EN.553.291. Linear Algebra and Differential Equations. 4.0 Credits.
An introduction to the basic concepts of linear algebra, matrix theory, and differential equations that are used widely in modern engineering and science. Intended for engineering and science majors whose program does not permit taking both AS.110.201 and AS.110.302.
Prerequisites: AS.110.107 OR AS.110.109 OR AS.110.113
Instructor(s): M. Micheli
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.310. Probability & Statistics. 4.0 Credits.
An introduction to probability and statistics at the calculus level, intended for engineering and science students planning to take only one course on the topics. Combinatorial probability, independence, conditional probability, random variables, expectation and moments, limit theory, estimation, confidence intervals, hypothesis testing, tests of means and variances, and goodness-of-fit will be covered. Recommended co-requisite: multivariable calculus.
Prerequisites: (AS.110.106 OR AS.110.108) AND (AS.110.107 OR AS.110.109 OR AS.110.113)
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.311. Probability and Statistics for the Biological Sciences and Engineering. 4.0 Credits.
An introduction to probability and statistics at the calculus level, intended for students in the biological sciences planning to take only one course on the topics. Combinatorial probability, independence, conditional probability, random variables, expectation and moments, limit theory, estimation, confidence intervals, hypothesis testing, tests of means and variances, and goodness-of-fit will be covered. Recommended Course Corequisite: AS.110.202
Prerequisites: (AS.110.106 OR AS.110.108) AND (AS.110.107 OR AS.110.109) AND AS.110.113
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.361. Introduction to Optimization. 4.0 Credits.
An introductory survey of optimization methods, supporting mathematical theory and concepts, and application to problems of planning, design, prediction, estimation, and control in engineering, management, and science. Study of varied optimization techniques including linear programming, network-problem methods, dynamic programming, integer programming, and nonlinear programming. Students should be familiar with computing and linear algebra. Recommended Course Background: one year of calculus
Prerequisites: (AS.110.107 OR AS.110.109 OR AS.110.113) AND (EN.553.291 OR AS.110.201 OR AS.110.212)
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.362. Introduction to Optimization II. 4.0 Credits.
An introductory survey of optimization methods, supporting mathematical theory and concepts, and application to problems of planning, design, prediction, estimation, and control in engineering, management, and science. Study of varied optimization techniques including linear programming, network-problem methods, dynamic programming, integer programming, and nonlinear programming. Appropriate for undergraduate students and graduate students without the mathematical background required for EN.553.761.
Prerequisites: EN.550.361 AND (AS.110.202 OR AS.110.211)
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.371. Cryptology and Coding. 4.0 Credits.
Computing experience. A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication: How can we ensure the privacy of messages? Coding theory studies how to make communication reliable: How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow.
Prerequisites: EN.550.171 AND (EN.550.291 OR AS.110.201 OR AS.110.212)
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.383. Scientific Computing with Python. 4.0 Credits.
In this course, we will study numerical methods, and scientific computing using the Python language. We will discuss topics in numerical analysis, such as equation solving, differential equations, interpolation, integration etc. We will also introduce image analysis techniques such as filtering, denoising, inpainting, and segmentation. We will discuss core computer language concepts, algorithms, and data-structures using Python. No previous experience with computer programming is needed.
Prerequisites: (EN.550.291 OR AS.110.201 OR AS.110.212) AND (AS.110.202 OR AS.110.211)
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.553.385. Scientific Computing: Linear Algebra. 4.0 Credits.
A first course on computational linear algebra and applications. Topics include floating-point arithmetic, algorithms and convergence, Gaussian elimination for linear systems, matrix decompositions (LU, Cholesky, QR), iterative methods for systems (Jacobi, Gauss–Seidel), and approximation of eigenvalues (power method, QR-algorithm). Theoretical topics such as vector spaces, inner products, norms, linear operators, matrix norms, eigenvalues, and canonical forms of matrices (Jordan, Schur) are reviewed as needed. Matlab is used to solve all numerical exercises; no previous experience with computer programming is required.
Prerequisites: (EN.553.291 OR AS.110.201 OR AS.110.212) AND (AS.110.202 OR AS.110.211)
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.386. Scientific Computing: Differential Equations. 4.0 Credits.
A first course on computational differential equations and applications. Topics include floating-point arithmetic, algorithms and convergence, root-finding (midpoint, Newton, and secant methods), numerical differentiation and integration, and numerical solution of initial value problems (Runge–Kutta, multistep, extrapolation methods, stability, implicit methods, and stiffness). Theoretical topics such as existence, uniqueness, and stability of solutions to initial-value problems, conversion of higher order/ non-autonomous equations to systems, etc., will be covered as needed. Matlab is used to solve all numerical exercises; no previous experience with computer programming is required.
Prerequisites: (AS.110.202 OR AS.110.211) AND (EN.550.291 OR AS.110.302 OR AS.110.306).
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.388. Scientific Computing: Differential Equations in Vector Spaces. 4.0 Credits.
A first course on computational differential equations in vector spaces and applications, a continuation of EN.553.385. Topics include root-finding for nonlinear systems of equations (bisection, Newton, and secant methods), numerical differentiation and integration, and numerical solution of initial-value problems (Runge–Kutta, multistep, extrapolation methods, stability, implicit methods, and stiffness) and boundary-value problems (shooting method, relaxation) for ordinary differential equations in finite-dimensional vector spaces. Theoretical topics such as existence, uniqueness, and stability of solutions to initial-value problems, conversion of higher-order/non-autonomous equations to systems, etc., will be covered as needed. Matlab is used to solve all numerical exercises.
Prerequisites: Prereqs: EN.550.385 AND (EN.550.291 OR AS.110.302 OR AS.110.306)
Instructor(s): G. Eyink
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.391. Dynamical Systems. 4.0 Credits.
Mathematical concepts and methods for describing and analyzing linear and nonlinear systems that evolve over time. Topics include boundedness, stability of fixed points and attractors, feedback, optimality, Liapounov functions, bifurcation, chaos, and catastrophes. Examples drawn from population growth, economic behavior, physical and engineering systems. The main mathematical tools are linear algebra and basic differential equations.
Prerequisites: EN.553.291 OR AS.110.201 OR AS.110.211
Instructor(s): X. Ye
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.400. Mathematical Modeling and Consulting. 4.0 Credits.
Creating, analyzing and evaluating optimization and mathematical models using case studies. Project-oriented practice and guidance in modeling techniques, with emphasis on communication of methods and results. Applications may include transportation networks, scheduling, industrial processes, and telecommunications. Computation will be emphasized throughout using MATLAB.
Prerequisites: EN.553.361 OR EN.553.362; Students may receive credit for EN.550.400/EN.553.400 or EN.553.600, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.413. Applied Statistics and Data Analysis. 4.0 Credits.
An introduction to basic concepts, techniques, and major computer software packages in applied statistics and data analysis. Topics include numerical descriptive statistics, observations and variables, sampling distributions, statistical inference, linear regression, multiple regression, design of experiments, nonparametric methods, and sample surveys. Real-life data sets are used in lectures and computer assignments. Intensive use of statistical packages such as S+ to analyze data.
Prerequisites: EN.553.112 OR EN.553.310 OR EN.553.311 OR EN.553.420; Students may receive credit for EN.550.413/EN.553.413 or EN.553.613, but not both.
Instructor(s): M. Tang
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.414. Applied Statistics and Data Analysis II. 3.0 Credits.
Part II of a sequence on data analysis and linear models. Topics include categorical and discrete data analysis, mixed models, semiparametric and nonparametric regression, and generalized additive models. Applications of these methods using the R environment for statistical computing will be emphasized.
Prerequisites: EN.550.413; Students may receive credit for EN.550.414/EN.553.414 or EN.553.614, but not both.
Instructor(s): M. Tang
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.416. Introduction to Statistical Learning, Data Analysis and Signal Processing. 4.0 Credits.
Introduction to high dimensional data sets: key problems in statistical and machine learning. Geometric aspects. Principal component analysis, linear dimension reduction, random projections. Concentration phenomena: examples and basic inequalities. Metric spaces and embeddings thereof. Kernel methods. Nonlinear dimension reduction, manifold models. Regression. Vector spaces of functions, linear operators, projections. Orthonormal bases; Fourier and wavelet bases, and their use in signal processing and time series analysis. Basic approximation theory. Linear models, least squares. Bias and variance tradeoffs, regularization. Sparsity and compressed sensing. Multiscale methods. Graphs and networks. Random walks on graphs, diffusions, page rank. Block models. Spectral clustering, classification, semi-supervised learning. Algorithmic and computational aspects of the above will be consistently in focus, as will be computational experiments on synthetic and real data. Linear algebra will be used throughout the course, as will multivariable calculus and basic probability (discrete random variables). Basic experience in programming in C or MATLAB or R or Octave. Recommended Course Background: More than basic programming experience in Matlab or R; some more advanced probability (e.g. continuous random variables), some signal processing (e.g. Fourier transform, discrete and continuous). Co-listed with AS.110.446
Prerequisites: (AS.110.201 OR AS.110.212) AND (EN.550.310 OR EN.550.311 OR EN.550.420) AND (AS.110.202 OR AS.110.211)
Instructor(s): M. Maggioni
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.417. Mathematical Modeling: Statistical Learning. 3.0 Credits.
Students will work independently or in groups on two or more projects using and developing machine learning methods such as linear and generalized linear regression, shrinkage methods, Bayesian decision theory, variable selection, clustering, dimension reduction, functional data analysis, kernel smoothing methods and so on. These concepts will be briefly discussed in class, but some basic knowledge about them is expected. Some usual coding methods such as R, python, Matlab and C++ will also be discussed in class. Successful works could gradually turn into a part of an undergraduate or graduate thesis, or research papers. This course emphasizes on both mathematical reasons behind a model and computational skills to implement.
Prerequisites: EN.550.436 or EN.550.413 or EN.550.430 or EN.550.630 or EN.550.632
Instructor(s): M. Gu
Area: Quantitative and Mathematical Sciences.

EN.553.420. Introduction to Probability. 4.0 Credits.
Probability and its applications, at the calculus level. Emphasis on techniques of application and on rigorous mathematical demonstration. Probability, combinatorial probability, random variables, distribution functions, important probability distributions, independence, conditional probability, moments, covariance and correlation, limit theorems. Students initiating graduate work in probability or statistics should enroll in EN.553.620 or EN.553.720. Prerequisites: one year of calculus.
Corequisites: multivariable calculus and linear algebra
Prerequisites: AS.110.107 OR AS.110.109 OR AS.110.113; Students may receive credit for EN.550.420/EN.553.420 or EN.553.620, but not both.; AS.110.201 OR AS.110.202 OR AS.110.211 OR AS.110.212, can be taken concurrently.
Instructor(s): J. Wierman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.426. Introduction to Stochastic Processes. 4.0 Credits.
Mathematical theory of stochastic processes. Emphasis on deriving the dependence relations, statistical properties, and sample path behavior including random walks, Markov chains (both discrete and continuous time), Poisson processes, martingales, and Brownian motion. Applications that illuminate the theory. Students may receive credit for only one of EN.553.426, EN.553.427, EN.553.626, or EN.553.627.
Prerequisites: (EN.550.420 OR EN.553.620) AND (EN.550.291 OR AS.110.201 OR AS.110.212); Students may receive credit for EN.550.426/EN.553.426 or EN.553.626, but not both.
Instructor(s): J. Wierman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.427. Stochastic Processes and Applications to Finance. 4.0 Credits.
A development of stochastic processes with substantial emphasis on the processes, concepts, and methods useful in mathematical finance. Relevant concepts from probability theory, particularly conditional probability and conditional expectation, will be briefly reviewed. Important concepts in stochastic processes will be introduced in the simpler setting of discrete-time processes, including random walks, Markov chains, and discrete-time martingales, then used to motivate more advanced material. Most of the course will concentrate on continuous-time stochastic processes, particularly martingales, Brownian motion, diffusions, and basic tools of stochastic calculus. Examples will focus on applications in finance, economics, business, and actuarial science.
Prerequisites: EN.553.420 OR EN.553.620; Students may receive credit for only one of EN.553.427, EN.553.427, OR EN.553.627
Instructor(s): D. Athreya; M. Bichuch
Area: Quantitative and Mathematical Sciences.

EN.553.428. Stochastic Processes and Applications to Finance II. 4.0 Credits.
A basic knowledge of stochastic calculus and Brownian motion is assumed. Topics include stochastic differential equations, the Feynman-Kac formula and connections to partial differential equations, changes of measure, fundamental theorems of asset pricing, martingale representations, first passage times and pricing of path-dependent options, and jump processes.
Prerequisites: EN.553.427 OR EN.553.627; Students may receive credit for EN.550.428/EN.553.428 or EN.553.628, but not both.
Instructor(s): J. Miller
Area: Quantitative and Mathematical Sciences.

