University

Ho-Fung Hung (2011)
Associate Professor, Sociology
B.Soc.Sc. 1995, Chinese University of Hong Kong
M.Phil. 1998
M.A. 1999, State University of New York
Ph.D. 2004 Johns Hopkins University
Nicholas Ingolia (2010)
Adjunct Assistant Professor, Biology

John T. Irwin (1977)
Professor, The Writing Seminars; English
The Decker Professor in the Humanities
B.A. 1962, University of St. Thomas
M.A. 1970, Rice University, Ph.D. 1970
Jeanne-Marie Jackson (2014)
Assistant Professor, English
B.A. 2006, Drew University; M.Phil 2010, Yale University; M.A. 2010,
Ph.D. 2012
Nicolas Jabko (2011)
Associate Professor, Political Science
M.A. 1994; Ph.D. 2001, University of California, Berkley

Richard Jasnow (1995)
Professor, Near Eastern Studies
B.A. 1977, University of Wisconsin
M.A. 1986, University of Chicago, Ph.D. 1988

Olivier Jeanne (2008)
Professor, Economics
1987, Graduate, Ecole Nationale des Ponts et Chaussée, Paris
Ms.C 1991, London School of Economics
Ph.D. 1996, Ecole des Hautes Etudes en Sciences Sociales

Peter Jelavich (2001)
Professor, History
B.A. 1975, Amherst
M.A. 1977, Princeton, Ph.D. 1982

Margaret Johnson (2012)
Assistant Professor, Biophysics
B.S. 2004, Columbia University
Ph.D. 2009, University of California-Berkeley

Michael Johnson (1994)
Professor, History
A.B. 1963, Knox College
M.A. 1967, Stanford, Ph.D. 1973

Mayumi (Yuki) Johnson (2010)
Teaching Professor and Director, Center for Language Education
B.A. 1979, Seijo University
M.A. 1989, University of Michigan
Ph.D. 1994, University of Minnesota

Richard Kagan (1972)
Professor, History; German and Romance Languages and Literatures
Arthur O. Lovejoy Professor of History
B.A. 1965, Columbia
Ph.D. 1968, Cambridge University

Patricia Kain (2004)
Teaching Professor, English

Director, Expository Writing Program (EWP)

Marc Kamionkowski (2011)
Professor, Physics and Astronomy
B.A. 1987, Washing University;
Ph.D. 1991, University of Chicago

David Kaplan (2002)
Professor, Physics and Astronomy
B.A. 1991, University of California, M.S. 1996
Ph.D. 1999, University of Washington

Jared Kaplan (2012)
Assistant Professor, Physics and Astronomy
B.S. 2005, Stanford University;
Ph.D. 2009, Harvard University

Robert Kargon (1965)
Professor, History of Science and Technology
Willis K. Shepard Professor of History of Science
B.S. 1959, Duke; M.S. 1960, Yale
Ph.D. 1964, Cornell

Kenneth Karlin (1989)
Professor, Chemistry
Ira Remsen Professor of Chemistry
B.S. 1970, Stanford; Ph.D. 1975, Columbia University

Edi Karni (1981)
Professor, Economics
Scott and Barbara Black Professor of Economics
B.A. 1965, The Hebrew University, M.A. 1970
M.A. 1971, University of Chicago, Ph.D. 1971

David Katz (2006)
Visiting Assistant Professor, Near Eastern Studies

Richard S. Katz (1976)
Professor and Chair, Political Science
A.B. 1969, University of Michigan
M.Phil. 1971, Yale, Ph.D. 1974

Margaret Keck (1995)
Professor, Political Science; German and Romance Languages and Literatures

Professor, Economics
Abram G. Hutzler Professor of Political Economy
B.S. 1969, London School of Economics
M.Phil. 1972, Yale, Ph.D. 1973

Naveeda Khan (2006)
Assistant Professor, Anthropology
B.A. 1992, Vassar College
M.A. 1995, New School for Social Research
Ph.D. 2003, Columbia University

Dong-Won Kim (1999)
Visiting Professor, History of Science and Technology

Sharon Kingsland (1981)
Professor, History of Science and Technology
B.S. 1973, University of Toronto, M.A. 1977, Ph.D. 1981
Faculty Listings

Nitya Kitchloo (2010)
Professor, Mathematics
B.S. 1993, California Institute of Technology
Ph.D. 1998, Massachusetts Institute of Technology

Matthew Klam (2009)
Assistant Professor, The Writing Seminars
B.A. 1986, Hollins College
M.A. 1992, University of New Hampshire

James Knierim (2/2009)
Associate Research Professor, Psychological and Brain Sciences

Melvin L. Kohn (2012)
Academy Professor
B.A. 1948, Cornell, Ph.D. 1952

Douglas Kosland (1987)
Adjunct Professor, Biology; Carnegie Institution

Susan Kővesi-Domokos (1974)
Professor, part-time, Physics and Astronomy
Ph.D. 1963, Eotvos Lorand University (Budapest)

Sharon Krag (2005)
Adjunct Professor, Biology

Jonathan Kramnick (1/2013)
Professor, English
B.A. 1989, Cornell University
M.A. 1992, Johns Hopkins University; Ph.D. 1995

Elena Krasnokutskaya (2010)
Assistant Professor, Economics
B.A. 1993, Fudan University, B.Ed. 1990
M.A. 1995, University of Virginia
Ph.D. 2000, University of Pennsylvania

Andrea Krauss (2011)
Assistant Professor, German and Romance Languages and Literatures
Ph.D. 2001, Freie Universität Berlin

Professor, Physics and Astronomy
S.B. 1971, M.I.T.
Ph.D. 1977, University of California

Reiji Kuruvilla (2005)
Associate Professor, Biology
B.Sc. 1987, Calcutta University, B.Ed. 1990
Ph.D. 1998, University of Houston

Michael Kwass (2011)
Associate Professor, History
B.A. 1986, University of Pennsylvania
M.A. 1989, University of Michigan; Ph.D 1994

Christopher Lakey (2013)
Assistant Professor, History of Art
B.A. 1996, Baylor University; M.A. 1999 University of Toronto; Ph.D. 2009, University of California, Berkeley
Barbara Landau (1/2000)
Professor, Cognitive Science, Psychological and Brain Sciences
Dick and Lydia Todd Faculty Development Professor of Cognitive Science
Vice Provost for Faculty Affairs (2011)

B.A. 1970, University of Pennsylvania
Ed.M. 1977, Rutgers
Ph.D. 1982, University of Pennsylvania

Pier Larson (1998)
Professor, History
B.A. 1985, University of Minnesota
M.A. 1987, University of Wisconsin, Ph.D. 1992

Jacob Lauinger (2010)
Assistant Professor, Near Eastern Studies
B.A. 1999, Princeton University
M.A. 2001; Ph.D. 2007, University of Chicago

Thomas Leckta (6/1994)
Professor, Chemistry
Jean and Norman Scowe Professor of Chemistry
B.A. 1985, Oberlin; Ph.D. 1991, Cornell

Juliette Lecomte (2007)
Professor, Biophysics; Biology
B.S. 1977, Université de Liège, Belgium
M.S. 1979, Carnegie Mellon University, Ph.D. 1982

Yuan Chuan Lee (1965)
Research Professor, Biology McCollum—Pratt Institute
B.S. 1955, National Taiwan University, M.S. 1957
Ph.D. 1962, Iowa State University

Young-Sam Lee (2010)
Assistant Professor, Biology
B.S. 1995; M.S. 1997, Seoul National University, Korea
M.S. 2000, Indiana University
Ph.D. 2005, University of Chicago

Geraldine Legendre (1995)
Professor, Cognitive Science
B.A. 1971, Lycée d’Etat Marguerite de Navarre, Bourges, France
Ph.D. 1987, UC San Diego

Robert Leheny (2000)
Associate Professor, Physics and Astronomy
A.B. 1989, Princeton
Ph.D. 1997, University of Chicago

Brad Leithauser (2007)
Professor, The Writing Seminars
B.A. 1975 Harvard University
J.D. 1980, Harvard University

Lori Leonard (2007)
Adjunct Associate Professor, Anthropology

Stuart W. Leslie (1984)
Professor and Chair, History of Science and Technology History (2004)
B.A. 1974, Carleton
M.A. 1976, University of Delaware, Ph.D. 1980

Michael Levien (2013)
Assistant Professor, Sociology
B.A. 2001, Williams College
M.A. 2007, University of California-Berkeley
Ph.D. May 2013

Naomi Levin (2009)
Assistant Professor, Earth and Planetary Sciences  
B.A. 2000, B.S. 2000, Stanford University  
M.S. 2002, University of Arizona  
Ph.D. 2008, University of Utah

Kevin Lewis (2014)  
Assistant Professor, Earth and Planetary Sciences  
B.S. 2003, Tufts University; Ph.D. 2009, California Institute of Technology

Theodore Lewis (2002)  
Professor, Near Eastern Studies  
Blum-Iwry Professor of Near Eastern Studies  
B.A. 1978, University of Wisconsin, M.A. 1979  
Ph.D. 1986, Harvard

Ruth Leys (1980)  
Professor, Humanities Center; History  
Henry M. and Elizabeth P. Wiesenfeld Professor  
B.A. 1961, Oxford University  

Michael Joseph Lichten (2012)  
Adjunct Professor, Biology

John Lind (2011)  
J.J. Sylvester Assistant Professor, Mathematics

Hans Lindblad (1/2011)  
Professor, Mathematics  
M.S. 1985, Lund Institute of Technology; Ph.D. 1989

Leonardo Lisi (2008)  
Associate Professor, Humanities Center  
B.A. 2002, University of York  
M.Phil. 2004, M.A. 2004, Ph.D. 2008; Yale University

Morris Low (1/2007)  
Adjunct Associate Professor, History of Science and Technology  
B.S. 1982, Griffith University, B.S. 1984  
Ph.D. 1993, University of Sydney

Richard Macksey (1958)  
Professor, part-time, Humanities Center, The Writing Seminars

Petar Maksimovic (1/2001)  
Professor, Physics and Astronomy  
B.S. 1992, University of Belgrade  
Ph.D. 1997, M.I.T.

Dora Malech (2014)  
Assistant Professor, The Writing Seminars  
BA 2003, University of Iowa Writers’ Workshop; M.F.A. 2005, Yale University

Douglas Mao (2007)  
Professor, English  
B.A. 1987, Harvard University  
Ph.D. 1993, Yale University

Nina Markovic (2002)  
Associate Professor, Physics and Astronomy  
B.S. 1993, University of Zagreb, Croatia  
Ph.D. 1998, University of Minnesota

Renee Marlin-Bennett (2007)  
Professor, Political Science  
B.A. 1981, Pomona College  
S.M. 1983, M.I.T., Ph.D. 1987

Paola Marrati (2003)  
Professor, Humanities Center; Philosophy (2004)  
M.A. 1988, Università degli studi di Pisa  
D.E.A. 1989, École des Hautes Études en Sciences Sociales  
Ph.D. 1995 Université Marc Bloch, Strasbourg

Tobias Marriage (2010)  
Assistant Professor, Physics and Astronomy  
A.B. 2000; Ph.D. 2006, Princeton University  
C.A.S.M. 2001, University of Cambridge

Bruce Marsh (1974)  
Academy Professor, Earth and Planetary Sciences  
B.S. 1969, Michigan State University  
M.S. 1971, University of Arizona  
Ph.D. 1974, UC Berkeley

Professor and Chair, History  
B.A. 1983, Cambridge University  
M.A. 1985, Johns Hopkins University; Ph.D. 1990

Sebastian Mazzuca (2015)  
Assistant Professor, Political Science  

J. Michael McCaffery (2006)  
Research Professor, Biology

Stephan McCandliss (1999)  
Research Professor, Physics and Astronomy

P. Kyle McCarter Jr. (1985)  
Professor, Near Eastern Studies  
William Foxwell Albright Professor of Biblical and Ancient Near Eastern Studies  
B.A. 1967, University of Oklahoma  
M.Div. 1970, McCormic Theological Seminary  
Ph.D. 1974, Harvard