EN.553.429. Introduction to Research in Discrete Probability. 3.0 Credits.
Aspects of the research process, including reading and writing mathematics, LaTeX, literature search, problem identification, problem-solving, oral presentations, Beamer, conference attendance, publication of results, and research ethics. An initial research experience, individually and/or in groups, with students identifying and developing projects in discrete mathematics and probability, such as percolation, random graphs, random walks, birthday problems, gambler’s ruin, coupon collector problems, and self-avoiding walks. Instructor’s permission required. Open only to undergraduates.
Prerequisites: EN.553.171 AND (EN.553.420 OR EN.553.620); Students may receive credit for EN.550.429/EN.553.429 or EN.553.629, but not both.
Instructor(s): J. Wierman
Area: Quantitative and Mathematical Sciences.
EN.553.430. Introduction to Statistics. 4.0 Credits.
Introduction to the basic principles of statistical reasoning and data analysis. Emphasis on techniques of application. Classical parametric estimation, hypothesis testing, and multiple decision problems; linear models, analysis of variance, and regression; nonparametric and robust procedures; decision-theoretic setting. Bayesian methods.
Prerequisites: (EN.553.420 OR EN.553.620) AND ( AS.110.201 OR AS.110.212 OR EN.553.291 ); Students may receive credit for EN.550.430/EN.553.430 or EN.553.630, but not both.
Instructor(s): D. Athreya
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.431. Statistical Methods in Imaging. 3.0 Credits.
Denosing, segmentation, texture modeling, tracking, object recognition are challenging problems in imaging. We will present a collection of statistical models and methods in order to address these, including the E.M. algorithm, Maximum Entropy Modeling, Particle filtering, Markov Random Fields and Belief Propagation. Co-listed with EN.580.466. Some practice of Matlab or R is highly recommended.
Prerequisites: (AS.110.202 OR AS.110.211) AND (EN.550.310 OR EN.550.311 OR EN.550.420)
Instructor(s): Staff
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.432. Monte Carlo Methods. 3.0 Credits.
The objective of the course is to survey essential simulation techniques for popular stochastic models. The stochastic models may include classical time-series models, Markov chains and diffusion models. The basic simulation techniques covered will be useful in sample-generation of random variables, vectors and stochastic processes, and as advanced techniques, importance sampling, particle filtering and Bayesian computation may be discussed.
Prerequisites: Students may receive credit for EN.550.433/EN.553.433 or EN.553.633, but not both.; EN.550.430 OR EN.553.630.
Instructor(s): J. Spall
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.436. Data Mining. 4.0 Credits.
Data mining is a relatively new term used in the academic and business world, often associated with the development and quantitative analysis of very large databases. Its definition covers a wide spectrum of analytic and information technology topics, such as machine learning, artificial intelligence, statistical modeling, and efficient database development. This course will review these broad topics, and cover specific analytic and modeling techniques such as advanced data visualization, decision trees, neural networks, nearest neighbor, clustering, logistic regression, and association rules. Although some of the mathematics underlying these techniques will be discussed, our focus will be on the application of the techniques to real data and the interpretation of results. Because use of the computer is extremely important when “mining” large amounts of data, we will make substantial use of data mining software tools to learn the techniques and analyze datasets. Recommended Course Background: EN.553.413.
Prerequisites: Students may receive credit for EN.550.436/EN.553.436 or EN.553.636, but not both.; (AS.110.202 OR AS.110.211) AND (AS.110.201 OR AS.110.212 OR EN.550.291)
Instructor(s): T. Budavari
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.439. Time Series Analysis. 3.0 Credits.
Time series analysis from the frequency and time domain approaches. Descriptive techniques; regression analysis; trends, smoothing, prediction; linear systems; serial correlation; stationary processes; spectral analysis.
Prerequisites: (EN.553.310[C] OR EN.553.311 OR EN.553.420 OR EN.553.620) AND (AS.110.201 OR AS.110.212 OR EN.553.291); Students may receive credit for EN.550.439/EN.553.439 or EN.553.639, but not both.
Instructor(s): D. Naiman, F. Torcaso; M. Pemy
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.441. Equity Markets and Quantitative Trading. 3.0 Credits.
This course introduces equity markets from a mathematical point of view. The properties of equities and equity-linked instruments will be described. Several quantitative trading strategies will be studied. Order execution tactics and the effect of market structure will be analyzed. Students will select a specialized aspect of the equity markets to investigate and complete a related independent project.
Prerequisites: EN.553.442 OR EN.553.642 OR EN.553.444 OR EN.553.644 or instructor's permission. Students may receive credit for EN.550.441/EN.553.441 or EN.553.641, but not both.
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.442. Investment Science. 4.0 Credits.
This course offers a rigorous treatment of the subject of investment as a scientific discipline. Mathematics is employed as the main tool to convey the principles of investment science and their use to make investment calculations for good decision-making. Topics covered in the course include the basic theory of interest and its application to fixed-income securities, cash flow analysis and capital budgeting, mean-variance portfolio theory, and the associated capital asset pricing model, utility function theory and risk analysis, derivative securities and basic option theory, portfolio evaluation. The student is expected to be comfortable with the use of mathematics as a method of deduction and problem solving. Students may not receive credit for both EN.550.342 and EN.553.442.
Prerequisites: Students may receive credit for only one of EN.550.342, EN.550.442, EN.553.442 or EN.553.642; (AS.110.107 OR AS.110.109 OR AS.110.113) AND (EN.553.291 OR AS.110.201 OR AS.110.212) AND (EN.550.310 OR EN.550.311 OR EN.553.420 OR EN.553.620 OR EN.550.430 EN.553.630)
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.443. Financial Computing in C++. 4.0 Credits.
The first part of course, will introduce the basic concepts of C++ including variables, functions, pointers and references, function and operator overloading and along with inheritance and polymorphism, templates and the C++ Standard Library. Basic ideas of object-oriented design will be introduced. The second part of the course will cover computational techniques for solving mathematical problems arising in finance. Numerical solution of parabolic partial differential equations for option valuation and their relation to tree methods together with a basic introduction of concepts such as convergence and stability as applied to finite difference schemes. Prerequisites EN.553.427 Stochastic Processes and Applications to Finance. No prior experience with C/C++ is required.
Prerequisites: EN.550.427
Instructor(s): M. Bichuch
Area: Quantitative and Mathematical Sciences.
EN.553.444. Introduction to Financial Derivatives. 4.0 Credits.
This course will develop the mathematical concepts and techniques for modeling cash instruments and their hybrids and derivatives.
Prerequisites: Students may receive credit for EN.550.444/EN.553.444 or EN.553.644, but not both.;AS.110.302 AND EN.553.420
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.445. Interest Rate and Credit Derivatives. 4.0 Credits.
Advances in corporate finance, investment practice and the capital markets have been driven by the development of a mathematically rigorous theory for financial instruments and the markets in which they trade. This course builds on the concepts, techniques, instruments and markets introduced in EN.553.444. In addition to new topics in credit enhancement and structured securities, the focus is expanded to include applications in portfolio theory and risk management, and covers some numerical and computational approaches.
Prerequisites: EN.553.444 OR EN.553.644;Students may receive credit for EN.550.445/EN.553.445 or EN.553.645, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.446. Risk Measurement/Management in Financial Markets. 4.0 Credits.
This course applies advanced mathematical techniques to the measurement, analysis, and management of risk. The focus is on financial risk. Sources of risk for financial instruments (e.g., market risk, interest rate risk, credit risk) are analyzed; models for these risk factors are studied and the limitation, shortcomings and compensatory techniques are addressed.
Prerequisites: Students may receive credit for EN.550.446/EN.553.446 or EN.553.646, but not both.;EN.553.444 OR EN.553.644
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.447. Quantitative Portfolio Theory and Performance Analysis. 4.0 Credits.
This course focuses on modern quantitative portfolio theory, models, and analysis. Topics include intertemporal approaches to modeling and optimizing asset selection and asset allocation; benchmarks (indexes), performance assessment (including, Sharpe, Treynor and Jensen ratios) and performance attribution; immunization theorems; alpha-beta separation in management, performance measurement and attribution; Replicating Benchmark Index (RBI) strategies using cash securities / derivatives; Liability-Driven Investment (LDI); and the taxonomy and techniques of strategies for traditional management: Passive, Quasi-Passive (Indexing) Semi-Active (Immunization & Dedicated) Active (Scenario, Relative Value, Total Return and Optimization). In addition, risk management and hedging techniques are also addressed.
Prerequisites: Students may receive credit for 550.447/553.447 OR EN.553.647, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.448. Financial Engineering and Structured Products. 4.0 Credits.
This course focuses on structured securities and the structuring of aggregates of financial instruments into engineered solutions of problems in capital finance. Topics include the fundamentals of creating asset-backed and structured securities—including mortgage-backed securities (MBS), stripped securities, collateralized mortgage obligations (CMOs), and other asset-backed collateralized debt obligations (CDOs)—structuring and allocating cash-flows as well as enhancing credit; equity hybrids and convertible instruments; asset swaps, credit derivatives and total return swaps; assessment of structure-risk interest rate-risk and credit-risk as well as strategies for hedging these exposures; managing portfolios of structured securities; and relative value analysis (including OAS and scenario analysis).
Prerequisites: EN.550.444[C] OR EN.550.442[C]
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.449. Advanced Equity Derivatives. 4.0 Credits.
This course will cover the pricing, trading and risk management of equity derivatives, with emphasis on more exotic derivatives such as path-dependent and multi-asset derivatives. The course will emphasize practical issues: students will build their own pricing and risk management tools, and gain experience simulating the dynamic hedging of a complex derivatives portfolio. Students will practice structuring and selling equity derivative products. Pricing issues such a model selection, unobservable input parameters and calibration will be discussed, and students will learn techniques to manage the often highly nonlinear and discontinuous risks associated with these products. The course will have a significant computing component: both in the classroom and as homework projects, students will use Excel, write VBA macros and write and call C++ routines in the Microsoft Windows environment (which is the most common computing environment used by the financial industry).
Prerequisites: Students may receive credit for EN.550.449/EN.553.449 or EN.553.649, but not both.;EN.553.444 OR EN.553.644
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.450. Computational Molecular Medicine. 4.0 Credits.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional “omics” data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful).
Prerequisites: ( EN.553.420 OR EN.553.620) AND ( EN.553.430 OR EN.553.630 ) OR equivalent courses in probability and statistics.;Students may receive credit for EN.550.450/EN.553.450 or EN.553.650, but not both.
Instructor(s): D. Geman; J. Bader
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.453. Mathematical Game Theory. 4.0 Credits.
Mathematical analysis of cooperative and noncooperative games. Theory and solution methods for matrix game (two players, zero-sum payoffs, finite strategy sets), games with a continuum of strategies, N-player games, games in rule-defined form. The roles of information and memory. Selected applications to economic, recreational, and military situations.
Prereq: Multivariable Calculus, probability, linear algebra.
Prerequisites: Students may receive credit for EN.550.453/EN.553.453 or EN.553.653, but not both. (EN.550.202 OR AS.110.211) AND (EN.550.420 OR EN.553.620) AND (EN.550.291 OR AS.110.201 OR AS.110.212).
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.457. Topics in Operations Research. 1.5 Credits.
Study in depth of a special mathematical or computational area of operations research, or a particular application area. Recent topics: decision theory, mathematical finance, optimization software.
Prerequisites: Students may receive credit for EN.550.463/EN.553.463 or EN.553.464, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.461. Optimization in Finance. 4.0 Credits.
A survey of many of the more important optimization methods and tools that are found to be useful in financial applications.
Prerequisites: Students may receive credit for EN.550.461/EN.553.461 or EN.553.661, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.463. Network Models in Operations Research. 4.0 Credits.
In-depth mathematical study of network flow models in operations research, with emphasis on combinatorial approaches for solving them. Introduction to techniques for constructing efficient algorithms, and to some related data structures, used in solving shortest-path, maximum-volume, flow, and minimum-cost flow problems. Emphasis on linear models and flows, with brief discussion of non-linear models and network design.
Prerequisites: Students may receive credit for EN.550.463/EN.553.463 or EN.553.663, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.465. Introduction to Convexity. 4.0 Credits.
Convexity is a simple mathematical concept that has become central in a diverse range of applications in engineering, science and business applications. Our main focus from the applications perspective will be the use of convexity within optimization problems, where convexity plays a key role in identifying the "easy" problems from the "hard" ones. The course will have an equal emphasis on expositing the rich mathematical structure of the field itself (properties of convex sets, convex functions, Helly-Caratheodory-Radon type theorems, polarity/duality, subdifferential calculus, polyhedral theory), and demonstrating how these ideas can be leveraged to model and solve optimization problems (via a detailed study of linear programming and basics of nonlinear convex optimization). Recommend Course Background: Familiarity with basic real analysis, linear algebra.
Prerequisites: Students may receive credit for EN.550.465/EN.553.465 or EN.553.665, but not both.
Instructor(s): A. Basu
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.471. Combinatorial Analysis. 4.0 Credits.
Recommended Course Background: AS.553.291 or AS.110.201
Prerequisites: Students may receive credit for EN.550.471/EN.553.471 or EN.550.671/EN.553.671, but not both.
Corequisites: EN.553.171 may not be taken concurrently with EN.553.471 or EN.553.472.
Instructor(s): E. Scheinerman
Area: Quantitative and Mathematical Sciences.

EN.553.472. Graph Theory. 4.0 Credits.
Study of systems of “vertices” with some pairs joined by “edges.” Theory of adjacency, connectivity, traversability, feedback, and other concepts underlying properties important in engineering and the sciences. Topics include paths, cycles, and trees; routing problems associated with Euler and Hamilton; design of graphs realizing specified incidence conditions and other constraints. Attention directed toward problem solving, algorithms, and applications. One or more topics taken up in greater depth.
Prerequisites: EN.550.291 OR AS.110.201 OR AS.110.212; Students may receive credit for EN.550.472/EN.553.472 or EN.553.672, but not both.
Corequisites: EN.550.171 may not be taken concurrently with EN.550.471 or EN.550.472
Instructor(s): E. Gnang
Area: Quantitative and Mathematical Sciences.

EN.553.473. Introduction to Nonlinear Dynamics and Chaos. 3.0 Credits.
An introduction to the phenomenology of nonlinear dynamic behavior with emphasis on models of actual physical, chemical, and biological systems, involving an interdisciplinary approach to ideas from mathematics, computing, and modeling. The common features of the development of chaotic behavior in both mathematical models and experimental studies are stressed, and the use of modern data-mining tools to analyze dynamic data will be explored. Some computing experience is desirable. Emphasis will be placed on the geometric/visual computer-aided description and understanding of dynamics and chaos.
Prerequisites: Students may receive credit for only one of EN.553.473 OR EN.550.673 OR EN.550.468 OR EN.540.668 OR (AS.110.201 OR AS.110.212) AND (AS.110.302 OR AS.110.306) OR EN.553.291
Instructor(s): Y. Kevrekidis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.485. Introduction to Harmonic Analysis and Its Applications. 4.0 Credits.
The course is an introduction to methods in harmonic analysis, in particular Fourier series, Fourier integrals, and wavelets. These methods will be introduced rigorously, together with their motivations and applications to the analysis of basic partial differential equations and integral kernels, signal processing, inverse problems, and statistical/machine learning. Co-listed with EN.553.685 and AS.110.433
Prerequisites: (AS.110.201 OR AS.110.212 OR EN.550.291/EN.553.291) AND (AS.110.202 OR AS.110.211) AND (AS.110.405 OR AS.110.415); Students may receive credit for only one of the following: AS.110.433, EN.553.485, or EN.553.685.
Instructor(s): M. Maggioni.
EN.553.487. Numerical Methods for Financial Mathematics. 3.0 Credits. Diffusion processes described by stochastic differential equations (SDEs) play an important role in the world of finance; one important tool in the study of complex SDEs is numerical simulation. In this class we concentrate on the numerical integration of SDEs, which requires a more complex mathematical construction than the integration of ordinary differential equations (ODEs). The algorithms for approximating SDE solutions are constructed on the basis of stochastic Taylor expansions, which can become particularly elaborate for systems with multiple noise sources. We propose to follow in detail all the steps from writing down an SDE to writing and running the computer code that will generate a "solution" of that SDE with a well-defined error. Python will be used for all applications, and more general programming concepts will be discussed as needed.

Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.553.488. Financial Computing I. 3.0 Credits. This course is aimed for student who need to develop the ability to use programming languages to solve data analytic problems that are likely to arise in financial applications. The C programming language will be introduced, and students will be exposed to some of the more useful C++ enhancements. The Python language will be introduced as well. Students should be comfortable using computers but no prior programming background is required. Some finance background is helpful but not necessary.

Prerequisites: Students may receive credit for EN.550.488/EN.553.488 or EN.553.688, but not both.;EN.553.310 OR EN.553.311 OR ( EN.553.420 EN.553.620) AND (EN.553.430 OR EN.553.630)
Instructor(s): D. Naiman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.492. Mathematical Biology. 3.0 Credits.
This course will examine the mathematical methods relevant to modeling biological phenomena, particularly dynamical systems and probability. Topics include ordinary differential equations and their simulation; stability and phase plane analysis; branching processes; Markov chains; and stochastically perturbed systems. Biological applications will be drawn from population growth, predator-prey dynamics, epidemiology, genetics, intracellular transport, and neuroscience.

Prerequisites: ( EN.553.420 OR EN.553.620 ) AND ( AS.110.201 OR AS.110.212 ) AND ( AS.110.302 OR AS.110.306 OR EN.553.291 );Students may receive credit for EN.550.492/EN.553.492 or EN.553.692, but not both.
Instructor(s): D. Athreya
Area: Natural Sciences, Quantitative and Mathematical Sciences.

EN.553.493. Mathematical Image Analysis. 3.0 Credits.
This course gives an overview of various mathematical methods related to several problems encountered in image processing and analysis, and presents numerical schemes to address them. It will focus on problems like image denoising and deblurring, contrast enhancement, segmentation and registration. The different mathematical concepts shall be introduced during the course; they include in particular functional spaces such as Sobolev and BV, Fourier and wavelet transforms, as well as some notions from convex optimization and numerical analysis. Most of such methods will be illustrated with algorithms and simulations on discrete images, using MATLAB. Prerequisites: Linear algebra, multivariate calculus, basic programming in MATLAB. Recommended Course Background: Real analysis
Prerequisites: ( AS.110.202 OR AS.110.211 ) AND ( EN.550.291 OR AS.110.201 OR AS.110.212 );Students may receive credit for EN.550.493/EN.553.493 or EN.553.693, but not both.
Instructor(s): P. Escande
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.494. Applied and Computational Linear Algebra. 3.0 Credits. In this seminar we plan to discuss generalizations of theorems and algorithms from matrix theory to hypermatrices. More specifically the seminar will discuss hypermatrix/tensor algebras, rank, spectra and transforms. Using the python friendly free open-source mathematics software SageMath and the hypermatrix algebra package we will discuss applications of hypermatrices to combinatorics, machine learning and data analysis. Preliminary knowledge of the Python language is not required.

Prerequisites: Students may receive credit for EN.550.494/EN.553.494 or EN.553.694, but not both.;AS.110.201 OR AS.110.212 OR EN.550.291
Instructor(s): E. Gnang
Area: Quantitative and Mathematical Sciences.

EN.553.500. Undergraduate Research. 1.0 - 3.0 Credits.
Reading, research, or project work for undergraduate students. Pre-arranged individually between students and faculty.
Instructor(s): D. Fishkind; E. Scheinerman; J. Wierman; T. Budavari.

EN.553.501. Senior Thesis. 3.0 Credits.
Instructor(s): Staff.

EN.553.502. Undergraduate Independent Study. 1.0 - 3.0 Credits.
Reading, research, or project work for undergraduate students. Pre-arranged individually between students and faculty. Recent topics and activities: percolation models, data analysis, course development assistance, and dynamical systems.
Instructor(s): Staff.

EN.553.503. Preparation for Research. 1.0 Credit.
Primarily an independent study course. Readings, assignments, and discussion to prepare students for research in applied mathematics and statistics. Topics include the research process, problem-solving, mathematical writing, LaTeX, Beamer, reading mathematics, literature search, oral presentations, REU programs, and the publication process. Brief meetings to be arranged. Students are expected to spend 3 to 4 hours per week in addition to the meetings. Grading is Satisfactory/Unsatisfactory only.
Instructor(s): J. Wierman.

EN.553.505. Applied Mathematics Pedagogy. 3.0 Credits. 
Instructor Permission Required - Opportunity for students to participate.
EN.553.512. Group Undergraduate Research. 1.0 - 3.0 Credits.
Reading, research, or project work for undergraduate students. Pre-
arranged meetings between students and faculty. This section has a
weekly research group meeting that students are expected to attend.
Instructor(s): D. Fishkind; E. Fertig; E. Scheinerman.

EN.553.552. Undergraduate Internship. 1.0 Credit.
Instructor(s): Staff.
EN.553.590. Internship - Summer. 1.0 Credit.
Instructor(s): Staff.
EN.553.597. Research-Summer. 3.0 Credits.
Instructor(s): Staff.
EN.553.599. Independent Study. 3.0 Credits.
Instructor(s): D. Fishkind; E. Scheinerman; F. Torcaso.

EN.553.600. Mathematical Modeling and Consulting. 4.0 Credits.
Creating, analyzing and evaluating optimization and mathematical
models using case studies. Project-oriented practice and guidance in
modeling techniques, with emphasis on communication of methods and
results. Applications may include transportation networks, scheduling,
industrial processes, and telecommunications. Computation will
be emphasized throughout using MATLAB. Recommend Course
Background: EN.553.361 OR EN.553.362.
Prerequisites: Students may receive credit for EN.550.400/EN.553.400 or
EN.553.600, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.613. Applied Statistics and Data Analysis. 4.0 Credits.
An introduction to basic concepts, techniques, and major computer
software packages in applied statistics and data analysis. Topics include
numerical descriptive statistics, observations and variables, sampling
distributions, statistical inference, linear regression, multiple regression,
design of experiments, nonparametric methods, and sample surveys.
Real-life data sets are used in lectures and computer assignments.
Intensive use of statistical packages such as S+ to analyze data.
Recommend Course Background: EN.553.112 OR EN.553.310 OR
EN.553.311 OR EN.553.420.
Prerequisites: Students may receive credit for EN.550.413/EN.553.413 or
EN.553.613, but not both.
Instructor(s): M. Tang
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.614. Applied Statistics and Data Analysis II. 3.0 Credits.
Part II of a sequence on data analysis and linear models. Topics include
categorical and discrete data analysis, mixed models, semiparametric
and nonparametric regression, and generalized additive models.
Applications of these methods using the R environment for statistical
computing will be emphasized.
Prerequisites: Students may receive credit for EN.550.414/EN.553.414 or
EN.553.614, but not both.
Instructor(s): M. Tang
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.620. Introduction to Probability. 4.0 Credits.
Probability and its applications, at the calculus level. Emphasis on
methods of application and on rigorous mathematical demonstration.
Probability, combinatorial probability, random variables, distribution
functions, important probability distributions, independence, conditional
probability, moments, covariance and correlation, limit theorems. Auditors
are not permitted. Recommended course background: (AS.110.107 or
AS.110.109 or AS.110.113) and previously or concurrently (AS.110.202 or
AS.110.201 or AS.110.212).
Prerequisites: Students may receive credit for EN.550.420/EN.553.420 or
EN.553.620, but not both.
Instructor(s): J. Wierman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.626. Introduction to Stochastic Processes. 4.0 Credits.
Mathematical theory of stochastic processes. Emphasis on deriving
the dependence relations, statistical properties, and sample path
behavior including random walks, Markov chains (both discrete and
continuous time), Poisson processes, martingales, and Brownian motion.
Applications that illuminate the theory. Students may receive credit
for only one of EN.553.426, EN.553.427, EN.553.626, or EN.553.627.
Recommended course background: EN.553.620 and (EN.553.291 OR
AS.110.201 OR AS.110.212).
Prerequisites: Students may receive credit for EN.550.426/EN.553.426 or
EN.553.626, but not both.
Instructor(s): J. Wierman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.627. Stochastic Processes and Applications to Finance. 4.0
Credits.
A development of stochastic processes with substantial emphasis on
applications in finance, economics, business, and actuarial science.
Relevant concepts from probability theory, particularly conditional
probability and conditional expectation, will be briefly reviewed. Important
concepts in stochastic processes will be introduced in the simpler
setting of discrete-time processes, including random walks, Markov
chains, and discrete-time martingales, then used to motivate more
advanced material. Most of the course will concentrate on continuous-
time stochastic processes, particularly martingales, Brownian motion,
diffusions, and basic tools of stochastic calculus. Examples will focus
on applications in finance, economics, business, and actuarial science.
Recommended Course Background: EN.553.620.
Prerequisites: Students may receive credit for only one of EN.550.427,
EN.553.427, EN.553.627
Instructor(s): M. Bichuch
Area: Quantitative and Mathematical Sciences.