Susan McCarter (2000)  
Adjunct Assistant Professor, Near Eastern Studies

Richard McCarty (1990)  
Professor, part-time, Biology  
William D. Gill Professor of Biology  
A.B. 1960; Ph.D. 1964, Johns Hopkins University

Michael McCloskey (1978)  
Professor, Cognitive Science; Psychological and Brain Sciences  
B.A. 1975, Emory; M.A. 1977, Princeton, Ph.D. 1978

Peter McCullough (2012)  
Adjunct Associate Professor, Physics and Astronomy

Alice McDermott (1999)  
Professor, The Writing Seminars  
The Richard A. Macksey Professor for Distinguished Teaching in the Humanities  
B.A. 1975, State University of New York  
M.A. 1978, University of New Hampshire
Katrina Bell McDonald (1994)
Associate Professor, Sociology
Associate Dean for Multicultural Affairs --9/15/2008
B.A. 1983, Mills College; M.A. 1984, Stanford
M.A. 1990, UC Davis, Ph.D. 1995

Jean McGarry (1988)
Professor and Co-Chair, The Writing Seminars
A.B. 1970, Harvard
M.A. 1983, Johns Hopkins University

James McPartland (1975)
Research Professor, Sociology
Director of the Center for the Study of Social Organization of Schools

Tyrel McQueen (2009)
Assistant Professor, Chemistry; Physics and Astronomy
B.S. 2004, Harvey Mudd College
M.A. 2006; Ph.D. 2009, Princeton University

Yitzhak Melamed (2008)
Associate Professor, Philosophy, Humanities Center
B.A./M.A. 1995, M.A. 1996, Tel Aviv University
M.Phil. 2000, Yale University, Ph.D. 2005

Kirill Melnikov (2008)
Associate Professor, Physics and Astronomy
M.Sc 1991, Novosibirsk State University, Russia
Ph.D. 1996 Johannes Gutenberg University, Germany

Brice Menard (2010)
Assistant Professor, Physics and Astronomy
Ph.D. 2002, Max Planck Institute

Mitchell Merback (2008)
Professor, History of Art
B.A. 1985 Alfred University
M.A. 1989, University of Chicago, Ph.D. 1995

Mona Merling (2014)
Chikako Mese (2004)
Professor and Chair, Mathematics
B.S. 1991, University of Dayton
M.S. 1994, Stanford University
Ph.D. 1996, Stanford University

Gerald J. Meyer (1991)
Professor and Chair, Chemistry Bernard N. Baker Professor in Chemistry
B.S. 1985, SUNY at Albany
Ph.D. 1989, University of Wisconsin

James Meyer (2012)
Adjunct Professor, History of Art

Tobie Meyer-Fong (2000)
Professor, History
B.A. 1989, Yale

Deborah Mifflin (1999)
Associate Teaching Professor, German and Romance Languages and Literatures
Coordinator, German Language Program

Charles D. Miller Professor

William P. Minicozzi II (1994)
Professor, Mathematics
Krieger-Eisenhower Professor
B.A. 1990, Princeton
Ph.D. 1994, Stanford

Sidney Mintz (2004)
Research Professor, Anthropology

Michele Miozzo (2005)
Assistant Research Professor, Cognitive Science

Robert A. Moffitt (1995)
Professor and Chair, Economics; Institute for Policy Studies Public Policy Program
Krieger-Eisenhower Professor
B.A. 1970, Rice
M.A. 1972, Brown, Ph.D. 1975

Silvia Montiglio (2010)
Professor, Classics
Gildersleeve Professor of Classics
Laurea 1984, University of Pavia

H. Warren Moos (1964)
Research Professor, Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
Sc.B. 1957, Brown, M.A. 1959
Ph.D. 1961, University of Michigan

Jack Morava (1980)
Professor, Mathematics; Physics and Astronomy
Ph.D. 1969, Rice University

Philip Morgan (2000)
Professor, History
Harry C. Black Professor of History
B.A. 1971, Cambridge University
Ph.D. 1977, University College London

Stephen Morgan (2014)
Bloomberg Distinguished Professor, Sociology and School of Education
B.A. 1993, Harvard University; M.Phil 1995, Oxford University; M.A. 1997, Harvard University; Ph.D. 2000
Anne Eakin Moss (2012)
Assistant Professor, Humanities Center
B.A. 1995, Harvard
M.A. 1998, Stanford; Ph.D. 2005

Kenneth Moss (2002)
Associate Professor, History

Evangelos N. Moudrianakis (1965)
Professor, Biology; Biophysics
B.S. 1959, University of Athens
M.A. 1963, Johns Hopkins University, Ph.D. 1964
Charles Mountain (2005)
Professor, part-time, Physics and Astronomy

Dean Moyar (2002)
Associate Professor, Philosophy
B.S. 1994, Duke University
M.A. 1998, University of Chicago, Ph.D. 2002

Stephen Murray (2009)
Research Professor, Physics and Astronomy

Christopher Nealon (2008)
Professor, English
B.A. 1989, Williams College
M.F.A. 1993, Warren William College
Ph.D. 1997, Cornell University

Jacques Neefs (2006)
Professor, German and Romance Languages and Literatures
James M. Beall Professor of French Literature
Maitrise 1968, Ecole Normale Superierure (Ulm)
Ph.D. 1987, Universite de Paris VIII

David Neufeld (1989)
Professor, Physics and Astronomy
B.A. 1981, Cambridge University
M.Sc. 1983, University of Sussex
Ph.D. 1987, Harvard

Katherine Newman (9/2010)
Professor, Sociology

James B. Knapp Dean (9/2010)
Zanvyl Krieger School of Arts and Sciences
B.A. 1975, University of California, San Diego
Ph.D. 1979, University of California, Berkeley

Stephen Nichols (2010)
Research Professor, German and Romance Languages and Literatures

Predrag Nikolic (2009)
Adjunct Assistant Professor, Physics and Astronomy

Adjunct Professor, History of Art

Aaron Noonberg (1989)
Adjunct Assistant Professor, Psychological and Brain Sciences

Colin Norman (12/1983)
Professor, Physics and Astronomy
B.E. 1969, University of Melbourne
D.Phil. 1973, Oxford

Juan Obarrio (2009)
Assistant Professor, Anthropology
Licenciado 1996, University of Buenos Aires
M. Phil. 2001, Ph.D. 2006, Columbia University

Kate Okikiolu (1/2011)
Professor, Mathematics
B.A. 1986, Cambridge University
Ph.D. 1991, UCLA

Peter Lee Olson (1977)
Professor, Earth and Planetary Sciences

Charles Mountain (2005)
Professor, part-time, Physics and Astronomy

Dean Moyar (2002)
Associate Professor, Philosophy
B.S. 1994, Duke University
M.A. 1998, University of Chicago, Ph.D. 2002

Stephen Murray (2009)
Research Professor, Physics and Astronomy

Christopher Nealon (2008)
Professor, English
B.A. 1989, Williams College
M.F.A. 1993, Warren William College
Ph.D. 1997, Cornell University

Jacques Neefs (2006)
Professor, German and Romance Languages and Literatures
James M. Beall Professor of French Literature
Maitrise 1968, Ecole Normale Superierure (Ulm)
Ph.D. 1987, Universite de Paris VIII

David Neufeld (1989)
Professor, Physics and Astronomy
B.A. 1981, Cambridge University
M.Sc. 1983, University of Sussex
Ph.D. 1987, Harvard

Katherine Newman (9/2010)
Professor, Sociology

James B. Knapp Dean (9/2010)
Zanvyl Krieger School of Arts and Sciences
B.A. 1975, University of California, San Diego
Ph.D. 1979, University of California, Berkeley

Stephen Nichols (2010)
Research Professor, German and Romance Languages and Literatures

Predrag Nikolic (2009)
Adjunct Assistant Professor, Physics and Astronomy

Adjunct Professor, History of Art

Aaron Noonberg (1989)
Adjunct Assistant Professor, Psychological and Brain Sciences

Colin Norman (12/1983)
Professor, Physics and Astronomy
B.E. 1969, University of Melbourne
D.Phil. 1973, Oxford

Juan Obarrio (2009)
Assistant Professor, Anthropology
Licenciado 1996, University of Buenos Aires
M. Phil. 2001, Ph.D. 2006, Columbia University

Kate Okikiolu (1/2011)
Professor, Mathematics
B.A. 1986, Cambridge University
Ph.D. 1991, UCLA

Peter Lee Olson (1977)
Professor, Earth and Planetary Sciences

B.A. 1972, University of Colorado
M.A. 1974, UC Berkeley, Ph.D. 1977

Akira Omaki (2011)
Assistant Professor, Cognitive Science
B.A. 2002, University of Hawaii
M.A. 2005, Sofia University
Ph.D. 2010, University of Maryland

Yi-Ping Ong (2010)
Assistant Professor, Humanities Center
B.A. 2001, Oxford University
M.A. 2004, 2006; Ph.D. 2009; Harvard University

Katrin Pahl (8/2005)
Associate Professor, German and Romance Languages and Literatures
Maitrise 1992, Universite de Paris, IV, Sorbonne
Ph.D. 2001, University of California, Berkeley

Anand Pandian (2007)
Associate Professor, Anthropology
B.A. 1994, Amherst University
Ph.D. 2004, University of California, Berkeley

Nick Papageorge (2012)
Assistant Professor, Economics
B.A. 2000, University of Chicago
M.A. 2005, Die Humboldt University
Ph.D. 2012 Washington University

Gabriel Paquette (2011)
Professor, History
B.A. 1999, Wesleyan University
M.A. 2001, National University of Island
M.Phil. 2002; Ph.D. 2006, University of Cambridge

Soojin Park (2011)
Assistant Professor, Cognitive Science
B.A. 2004, Yonsei University, Korea
M.S. 2005; M.Phil. 2006; Ph.D. 2008, Yale University

Benjamin Passey (2009)
Assistant Professor, Earth and Planetary Sciences
B.S. 2001, M.S. 2004, Ph.D. 2007, University of Utah

Felipe Pereda (2011)
Professor, History of Art
Nancy H. and Robert E. Hall Professor of the Humanities
B.A. 1991, Universidad Complutense de Madrid
B.A. 1994, Universidad Nacional de Educacion Distancia
Ph.D. 1996, Universidad Autonoma de Madrid

Herbert Petri (1992)
Adjunct Professor, Psychological and Brain Sciences

Cedomir Petrovic (2007)
Adjunct Professor, Physics and Astronomy

Stephen Plank (1997)
Adjunct Professor, Physics and Astronomy

Douglas Poland (1969)
Professor, Chemistry
B.A. 1961, Cornell, Ph.D. 1966

Deborah Poole (2002)
Professor, Anthropology
B.A. 1974, University of Michigan
Ph.D. 1984, University of Illinois

Maria Portuondo (2008)
Associate Professor, History of Science and Technology
B.S.E.E. 1984, University of Miami
Ph.D. 2005, Johns Hopkins University

Gary H. Posner (1969)
Research Professor, Chemistry
Jean and Norman Scowe Professor of Chemistry
B.A. 1964, Brandeis
Ph.D. 1968, Harvard

Lawrence Principe (1997)
Professor, History of Science and Technology
Chemistry; Philosophy (2004)
Drew Family Professor in the Humanities
B.A. and B.S. 1983, University of Delaware
Ph.D. 1988, Indiana University
Ph.D. 1996, Johns Hopkins University

Peter Privalov (1991)
Research Professor, Biology; Biophysics
Faculty of Physics 1956, Tbilisi University, Georgia USSR
Ph.D. 1964

Lawrence Raifman (1992)
Adjunct Assistant Professor, Psychological and Brain Sciences
Brenda Rapp (1994)
Professor and Chair, Cognitive Science
Psychological and Brain Sciences
B.S. 1979, University of Maryland
M.A. 1987, Johns Hopkins University, Ph.D. 1991

Peter Rapp (2008)
Adjunct Professor, Psychological and Brain Sciences
Kyle Rawlins (2010)
Assistant Professor, Cognitive Science
B.A. 2003; B.S. 2003, University of Massachusetts M.A. 2006
Ph.D. 2008, University of California, Santa Cruz