EN.553.628. Stochastic Processes and Applications to Finance II. 4.0
Credits.
A basic knowledge of stochastic calculus and Brownian motion is
assumed. Topics include stochastic differential equations, the Feynman-
Kac formula and connections to partial differential equations, changes
of measure, fundamental theorems of asset pricing, martingale
representations, first passage times and pricing of path-dependent
options, and jump processes.
Prerequisites: Students may receive credit for EN.550.428/EN.553.428 or
EN.553.628, but not both.
Instructor(s): J. Miller
Area: Quantitative and Mathematical Sciences.
EN.553.629. Introduction to Research in Discrete Probability. 3.0 Credits.
Aspects of the research process, including reading and writing mathematics, LaTeX, literature search, problem identification, problem-solving, oral presentations, Beamer, conference attendance, publication of results, and research ethics. An initial research experience, individually and/or in groups, with students identifying and developing projects in discrete mathematics and probability, such as percolation, random graphs, random walks, birthday problems, gambler’s ruin, coupon collector problems, and self-avoiding walks. Instructor's permission required.
Prerequisites: Students may receive credit for EN.550.429/EN.553.429 or EN.553.629, but not both.
Instructor(s): T. Budavari
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.630. Introduction to Statistics. 4.0 Credits.
Introduction to the basic principles of statistical reasoning and data analysis. Emphasis on techniques of application. Classical parametric estimation, hypothesis testing, and multiple decision problems; linear models, analysis of variance, and regression; nonparametric and robust procedures; decision-theoretic setting, Bayesian methods. Recommended Course Background: EN.553.620 AND ( AS.110.201 OR AS.110.212 OR EN.553.291 ).
Prerequisites: Students may receive credit for EN.550.430/EN.553.430 or EN.553.630, but not both.
Instructor(s): J. Wierman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.630. Monte Carlo Methods. 4.0 Credits.
The objective of the course is to survey essential simulation techniques for popular stochastic models. The stochastic models may include classical time-series models, Markov chains and diffusion models. The basic simulation techniques covered will be useful in sample-generation of random variables, vectors and stochastic processes, and as advanced techniques, importance sampling, particle filtering and Bayesian computation may be discussed. Recommended Course Background: EN.553.630.
Prerequisites: Students may receive credit for EN.550.433/EN.553.433 or EN.553.633, but not both.
Instructor(s): J. Spall
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.630. Data Mining. 4.0 Credits.
Data mining is a relatively new term used in the academic and business world, often associated with the development and quantitative analysis of very large databases. Its definition covers a wide spectrum of analytic and information technology topics, such as machine learning, artificial intelligence, statistical modeling, and efficient database development. This course will review these broad topics, and cover specific analytic and modeling techniques such as advanced data visualization, decision trees, neural networks, nearest neighbor, clustering, logistic regression, and association rules. Although some of the mathematics underlying these techniques will be discussed, our focus will be on the application of the techniques to real data and the interpretation of results. Because use of the computer is extremely important when “mining” large amounts of data, we will make substantial use of data mining software tools to learn the techniques and analyze datasets. Recommended Course Background: ( AS.110.202 OR AS.110.211 ) AND ( AS.110.201 OR AS.110.212 OR EN.553.291 ).
Prerequisites: Students may receive credit for EN.550.436/EN.553.436 or EN.553.636, but not both.
Instructor(s): T. Budavari
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.639. Time Series Analysis. 3.0 Credits.
Time series analysis from the frequency and time domain approaches. Descriptive techniques; regression analysis; trends, smoothing, prediction; linear systems; serial correlation; stationary processes; spectral analysis. Recommended course background: EN.553.620 and (AS.110.201 OR AS.110.212 OR EN.553.291)
Prerequisites: Students may receive credit for EN.550.439/EN.553.439 or EN.553.639, but not both.
Instructor(s): D. Naiman; F. Torcaso; M. Pemy
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.641. Equity Markets and Quantitative Trading. 3.0 Credits.
This course introduces equity markets from a mathematical point of view. The properties of equities and equity-linked instruments will be described. Several quantitative trading strategies will be studied. Order execution tactics and the effect of market structure will be analyzed. Students will select a specialized aspect of the equity markets to investigate and complete a related independent project. Recommended Course Background: EN.553.642 OR EN.553.644 OR Instructor's Permission.
Prerequisites: Students may receive credit for EN.550.441/EN.553.441 or EN.553.641, but not both.
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.642. Investment Science. 4.0 Credits.
This course offers a rigorous treatment of the subject of investment as a scientific discipline. Mathematics is employed as the main tool to convey the principles of investment science and their use to make investment calculations for good decision-making. Topics covered in the course include the basic theory of interest and its application to fixed-income securities, cash flow analysis and capital budgeting, mean-variance portfolio theory, and the associated capital asset pricing model, utility function theory and risk analysis, derivative securities and basic option theory, portfolio evaluation. The student is expected to be comfortable with the use of mathematics as a method of deduction and problems solving. Recommended Course Background: ( AS.110.107 OR AS.110.109 OR AS.110.113 ) AND ( EN.553.291 OR AS.110.201 OR AS.110.212 ) AND ( EN.553.310 OR EN.553.311 OR EN.553.420 OR EN.553.430).
Prerequisites: Students may receive credit for EN.550.342 or EN.550.442/EN.553.442 or EN.553.642, but not both.
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.644. Introduction to Financial Derivatives. 4.0 Credits.
This course will develop the mathematical concepts and techniques for modeling cash instruments and their hybrids and derivatives. Recommended Course Background: AS.110.302 AND EN.553.620.
Prerequisites: Students may receive credit for EN.550.444/EN.553.444 or EN.553.644, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.645. Interest Rate and Credit Derivatives. 4.0 Credits.
Advances in corporate finance, investment practice and the capital markets have been driven by the development of a mathematically rigorous theory for financial instruments and the markets in which they trade. This course builds on the concepts, techniques, instruments and markets introduced in EN.553.644. In addition to new topics in credit enhancement and structured securities, the focus is expanded to include applications in portfolio theory and risk management, and covers some numerical and computational approaches. Recommended Course Background: EN.553.644
Prerequisites: Students may receive credit for EN.550.445/EN.553.445 or EN.553.645, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.646. Risk Measurement/Management in Financial Markets. 4.0 Credits.
This course applies advanced mathematical techniques to the measurement, analysis, and management of risk. The focus is on financial risk. Sources of risk for financial instruments (e.g., market risk, interest rate risk, credit risk) are analyzed; models for these risk factors are studied and the limitation, shortcomings and compensatory techniques are addressed. Recommended Course Background: EN.553.644.
Prerequisites: Students may receive credit for EN.550.446/EN.553.446 or EN.553.646, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.647. Quantitative Portfolio Theory and Performance Analysis. 4.0 Credits.
This course focuses on modern quantitative portfolio theory, models, and analysis. Topics include intertemporal approaches to modeling and optimizing asset selection and asset allocation; benchmarks (indexes), performance assessment (including, Sharpe, Treynor and Jenson ratios) and performance attribution; immunization theorems; alpha-beta separation in management, performance measurement and attribution; Replicating Benchmark Index (RBI) strategies using cash securities / derivatives; Liability-Driven Investment (LDI); and the taxonomy and solution methods for matrix game (two players, zero-sum payoffs, finite strategy sets), games with a continuum of strategies, N-player games, games in rule-defined form. The roles of information and memory. Selected applications to economic, recreational, and military situations. Mathematical analysis of cooperative and noncooperative games. Theory and solution methods for matrix game (two players, zero-sum payoffs, finite strategy sets), games with a continuum of strategies, N-player games, games in rule-defined form. The roles of information and memory. Selected applications to economic, recreational, and military situations. Recommended Course Background: EN.553.620 AND EN.553.630.
Prerequisites: Students may receive credit for EN.550.447 OR EN.553.447) OR EN.553.647, but not both.
Instructor(s): D. Audley
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.648. Advanced Equity Derivatives. 4.0 Credits.
This course will cover the pricing, trading and risk management of equity derivatives, with emphasis on more exotic derivatives such as path-dependent and multi-asset derivatives. The course will emphasize practical issues: students will build their own pricing and risk management tools, and gain experience simulating the dynamic hedging of a complex derivatives portfolio. Students will practice structuring and selling equity derivative products. Pricing issues such a model selection, unobservable input parameters and calibration will be discussed, and students will learn techniques to manage the often highly nonlinear and discontinuous risks associated with these products. The course will have a significant computing component: both in the classroom and as homework projects, students will use Excel, write VBA macros and write and call C++ routines in the Microsoft Windows environment (which is the most common computing environment used by the financial industry). Recommended Course Background: EN.553.644.
Prerequisites: Students may receive credit for EN.550.449/EN.553.449 or EN.553.649, but not both.
Instructor(s): J. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.650. Computational Molecular Medicine. 4.0 Credits.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional "omics" data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful). Recommended Course Background: EN.553.620 AND EN.553.630.
Prerequisites: Students may receive credit for EN.550.450/EN.553.450 or EN.553.650, but not both.
Instructor(s): D. Geman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.653. Mathematical Game Theory. 4.0 Credits.
Mathematical analysis of cooperative and noncooperative games. Theory and solution methods for matrix game (two players, zero-sum payoffs, finite strategy sets), games with a continuum of strategies, N-player games, games in rule-defined form. The roles of information and memory. Selected applications to economic, recreational, and military situations. Prereq: Multivariable Calculus, probability, linear algebra. Recommended Course Background: (AS.110.202 OR AS.110.211) AND EN.553.620 AND (EN.553.291 OR AS.110.201 OR AS.110.212)
Prerequisites: Students may receive credit for EN.550.453/EN.553.453 or EN.553.653, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.
EN.553.661. Optimization in Finance. 4.0 Credits.
A survey of many of the more important optimization methods and tools that are found to be useful in financial applications. Recommended Course Background: EN.553.642 OR EN.553.644.
Prerequisites: Students may receive credit for EN.550.461/EN.553.461 or EN.553.661, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.663. Network Models in Operations Research. 4.0 Credits.
In-depth mathematical study of network flow models in operations research, with emphasis on combinatorial approaches for solving them. Introduction to techniques for constructing efficient algorithms, and to some related data structures, used in solving shortest-path, maximum-volume, flow, and minimum-cost flow problems. Emphasis on linear models and flows, with brief discussion of non-linear models and network design. Recommended Course Background: EN.553.361 OR EN.553.761 OR EN.553.661.
Prerequisites: Students may receive credit for EN.550.463/EN.553.463 or EN.553.663, but not both.
Instructor(s): B. Castello
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.665. Introduction to Convexity. 4.0 Credits.
Convexity is a simple mathematical concept that has become central in a diverse range of applications in engineering, science and business applications. Our main focus from the applications perspective will be the use of convexity within optimization problems, where convexity plays a key role in identifying the "easy" problems from the "hard" ones. The course will have an emphasis on expositing the rich mathematical structure of the field itself (properties of convex sets, convex functions, Helly-Caratheorody-Radon type theorems, polarity/duality, subdifferential calculus, polyhedral theory), and demonstrating how these ideas can be leveraged to model and solve optimization problems (via a detailed study of linear programming and basics of nonlinear convex optimization). Recommend Course Background: Familiarity with basic real analysis, linear algebra.
Prerequisites: Students may receive credit for EN.550.465 /EN.553.465 or EN.553.665, but not both.
Instructor(s): A. Basu.

EN.553.671. Combinatorial Analysis. 4.0 Credits.
An introduction to combinatorial analysis at the graduate level. Meets concurrently with 553.471. Counting techniques: generating functions, recurrence relations, Polya's theorem. Combinatorial designs: Latin squares, finite geometries, balanced incomplete block designs. Emphasis on problem solving. Recommended Course Background: EN.553.291 or AS.110.201
Prerequisites: Students may receive credit for EN.550.471/EN.553.471 or EN.553.671, but not both.
Instructor(s): E. Scheinerman.

EN.553.672. Graph Theory. 4.0 Credits.
Study of systems of "vertices" with some pairs joined by "edges." Theory of adjacency, connectivity, traversability, feedback, and other concepts underlying properties important in engineering and the sciences. Topics include paths, cycles, and trees; routing problems associated with Euler and Hamilton; design of graphs realizing specified incidence conditions and other constraints. Attention directed toward problem solving, algorithms, and applications. One or more topics taken up in greater depth. Recommended Course Background: (EN.553.291 OR AS.110.201 OR AS.110.212)
Prerequisites: EN.550.291 OR AS.110.201 OR AS.110.212; Students may receive credit for EN.550.472/EN.553.472 or EN.553.672, but not both.
Instructor(s): E. Gnang.

EN.553.673. Introduction to Nonlinear Dynamics and Chaos. 3.0 Credits.
An introduction to the phenomenology of nonlinear dynamic behavior with emphasis on models of actual physical, chemical, and biological systems, involving an interdisciplinary approach to ideas from mathematics, computing, and modeling. The common features of the development of chaotic behavior in both mathematical models and experimental studies are stressed, and the use of modern data-mining tools to analyze dynamic data will be explored. Some computing experience is desirable. Emphasis will be placed on the geometric/visual computer-aided description and understanding of dynamics and chaos. Recommended course background: ([AS.110.201 or AS.110.212] and [AS.110.302 or AS.110.306]) or EN.553.291.
Prerequisites: Students may receive credit for only one of EN.553.473 OR EN.553.673 OR EN.540.468 OR EN.540.668, ([AS.110.201 OR AS.110.212] AND [AS.110.302 OR AS.110.306]) OR EN.553.291
Instructor(s): Y. Kevrekidis.

EN.553.685. Introduction to Harmonic Analysis and Its Applications. 4.0 Credits.
The course is an introduction to methods in harmonic analysis, in particular Fourier series, Fourier integrals, and wavelets. These methods will be introduced rigorously, together with their motivations and applications to the analysis of basic partial differential equations and integral kernels, signal processing, inverse problems, and statistical/machine. Recommended Course Background: (AS.110.201 OR AS.110.212 OR EN.553.291) AND (AS.110.202 OR AS.110.211) AND (AS.110.405 OR AS.110.415)
Prerequisites: Students may receive credit for only one of the following: AS.110.433, EN.553.485, or EN.553.685.
Instructor(s): M. Maggioni.

EN.553.688. Financial Computing I. 3.0 Credits.
The course is an introduction to methods in harmonic analysis, in particular Fourier series, Fourier integrals, and wavelets. These methods will be introduced rigorously, together with their motivations and applications to the analysis of basic partial differential equations and integral kernels, signal processing, inverse problems, and statistical/machine. Recommended Course Background: (AS.110.201 OR AS.110.212 OR EN.553.291) AND (AS.110.202 OR AS.110.211) AND (AS.110.405 OR AS.110.415)
Prerequisites: Students may receive credit for only one of the following: AS.110.433, EN.553.485, or EN.553.685.
Instructor(s): M. Maggioni.
EN.553.692. Mathematical Biology. 3.0 Credits.
This course will examine the mathematical methods relevant to modeling biological phenomena, particularly dynamical systems and probability. Topics include ordinary differential equations and their simulation; stability and phase plane analysis; branching processes; Markov chains; and stochastically perturbed systems. Biological applications will be drawn from population growth, predator-prey dynamics, epidemiology, genetics, intracellular transport, and neuroscience. Recommended Course Background: EN.553.620 AND (AS.110.201 OR AS.110.212) AND (AS.110.302 OR AS.110.306 OR EN.553.291)
Prerequisites: Students may receive credit for EN.550.492/EN.553.492 or EN.553.692, but not both.
Instructor(s): D. Athreya
Area: Natural Sciences, Quantitative and Mathematical Sciences.

EN.553.693. Mathematical Image Analysis. 3.0 Credits.
This course gives an overview of various mathematical methods related to several problems encountered in image processing and analysis, and presents numerical schemes to address them. It will focus on problems like image denoising and deblurring, contrast enhancement, segmentation and registration. The different mathematical concepts shall be introduced during the course; they include in particular functional spaces such as Sobolev and BV, Fourier and wavelet transforms, as well as some notions from convex optimization and numerical analysis. Most of such methods will be illustrated with algorithms and simulations on discrete images, using MATLAB. Prerequisites: linear algebra, multivariate calculus, basic programming in MATLAB. Recommended Course Background: (AS.110.202 OR AS.110.211) AND (EN.553.291 OR AS.110.201 OR AS.110.212)
Prerequisites: Students may receive credit for EN.550.493/EN.553.493 or EN.553.693, but not both.
Instructor(s): P. Escande
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.694. Applied and Computational Linear Algebra. 3.0 Credits.
In this seminar we plan to discuss generalizations of theorems and algorithms from matrix theory to hypermatrices. More specifically the seminar will discuss hypermatrix/tensor algebras, rank, spectra and transforms. Using the python friendly free open-source mathematics software SageMath and the hypermatrix algebra package we will discuss applications of hypermatrices to combinatorics, machine learning and data analysis. Preliminary knowledge of the Python language is not required. Recommended Course Background: AS.110.212 OR AS.110.201 OR EN.553.291.
Prerequisites: Students may receive credit for EN.553.494 or EN.553.694, but not both.
Instructor(s): E. Gnang.

EN.553.700. Master’s Research. 3.0 - 10.0 Credits.
Reading, research, or project work for Master’s level students. Arranged individually between students and faculty.
Instructor(s): Staff.

EN.553.701. Real Analysis: Preparation for the Ph.D. Introductory Examination. 4.0 Credits.
This course is designed to prepare students for the Real Analysis part of the introductory exam of the Department of Applied Mathematics and Statistics. In this course we will cover fundamental topics in real analysis, such as, Set Theory, The Topology of Euclidean Space, Continuuous Mappings, Uniform Convergence, Differentiable Mappings, Inverse & Implicit Function Theorems, Integration Theory, Fourier Series, and Basics of Differential Equations.
Instructor(s): N. Charon.

EN.553.720. Probability Theory I. 4.0 Credits.
The course objectives are to develop probabilistic reasoning and problem solving approaches, to provide a rigorous mathematical basis for probability theory, and to examine several important results in the theory of probability. Topics include axiomatic probability, independence, random variables and their distributions, expectation, integration, variance and moments, probability inequalities, and modes of convergence of random variables. The course will include introductory measure theory as needed. Students are expected to have previous study of both analysis and probability. This course is the first half of a yearlong sequence. The second semester's course, EN.553.721 Probability Theory II, will cover classical limit theorems, characteristic functions, and conditional expectation.
Prerequisites: Students may take EN.550.620 or EN.553.720, but not both.
Instructor(s): J. Fill.

EN.553.721. Probability Theory II. 4.0 Credits.
Probability at the level of measure theory, focusing on limit theory. Modes of convergence, Poisson convergence, three-series theorem, strong law of large numbers, continuity theorem, central limit theorem, Berry-Esséen theorem, infinitely divisible and stable laws. Recommended Course Background: EN.553.720 AND (AS.110.405 OR AS.110.415)
Instructor(s): J. Fill.

EN.553.722. Introduction to Stochastic Calculus. 3.0 Credits.
A graduate-level class on stochastic calculus, providing a rigorous introduction on stochastic integrals and differential equations.
Prerequisites: EN.550.621[C]
Instructor(s): M. Bichuch.

EN.553.723. Markov Chains. 3.0 Credits.
Recent advances in computer science, physics, and statistics have been made possible by corresponding sharply quantitative developments in the mathematical theory of Markov chains. Possible topics: rates of convergence to stationarity, eigenvalue techniques, Markov chain Monte Carlo, perfect simulation, self-organizing data structures, approximate counting and other applications to computer science, reversible chains, interacting particle systems. This course will be graded pass/fail.
Instructor(s): J. Fill.

EN.553.727. Large Deviations Theory. 3.0 Credits.
This course presents an introduction to the theory of large deviations, which provides a quantitative framework for understanding exponentially rare events. Topics encompass the development of large deviation principles in both finite and infinite-dimensional settings, from empirical measures of i.i.d samples to random perturbations of dynamical systems. Applications include problems in information theory, hypothesis testing, and transitions between steady states in biological and physical models.
Instructor(s): M. Bichuch.

EN.553.730. Statistical Theory. 4.0 Credits.
The fundamentals of mathematical statistics will be covered. Topics include: distribution theory for statistics of normal samples, exponential statistical models, the sufficiency principle, least squares estimation, maximum likelihood estimation, uniform minimum variance unbiased estimation, hypothesis testing, the Neyman-Pearson lemma, likelihood ratio procedures, the general linear model, the Gauss-Markov theorem, simultaneous inference, decision theory, Bayes and minimax procedures, chi-square methods, goodness-of-fit tests, and nonparametric and robust methods.
Prerequisites: Students may take EN.550.630 or EN.553.730, but not both.
Instructor(s): C. Priebe.
EN.553.731. Statistical Theory II. 3.0 Credits.
Advanced concepts and tools fundamental to research in mathematical statistics and statistical inference: asymptotic theory; optimality; various mathematical foundations.
Instructor(s): D. Naiman.

EN.553.732. Bayesian Statistics. 3.0 Credits.
The course will cover Bayesian methods for exploratory data analysis. The emphasis will be on applied data analysis in various disciplines. We will consider a variety of topics, including introduction to Bayesian inference, prior and posterior distribution, hierarchical models, spatial models, longitudinal models, models for categorical data and missing data, model checking and selection, computational methods by Markov Chain Monte Carlo using R or Matlab. We will also cover some nonparametric Bayesian models if time allows, such as Gaussian processes and Dirichlet processes. Prerequisite: 553.730 (recommended) or 553.630
Prerequisites: Students may take EN.550.632 or EN.553.732, but not both.
Instructor(s): Y. Xu.

EN.553.733. Advanced Topics in Bayesian Statistics. 3.0 Credits.
This course covers advanced topics in Bayesian statistical analysis beyond the introductory course. Therefore knowledge of basic Bayesian statistics is assumed (at the level of “A first course in Bayesian statistical methods”, by Peter Hoff (Springer, 2009). The models and computational methods will be introduced with emphasis on applications to real data problems. This course will cover nonparametric Bayesian models including Gaussian process, Dirichlet process (DP), Polya trees, dependent DP, Indian buffet process, etc. Recommended Course Background: EN.553.732 or permission from the instructor
Instructor(s): Y. Xu.

EN.553.734. Introduction to Nonparametric Estimation. 3.0 Credits.
This course will cover the fundamental topics in the theory of nonparametric estimation. Several different nonparametric estimators (e.g., kernel, local polynomial, projection, spline, and trigonometric) and their statistical properties will be considered. Minimax lower bounds for a variety of nonparametric estimation problems will be discussed. A number of topics related to estimator asymptotic efficiency and adaptation will be studied. An overview of shape constrained nonparametric estimation will be presented for a variety of shape constraints (e.g., monotonicity and convexity).
Prerequisites: EN.550.630
Instructor(s): T. Lebair.

EN.553.735. Topics in Statistical Pattern Recognition. 3.0 Credits.
The Dissimilarity Representation for Pattern Recognition. This course will investigate aspects of statistical inference and statistical pattern recognition associated with observing only dissimilarities between entities rather than observing feature vectors associated with the individual entities themselves.
Instructor(s): C. Priebe.

EN.553.736. System Identification and Likelihood Methods. 2.0 Credits.
The focus of this roundtable-format course will be stochastic modeling as relates to system identification and maximum likelihood. The principles and algorithms being covered in this course have tremendous importance in the world at large. For example, maximum likelihood is arguably the most popular method for parameter estimation in most real-world applications. System identification is the term used in many fields to refer to the process of mathematical model building from experimental data, with a special focus on dynamical systems. The system identification process refers to several important aspects of model building, including selection of the model form (linear or nonlinear, static or dynamic, etc.), experimental design, parameter estimation, and model validation. This course will cover topics such as the maximum likelihood formulation and theory for dynamical systems, the EM (expectation-maximization) algorithm and its variants, Fisher information, common model structures, online versus offline estimation, the role of feedback in identification (i.e., open-loop versus closed-loop estimation), standard and extended Kalman filtering, and uncertainty characterization (e.g., confidence regions).
Recommended Course Background: Undergraduate-level matrix theory and ordinary differential equations; graduate-level course in probability and statistics (e.g., 553.430 or equivalent; in particular, students should have prior exposure to maximum likelihood and Bayes’ rule). Prior experience in data analysis and algorithms will be helpful.
Instructor(s): J. Spall.

EN.553.737. Distribution-free statistics and Resampling Methods. 3.0 Credits.
Distribution-free and resampling methods address statistical estimation, testing and validation under minimal assumptions on the true distribution of observed data, avoiding, in particular, to rely on some specific parametric class (e.g., Gaussian). The course will study the following topics: order statistics, rank-based methods, tests of independence, symmetry, location differences, scale differences and goodness-of-fit, permutation tests and bootstrap with an introduction to the problem of multiple comparisons. Recommended Courses: EN.553.430 or EN.553.730 or equivalent.
Instructor(s): E. Younes.

EN.553.738. High-Dimensional Approximation, Probability, and Statistical Learning. 3.0 Credits.
The course covers fundamental mathematical ideas for certain approximation and statistical learning problems in high dimensions. We start with basic approximation theory in low-dimensions, in particular linear and nonlinear approximation by Fourier and wavelets in classical smoothness spaces, and discuss applications in imaging, inverse problems and PDE’s. We then introduce notions of complexity of function spaces, which will be important in statistical learning. We then move to basic problems in statistical learning, such as regression and density estimation. The interplay between randomness and approximation theory is introduced, as well as fundamental tools such as concentration inequalities, basic random matrix theory, and various estimators are constructed in detail, in particular multi scale estimators. At all times we consider the geometric aspects and interpretations, and will discuss concentration of measure phenomena, embedding of metric spaces, optimal transportation distances, and their applications to problems in machine learning such as manifold learning and dictionary learning for signal processing.
Instructor(s): M. Maggioni.
EN.553.739. Statistical Pattern Recognition Theory & Methods. 3.0 Credits.
This biennial course covers topics in the theory, methods, and applications of machine learning from an explicitly statistical perspective. Recommended Course Background: (EN.550.420 OR EN.553.420 OR EN.553.620) AND (EN.550.430 OR EN.553.430 OR EN.553.630)
Instructor(s): C. Pribebe.

EN.553.740. Machine Learning. 3.0 Credits.
This course will cover theoretical and practical aspects of statistical learning. We will review a collection of learning algorithms for classification and regression estimation, including linear methods, kernel methods, tree-based and boosting methods; we will also discuss unsupervised methods for linear and nonlinear data reduction and clustering. We will introduce fundamental concepts of the theory of model selection and validation: bias/variance dilemma, penalty methods, and some measures of complexity; the course will also describe standard validation algorithms, like cross-validation and bootstrap. Recommended prerequisite: 553.620 and 553.630.
Instructor(s): E. Younes.

EN.553.742. Statistical Inference on Graphs. 3.0 Credits.
This course provides an introduction to and overview of current research in random graph inference, with a particular focus on spectral methods and their applications to inference for independent-edge random graphs. Topics include concentration inequalities; analysis of matrix perturbations; spectral decompositions of graph adjacency and Laplacian matrices; consistent estimation of latent variables associated to vertices; clustering, community detection, and classification in networks; and multi-sample hypothesis testing for graphs. Emphasis will be on a framework for establishing classical properties—consistency, normality, and efficiency—for estimators of graph parameters. Students will read papers in the literature and are expected to participate actively in class. Recommended prerequisites EN.553.792 and EN.553.630.
Instructor(s): D. Athreya; M. Tang.

EN.553.743. Graphical Models. 4.0 Credits.
This course describes how models are built on networks encoding the conditional dependency structure between random variables, also called graphical models, can be used to design multivariate probability distributions. A special focus will be made on important particular cases, like Markov Chains, Bayesian networks or Markov Random Fields. We will also discuss parametric estimation and inference problems, and issues arising when some of the variables cannot be observed.
Prerequisites: EN.550.420 or equivalent AND EN.550.430 or equivalent
Instructor(s): Staff.

EN.553.746. Advanced Topics in Derivatives. 1.0 Credit.
Topics will include static arbitrage versus dynamic arbitrage, proof of Black-Scholes formula using a change of measure, the Modigliani-Miller representation of the corporation, Merton model of corporate debt valuation, Asian options’ operational use, pricing and hedging; stochastic volatility and local volatility models; elements of market microstructure and high frequency trading. Grading will be mostly based on oral presentations. The course is aimed at second year Master’s students and will not begin meetings until mid-October.
Instructor(s): H. Geman.

EN.553.749. Advanced Financial Theory. 3.0 Credits.
The first part of the course will review in depth the main instruments in the various asset classes, as well as the founding results on investment decision, capital budgeting and project financing. The second part will analyze the theory of the firm: capital structure, dilution and share repurchase, dividend policy, Modigliani- Miller theorem and will lead to the contingent claim pricing of corporate debt and equity as in Merton (1974) and its extensions. The third part will extend the CAPM to the Arbitrage Pricing Theory of Ross (1976) and its theoretical and operational consequences. The fourth part will be dedicated to the stochastic modelling of the yield curve to price caps, floors and swaptions, and their use in the Asset Liability Management of a bank and insurance company. This course will not begin until mid-October.
Prerequisites: Students may take EN.550.649 or EN.553.749, but not both.
Instructor(s): H. Geman.

EN.553.753. Commodities and Commodity Markets. 4.0 Credits.
The first half of this course will be devoted to energy markets, both in terms of the market itself and how to model peculiar features of this business. First we will discuss fossil fuels, including physical and financial natural gas and LNG; crude and refined petroleum commodities; and possibly coal markets. Then the focus will turn to electricity markets, including market structures; energy, capacity and ancillary services markets; characteristics of demand; power plant commitment and dispatch; the “stack” or market supply curve; characteristics of different plants and fuels; regional differences in markets; and hedging techniques from trading vanilla products all the way to complex multi-commodity structures. We will discuss renewable energy sources, their characteristics, economics, and effects on the larger market, as well as emissions markets as a way of removing pollution externalities. The first half will conclude by elaborating on risk management techniques; credit; legislation and regulation; and derivative accounting as time permits. The second half of the course will turn to shipping, metals and agricultural markets. The metal physical markets will be described, the major Exchanges presented (LME, SHFE), as well as the warehousing issues in the case of base metals. The case of precious metals will be singled out, and gold in particular; and finally uranium and rare earths. Agricultural (grains and softs) markets will be presented, together with the crucial issues of biofuels, fertilizers, water, and arable land. In all cases, there will be a large focus on the trading activities – both to hedge and to gain exposure to commodities – in spot and derivative markets. Numerous examples of forward curves will be provided, as well as volatility skews. The valuation of swaps, spread options and Asian options will be (re)derived. Students should have rudimentary knowledge of financial markets. Recommended Course Background: EN.553.620 and (AS.110.106 or AS.110.108)
Instructor(s): G. Schultz; H. Geman.