Eugenio Refini (2014)
Assistant Professor, German and Romance Languages and Literatures
B.A. 2005, University of Pisa and Scuola Normale Superiore; M.A. 2007, Ph.D. 2010

Daniel Reich (1990)
Professor and Chair, Physics and Astronomy
Ph.D. 1988, University of Chicago

Brian Reilly (2010)
Visiting Assistant Professor, German and Romance Languages and Literatures
Sharlyn Rhee (2005)
Visiting Assistant Professor, Humanities Center
Adam Riess (1/2006)
Professor, Physics and Astronomy
Thomas J. Barber Professor of Physics and Astronomy
B.S. 1992, M.I.T.
A.M. 1994, Harvard University
Ph.D. 1996, Harvard University

Mark O. Robbins (1/1986)
Professor, Physics and Astronomy
B.A. 1977, Harvard; M.A. 1977
Ph.D. 1983, University of California

Elijah Roberts (2012)
Assistant Professor, Biophysics
B.S. 1996, Ohio University;
Ph.D. 2010, University of Illinois

James Roberts (2010)
Assistant Research Professor, Earth and Planetary Sciences
Elizabeth Rodini (2004)
Teaching Professor/Director of Museums and Society
B.A. 1986, University of Wisconsin
M.A. 1989, University of Michigan
Ph.D. 1995, University of Chicago

Steven Rokita (2012)
Professor, Chemistry
B.S. 1979, University of California-Berkeley
Ph.D. 1983, MIT

Matthew Roller (1994)
Professor, Classics
B.A. 1988, Stanford
M.A. 1990, UC Berkeley, Ph.D. 1994

George Rose (2002)
Professor, Biophysics, Krieger-Eisenhower Professor
B.S. 1963, Bard College
M.S. 1972, Oregon State University, Ph.D. 1976

Jesse Rosenthal (2010)
Assistant Professor, English
B.A. 1998, Swarthmore College
M.A. 2003; M.Phil. 2005
Ph.D. 2009, Columbia University

Justine Roth (2003)
Associate Professor, Chemistry
B.S. 1994, University of Florida
Ph.D. 2000, University of Washington

Erin Rowe (2012)
Assistant Professor, History
Ph.D. 2005, Johns Hopkins University

William Rowe (1982)
Professor, History
John and Diane Cooke Professor of Chinese History
A.B. 1967, Wesleyan
M.A. 1976, Columbia University, Ph.D. 1980

Catherine Royer (2005)
Visiting Professor, Biophysics
Elena Russo (2000)
Professor, German and Romance Languages and Literatures
Baccalaurat 1977, Lycée Chateaubriand
Licence ès Lettres 1982, Université de Genève
Ph.D. 1988, Princeton

Marina Rustow (2010)
Associate Professor, History
Charlotte Bloomberg Professor in the Humanities
M.A. 1998; M.Phil 1999
Ph.D. 2004, Columbia University

Mary Ryan (2002)
Professor, History
John Martin Vincent Professor in History
B.A. 1967, University of Wisconsin, M.A. 1968
Ph.D. 1971, University of California

Robert Rynasiewicz (1986)
Professor, Philosophy
Sc.B. 1974, Brown
Ph.D. 1981, University of Minnesota

Lester M. Salamon (1986)
Professor, Political Science
B.A. 1964, Princeton; Ph.D. 1971, Harvard

Mary Jo Salter (2007)
Professor and Co-Chair, The Writing Seminars
B.A. 1976, Harvard University
M.A. 1978, University of Cambridge

Olya Samilenko (1992)
Adjunct Associate Professor, Center for Language Educatio-Russian

Yuya Sasaki (2012)
Assistant Professor, Economics
B.S. 2002, Utah State University
M.S. 2007; Ph.D. 2012, Brown University

George Scangos (1/1992)
Adjunct Professor, Biology

Joel Schildbach (1996)
Professor and Vice Dean, Biology
B.A. 1986, Oregon State University
Ph.D. 1992, Harvard

Robert Schleif (1989)
Professor, Biology, Biophysics
B.S. 1963, Tufts; Ph.D. 1967, UC Berkeley

Daniel Schlozman (2012)
Assistant Professor, Political Science
A.B. 2003 Harvard University; Ph.D. 2011

Trina Schroer (1/1990)
Professor, Biology
B.S. 1980, Stanford; Ph.D. 1986, UC San Francisco

Regine Schulz (2008)
Adjunct Professor, Near Eastern Studies

Glenn Schwartz (1996)
Professor and Chair, Near Eastern Studies
Whiting Professor of Archaeology

B.A. 1976, Yale, M.Phil. 1980, Ph.D. 1982

Loreto Sánchez Serrano (1999)
Associate Teaching Professor (2010), German and Romance Languages and Literatures

Alan Shapiro (1997)
Professor, Classics; History of Art
W. H. Collins Vickers Professor of Archaeology
B.A. 1971, Swarthmore
M.A. 1972, UC Berkeley; Ph.D. 1977, Princeton

Adam Sheingate (2000)
Associate Professor, Political Science
B.S. 1991, University of Wisconsin, M.A. 1993
Ph.D. 1998, Yale

Amy Shelton (1/2002)
Associate Professor, Psychological and Brain Sciences
B.S. 1993, Illinois State University
Ph.D. 1999, Vanderbilt

Alexandra Shepard (2015)
John Hinkley Visiting Professor, History
B.A. 1991, Clare College; M.Phil 1994, Yale University; Ph.D. 1998, University of Cambridge

Todd Shepard (2008)
Associate Professor, History; German and Romance Languages and Literatures
B.A. 1991, Wesleyan University
Ph.D. 2002 Rutgers University

Bernard Shiffman (1973)
Professor and Chair, Mathematics
B.S. 1964, M.I.T.; Ph.D. 1968, University of California

Vyacheslav Shokurov (1991)
Professor, Mathematics
D.Sc. 1976, Steklov Institute
Ph.D. 1976, Moscow State University

Stephen Shore (2007)
Assistant Professor, Economics
A.B. 1998, Princeton University
M.A. 2001, Harvard University, Ph.D. 2003

Harry Sieber (1967)
Professor, German and Romance Languages and Literatures
History B.A. 1963, Baylor
Ph.D. 1967, Duke University

Joseph Silk (2010)
Homewood Professor, Physics and Astronomy

Beverly J. Silver (1992)
Professor, Sociology
B.A. 1980, Barnard
Ph.D. 1992, SUNY, Binghamton

Harris J. Silverstone (1/1965)
Professor, Chemistry
A.B. 1960, Harvard
Ph.D. 1964, California Institute of Technology

David Smith (1/2003)
Faculty Listings

Professor, The Writing Seminars
Elliott Coleman Professor
B.A. 1965, University of Virginia
M.A. 1969, Southern Illinois University
Ph.D. 1976, Ohio University

Wayne Smith (2000)
Adjunct Professor, Political Science

Brian Smithling (2012)
Assistant Professor, Mathematics
S.B. 2001, MIT
M.S. 2003, University of Chicago; Ph.D. 2007

Paul Smolensky (1994)
Professor, Cognitive Science
Krieger-Eisenhower Professor
A.B. 1976, Harvard
M.S. 1977, Indiana University, Ph.D. 1981

Christopher Sogge (1996)
Professor, Mathematics
J.J. Sylvester Professor
B.A. 1982, University of Chicago
Ph.D. 1985, Princeton

Santiago Solís (2014)
Visiting Assistant Professor, German and Romance Languages and Literatures
Rachel Somerville (11/1/2008)
Associate Research Professor, Physics and Astronomy

Research Professor, Economics

Lester Spence (2005)
Associate Professor, Political Science
B.A. 1991, University of Michigan, Ph.D. 2001

Gabrielle Spiegel (1993)
Professor, History
Krieger-Eisenhower Professor
B.A. 1964, Bryn Mawr; M.A.T. 1965, Harvard
M.A. 1970, Johns Hopkins University, Ph.D. 1974

Allan Spradling (1980)
Adjunct Professor, Biology; Carnegie Institution

Joel Spruck (1992)
Professor, Mathematics
J.J. Sylvester Professor of Mathematics
B.S. 1967, Columbia University
M.S. 1969, Stanford, Ph.D. 1971

Neta Stahl (2008)
Assistant Professor, Humanities Center
B.A. 1996, Tel Aviv University, M.A. 1998, Ph.D. 2005

Walter Stephens (1999)
Professor, German and Romance Languages and Literatures
Charles S. Singleton Professor of Italian Studies
B.A. 1972, Yale, M.A. 1976; Ph.D. 1979, Cornell

Mark Stiles (2004)
Adjunct Professor, Physics and Astronomy

Richard Stolarski (2010)
Research Professor, Earth and Planetary Sciences

Maureen Stone (1996)
Adjunct Professor, Cognitive Science

Carl Strehlke (1998)
Adjunct Professor, History of Art

Darrell F. Strobel (1984)
Professor, Earth and Planetary Sciences; Physics and Astronomy
B.S. 1964, North Dakota State University
A.M. 1965, Harvard, Ph.D. 1969

Elisabeth Strowick (1/2008)
Professor, German and Romance Languages and Literatures
Diploma 1994, Ph.D. 1998, University of Hamburg

Associate Professor, Psychological and Brain Sciences; Mind/Brain Institute

Robert G. Merrick Jr. Research Chairholder
B.S. 1993, Ph.D. 1998, Ruhr-Universitat Bochum, Germany

Hirotaka Sugawara (2008)
Visiting Professor, Physics and Astronomy

Michael Sullivan (2007)
Visiting Assistant Professor, Classics

Eric Sundquist (2010)
Professor and Chair, English
Andrew W. Mellon Professor of the Humanities
B.A. 1974, University of Kansas
M.A. 1976; Ph.D. 1978, Johns Hopkins University

Raman Sundrum (2000)
Professor, Physics and Astronomy
Alumni Centennial Professor
B.Sc. 1984, University of Sydney; Ph.D. 1990, Yale

Dimitri A. Sverjensky (1984)
Professor, Earth and Planetary Sciences
B.S. 1974, University of Sydney
M.Phil. 1977, Yale, Ph.D. 1980

Morris Swartz (1998)
Professor, Physics and Astronomy
B.S. 1976, Worcester Polytechnic Institute
Ph.D. 1983, University of Chicago

Alexander Szalay (1989)
Professor, Physics and Astronomy
Alumni Centennial Professor
B.Sc. 1969, Kossuth University
M.Sc. 1972, Eotvos University, Ph.D. 1975

Katalin Szlavecz (1998)
Associate Research Professor, Earth and Planetary Sciences

James Taylor (2014)
Associate Professor, Biology
**Oleg Tchernyshyov (2002)**
Associate Professor, Physics and Astronomy
Engineer-physicist 1990, Moscow Institute of Physics and Technology
Ph.D. 1998, Columbia University

**Mark Teaford (2003)**
Adjunct Professor, Biology

**Mark Thompson (2010)**
Associate Professor, English
B.A. 1993, University of Virginia
M.A. 1998; Ph.D. 2001, New York University

**L. Nandi Theunissen (2012)**
Assistant Professor, Philosophy
Duane L. Peterson Professor of Ethics
B.A. 2002, University of Western Australia
B.A. 2003 University of Sydney, M.A. 2006
Ph.D. 2012, Columbia

**Mark Tovar (2005)**
Associate Professor, Chemistry
Ph.D. 1993, Yale

**John Tovar (2005)**
Associate Professor, Chemistry
B.S. 1997 UCLA.; Ph.D. 2002, M.I.T.

**Craig Townsend (1976)**
Professor, Chemistry; Biology; Biophysics
Alspoh H. Corwin Professor of Chemistry
B.A. 1969, Williams; Ph.D. 1974, Yale

**Kellee Tsai (2000)**
Professor, Political Science
Vice Dean for Humanities and Social Sciences (2010)
B.A. 1989, Barnard
M.Phil. 1996, Columbia University, Ph.D. 1999

**John Toscano (1995)**
Professor and Chair, Chemistry
B.A. 1987, Princeton
Ph.D. 1993, Yale

**Herica Valladares (2005)**
Assistant Professor, Classical
B.A. 1995 Oberlin College
M.A. 1999, Columbia University, M.Phil 2000, Ph.D. 2005

**Joel Tolman (2002)**
Associate Professor, Chemistry
B.A. 1990, Rutgers
Ph.D. 1997, Yale

**John Toscano (1995)**
Professor and Chair, Chemistry
B.A. 1987, Princeton
Ph.D. 1993, Yale

**Kathryn Tuma (2005)**
Assistant Professor, History of Art
Second Decade Society Career Development
Assistant Professor
A.B. 1991, Harvard University
M.A. 1993 UC Berkeley, Ph.D. 2000

**L. Nandi Theunissen (2012)**
Assistant Professor, Philosophy
Duane L. Peterson Professor of Ethics
B.A. 2002, University of Western Australia
B.A. 2003 University of Sydney, M.A. 2006
Ph.D. 2012, Columbia

**Kellee Tsai (2000)**
Professor, Political Science
Vice Dean for Humanities and Social Sciences (2010)
B.A. 1989, Barnard
M.Phil. 1996, Columbia University, Ph.D. 1999

**Roeland Van der Marel (2002)**
Adjunct Professor, Physics and Astronomy

**Mark Van Doren (1999)**
Professor, Biology
B.A. 1987, Cornell
Ph.D. 1994, UC San Diego

**Meredith Williams (2000)**
Assistant Professor, History of Art
Second Decade Society Career Development
Assistant Professor
A.B. 1991, Harvard University
M.A. 1993 UC Berkeley, Ph.D. 2000

**Herica Valladares (2005)**
Assistant Professor, Classical
B.A. 1995 Oberlin College
M.A. 1999, Columbia University, M.Phil 2000, Ph.D. 2005

**Mihai Tohaneanu (2011)**
J.J. Sylvester Assistant Professor, Mathematics

**Herica Valladares (2005)**
Assistant Professor, Classical
B.A. 1995 Oberlin College
M.A. 1999, Columbia University, M.Phil 2000, Ph.D. 2005

**Ceser Gomes Victora (2010)**
Visiting Associate Professor, Anthropology

**Kathryn Tuma (2005)**
Assistant Professor, History of Art
Second Decade Society Career Development
Assistant Professor
A.B. 1991, Harvard University
M.A. 1993 UC Berkeley, Ph.D. 2000

**Mihai Tohaneanu (2011)**
J.J. Sylvester Assistant Professor, Mathematics

**Herica Valladares (2005)**
Assistant Professor, Classical
B.A. 1995 Oberlin College
M.A. 1999, Columbia University, M.Phil 2000, Ph.D. 2005

**Kathryn Tuma (2005)**
Assistant Professor, History of Art
Second Decade Society Career Development
Assistant Professor
A.B. 1991, Harvard University
M.A. 1993 UC Berkeley, Ph.D. 2000

**Kathryn Tuma (2005)**
Assistant Professor, History of Art
Second Decade Society Career Development
Assistant Professor
A.B. 1991, Harvard University
M.A. 1993 UC Berkeley, Ph.D. 2000
Krieger-Eisenhower Professor
B.A. 1968, Oxford University
Ph.D. 1973, Princeton

Robert Williams (11/1993)
Adjunct Professor, Physics and Astronomy

Associate Professor, Cognitive Science
B.A. 1995, University of Colorado
Ph.D. 2000, Johns Hopkins University

W. Stephen Wilson (1977)
Professor, Mathematics

Nathaniel Winstead (2010)
Assistant Research Professor, Earth and Planetary Sciences

Sarah Woodson (3/1999)
Professor, Biophysics; Biology

Thomas C. Jenkins Professor of Biophysics
B.A. 1982, Kalamazoo College
Ph.D. 1987, Yale

Jonathan Wright (2008)
Professor, Economics
B.A. 1990, Trinity College, Dublin
M.Sc. 1992, London School of Economics
A.M. 1995, Harvard University, Ph.D. 1997

Rosemary Wyse (1987)
Professor, Physics and Astronomy
B.Sc. 1978, University of London
Ph.D. 1982, University of Cambridge

Steven Yantis (1986)
Professor and Chair, Psychological and Brain Sciences
B.S. 1978, University of Washington
Ph.D. 1985, University of Michigan

David R. Yarkony (1977)
Professor, Chemistry
D. Mead Johnson Professor of Chemistry
B.A. 1971, SUNY Stony Brook
Ph.D. 1975, UC Berkeley

Michael Yassa (2011)
Assistant Professor, Psychological and Brain Sciences
B.A. 2002; M.A. 2007, Johns Hopkins University
Ph.D. 2010, University of California, Irvine

Dimitrios Yatromanolakis (2003)
Associate Professor, Classics; Anthropology
Humanities Center
B.A. 1992, University of Athens
M.St. 1993, D.Phil. 1998, University of Oxford

David Yezzi (2014)
Associate Professor, The Writing Seminars
H. Peyton Young (2009)
Research Professor, Economics

Emily Zackin (2013)
Assistant Professor, Political Science
B.A. 2002, Swarthmore College
M.A. 2004, Columbia; Ph.D. 2010, Princeton

Benjamin Zaitchik (2008)
Assistant Professor, Earth and Planetary Sciences
B.A. 1998, Harvard University
M.S. 2001, Cornell University
Ph.D. 2006, Yale University

Nadia Zakamska (2010)
Assistant Professor, Physics and Astronomy
B.Sc. 1999; M.Sc. 2001, Moscow Institute of Physics and Technology
Ph.D. 2005, Princeton University

Alessandro Zannirato (2005)
Associate Teaching Professor, German and Romance Languages and Literatures

Other Faculty Appointments

Lecturers
Fadel Abdallah, M.S.
Center for Language Education-Arabic 2007

Muhammed Alan, Ph.D.
Mathematics 2009

Bruce Anderson Alan, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2010

Austin Allen, M.F.A
Lecturer
The Writing Seminars 2014

Emily Anderson, Ph.D.
Classics 2010

Catherine R. Arthur, M.A.
History 2008

Flavia Azeredo Cerqueira, Ph.D.
Lecturer
German and Romance Languages and Literatures 2014
Sanchita Balachandran, M.A.
Senior Lecturer, Near Eastern Studies
Curator JH Archaeological Museum

Carl Bausch, J.D.
Earth and Planetary Sciences

Turgay Bayraktar, Ph.D.
Mathematics 2011

Donald Berger, M.A.
Lecturer
Expository Writing Program in the Department of English
Glenn Blake, M.A.
Senior Lecturer
The Writing Seminars 2006; 2008

Anne Elizabeth Brodsky, Ph.D.
English (EWP) 2007

Richard Brown, Ph.D.
Senior Lecturer
Mathematics 2009

Lucy Bucknell, M.A.
Senior Lecturer
The Writing Seminars 2000; 2008

Jerry Burgess, Ph.D.
Lecturer
Earth and Planetary Sciences 2014
Beatrice Caplan, Ph.D.
German and Romance Languages and Literatures 2006

Amanda Charrier, PhD
Lecturer
Earth and Planetary Sciences 2014
Aiguo Chen, M.A.
Center for Language Education-Chinese 2008

Xin Chen, Ph.D.

Joan Chen-Main, Ph.D.
Cognitive Science 2012

Clay Cogswell, M.F.A.
The Writing Seminars 2010

Zri Y. Cohen, Ph.D.
Center for Language Education-Hebrew 2011

Kristin Cook-Gailloud, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2009

Tristan Davies, M.A.
Senior Lecturer
The Writing Seminars 1987; 1997

Lisa DeLeonardis, Ph.D.
Senior Lecturer, History of Art 2004

Linda DeLibero, M.A.

Senior Lecturer, Writing Seminars 2001
Director, Film and Media Studies

Margaret Denithorne
The Writing Seminars
(Program in Theater Arts and Studies) 2007

Larissa D’Souza, Ph.D.
Senior Lecturer, Chemistry 2012

William Evans, M.F.A., M.A.
Senior Lecturer, English 2005

Emily Fisher, Ph.D.
Biology 2008

Carolyn Fitch, Ph.D.
Senior Lecturer, Biophysics 2012

Patrick Fleming, Ph.D.
Senior Lecturer
Biophysics 2004; 2007

Robert Ford, M.A.
Lecturer
Political Science 2014
Heather Roberts Fox, Ph.D.
Psychological and Brain Sciences 2011

Robert Freedman, Ph.D.
Adjunct Professor
Political Science 2006
Paula Gefaell-Borras
German and Romance Languages and Literatures 2008

James Glossman
The Writing Seminars
(Program in Theater Arts and Studies) 2004

Aaron Goodfellow, Ph.D.
Senior Lecturer, Anthropology 2012

Aaron Goodfellow, Ph.D.
Senior Lecturer, Anthropology 2010

James D. Goodyear, Ph.D.
Senior Lecturer
Associate Director, Public Health Studies Program 2000

John Grasser, M.F.A.
Lecturer
The Writing Seminars 2014

Stuart Gray, Ph.D.
Lecturer
Political Science 2014
Jane Greco, Ph.D.
Senior Lecturer, Chemistry 2006

Nishanth Gudapati, Ph.D.
Visiting Lecturer, Mathematics 2014

Claude Guillemard, D.E.A.
Senior Lecturer
German and Romance Languages and Literatures 1991
Stephen Harris, J.D.
Sociology 1/1993 (part-time)

Floyd Hayes, Ph.D.
Senior Lecturer
Center for Africana Studies 2004
Coordinator, Programs in Africana Studies

Julia Heney, M.F.A.
Lecturer
The Writing Seminars, 2014
Robert Horner, Ph.D.
Senior Lecturer
Biology 1989

Audrey Huang, Ph.D.
Biology 2005

Aranzazu M. Hubbard, M.A.
German and Romance Languages and Literatures 2010

Ann Jarema, M.S.
Psychological and Brain Sciences 2007

Veronika Jicinska, Ph.D.
German and Romance Languages and Literatures 2010

Fumiko Joo, Ph.D.
Lecturer
East Asian Studies Program 2014
Gregory Kane
Lecturer
The Writing Seminars 2008 (part-time)
Choonwon Kang, Ph.D.
Center for Language Education-Korean 1990

Satoko Katagiri, M.A.
Center for Language Education-Japanese 2003

Kjerstin Kauffman, M.F.A.
Lecturer
The Writing Seminars 2014
Jian Kong, Ph.D.
Senior Lecturer
Mathematics 2004

Chris Kraft, Ph.D.
Psychological and Brain Sciences 2002

Huei-ying Kup, Ph.D.
Senior Lecturer, Sociology 2011

Senior Lecturer, The Writing Seminars

Lu Li, M.A.
Center for Language Education-Chinese 2010

Zhan Li, Ph.D.
Visiting Lecturer, Mathematics 2014

Liman Lievens, B.A.
Center for Language Education-Chinese 1996

Farrah Madison, Ph.D.
Psychological and Brain Sciences 2011

Sarah Manekin, B.A.
English 2008

John Mann, Ed.D.
Senior Lecturer
The Writing Seminars 2004; 2008

Joseph H. Martin, Ph.D.
The Writing Seminars
(Program in Theater Arts and Studies) 2007

Naiara Martinez-Velez, M.A.
German and Romance Languages and Literatures 2011

Laura Mason, Ph.D.
Senior Lecturer
History 2011

Don Mathis, Ph.D.
Cognitive Science 2012

Nathan McNamara, M.F.A.
Lecturer
The Writing Seminars 2014
David McNeal, M.A.
Center for Language Education-Chinese 2011

Robert Mintz, Ph.D.
Program in Museums and Society 2010

Arthur Molella, Ph.D.
Senior Lecturer
History of Science and Technology 2014
Alexios Monopolis, Ph.D.
Earth and Planetary Sciences 2012

Barbara Morgan, Ph.D.
Senior Lecturer
Economics 2006

Susan Morris, Ph.D.
Lecturer
History of Science and Technology 2014

Matthew Morton, M.F.A
Lecturer
The Writing Seminars 2014
Anne-Elizabeth Murdy Brodsky, Ph.D.
English 2007