EN.553.761. Nonlinear Optimization I. 3.0 Credits.
This course considers algorithms for solving various nonlinear optimization problems and, in parallel, develops the supporting theory. The primary focus will be on unconstrained optimization problems. Topics for the course will include: necessary and sufficient optimality conditions; steepest descent method; Newton and quasi-Newton based line-search, trust-region, and adaptive cubic regularization methods; linear and nonlinear least-squares problems; and linear and nonlinear conjugate gradient methods. Recommended Course Background: Multivariable Calculus, Linear Algebra, Real Analysis such as AS.110.405
Prerequisites: Students may take EN.550.661 or EN.553.761, but not both.
Instructor(s): A. Basu.
EN.553.762. Nonlinear Optimization II. 3.0 Credits.
This course considers algorithms for solving various nonlinear optimization problems and, in parallel, develops the supporting theory. The primary focus will be on constrained optimization problems. Topics for the course will include: necessary and sufficient optimality conditions for constrained optimization; projected-gradient and two-phase accelerated subspace methods for bound-constrained optimization; simplex and interior-point methods for linear programming; duality theory; and penalty, augmented Lagrangian, sequential quadratic programming, and interior-point methods for general nonlinear programming. In addition, we will consider the Alternating Direction Method of Multipliers (ADMM), which is applicable to a huge range of problems including sparse inverse covariance estimation, consensus, and compressed sensing. Recommended Course Background: Multivariable Calculus, Linear Algebra, Real Analysis such as AS.110.405.
Instructor(s): D. Robinson.

EN.553.763. Stochastic Search & Optimization. 3.0 Credits.
An introduction to stochastic search and optimization, including discrete and continuous optimization problems. Topics will include the "no free lunch" theorems, beneficial effects of injected Monte Carlo randomness, algorithms for global and local optimization problems, random search, recursive least squares, stochastic approximation, simulated annealing, evolutionary and genetic algorithms, machine (reinforcement) learning, and statistical multiple comparisons. Students should have knowledge of basic matrix algebra. Recommended Course Background: Graduate course in probability and statistics.
Instructor(s): J. Spall.

EN.553.764. Modeling, Simulation, and Monte Carlo. 3.0 Credits.
Concepts and statistical techniques critical to constructing and analyzing effective simulations; emphasis on generic principles rather than specific applications. Topics include model building (bias-variance tradeoff, model selection, Fisher information), benefits and drawbacks of simulation modeling, random number generation, simulation-based optimization, discrete multiple comparisons using simulations, Markov chain Monte Carlo (MCMC), and input selection using optimal experimental design.
Instructor(s): J. Spall.

EN.553.765. Convex Optimization. 3.0 Credits.
This course presents algorithms for convex optimization along with the supporting theoretical convergence results. The chosen topics covered, which are driven by big data and machine learning applications, include convex sets and functions, gradient methods (steepest descent, line searches, rates-of-convergence for weakly and strongly convex functions, Frank-Wolfe method), accelerated methods (heavy ball, Nesterov), stochastic gradient, coordinate descent, proximal and projected gradient methods, duality theory and duality-based algorithms (augmented Lagrangian, ADMM), and Newton/quasi-newton methods. Recommended Course Background: (AS.110.201 or AS.110.212 or EN.553.291) and AS 110.405.
Instructor(s): D. Robinson.

EN.553.766. Combinatorial Optimization. 3.0 Credits.
The main goal of this course is to introduce students to combinatorial optimization techniques. The first part of the course will focus on combinatorial algorithms for classical problems. The next part of the course will show how polyhedral theory can be used to deal with combinatorial optimization problems in a unifying manner. Familiarity with linear programming and algorithms desirable but not strictly required. Recommended Course Background: Linear Algebra.
Instructor(s): A. Basu.

EN.553.769. Topics in Discrete Optimization. 3.0 Credits.
We will study solution techniques for problems in discrete optimization, emphasizing computational aspects of the theory and algorithms. Recommended Prerequisites: good backgrounds in linear programming and graph theory.
Instructor(s): W. Cook.

EN.553.770. Topics In Discrete Math. 3.0 Credits.
Topics in Discrete Mathematics: Graphons. Just as real numbers can be defined as limits of convergent sequences of rational numbers, graphons are the limits of convergent sequences of graphs. The notion of a graphon is very recent (less than a decade old) but graphons already are playing an interesting role in pure combinatorics (extremal graph problems) and in applications/algorithms for huge networks. Active participation by students is key as we work our way through challenging ideas.
Instructor(s): E. Scheinerman.

EN.553.780. Shape and Differential Geometry. 3.0 Credits.
The purpose of this class is to provide an elementary knowledge of the differential geometry of curves and surfaces, and to place this in relation with the description and characterization of 2D and 3D shapes. Intrinsic local and semi-local descriptors, like the curvature or the second fundamental form will be introduced, with an emphasis on the invariance of these features with respect to rotations, translations, etc. Extension of this point of view to other class of linear transformations will be given, as well as other types of shape descriptors, like moments or medial axes. Recommended Course Background: Calculus III and linear algebra.
Instructor(s): E. Younes
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.781. Numerical Analysis. 4.0 Credits.
Brief review of topics in elementary numerical analysis such as floating-point arithmetic, Gaussian elimination for linear equations, interpolation and approximation. Core topics to be covered: numerical linear algebra including eigenvalue and linear least-squares problems, iterative algorithms for nonlinear equations and least squares problems, and convergence theory of numerical methods. Other possible topics: sparse matrix computations, numerical solution of partial differential equations, finite element methods, and parallel algorithms.
Prerequisites: Students may take EN.550.681 or EN.553.781, but not both.
Instructor(s): M. Micheli, N. Charon.

EN.553.782. Statistical Uncertainty Quantification. 3.0 Credits.
This course introduces uncertainty quantification (UQ) on mathematical models and data, with emphasis on the use of stochastic processes and probability theory. Topics include computer experiments, designs, conditional probability, Bayesian inference, Gaussian stochastic processes, continuity, reproducing kernel Hilbert space, covariance functions, computer model emulation, parameter estimation, approximation, dynamic linear models, Kalman filter, computation, sensitivity analysis, functional ANOVA, model selection and calibration. Examples of some continuous time processes will be introduced, such as Brownian motion, Brownian bridge, O-U process, with extensions to multidimensional input space. Uncertainty analysis of mathematical models will be the focus from both theoretical and computational perspectives. Applications will concentrate on understanding and predicting the behavior of complex systems in science and engineering. Prerequisite EN.553.620 or EN.553.720 Recommended course background:
EN.553.630 or EN.553.730.
Prerequisites: Students may take EN.550.782 or EN.553.782, but not both.
Instructor(s): M. Gu.
Instructor(s): D. Audley; D. Naiman; J. Miller; M. Bichuch.

This course is open only to AMS department master's students.

Credits.

EN.553.791. Financial Mathematics Master's Summer Internship. 2.0 Credits.

Instructor(s): J. Spall.

EN.553.784. Mathematical Foundations of Computational Anatomy. 3.0 Credits.

The course will provide fundamental concepts and methods that pertain the analysis of the variation of anatomical shapes extracted from medical images. It will review basic properties of the most important shape representations (landmark, curves, surfaces, images...), describe distances and discrepancy measures that allow for their comparison, and introduce nonlinear optimal control methods that underlie the Large Deformation Diffeomorphic Metric Mapping (LDDMM) family of registration algorithms. The course will then discuss shape averaging methods and template-centered representations for the analysis of shape datasets. Recommended Course Background: Optimization (EN.553.361 or higher) and (AS.110.202 OR AS.110.211 or higher) AND AS.110.302 or higher.

Instructor(s): A. Clark.

EN.553.794. Mathematical Foundations of Computational Anatomy. 3.0 Credits.

This roundtable course is an introduction to two related areas?neural networks (NNs) and control systems based on the use of feedback. Artificial NNs are effective conceptual and computational vehicles for many important applications; feedback control is relevant to virtually all natural and human-made systems. NNs are applied in areas such as system modeling and control, function approximation, time-series filtering/prediction/smoothing, speech/image/signal processing, and pattern recognition. Topics to be covered for NNs include network architecture, learning algorithms, and applications. Specific NNs discussed include perceptrons, feedforward networks with backpropagation, and recurrent networks. This course also provides an introduction to feedback control systems, including the role of feedback in regulating systems and in achieving stability in systems. We consider stochastic (noise) effects in feedback systems. We also consider the interface of NNs and control by discussing how NNs are used in building modern control systems in problems where standard methods are infeasible. Recommended Course Background: Matrix theory, differential equations, and a graduate course in probability and statistics.

Instructor(s): J. Spall.

EN.553.791. Financial Mathematics Master's Summer Internship. 2.0 Credits.

This course is open only to AMS department master's students.

Instructor(s): D. Audley; D. Naiman; J. Miller; M. Bichuch.

EN.553.792. Matrix Analysis and Linear Algebra. 4.0 Credits.

A second course in linear algebra with emphasis on topics useful in analysis, economics, statistics, control theory, and numerical analysis. Review of linear algebra, decomposition and factorization theorems, positive definite matrices, norms and convergence, eigenvalue location theorems, variational methods, positive and nonnegative matrices, generalized inverses.

Prerequisites: Students may take EN.550.692 or EN.553.792, but not both.

Instructor(s): D. Fishkind.

EN.553.793. Turbulence Theory. 3.0 Credits.

An advanced introduction to turbulence theory for graduate students in the physical sciences, engineering and mathematics. Both intuitive understanding and exact analysis of the fluid equations will be stressed. Previous familiarity with fluid mechanics is not required, although it could be helpful.

Instructor(s): G. Eyink.

EN.553.795. Advanced Parameterization in Science and Engineering. 3.0 Credits.

This course will present an overview of topics in science-based parameterization, including dynamics, probability and other applied mathematical methods. These concepts will be presented in a unified format, with some emphasis on scientific computing. Specific topics include: basic probability, statistical dynamics, (moment hierarchies, Liouville/forward equations, path-integral methods), asymptotic closure (homogenization, Chapman-Enskog), closure techniques without any separation of scales (non-linear Galerkin & Weighted residuals, algebraic closures, PDF-based closures, down-scaling), uncertainty quantification (variance & other measures of uncertainty, Bayesian estimation, ensemble methods), hybrid methods.

Instructor(s): G. Eyink

Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.797. Introduction to Control Theory and Optimal Control. 3.0 Credits.

A control system is a dynamical system on which one can act through a parameter that can be chosen freely at any point in time. In this class, we will be interested in two main problems. The first one is controllability, which studies conditions for the existence of controls allowing an initial point to be driven to any other point. The second one is optimal control, in which we will study methods to minimize a certain cost over all possible controls, possibly with endpoint constraints. Such problems have many applications in engineering: crossing a river with minimal fuel, planning trajectories of rocket engines etc. Recommended Course Background: Multivariate Calculus, Linear Algebra, Differential Equations. Some familiarity with Optimization is recommended, but not mandatory.

Instructor(s): N. Charon.
EN.553.799. Topics In Applied Math. 3.0 Credits.
Analysis of Algorithms. This course in the probabilistic analysis of algorithms (AoFA) will be accessible to any student who has had at least one course in probability and will be most beneficial to those who have had at least one probability course at the measure-theoretic level. The course will review basic topics from the theory of probability that have proved useful in AoFA. It will provide introductions to more advanced AoFA-relevant topics chosen from such topics as: Markov chains, branching processes, urn models, Poissonization (and de-Poissonization), various metrics on distributions, fixed-point characterizations of distributions, convergence of sequences of stochastic processes, perfect simulation using Markov chains (and otherwise), and large deviation principles. The course will interweave probability theory and applications to AoFA, focusing on the fundamentally important and exceptionally rich example of limiting distributions for various ways of measuring the cost of executing the QuickSort and QuickSelect algorithms.
Instructor(s): J. Fill.

EN.553.800. Dissertation Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.553.801. Department Seminar. 1.0 Credit.
A variety of topics discussed by speakers from within and outside the university. Required of all resident department graduate students.
Instructor(s): T. Budavari.

EN.553.802. Graduate Independent Study. 3.0 Credits.
Instructor(s): M. Maggioni.

EN.553.810. Probability & Statistics. 1.0 - 4.0 Credits.
Instructor(s): C. Priebe.

EN.553.822. Stochastic Calculus Seminar. 2.0 Credits.
Seminar and readings in stochastic calculus.
Instructor(s): M. Bichuch.

EN.553.826. Information Theory Seminar. 3.0 Credits.
Graduate seminar covering topics in information theory and information geometry. Topics may include large deviation theory, I-divergence, Fisher information and ergodic theory. Emphasis will be placed on developing a rigorous geometric understanding of methods and models in probability and statistics. Course cannot be counted toward AMS Master's degree requirements
Prerequisites: EN.550.447 OR EN.550.630 or Permission of instructor.
Instructor(s): K. Levin.