Makiko Nakao, M.A.
Center for Language Education-Japanese 1994

Carolyn Norris, Ph.D
Senior Lecturer
Biology 2000

Marie Theresa O’Connor, Ph.D.
English 2010

Sakiko Olsen, Ph.D.
Senior Lecturer
Earth and Planetary Sciences 1996
George Oppel, Ph.D.
English 2010

Louise Pasternack, Ph.D.
Senior Lecturer
Chemistry 2001

Rebecca Pearlman, Ph.D.
Senior Lecturer
Biology 2001

Sergio Ruiz Perez, M.A.
German and Romance Languages and Literatures 2011

Martin Perschler, Ph.D.
History of Art 2009

Matthew Porterfield
The Writing Seminars (Film and Media Studies) 2008

Maria del Rosario Ramos, Ph.D.
German and Romance Languages and Literatures 2008

Ellen Robbins, Ph.D.
Near Eastern Studies 1992

Christov Roberson, Ph.D.
Biology 2012

Shannon Robinson, Ph.D.
Lecturer
The Writing Seminars 2014

Jimmy J. Roche, M.F.A.
The Writing Seminars-Film and Media Studies 2010

William Roche
The Writing Seminars (Program in Theater Arts and Studies) 2004

Mark Rom, Ph.D.
Political Science 2010

Sara Romero, M.A.
German and Romance Languages and Literatures 2012

Suzanne Roos, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 1993

Uma Saini, M.A.
Senior Lecturer
Center for Language Education-Hindi 2000

Steve Scafidi, M.F.A.
The Writing Seminars 2008

Scott Schmidt, M.P.P.
Lecturer
Political Sciences 2014
Richard Shingles, Ph.D.
Biology, 2005

Joanne Simpson
The Writing Seminars 1999

Daniel Stintzi, M.F.A.
Lecturer
The Writing Seminars 2014

Khalil Tahrawi, Ph.D.
Center for Language Education-Arabic 2004

Alexandra Tan, Ph.D.
Biophysics 2012

Elizabeth Thompson, M.F.A
Lecturer
The Writing Seminars 2014

Kathryn Tifft, Ph.D.
Biology 2012

Michelle Tracy, M.A.
German and Romance Languages and Literatures 2007

Jason Trageser, Ph.D.
Psychological and Brain Sciences 2011

Tina Trapane, Ph.D.
Senior Lecturer
Chemistry 1999

Jason Tyler, B.A.
The Writing Seminars (Film and Media Studies) 2011

Sydney Van Morgan, Ph.D.
Senior Lecturer
Sociology 2014

Magda von der Heydt, Ph.D.
Senior Lecturer
Sociology 2006

Christine Waddail, M.A.
Center for Language Education 2007

Kathryn Wagner, Ph.D.
Senior Lecturer
Political Science 2010

Program Coordinator Aitchison Program

Meredith Ward, M.A.
The Writing Seminars (Film and Media Studies) 2008

Sue Waterman, M.L.S.
German and Romance Languages and Literatures 2003

Aliza Watters, Ph.D.
Lecturer
Expository Writing Program in the Department of English

Barry Weingarten, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 1999

Heidi Wheeler, M.A.
Senior Lecturer
German and Romance Languages and Literatures 1999

Greg Williamson, M.A.
Senior Lecturer
The Writing Seminars 1989

April Wuensch, Ph.D.
Senior Lecturer
German and Romance Languages and Literatures 2004

Coordinator, French Elements
Julia Yarmolinskaya, Ph.D.  
Cognitive Science 2011  
Center for Language Education 2007

Nan Zhao, M.Ed.  
Center for Language Education 2012

Military Science
Michael Gorreck  
Lieutenant Colonel  
Director

Russell Buckhalt  
Major  
Assistant Professor

David Normand  
Major  
Assistant Professor

David Yi  
Captain  
Assistant Professor

Erik Mineo  
Captain, Director for Scholarship and Enrollment

Rodney Graves  
Master Sergeant  
Senior Military Instructor

Bart Sime  
Sergeant First Class  
Military Instructor

Tim O'Neil  
Recruiting Officer

Joint Appointments
Marilyn Albert, Ph.D.  
Professor (Medicine)  
Psychological and Brain Sciences 2005

Mariam Alexander, M.D., M.P.H.  
Assistant Professor (Public Health)  
Public Health Studies Program 2010

Richard Allen, Ph.D.  
Assistant Professor (Medicine)  
Psychological and Brain Sciences 1997

Nan Marie Astone, Ph.D.  
Associate Professor (Public Health)  
Sociology 1989

Jay Baraban, Ph.D.  
Professor (Medicine)  
Psychological and Brain Sciences 2007

Stanley Becker, Ph.D.  
Professor (Public Health)  
Public Health Studies Program 2008

David Bishai, Ph.D.  
Associate Professor (Public Health)  
Economics 2006  
Public Health Studies Program 2008

Amanda Blackford, Sc.M.  
Biostatistician (Medicine)  
Public Health Studies Program 2010

Dana F. Boatman  
Associate Professor (Medicine)  
Cognitive Science 5/1993

Lee Bone, M.P.H., R.N.  
Associate Professor (Public Health)  
Public Health Studies Program 2010

Lynda Burton, Sc.D.  
Adjunct Associate Professor (Public Health)  
Public Health Studies Program 2010

Shiyi Chen, Ph.D.  
Professor (Engineering)  
Physics and Astronomy 4/2006

Lawrence Cheskin, M.D.  
Associate Professor (Public Health)  
Public Health Studies Program 2011

Nathaniel Comfort, Ph.D.  
Associate Professor (Medicine)  
History of Science and Technology 2004

Charles Edward Connor, Ph.D.  
Professor (Medicine)  
Director, Krieger Mind/Brain Institute  
Psychological and Brain Sciences 2006

Leslie Cope, Ph.D., M.S.E.  
Assistant Professor (Medicine)  
Public Health Studies Program 2010

Robert Dalrymple, Ph.D.  
Professor (Engineering)  
Earth and Planetary Sciences 1/2002

John Desmond, Ph.D.  
Associate Professor (Medicine)  
Cognitive Science 2007

William Eaton, Ph.D.  
Professor (Public Health)  
Sociology 1989

David Edwin, Ph.D.  
Associate Professor (Medicine)  
Psychological and Brain Sciences 1990; 1999

Jason Eisner, Ph.D.  
Associate Professor (Engineering)  
Cognitive Science 2002

Margaret Ensminger, Ph.D.  
Professor (Public Health)  
Sociology 1992

Joshua Epstein, Ph.D.  
Professor (Medicine)
Economics 2010
Greg Eyink, Ph.D.
Professor (Engineering)
Mathematics 2004
Physics and Astronomy 4/2006
Ruth Faden, Ph.D.
Professor (Public Health)
Policy Studies Program, Institute for Policy Studies
Arts and Sciences 9/1992
Michael Falk, Ph.D.
Professor (Engineering)
Physics and Astronomy 2009
Mary Fissell, Ph.D.
Professor (Medicine)
History 1/2007
History of Science and Technology 1/1992
Carolyn Furr-Holden, Ph.D.
Assistant Professor (Public Health)
Public Health Studies Program 2011
Kelly Gebo, M.D., M.P.H.
Associate Professor (Medicine)
Sociology 2008
Director, Public Health Studies Program, KSAS
Barry Gordon, M.D.
Professor (Medicine)
Cognitive Science 1992
Seth Guikema, Ph.D.
Assistant Professor (Engineering)
Earth and Planetary Sciences 2011
Steve Hanke, Ph.D.
Professor (Engineering)
Economics 1971
Marta Hanson, Ph.D.
Assistant Professor (Medicine)
History of Science and Technology 2005
Ciaran Harman, Ph.D.
Assistant Professor (Engineering)
Earth and Planetary Sciences 2014
Kevin Hemker, Ph.D.
Professor (Engineering)
Stewart Hendry, Ph.D.
Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002
Argye Hillis-Trupe, Ph.D.
Professor (Medicine)
Cognitive Science 1999
Markus Hilpert, Ph.D.
Associate Research Scientist (Public Health)
Earth and Planetary Sciences 2014
Plen-Chien Huang, Ph.D.
Professor (Public Health)
Biophysics 2004
Takeru Igusa, Ph.D.
Professor (Engineering)
Earth and Planetary Sciences 2011
Scott Kahan, M.D., M.P.H.
Instructor (Public Health)
Public Health Studies Program 2010
Alfredo Kirkwood, Ph.D.
Associate Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002
Pravin Krishna, Ph.D.
Professor (SAIS)
Economics 2004
Thomas LaVeist, Ph.D.
Professor (Public Health)
Sociology 1992
Public Health Studies Program 2008
Philip Leaf, Ph.D.
Professor (Public Health)
Public Health Studies Program 2010
Lori Leonard, Ph.D.
Associate Professor (Public Health)
Sociology 2011
Harry Marks, Ph.D.
Associate Professor (Medicine)
Anthropology 2005
History 1/2007
History of Science and Technology 5/1989
Guy McKhann, M.D.
Professor (Medicine)
Krieger Mind/Brain Institute Cognitive Science
Psychological and Brain Sciences 1/2002
Graham Mooney, Ph.D.
Assistant Professor (Medicine)
History of Science and Technology 2004
Vicente Navarro, Ph.D.
Professor (Public Health)
Sociology 1989
Policy Studies Program, Institute for Policy Studies
Arts and Sciences 9/1992
Sandra Newman, Ph.D.
Professor (Institute for Policy Studies, Director)
Sociology 2000
Jian Ni, Ph.D.
Assistant Professor (Business)
Economics 2011
Ernst Niebur, Ph.D.
Professor (Medicine)
Krieger Mind/Brain Institute
Faculty Listings

Psychological and Brain Sciences 1/2002
Mitsukuni Nishida, Ph.D.
Assistant Professor (Business)
Economics 2010

Catherine Norman, Ph.D.
Assistant Professor (Engineering)
Economics 2010

Randall Packard, Ph.D.
Professor (Medicine)
History 2003
History of Science and Technology 1/2002

Cindy Parker, M.D., M.P.H.
Assistant Professor (Public Health)
Earth and Planetary Sciences 2010

Elizabeth Patton
Senior Lecturer
Humanities Center 1999; 2014

Darcy Phelan, Ph.D.
Assistant Scientist (Public Health)
Public Health Studies Program 2011

Paula Pitha-Rowe, Ph.D.
Professor (Medicine)
Biology 2007

Gianna Pomata, Ph.D.
Professor (Medicine)
German and Romance Languages and Literatures 2010
History of Science and Technology 2008

Kenneth Rose, Ph.D.
Professor (Medicine)
Earth and Planetary Sciences 2011

Erica J. Schoenberger, Ph.D.
Professor (Engineering)
Anthropology 1989

Peter Searson, Ph.D.
Professor (Engineering)
Physics and Astronomy 2006

Robert Siliciano, M.D., Ph.D.
Professor (Medicine)
Biology 2007

Katherine Smith, Ph.D.
Associate Professor (Public Health)
Sociology 2005

Marc Stein, Ph.D.
Assistant Professor (Education)
Sociology 2012

Donald Steinwachs, Ph.D.
Professor (Public Health)
Public Health Studies Program 2010

Veit Stuphorn, Ph.D.
Professor (Medicine)
Psychological and Brain Sciences 2014

James Tielsch, Ph.D.
Professor (Public Health)
Public Health Studies Program 2010

Daniel Todes, Ph.D.
Professor (Medicine)
History of Science and Technology 1984

Michael Trush, M.P.H.
Professor (Public Health)
Public Health Studies Program 2010

Amy Ong Tsui, Ph.D.
Professor (Public Health)
Sociology 2002

Rudiger von der Heydt, Ph.D.
Professor (Medicine)
Krieger Mind/Brain Institute
Psychological and Brain Sciences 1/2002

David Weishample
Professor (Medicine)
Earth and Planetary Sciences 2012

Susan Weiss, Ph.D.
Chair/Faculty (Peabody)
German and Romance Languages and Literatures 2002

Peter Wilcock, Ph.D.
Professor (Engineering)
Earth and Planetary Sciences 2011

Michael Yu, Ph.D.
Associate Professor (Engineering)
Chemistry 2001

Scott Zeger, Ph.D.
Professor (Public Health)
Public Health Studies Program 2011

Barry Zirkin, M.P.H.
Professor (Public Health)
Public Health Studies Program 2010

In listing the members of the teaching staff of the School of Engineering, the date in parentheses indicates the year of original appointment. Any joint appointments or directorships are listed last.

Professors Emeriti

John Boland, Ph.D.
Geography and Environmental Engineering

Moise H. Goldstein Jr., D.Sc.
Electrical and Computer Engineering

Willis Gore
Electrical and Computer Engineering

Robert Green, Ph.D.
Materials Science and Engineering
Richard I. Joseph, Ph.D.
Electrical and Computer Engineering

Joseph L. Katz, Ph.D.
Chemical and Biomolecular Engineering

Jerome Kruger, Ph.D.
Materials Science and Engineering

C. Harvey Palmer Jr., Ph.D.
Electrical and Computer Engineering

Wilson J. Rugh, Ph.D.
Electrical and Computer Engineering

William Sharpe, PhD.
Mechanical Engineering

Eugene D. Shchukin, Ph.D.; Dr.Sc.
Research Professor Emeritus, Geography and Environmental Engineering

Charles (Roger) Westgate, Ph.D.
Electrical and Computer Engineering

Professors

Soumyadipta Acharya (2010)
Assistant Research Professor, Biomedical Engineering

Hedy Alavi (1997)
Associate Teaching Professor and Assistant Dean for International Programs
Geography and Environmental Engineering
B.S. 1972, Jundi Shapour University
M.B.A. 2006, The Johns Hopkins University; M.S. 1980, Ohio State University; Ph.D. 1983

Yanif Amad (2010)
Assistant Professor, Computer Science
B.E. 2001, Imperial College of Science, Technology and Medicine
M.S., 2004, Brown University, Ph.D. 2009

Yair Amir (1995)
Professor, Computer Science
B.S. 1985, Technion, Haifa, M.S. 1990
Ph.D. 1995, Hebrew University of Jerusalem

Andreas Andreou (1987)
Professor, Electrical and Computer Engineering
B.S. 1978, Higher Technical Institute, Cyprus
M.S. 1982, Johns Hopkins University, Ph.D. 1986

Siamak Ardekani (2014)
Assistant Research Professor, Biomedical Engineering

Raman Arora (2014)
Assistant Professor, Computer Science
B.S. 2001, Netaji Subhas Institute of Technology
M.S. 2005, University of Wisconsin, Madison, Ph.D. 2009

Athreya Avanti (2011)
Assistant Research Professor, Applied Mathematics and Statistics

Joel Bader (2003)
Associate Professor, Biomedical Engineering

Computer Science
B.S. 1986, Lehigh University
Ph.D. 1989, UC Berkeley

William P. Ball (1992)
Professor, Geography and Environmental Engineering; Civil Engineering
B.S. 1976, University of Virginia
M.S. 1977, Stanford; Ph.D. 1990

Ishan Barman (2014)
Assistant Professor, Mechanical Engineering
B.S. 2005, Indian Institute of Technology
M.S. 2007, Massachusetts Institute of Technology; Ph.D. 2011

Amitabh Basu (2013)
Assistant Professor, Applied Mathematics and Statistics
B.S. 2004, Indian Institute of Technology
M.S. 2006, Stony Brook University; Ph.D. 2010, Carnegie Mellon University

Alexis Battle (2014)
Assistant Professor, Computer Science
B.S. 2003, Stanford University; Ph.D. 2013

John Baty (2012)
Assistant Research Professor, Materials Science and Engineering

Michael J. Betenbaugh (1988)
Professor, Chemical and Biomolecular Engineering
B.S. 1981, University of Virginia
Ph.D. 1988, University of Delaware

Michael Bevan (2008)
Associate Professor, Chemical and Biomolecular Engineering
B.S. 1994, Lehigh University
Ph.D. 1999, Carnegie Mellon University

Edward J. Bouwer (1985)
Abel Wolman Professor and Chair, Geography and Environmental Engineering; Civil Engineering
B.S. 1977, Arizona State University
M.S. 1978, Stanford, Ph.D. 1982

Vladimir Braverman (2011)
B.S. 1998; M.S. 2004, Ben-Gurion University at Negev
Ph.D. 2011, University of California, Los Angeles

Grace S. Brush (1978)
Professor, Geography and Environmental Engineering
B.S. 1949, St. Francis Xavier University
M.S. 1951, University of Illinois
Ph.D. 1956, Harvard

Tamas Budavari (2014)
Assistant Professor, Applied Mathematics and Statistics
M.S. 1997, Eotvos Lorand University, Budapest; Ph.D. 2001

Randal Burns (2001)
Associate Professor, Computer Science
B.S. 1993, Stanford
M.S. 1997, UC Santa Cruz, Ph.D. 2000

Robert C. Cammarata (1987)
Professor, Materials Science and Engineering
Mechanical Engineering

Stephen Checkoway (2012)
Assistant Research Professor Computer Science

Kai Loon Chen (2008)
Assistant Professor, Geography and Environmental Engineering
B.E. 2001, University of Singapore; M. E. 2003, National University of Singapore
M.S. 2004, Yale University; Ph.D. 2008, Yale University.

Sang (Peter) Chin (2011)
Assistant Research Professor, Electrical and Computer Engineering

Gregory S. Chirikjian (1992)
Professor, Mechanical Engineering; Computer Science; Electrical and Computer Engineering; Applied Mathematics and Statistics
B.S. 1988, Johns Hopkins University; M.S. 1988
Ph.D. 1992, California Institute of Technology

Noah Cowan (2003)
Associate Professor, Mechanical Engineering; Computer Science
B.S. 1995, Ohio State, M.S., 1997
Ph.D. 2001 University of Michigan

Honggang Cui (2010)
Assistant Professor, Chemical & Biomolecular Engineering
B.S. 1999 Beijing University of Chemical Technology
M.S. 2002, Tsinghua University
Ph.D. 2007, University of Delaware

The Willard & Lillian Hackerman Professor, Civil Engineering; Earth and Planetary Sciences in Arts and Sciences
A.B. 1967, Dartmouth
M.S. 1968, University of Hawaii
Ph.D. 1973, University of Florida

Nitin Daphalapurkar (2012)
Assistant Research Professor, Mechanical Engineering

Frederic M. Davidson (1970)
Professor, Electrical and Computer Engineering
B.S. 1964, Cornell
Ph.D. 1969, University of Rochester

Michael Dinitz (2014)
Assistant Professor, Computer Science
B.S. 2005, Princeton University
Ph.D. 2010, Carnegie Mellon University

Marc D. Donohue (1979)
Professor, Chemical and Biomolecular Engineering Director, Advanced Technology Lab
B.S. 1973, Clarkson College of Technology
Ph.D. 1977, UC Berkeley

Andrew S. Douglas (1983)
Professor, Mechanical Engineering; Biomedical Engineering
Vice Dean for Faculty, Whiting School of Engineering (2007)
B.S. 1975, University of Cape Town, M.S. 1977
Ph.D. 1982, Brown University

Jason Eisner (2000)
Associate Professor, Computer Science
B.S. 1990, Harvard; M.S. 1993, Cambridge University
Ph.D. 2001, University of Pennsylvania

Jafaar El-Awady (2010)
Assistant Professor, Mechanical Engineering
B.S. 2001 Cairo University M.S. 2003
Ph.D. 2008, University of California, Los Angeles

Mounya Elhilali (2008)
Associate Professor, Electrical and Computer Engineering
B.S. 1998, Al Akhawayn University
M.S. 2003, University of Maryland; Ph.D. 2004

J. Hugh Ellis (1984)
Professor, Geography and Environmental Engineering; Chair, Civil Engineering
B.S. 1979, University of Waterloo, M.S. 1981, Ph.D. 1984

Jonah Erlebacher (2000)
Professor and Chair, Materials Science and Engineering
Chemical and Biomolecular Engineering
B.S. 1991, Yale; Ph.D. 1999, Harvard

Ralph R. Etienne-Cummings (1998)
Professor and Chair, Electrical and Computer Engineering
Associate Director of Education and Outreach Programs in the
Engineering Research Center for Computer-Integrated Surgical Systems and Technology.
B.S. 1988, Lincoln University
Ph.D. 1995, University of Pennsylvania

Gregory Eyink (2002)
Professor, Applied Mathematics and Statistics; Mechanical Engineering; Mathematics (A&S)
B.S. 1981, Ohio State, Ph.D. 1987

Michael Falk (2008)
Professor, Materials Science and Engineering
B.A. 1990, Johns Hopkins University; M.S.E. 1991
Ph.D. 1998, University of California

James A. Fill (1988)
Professor, Applied Mathematics and Statistics
Computer Science
B.S. 1976, University of Illinois; M.S. 1979, University of Chicago, Ph.D. 1980

Donniell Fishkind (2001)
Associate Research Professor, Applied Mathematics and Statistics

Amy Foster (2010)
Assistant Professor, Electrical and Computer Engineering
B.S.2003, State University of New York at Buffalo
M.S. 2007, Cornell University, Ph.D. 2009

Mark Foster (2010)
Assistant Professor, Electrical and Computer Engineering

Joëlle Fréchette (2006)
Associate Professor, Chemical and Biomolecular Engineering
B.E. 1998, École Polytechnique de Montréal
M.A. 2000, Princeton University, Ph.D. 2003
Zachary Gagnon (2011)
Assistant Professor, Chemical and Biomolecular Engineering
B.S. 2003, University of Massachusetts
M.S. 2005, Notre Dame; Ph.D. 2009

Denice Gayme (2012)
Assistant Professor, Mechanical Engineering
B.S. 1997, McMaster University
M.S. 1998, UC Berkeley
Pd.D. 2010, California Institute of Technology

Donald Geman (2001)
Professor, Applied Mathematics and Statistics
Electrical and Computer Engineering
B.S. 1965, University of Illinois
Ph.D. 1970, Northwestern

Helyette Geman (2011)
Research Professor, Applied Mathematics and Statistics
Sharon Gerecht (2007)
Associate Professor, Chemical and Biomolecular Engineering
B.A. 1994, Technion – Israel Institute of Technology;
M.Sc. 1999, Tel Aviv University; Ph.D. 2004, Technion-Israel Institute of Technology

Somnath Ghosh (2011)
The Michael G. Callas Professor, Civil Engineering
B.S. 1980, Indian Institute of Technology
M.S. 1983, Cornell University
Ph.D. 1988, University of Michigan, Ann Arbor

John I. Goutsias (1986)
Professor, Electrical and Computer Engineering; Applied Mathematics and Statistics
B.S. 1981, National Technical University of Athens; M.S. 1982, University of Southern California, Ph.D. 1986

David Gracias (2003)
Professor, Chemical and Biomolecular Engineering
M.S. 1986, Indian Institute of Technology
Ph.D. 1999, UC Berkeley

Lori Graham-Brady (2000)
Professor, Civil Engineering

Jeffrey Gray (2002)
Associate Professor, Chemical and Biomolecular Engineering
B.S.E. 1994, University of Michigan
Ph.D. 2000, University of Texas

Matthew Green (2011)
Assistant Research Professor, Computer Science

James K. Guest (2005)
Associate Professor, Civil Engineering
B.S.E. 1998, University of Pennsylvania
M.S.E. 2001; M.A. 2003 Princeton University
Ph.D. 2005, Princeton University

Seth Guikema (2008)
Associate Professor, Geography and Environmental Engineering
Biomedical Engineering
B.S. 1987, University of Toronto
Ph.D. 1991, Cambridge University

Takeru Igusa (1999)
Professor, Civil Engineering
Applied Mathematics and Statistics
B.S. 1977, Harvard;
M.S. 1979, UC Berkeley, Ph.D. 1983