EN.553.831. Advanced Topics in Nonparametric Bayesian Statistics. 3.0 Credits.
Will discuss advanced topics in nonparametric Bayesian statistics
Instructor(s): Y. Xu.

EN.553.832. Machine Learning Journal Course. 3.0 Credits.
Journal course on machine learning topics. Course is restricted to first and second year AMS PhD students, and others by permission of instructor.
Instructor(s): D. Naiman.

EN.553.833. Bayesian Modeling in Biomedical Applications. 3.0 Credits.
This topic course will cover Bayesian modeling in biomedical applications, especially in Electronic Health Record area. The knowledge of basic Bayesian statistics (at the level of "A first course in Bayesian statistical methods", by Peter Hoff (Springer, 2009)) and Nonparametric Bayesian statistics (e.g. Gaussian process, Dirichlet process (DP), dependent DR Indian buffet process, etc) is assumed. Students will be required to do intensive literature readings on both Bayesian modeling from statistical journals and biomedical topics from medical journals, present papers of common interests, and discuss potential research ideas for their final project.
Instructor(s): Y. Xu.

EN.553.847. Financial Mathematics Masters Seminar. 1.0 Credit.
This course is only open to students enrolled in the MSE in Financial Mathematics program. Advanced topics chosen according to the interests of the instructor and graduate students. The course will focus on recent research articles in the financial mathematics literature.
Instructor(s): D. Audley; D. Naiman; J. Miller.

EN.553.865. Optimization and Discrete Math. 1.0 - 4.0 Credits.
Discussion of new results in the specified research area based on journal articles, research monographs and current research. Each week a participant in the seminar will present a lecture. Organized by advanced graduate students with the sponsorship of an Applied Mathematics and Statistics faculty member.
Instructor(s): A. Basu; D. Robinson.

EN.553.892. Matrix Analysis II Seminar. 2.0 Credits.
Continuation of EN.553.792.
Instructor(s): N. Charon.

Cross Listed Courses

Mathematics

AS.110.795. Data Science Seminar.
Presentations of current research papers by faculty, graduate students and invited guest speakers. For graduate students only.
Instructor(s): M. Maggioni.
Area: Quantitative and Mathematical Sciences.

General Engineering

EN.500.200. Computing for Engineers and Scientists. 4.0 Credits.
This course introduces a variety of techniques for solving problems in engineering and science on a computer using MATLAB. Topics include structure and operation of a computer, the programming language MATLAB, computational mathematics, and elementary numerical analysis. Co-listed with EN.550.200.
Prerequisites: Prereqs: AS.110.107 OR AS.110.109
Instructor(s): J. Yoder; K. Hedrick; T. Lebair.
Area: Engineering, Quantitative and Mathematical Sciences.

Civil Engineering

EN.560.601. Applied Math for Engineers. 3.0 Credits.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Zhong.
Area: Engineering, Quantitative and Mathematical Sciences.
Biomedical Engineering
EN.580.694. Statistical Connectomics. 3.0 Credits.
This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).
Instructor(s): J. Vogelstein
Area: Engineering.

Computer Science
EN.601.442. Modern Cryptography. 3.0 Credits.
Modern Cryptography includes seemingly paradoxical notions such as communicating privately without a shared secret, proving things without leaking knowledge, and computing on encrypted data. In this challenging but rewarding course we will start from the basics of private and public key cryptography and go all the way up to advanced notions such as zero-knowledge proofs, functional encryption and program obfuscation. The class will focus on rigorous proofs and require mathematical maturity. [Analysis]
Prerequisites: EN.600.271 AND (EN.553.420 or EN.553.310); Students may receive credit for only one of EN.600.442, EN.601.442, EN.601.642.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.642. Modern Cryptography. 3.0 Credits.
Same material as 601.442, for graduate students. Modern Cryptography includes seemingly paradoxical notions such as communicating privately without a shared secret, proving things without leaking knowledge, and computing on encrypted data. In this challenging but rewarding course we will start from the basics of private and public key cryptography and go all the way up to advanced notions such as zero-knowledge proofs, functional encryption and program obfuscation. The class will focus on rigorous proofs and require mathematical maturity. [Analysis] Required course background: EN.601.231 or EN.601.631.
Prerequisites: Students may receive credit for only one of EN.600.442, EN.601.442, EN.601.642.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

Biomedical Engineering
www.bme.jhu.edu
The faculty and students of the Johns Hopkins Department of Biomedical Engineering, founded more than 50 years ago, are engineering the future of medicine. Consistently ranked the #1 BME program in the nation, we are pushing the boundaries of discovery and innovation, pioneering new and emerging disciplines of biomedical engineering that in turn drive our academic programs.
Biomedical engineering is an interdisciplinary endeavor, and new discoveries and technological advances require a variety of experimental and computational approaches. Our unique positioning within the Johns Hopkins Whiting School of Engineering and the Johns Hopkins School of Medicine provides students and faculty with opportunities to engage with other leading engineers, scientists, and physicians. Together, we are developing the disruptive technologies that will transform the practice of medicine and improve human health. Many of these technologies are currently used in the clinic to diagnose and treat diseases, from cardiac arrhythmias and sepsis to Alzheimer’s and cancer. Examples of Hopkins BME advances include new drug delivery methods, diagnostic imaging devices, artificial organs and orthopedic implants, prosthetic limbs, and patient-specific quantitative models of disease.

Johns Hopkins BME is training the next generation of leaders in biomedical engineering through academic programs at three levels:
1. an undergraduate program, leading to a B.S. degree
2. three master’s programs, leading to an MSE degree in biomedical engineering, with course-based or thesis-based options; an MSE in bioengineering innovation and design; or dual MSE and MS degrees from Johns Hopkins BME and Tsinghua University in Beijing, China, respectively
3. a doctoral program, leading to a Ph.D. degree

At both the undergraduate and graduate levels, we are transforming the BME educational landscape through BME 2.0, an integrative learning experience in which every student is an active participant in our discovery, innovation, and translation efforts. Supported by our personalized advising program, students at all levels will specialize in one of several cutting-edge biomedical engineering focus areas derived from our research expertise. These focus areas include:

- biomedical data science
- biomedical imaging and instrumentation
- computational medicine
- genomics and systems biology
- neuroengineering
- regenerative and immune engineering

Through project-based courses and hands-on learning experiences, our students will apply their knowledge in these areas to solve real-world clinical, design, and engineering problems. Combined with advanced research and design opportunities, these experiences ensure that our graduates are well prepared for careers in industry, medicine, or research.

Facilities
Situated on both the Homewood and School of Medicine campuses, our research and educational spaces are equipped to support a broad range of interdisciplinary discovery and innovation efforts.

At the School of Medicine campus, faculty members maintain laboratories supplied with a wide variety of equipment in the Traylor, Ross, Rangos, Miller, and Smith research buildings. This location fosters a close association with other basic biomedical science programs and provides access to the clinical environment of one of the nation’s top-ranked hospitals.

The Homewood campus is home to Clark Hall, a dedicated BME space that features research laboratories, classrooms, and conference spaces. Clark Hall also houses the BME Design Studio, a premiere workspace where students can design and develop solutions to clinical and global health challenges. To maintain close ties with clinical collaborators, the Design Studio is connected around-the-clock to similar BME student design spaces located on the School of Medicine campus. BME students at all levels, from freshman to graduate students, are able to work in our design spaces and research labs, ensuring that they can begin practicing the discipline on their very first day at Hopkins.
Additional Hopkins BME amenities include physiology teaching laboratories, microscope facilities, a microfabrication laboratory, tissue culture rooms, a fully-staffed mechanical shop, conference and seminar spaces that allow broadcasting throughout the university, and state-of-the-art 3-D printing facilities designed to support a broad range of prototyping needs.

Our faculty and students also have access to ample resources through our affiliations with several of the Johns Hopkins institutes and centers that have emerged from Hopkins BME research activities. Hotbeds for interdisciplinary scientific collaborations, these centers and institutes, all of which are directed or co-directed by Hopkins BME faculty, include the Institute for Computational Medicine, Center for Imaging Science, Carnegie Center for Surgical Innovation, Translational Tissue Engineering Center, Kavli Neuroscience Discovery Institute, Mathematical Institute for Data Science, and Center for Hearing and Balance. Hopkins BME is also home to the Center for Bioengineering Innovation and Design, which oversees our renowned graduate design program. In addition to these affiliated centers and institutes, our faculty have ongoing collaborations with scientists and physicians throughout the various Johns Hopkins divisions, including the Applied Physics Lab, School of Public Health, Krieger School of Arts and Sciences, and Carey Business School.

The profoundly interdivisional nature of Hopkins BME provides students with access to a wide range of university resources, including computing laboratories, libraries, and core facilities for microscopy, flow cytometry, sequencing and genetics, creating CRISPR/Cas9-based transgenic strains, and more. These amenities allow our students to produce the innovative technologies and groundbreaking research discoveries that result in patents, start-up companies, high-impact publications, and a better standard of health care for people across the globe.

**Undergraduate Programs**

The mission of the undergraduate programs is to provide state-of-the-art biomedical engineering education to students in order that they may continue their education in graduate, medical, and professional schools or pursue careers in industry. To this end, our responsibility is as much to the future as it is to the present. Through a strong research and educational environment, we strive to empower our students to explore and define their own frontiers as well as instill the ethical principles that will foster rewarding professional endeavors. The B.S. in Biomedical Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

The biomedical engineering program normally leads to the bachelor of science degree and requires at least 129 credits. The B.S. program is recommended for students who plan careers in engineering or who plan to attend graduate school in engineering. If a student wishes to take a more flexible program with less emphasis on engineering, a B.A. program is also available. Either the B.S. or the B.A. program can meet the needs of a student who plans graduate study in a nonengineering area.

The undergraduate program provides a strong foundation in mathematics, engineering, and science. It emphasizes preparation for advanced study in an area related to biomedical engineering and is broad enough to accommodate students who plan graduate work in biology, medicine, engineering, biophysics, physiology, or biomedical engineering.

Our fundamental focus is to instill a passion for learning, scientific discovery, innovation and entrepreneurial spirit, and societal impact on an extraordinary group of students who will become:

- Adept at applying their engineering and biological training to solving problems related to health and healthcare that are globally relevant and based on ethically sound principles.
- Leaders in their respective careers in biomedical engineering or interrelated areas of industry, government, academia, and clinical practice.
- Engaged in life-long learning by continuing their education in graduate or professional school or through opportunities for advanced career or professional training.

Each student plans a curriculum suited to his or her goals with the assistance of a faculty advisor. Upon completion of the B.S. in biomedical engineering, students will demonstrate the ability to:

- apply knowledge of advanced mathematics, life sciences, natural sciences, and principles of engineering to problems at the interface of engineering, biology, and medicine and mathematically model and simulate biological systems using computers.
- design and conduct experiments, as well as analyze and interpret data; formulate hypotheses for experiments, including those on living systems; devise procedures for experiments, including those on living systems; collect and validate data using appropriate equipment; display, describe, summarize, and interpret experimental results in a lab report; relate the experimental results to previous work, including the interaction between living and non-living materials and systems; and practice lab safety.
- design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability; identify a need and define the biomedical engineering problem to be solved, determine the constraints to the problem and assess the successful likelihood for different approaches, undergo the design process of creation, synthesis, and integration and evaluate success of the design to meet the desired need.
- function on multidisciplinary teams; understand team goals and complementary roles and expertise of each team member; share opinions and viewpoints with other team members; and assume and fulfill individual responsibilities within a team.
- identify, formulate, and solve engineering problems; conceptualize the engineering problem, formulate a solution to the problem, and solve problems using experimental, mathematical and/or computational tools.
- understand professional and ethical responsibility; understand the guidelines for ethical and responsible use of human subjects and data for research; understand the guidelines for ethical and responsible use of animals for research; understand professional and ethical standards in the workplace and properly reference the work of others.
- communicate effectively; synthesize, summarize, and explain technical content in a written report; and synthesize, summarize, and explain technical content in an oral presentation.
- understand the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context; understand the contributions biomedical engineers can play in academia, industry, and government; and understand how biomedical engineering solutions are of benefit inside and outside the U.S.
- recognize the need for, and gain an ability to engage in, life-long learning; use library resources, professional journals, and Internet
effectively; update technical literacy to understand contemporary issues; and recognize the need for self-assessment.

- comprehend contemporary issues; understand recent developments in biomedical engineering; understand differing viewpoints in academia, government, industry, and business; and gain the ability to search and critically evaluate scientific literature.

- use the techniques, skills, and modern engineering tools necessary for engineering practice; gain proficiency in computer simulations and mathematical analysis tools; create mathematical models; develop laboratory skills applied to living systems; and utilize data acquisition systems.

The program also encourages individual study and research and gives academic credit for them. Students are welcome to work in laboratories on the Homewood campus or at the Medical Institutions in East Baltimore.

**Bachelor of Science in Biomedical Engineering**

Students seeking the B.S. degree are encouraged to focus their studies on one of five subspecialties that incorporates traditional engineering disciplines and biomedical applications. See the Biomedical Engineering Undergraduate Advising Manual for specifics on focus areas, lists of recommended mathematics and engineering electives, limitations on credits for courses with overlapping material, and the design content of engineering courses.

**Requirements for the B.S. Degree**

(See also General Requirements for Departmental Majors (p. 7).)

The B.S. degree in biomedical engineering requires 129 credits. The courses listed below must either be taken or passed by examination for advanced credit. All courses used to satisfy degree requirements must be taken for a grade (no satisfactory/unsatisfactory grading may be counted). No more than 6 credits of engineering, science, or mathematics courses in which a grade of D was received may be counted.

**Basic Sciences (18 credits)**

**Free Electives**

Students can choose from any area.