Iulian Iorachita (2010)
Assistant Research Professor, Mechanical Engineering

Associate Research Professor, Applied Mathematics and Statistics

Xiaofeng Jia (2011)
Associate Research Professor, Biomedical Engineering

Jin Ung Kang (1999)
Jacob Suter Jammer Professor in Electrical Engineering, Electrical and Computer Engineering
B.S. 1992, Western Washington University
M.S. 1993, University of Central Florida, Ph.D. 1996

Alexander E. Kaplan (1986)
Professor, Electrical and Computer Engineering
M.S. 1961, Moscow Institute for Physics and Technology; Ph.D. 1967, USSR Academy of Sciences

Rachel Karchin (2006)
Associate Professor, Biomedical Engineering
B.S. 1998, University of California, Santa Cruz
M.S. 2000, University of California, Santa Cruz
Ph.D. 2003, University of California, Santa Cruz

Professor, Materials Science and Engineering
B.S. 1978, Massachusetts Institute of Technology
Ph.D. 1982, University of California, Los Angeles

Joseph Katz (1987)
William F. Ward Distinguished Professor, Mechanical Engineering
Geography and Environmental Engineering
B.S. 1977, Tel Aviv University; M.S. 1978, California Institute of Technology, Ph.D. 1982

Peter Kazanzides (2003)
Research Professor, Computer Science

Associate Professor, Computer Science
B.A. 1997, Harvard

Sanjeev Khudanpur (2001)
Associate Professor, Electrical and Computer Engineering
Computer Science
B.S. 1988, Indian Institute of Technology
Ph.D. 1997, University of Maryland

Jacob Khurgin (1988)
Professor, Electrical and Computer Engineering
M.S. 1979, Leningrad Institute of Optics
Ph.D. 1987, Polytechnic University of New York

Marin Kobilarov (2012)
Assistant Professor, Mechanical Engineering
B.Sc. 2003, Trinity College
Ph.D. 2008, University of Southern California, Los Angeles

Philipp Koehn (2014)
Professor, Computer Science
M.S. 1994, University of Tennessee, Knoxville
Ph.D. 2003, University of Southern California

Konstantinos Konstantopoulos (1997)
Professor and Chair, Chemical and Biomolecular Engineering;
Biomedical Engineering
B.S. 1989, National Technology University of Athens; Ph.D. 1995, Rice University

Edward J. Schaefer Professor, Computer Science
Applied Mathematics and Statistics
B.S. 1964, Andhra University
M.S. 1966, Indian Institute of Technology
Ph.D. 1969, University of Pennsylvania

David Kraemer (2014)
Associate Teaching Professor, Mechanical Engineering
B.S. 1991, University of Notre Dame; M.S. 1994, University of Michigan;
M.S. 1997, The Johns Hopkins University; Ph.D. 2001

Benjamine Langmead (2012)
Assistant Professor, Computer Science
B.S. 2003, Columbia University
M.Sc. 2009, University of Maryland-College Park; Ph.D. 2012

Nam Lee (2008)
Assistant Research Professor, Applied Mathematics and Statistics

Xin Li (2013)
Assistant Professor, Computer Science
B.S. 2002, Tsinghua University; M.S. 2005;
Ph.D. 2011, University of Texas at Austin

En (Evan) Ma (1998)
Professor, Materials Science and Engineering
B.S. 1982, Tsinghua University, China, M.S. 1985
Ph.D. 1989, California Institute of Technology

Feilim Mac Gabhann (2009)
Assistant Professor, Biomedical Engineering
Institute for Computational Medicine
B.E. 1997, University College, Dublin
Ph.D. 2006, Johns Hopkins University

Hai-Quan Mao (2002)
Professor, Materials Science and Engineering
B.S. 1988, Wuhan University, China, M.S. 1985
Ph.D. 1989, California Institute of Technology

David Masica (2013)
Assistant Research Professor, Biomedical Engineering

Patricia McGuiggan (2006)
Associate Research Professor, Materials Science and Engineering

Charles V. Meneveau (1990)
Louis M. Sardella Professor, Mechanical Engineering; Geography and Environment Engineering
B.S. 1985, University Federico Santa Maria, Chile
M.S. 1987, Yale, Ph.D. 1989

Gerard G. L. Meyer (1973)
Professor, Electrical and Computer Engineering
M.S. 1967, UC Berkeley, Ph.D. 1970

Michael I. Miller (1998)
Herschel and Ruth Seder Professor, Biomedical Engineering
Director, Center for Imaging Science
Electrical and Computer Engineering
Applied Mathematics and Statistics; Computer Science
B.S. 1976, SUNY; M.S. 1978, Johns Hopkins University, Ph.D. 1983

Judith Mitrani-Reiser (2010)
Assistant Professor, Civil Engineering
B.S. 2000, University of Florida
M.S. 2001, University of California, Berkeley
Ph.D. 2007, California Institute of Technology

Rajat Mittal (2009)
Professor, Mechanical Engineering
B.E. 1989, Indian Institute of Technology
M.S. 1991, University of Florida
Ph.D. 1995, University of Illinois at U.C.

Sara Miner More (2014)
Associate Teaching Professor, Computer Science
B.S. 1996, University of Dayton;
M.S. 1998, University of California, San Diego; Ph.D. 2003

Timothy Mueller (2012)
Assistant Professor, Materials Science and Engineering
A.B. 1998, Harvard University
Ph.D. 2007, Massachusetts Institute of Technology

Professor, Applied Mathematics and Statistics
B.S. 1977, Cornell; M.S. 1979, University of Illinois, Ph.D. 1982

Nassir Navab (2013)
Professor, Computer Science
Ph.D. 1993, INRIA (Institut National de Recherche en Informatique et en Automatique)

Thao (Vicky) Nguyen (2007)
Associate Professor, Mechanical Engineering
B.S., 1998 Massachusetts Institute of Technology
M.S., 2000 Stanford University, Ph.D. 2004

Marc Ostermeier (2000)
Professor, Chemical and Biomolecular Engineering
B.S. 1990, University of Wisconsin
Ph.D. 1996, University of Texas, Austin

Stefanos Papanikolau (2014)
Assistant Research Professor, Mechanical Engineering

Theodore O. Poeher (1973)
Research Professor, Materials Science and Engineering

Philippe Pouliquen (2014)
Assistant Research Professor, Electrical and Computer Engineering

Carey S. Priebe (1994)
Professor, Applied Mathematics and Statistics

Computer Science
B.S. 1984, Purdue
M.S. 1988, San Diego State University
Ph.D. 1993, George Mason University

Jerry L. Prince (1989)
William B. Kouwenhoven Professor and Associate Director for Research in Engineering Research Center for Computer-Integrated Surgical Systems and Technology, Electrical and Computer Engineering; Computer Science; Applied Mathematics and Statistics
B.S. 1979, University of Connecticut
M.S. 1982, M.I.T., Ph.D. 1988

Andrea Prosperetti (1985)
Charles A. Miller Jr. Distinguished Professor in Mechanical Engineering; Geography and Environmental Engineering
B.S. 1968, Università di Milano
M.S. 1972, California Institute of Technology, Ph.D. 1974

Kaliat T. Ramesh (1988)
Elonzo G. Decker Jr. Professor in Science and Engineering, Mechanical Engineering
Materials Science and Engineering
B.S. 1982, Bangalore University, India
M.S. 1987, Brown, Ph.D. 1987

Aviel Rubin (2003)
Professor, Computer Science

Suchi Saria (2012)
Assistant Professor, Biomedical Engineering
Institute for Computational Medicine
B.S. 1994, Cornell University
S.M. 1997, M.I.T., Ph.D. 2006

Benjamin Schafer (2000)
Professor and Chair, Civil Engineering
B.S. 1993, University of Iowa; M.S. 1995, Cornell, Ph.D. 1997

Vice Dean for Education, Whiting School of Engineering (2008)
Erica J. Schoenberger (1984)  
Professor, Geography and Environmental Engineering  
B.S. 1974, Stanford; M.S. 1979, UC Berkeley, Ph.D. 1984

Rebecca Schulman (2011)  
Assistant Professor, Chemical and Biomolecular Engineering  
B.S. 1999, Massachusetts Institute of Technology  
Ph.D. 2007, California Institute of Technology

Peter C. Searson (1990)  
Joseph R. Reynolds Professor, Materials Science and Engineering  
Chemical and Biomolecular Engineering  
B.S. 1978, University of Manchester, M.S. 1980, Ph.D. 1982

Joanna Selinski (1996)  
Associate Teaching Professor, Computer Science  
B.S. 1984, Chestnut Hill College;  
M.S.E. 1986, The Johns Hopkins University; Ph.D. 1996

Michael Shields (2013)  
Assistant Professor, Civil Engineering  
B.S. 2006, Loyola University  
M.S. 2007, Columbia University; Ph.D. 2010

Sauleh Siddiqui (2012)  
Assistant Professor, Civil Engineering; Applied Mathematics and Statistics  
B.A. 2007, Franklin and Marshall College  
Pd.D. 2011 University of Maryland, College Park

Scott F. Smith (1988)  
Professor, Computer Science  
B.S. 1983, Purdue University  
Ph.D. 1989, Cornell University

James B. Spicer (1993)  
Professor, Materials Science and Engineering  
B.S. 1985, Southern Methodist University  
Ph.D. 1991, Johns Hopkins University

J. Webster Stayman (2013)  
Assistant Research Professor, Biomedical Engineering

Alan Stone (1983)  
Professor, Geography and Environmental Engineering; Civil Engineering  
B.S. 1978, University of Maryland  
M.S. 1981, California Institute of Technology, Ph.D. 1983

Sean Sun (2003)  
Associate Professor, Mechanical Engineering  
B.S. 1994, Pennsylvania State University  
Ph.D. 1998, UC Berkeley

Minh Tang (2014)  
Assistant Research Professor, Applied Mathematics and Statistics

Danielle Tarraf (2008)  
Assistant Professor, Electrical and Computer Engineering  
B.E. 1996, American University of Beirut  
M.S. 1998, Massachusetts Institute of Technology; Ph.D. 2006

John C. Malone Professor, Computer Science  
Mechanical Engineering  
Director, Center for Computer Integrated Surgical Systems and Technology  
B.S. 1970, Johns Hopkins University  
Ph.D. 1976, Stanford University

Susanna Thon (2013)  
Assistant Professor, Electrical and Computer Engineering  
B.S. 2005, Massachusetts Institute of Technology;  
M.A. 2008, University of California, Santa Barbara; Ph.D. 2010

Winston Timp (2013)  
Assistant Professor, Biomedical Engineering  
B.S. 2001, University of Illinois at Urbana-Champaign  
M.S. 2005, Massachusetts Institute of Technology; Ph.D. 2007

Trac Duy Tran (1998)  
Professor, Electrical and Computer Engineering  
B.S. 1994, M.I.T., M.S. 1994  
Ph.D. 1998, University of Wisconsin

Natalia Trayanova (2006)  
Murray B. Sachs Professor, Biomedical Engineering, Institute for Computational Medicine  
M.S. 1982, Sofia University, Bulgaria  
Ph.D. 1986, Bulgarian Academy of Sciences

Martin Ulmschneider (2013)  
Assistant Professor, Materials Science and Engineering  

Fijoy Vadakkumpadan  
Assistant Research Professor, Institute for Computational Medicine

Associate Professor, Biomedical Engineering  
Computer Science; Mechanical Engineering  
B.A. 1995, Catholic University  
M.S. 2000, UC Berkeley, Ph.D. 2003

Joshua Vogelstein (2014)  
Assistant Professor, Biomedical Engineering  
B.S. 2002, Washington University, St. Louis  
M.S. 2009, The Johns Hopkins University  
Ph.D. 2009, Johns Hopkins School of Medicine

Chao Wang (2012)  
Assistant Professor, Chemical and Biomolecular Engineering  
B.S. 2004, University of Science and Technology of China  
M.S. 2005, Brown University; Ph.D. 2008

Professor, Mechanical Engineering  
B.S. 1995, University of Patras; M.S. 1997, UCLA

Timothy P. Weinert (1995)  
Professor, Materials Science and Engineering  
Mechanical Engineering  
B.S. 1983, Dartmouth; M.S. 1985  
Ph.D. 1990, Stanford University

Howard L. Weinert (1974)  
Professor, Electrical and Computer Engineering  
B.S. 1967, Rice; M.S. 1968, Stanford, Ph.D. 1972
James West (2003)
Research Professor, Electrical and Computer Engineering

Louis L. Whitcomb (1994)
Professor and Chair, Mechanical Engineering
Computer Science
B.S. 1984, Yale University
M.S. 1988, Ph.D. 1992

John C. Wierman (1981)
Professor, Applied Mathematics and Statistics
Director, Center for Leadership Education
B.S. 1971, University of Washington, Ph.D. 1976

Peter R. Wilcock (1987)
Research Professor, Geography and Environmental Engineering

Justin Williams (2002)
Associate Research Professor, Geography and Environmental Engineering

Denis Wirtz (1994)
Theophilus Halley Smoot Professor, Chemical and Biomolecular Engineering
Materials Science and Engineering
B.S. 1998, University of Belgium
M.S. 1990, Stanford, Ph.D. 1993

David Yarowsky (1996)
Professor, Computer Science
B.S. 1987, Harvard University
M.S. 1993, University of Pennsylvania, Ph.D. 1996

Laurent Younes (2003)
Professor and Chair, Applied Mathematics and Statistics
M.S. 1985, University Paris Sud, Ph.D. 1988

Tamer Zaki (2013)
Associate Professor, Mechanical Engineering
B.S. 1998, Pennsylvania State University
M.S. 2001, Stanford University; Ph.D. 2005

Other Faculty Appointments

Lecturers

William Agresti
Lecturer, JHU Information Security Institute, 2012

Michael Agronin, M.S.
Lecturer, Center for Leadership Education, 2012

Robert Allen Ph.D.
Lecturer, Biomedical Engineering, 2013

Lawrence Aronhime, M.B.A.
Senior Lecturer, Center for Leadership Education, 2001

David Audley, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 1997

Jenny Bernstein, M.P.H.
Lecturer, Center for Leadership Education, 2014

Beryl Castello, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2004

Xin Chen, Ph.D.
Lecturer, Civil Engineering, 2012

Thomas Coleman, Ph.D.
Geography and Environmental Engineering, 2014

Lise Dahuron, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2007

Laura Davis, M.A.
Lecturer, Center for Leadership Education, 2011

Lucas deMelo, Ph.D.
Lecturer, Civil Engineering, 2012

Marci De Vries, M.A.
Lecturer, Center for Leadership Education, 2011

Kevin Dungey, Ph.D.
Senior Lecturer, Center for Leadership Education, 1998

Kevin Fairbanks, Ph.D.
Lecturer, JHU Information Security Institute, 2012

David Fisher, J.D.
Lecturer, Center for Leadership Education, 2001

Mark Franceschini
Senior Lecturer, Center for Leadership Education, 2000

Peter Fröhlich, Ph.D.
Senior Lecturer, Computer Science, 2005

Sean Furlong, M.A.
Lecturer, Center for Leadership Education, 2013

Robert E. Glaser, Ph.D.
Lecturer, Electrical and Computer Engineering, 1987

An Goffin, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2008

Robert Graham, M.S.
Lecturer, Center for Leadership Education, 2014

Daniel Gutman, J.D.
Lecturer, Geography and Environmental Engineering, 2012

Eileen Haase, Ph.D.
Lecturer, Biomedical Engineering, 2003

Wayne Hacker, M.S.
Lecturer, Applied Mathematics and Statistics, 2008

Margaret Hart, M.S.
Lecturer, Center for Leadership Education, 2014

Jason Heiserman, Ph.D.
Lecturer, Center for Leadership Education, 2009

Illysa Izenberg, MBA
Lecturer, Center for Leadership Education, 2010

Michael Jacobs
Lecturer, Computer Science, 1999

Robert E. Jenkins, M.S.
Nicole Jerr, M.A
Lecturer, Center for Leadership Education

Theresa Jones, M.B.A.
Lecturer, Center for Leadership Education, 2010

George Kalb, M.S.
Lecturer, Computer Science, 2000

Michael Karweit, Ph.D.
Senior Lecturer, Geography and Environmental Engineering

Leslie Kendrick, M.B.A.
Senior Lecturer, W.P. Center for Leadership Education, 2000

Michael Kociemba, M.S.
Lecturer, JHU Information Security Institute, 2012

Sheela Kosaraju, J.D.
Lecturer, Computer Science, 2008

Andrew F. Kulanko, M.S.
Senior Lecturer, Center for Leadership Education, 2001

Darren Lacey, J.D.
Lecturer, JHU Information Security Institute, 2004

Harold Lehmann, M.D., Ph.D.
Lecturer, Computer Science, 1993

Annette Leps, M.B.A.
Senior Lecturer, Center for Leadership Education, 2006

Xiangyang Li, Ph.D.
Senior Lecturer, JHU Information Security Institute, 2012

Denise Link-Farajali, Ed.M.
Lecturer, Center for Leadership Education, 2011

Peng Liu, Ph.D.
Lecturer, Applied Mathematics and Statistics, 2013

Kimberly Manns, M.A.
Lecturer, Center for Leadership Education, 2014

William Marr, Ph.D.
Lecturer, Civil Engineering, 2013

Steven Marra, Ph.D.
Senior Lecturer, Mechanical Engineering, 2011

John Matteo, M.S.E.
Lecturer, Civil Engineering, 2008

Timothy McGee, Ph.D.
Lecturer, Mechanical Engineering, 2011

Benjamin Mitchell, Ph.D.
Lecturer, Computer Science, 2014

Charles Morton, J.D.
Lecturer, Center for Leadership Education, 2007

Seth Nielson, Ph.D.
Lecturer, Computer Science, 2014

Charlotte O'Donnell, M.F.A.
Lecturer, Center for Leadership Education, 2009

Sinan Ozdemir, M.A.
Lecturer, Center for Leadership Education, 2014

Martin Ozimek, Ph.D.
Lecturer, Mechanical Engineering, 2011

Christopher Pappacena, Ph.D.
Lecturer, Computer Science, 2011

Marco Priolo, M.S.
Lecturer, Center for Leadership Education, 2014

Keith Quesenberry, M.S.
Lecturer, Center for Leadership Education, 2012

Brian Rakes, J.D.
Lecturer, Center for Leadership Education, 2012

Julie Reiser, Ph.D.
Senior Lecturer, Center for Leadership Education, 2007

Joshua Reiter, Ed.D.
Senior Lecturer, Center for Leadership Education, 2000

Eric Rice, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006

Yury Ronzhes, Ph.D.
Lecturer, Mechanical Engineering, 2008

Douglas S. Sandhaus, J.D.
Senior Lecturer, Center for Leadership Education, 2002

Rachel Sangree, Ph.D.
Lecturer, Civil Engineering, 2009

William Sauers, J.D.
Lecturer, JHU Information Security Institute, 2012

Nathan Scott, Ph.D.
Senior Lecturer, Mechanical Engineering, 2011

Pamela Sheff, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006

William Smedick, Ed.D.
Senior Lecturer, Center for Leadership Education, 2007

Dwight Smith, Ph.D.
Lecturer, Engineering, 2014

Jay Thompson, M.S.
Lecturer, Center for Leadership Education, 2013

Federico Torcaso, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2002

Lanier Watkins, Ph.D.
Lecturer, Center for Leadership Education, 2013

Caroline Wilkins, Ph.D.
Lecturer, Center for Leadership Education, 2012

Justin Williams, Ph.D.
Johns Hopkins University - 2015-2016

Senior Lecturer, Geography and Environmental Engineering, 1999

Orla Wilson, Ph.D.
Lecturer, Materials Science and Engineering, 2008

Joint Appointments

Steven An, Ph.D.
Associate Professor, School of Public Health
Chemical and Biomolecular Engineering, 2014

Stephen Belkoff, Ph.D.
Associate Professor, Orthopedic Surgery (Medicine)
Mechanical Engineering 2001

Emad Boctor, Ph.D.
Assistant Professor, Radiology and Radiological Sciences (Medicine)
Computer Science, 2009

Paul Bottomly, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering 2000

Kit Bowen, Ph.D.
Professor, Chemistry; Materials Science and Engineering, 2014

Patrick Breysse, Ph.D.
Professor, Environmental Health (Public Health)
Chemical and Biomolecular Engineering

Colin Broholm, Ph.D.
Professor, Physics and Astronomy; Materials Science and Engineering

Chia-Ling Chien, Ph.D.
Professor, Physics and Astronomy; Materials Science and Engineering

Michael Edidin, Ph.D.
Professor, Biology (Arts and Sciences)
Materials Science and Engineering, 2005

Jennifer Elisseeff, Ph.D.
Professor, Biomedical Engineering (Medicine)
Chemical and Biomolecular Engineering, 2012
Materials Science and Engineering, 2014

Joshua Epstein, M.D.
Professor, Emergency Medicine; Applied Mathematics and Statistics, 2011

Howard Fairbrother, Ph.D.
Professor, Chemistry; Materials Science and Engineering, 2014

Liliana Florea, Ph.D.
Assistant Professor, General Internal Medicine (Medicine)
Computer Science, 2013

Eric Frey, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering, 2010

Warren Grayson, M.D.
Assistant Professor, Biomedical Engineering, (Medicine);
Materials Science and Engineering, 2014

Jordan Green, M.D.
Associate Professor, Biomedical Engineering, (Medicine);

Materials Science and Engineering, 2014

John Isaacs, Ph.D.
Professor, Chemical Therapeutics (Medicine)
Chemical and Biomolecular Engineering, 2007

Robert Ivkov, M.D.
Assistant Professor, Oncology (Medicine);
Materials Science and Engineering, 2014

Rangaramar Kannan, Ph.D.
Professor, Center for Nanomedicine (Medicine)
Materials Science and Engineering, 2011

Albert Lardo, M.D
Associate Professor, Department of Medicine;
Mechanical Engineering, 2013

Stuart W. Leslie, Ph.D.
Professor, History of Science and Technology (Arts and Sciences)
Geography and Environmental Engineering 1997

Elliot McVeigh, Ph.D.
Professor, Biomedical Engineering (Medicine)
Electrical and Computer Engineering, 2007; Computer Science, 2013

Aleksander S. Popel, Ph.D.
Professor, Biomedical Engineering (Medicine)
Mechanical Engineering 1986
Chemical and Biomolecular Engineering

Arman Rahmim, Ph.D.
Assistant Professor, Radiology (Medicine)
Electrical and Computer Science 2010

Kannan Rangeramanujam, M.D.
Professor, Department of Ophthalmology (Medicine);
Materials Science and Engineering, 2014

Mark Robbins, Ph.D.
Professor, Physics and Astronomy (Arts and Sciences)
Mechanical Engineering 2001

Steven Salzberg, Ph.D.
Professor, Internal Medicine (Medicine)
Computer Science, 2011

Jeffrey Siewerdsen, Ph.D.
Biomedical Engineering (Medicine);
Computer Science, 2010

Dan Stoianovici, Ph.D.
Professor, Urology (Medicine)
Mechanical Engineering, 2005

Alexander Szalay, Ph.D.
Professor, Physics and Astronomy (Arts and Sciences)
Computer Science 2001

James Taylor, Ph.D.
Associate Professor, Biology
Computer Science 2014

Nitish Thakor, Ph.D.
Professor, Biomedical Engineering (Medicine)
Electrical and Computer Engineering, 2007

John Tovar, Ph.D.
Associate Professor, Chemistry; Materials Science and Engineering, 2014

Benjamin Tsui, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering 2006

Raimond L. Winslow, Ph.D.
Professor, Biomedical Engineering (Medicine)
Director, Center for Cardiovascular Bioinformatics and Modeling,
Computer Science 1991; Electrical and Computer Engineering, 2003

Thomas Woolf
Professor, Department of Physiology; Computer Science, 2013