1. Students who receive credit for AP Physics I and/or Physics II will receive a waiver for the laboratory course. This will reduce the required number of credits for Basic Sciences by 1 or 2 credits. Students are still required to complete at least 129 total credits for the degree.

2. Students who take an approved math course and receive 3 credits will have a total of 19 credits. Students are still required to complete at least 129 total credits for the degree.

3. See Writing Requirement (p. 7).

4. Career Exploration in BME is a 0-credit self-identified set of career related events (lectures, panels, journal clubs, etc.) beginning in the spring semester of year one and continuing until graduation. Career Exploration is administered through a Community Blackboard site; students will be enrolled by the department.
Building on the foundation of the core curriculum, each student is required to take a cohesive sequence of advanced engineering encompassing one of six Biomedical Engineering focus areas. A student’s choice of focus area is made during the sophomore year and is based on their experience with the Biomedical Engineering Core and how they wish to apply their skill, knowledge, and passion:

**Biomedical Data Science**—The past decade has seen major advances in our ability to acquire data on human health across multiple spatio-temporal scales. This wealth of data poses challenges that have never before been confronted. At the heart of these is understanding how massive data sets are best analyzed to discover new knowledge about the function of living systems in health and disease, and how this knowledge can be harnessed to provide improved, more affordable health care.

**Biomedical Imaging and Instrumentation**—Although being distinct disciplines, experience substantial overlap and enjoy significant synergies in our department. Course-based and research opportunities span fundamental development of imaging technologies, incorporation of these technologies into instruments, and translation into the clinic. In addition to collecting anatomical data, students will learn how data analysis and computer simulations are used to generate truly functional images that allow a physician to understand an organ or tissue from the smallest scale to the systems level.

**Computational Medicine**—This is an emerging discipline devoted to the development of quantitative approaches for understanding the mechanisms, diagnosis and treatment of human disease through applications of mathematics, engineering and computational science. The core approach of CM is to develop computational models of the molecular biology, physiology, and anatomy of disease, and apply these models to improve patient care.

**Genomics and Systems Biology**—This area uses advanced mathematical and modeling approaches to understand the mechanisms of disease through analysis of large datasets. Understanding the multiple scales that make up the human body maintain health and contribute to disease. Understanding life begins at the smallest of scales requiring a detailed understanding of how molecules assemble into the molecular machines that create cells that in turn constitute the tissues and organs that make up the human body. Understanding these multi-scale interactions is a staggering challenge that requires new approaches that combine network analysis theory with new ways of visualizing and manipulating biological networks across multiple spatial and temporal scales.

**Neuroengineering**—Neuroengineering is an emerging and fast growing basic and translational research avenue within today’s biomedical and bioengineering fields. The main focus of neuroengineering is to use engineering tools to modulate central, peripheral and autonomic nervous system function. It aims at developing new engineering oriented technologies within the medical field for screening, diagnosis, prognosis, rehabilitation, repair, and regeneration. Brain computer interface, deep brain stimulation, and cell replacement therapy are exemplar disciplines developed by utilizing core engineering approaches to understand pathologies and treat patients with neurological disorders.

**Regenerative and Immune Engineering**—This area has traditionally focused on understanding and harnessing the power of stem cells in concert with developing new biomaterials to guide cell behavior and reconstruct tissues and organs ranging from bone, cartilage, liver, pancreas, skin, blood vessel, and peripheral nerve. To complement these efforts designed to meet critical health care needs, immunoengineering approaches are used not only augment regeneration, but also to treat diseases such as cancer.

Courses in a focus area must be taken for a total of 21 or more credits. At least 15 credits must come from the relevant upper-level engineering course list; a maximum of six credits from the non-upper-level engineering course list may be used. Please refer to www.bme.jhu.edu/undergraduate/resources.htm for applicable courses designed for each focus area by faculty members with research interests appropriate to the area; all faculty members are active participants in shaping the undergraduate curriculum.

At least 6 credits must come from an approved list of design options. There are many combinations of courses, programs and independent study opportunities to satisfy this requirement. This is discussed in detail in the Undergraduate Handbook. Please refer to http://www.bme.jhu.edu/undergraduate/documents/BME-Undergraduate-Handbook.pdf.

**Other Electives**

At least 29 additional credits are needed to complete the 120 credit requirement for the BA degree.

Total Credits: **120**

---

**Graduate Programs**

**Master of Science in Engineering**

The master’s degree program is designed for students who wish to pursue careers in research and development, or as a step toward Ph.D. or M.D./Ph.D. education. The program has two degree options: a course-based plan consisting of 30 credits (equivalent to 10 full courses to be completed in one year) and a thesis-based track that requires 30 credits plus a thesis project which is completed in a second year.

**Admission and Financial Aid**

Students with undergraduate degrees in engineering are eligible to apply. Exceptional students with degrees in basic sciences may also apply, but would normally have to take a number of courses to overcome deficiencies in their curriculum.

Students do not receive departmental financial aid. However, external financial aid is available for qualified students and partial tuition remission may be available for previous Johns Hopkins students. In addition, thesis-track students (once selected for the thesis track) may be provided with additional financial aid to facilitate the research component of their degree (each financial aid package will be negotiated on an individual basis but typically will include either (or a combination of) tuition waivers or a monthly stipend.

Applications for admission are due by the appointed deadline (usually in early January).

For more information and to apply online, go to [http://www.bme.jhu.edu/graduate/mse/apply](http://www.bme.jhu.edu/graduate/mse/apply).

**Requirements for the M.S.E. Degree**

**Course-based Degree Option**

The course-based degree option will require the completion of 30 credits (the equivalent of 10 full courses) that meet the following stipulations:

- A minimum of five graduate-level courses focused in a selected biomedical engineering sub-discipline (e.g., cell and tissue engineering, computational biology, imaging, instrumentation, or systems biology) as approved by the student’s advisor.
- Additional classes that will consist of math, science, medicine, or technology coursework related to biomedical engineering, which can also include the JHU Center for Leadership’s Professional Development Courses (e.g., 633.645, 663.650, 663.646, and 663.651).
Thesis-based Degree Option

Each student will take 30 credits at the graduate-level (the same as first year students), including one or more research/practicum courses.

Thesis track students must also complete a thesis based on a research topic requiring application of quantitative or applied engineering principles to biomedical engineering.

Master of Science in Engineering in Innovation and Design

The Center for Bioengineering Innovation and Design (CBID), housed in the Department of Biomedical Engineering, focuses on the design aspect of Biomedical Engineering. This exciting program gives students opportunities to design, develop, build, and test devices that solve some of the most pressing problems facing clinicians today.

The mission of CBID is to:

- Improve human health by developing medical devices that solve important clinical problems
- Educate a new generation of medical device engineers and fellows
- Facilitate technology transfer and industry collaboration

In the graduate program CBID students will learn to identify clinical needs and innovate a novel solution to solve that clinical problem. Working in teams, students work closely with engineering faculty and physicians throughout the medical institution to come up with device ideas, build prototypes, research intellectual property, learn about the regulatory process, write business plans, and present their designs to fellow students, faculty, and outside advisors.

Undergraduate students in BME can also become involved in medical device design by joining an undergraduate design team which works on solving clinical problems by designing innovative devices.

Incorporated in all the BME design curriculum is a focus on technology commercialization. All students, graduate and undergraduate, will interact with clinical and corporate sponsors and have experiences that promote the development of leadership, communications, and marketing skills, thus helping to ensure our graduates’ professional success.

The CBID M.S.E. is a one-year program lasting from May through the following May. Please see our website for more information on our programs: http://cbid.bme.jhu.edu.

Information can also be found here: http://www.bme.jhu.edu/graduate/masters-design/

Ph.D. in Biomedical Engineering through the School of Medicine

Biomedical Engineering has emerged as one of the most exciting interdisciplinary research fields in modern science. Biomedical engineers apply modern approaches from the experimental life sciences in conjunction with theoretical and computational methods from the disciplines of engineering, mathematics, and computer science to the solution of biomedical problems of fundamental importance. The Biomedical Engineering Graduate Program of Johns Hopkins University is designed to train engineers to work at the cutting edge of this exciting discipline.

The cornerstone of the program is our belief in the importance of in-depth training of students in life sciences, modern engineering, mathematics, computer science, and in the conduct of original research leading to the doctoral dissertation. In-depth training in life sciences is achieved in one of two ways. Typically, incoming Ph.D. students enroll in the first year basic sciences curriculum of the Johns Hopkins University School of Medicine. That is, they learn human biology with the medical students. This is a unique and intensive curriculum covering a broad range of topics including molecules and cells, human anatomy, immunology, physiology, and neuroscience. Students choosing this option typically devote their entire first academic year to these courses. This curriculum is an excellent way to build a broad and solid foundation in the life sciences. Alternatively, students may elect alternative life sciences curricula. These curricula have been carefully designed to provide training in areas of the life sciences that are appropriate to each of the program’s research areas. This option is of particular value to students who enter the program having a strong background in the life sciences. In-depth training in engineering, mathematics, and computer science is achieved through elective courses that are taken in the second year.

All students are admitted with full financial support. This covers tuition and provides a modest stipend for the duration of their Ph.D. Because the students are fully funded, they can choose to perform their dissertation in essentially any laboratory in the University (subject to the approval of the Program directors). A special program with the National Heart, Lung, and Blood Institute of the National Institute of Health (NIH) allows students to also choose from research laboratories at the NIH.

Students typically do research rotations during the summer before start of the first academic semester, during the first year (typically as they are taking medical school courses), and during the following summer year. They are expected to choose a research laboratory before the start of the second academic year.

Emphasis is placed on original research leading to the doctoral dissertation. The research is usually experimental in nature, and students are expected to learn biological experimentation techniques. Nevertheless, experiment or theory can be emphasized in the research as desired by the student.

Requirements for Admission

The School of Medicine program accepts applications for the Ph.D. program until December 1 of each year. We typically recruit students in five areas: Computational Biology, Imaging, Tissue Engineering, Neural engineering, and Molecular, Neural, and Cardiac physiology (MNCP). The program is unique in that it offers the BME student the strengths of one of the best medical schools in the world. If you wish to combine engineering with cutting edge research in medicine, this may be the program for you.

In their first year, our students have the option of taking many of the same courses as the medical students, including human anatomy, molecules and cells, and genes to society. In their second year, our students take advanced engineering courses. Therefore, students that apply to our program need not only have a strong background in engineering and mathematics, but also sufficient background in chemistry (including organic chemistry) and biology (at least two introductory courses).

The admission process is by committee. The applicant should specify which area they are interested in and write about the kind of research they are considering. The faculty in each area vote and rank the applicants. The final pool of applicants is ranked and voted on by the entire faculty.

About one third of our incoming students are international students. A short list of these students is formed by committee and the top candidates are interviewed by phone. Like all admitted students,
Biomedical Engineering

international students receive full financial aid as well as a monthly stipend. They too have the freedom to choose from any lab.

Applications should be complete when submitted. In order to be considered a complete application we must have:

- A completed online application form.
- **Official transcripts from each college or university attended**—Sealed, official transcripts or certified records of all university (undergraduate and graduate) study must be submitted. If you have attended more than one institution, transcripts from each must be included with your application.
- **Official Graduate Record Examination**—GRE/MCAT scores will be acceptable and can be arranged through the Office of Graduate Affairs (address provided below). The GRE code for applying to graduate programs at the Johns Hopkins School of Medicine is 5316.
  - The BME Ph.D. program does not rely heavily on the GRE exam in making admissions or financial aid decisions. Research experience, course grades, and recommendations carry more weight. However, because the GRE score is part of the application and does affect admissions decisions in some cases, foreign applicants who took the GRE in its electronic form, in a country where the electronic test is no longer offered, are advised to retake the exam in its paper form. Applications will be considered regardless of which form of the exam was taken.
- **Three letters of recommendation**—These letters should come from faculty members who are acquainted with you and your academic work. These letters should be sealed and comment on your aptitude and promise for independent research.
- **Personal Statement**—a typewritten statement (one page maximum) indicating the basis of your interest in graduate study and your career objectives. Included should be a discussion of any research experience you have had.

Applicants for admission must fulfill the following course prerequisites:

- one year of college level biology (may include quantitative biology or physiology)
- one semester of organic chemistry
- differential equations

If you are interested in applying and do not have the prerequisite courses, you may want to submit your application with an explanatory note indicating you have made or will make arrangements to take the prerequisites before you would matriculate, if your application is accepted. In the past, applicants have taken the prerequisites at their present schools, local community colleges, etc. Courses taken at any accredited college or university are acceptable.

Each applicant must have received a B.A. or B.S. degree or its equivalent prior to matriculation. A Masters degree is not required for admission to our program.

All written correspondence and supporting documents should be sent directly to:

The Office of Graduate Affairs
The Johns Hopkins School of Medicine
1830 E. Monument St., Suite 2-107
Baltimore, MD 21205-2196
410-614-3385 phone
410-614-3386 fax

**Financial Aid**

Fellowships for tuition and support stipends (regardless of citizenship or national origin) are available from the general funds of the university. U.S. citizens and Permanent Residents are eligible for support from training grants from the NIH. Students are encouraged to apply for individual fellowships from the National Science Foundation and for NRSA awards from the NIH. Only online applications for admission are accepted and must be received by December 1.

**Requirements for the Ph.D. Degree**

The first two years are ordinarily devoted to advanced courses in engineering science and in biomedical science. Engineering, mathematics, and other physical science courses to be taken are arranged between students and their advisors. Each student is assigned a faculty mentor during the first year. This relationship is designed to help students acclimate to the program. Eighteen credit hours of course work in engineering, mathematics, or physical sciences are required. In addition, students must complete eighteen credit hours of course work in the life sciences. Of these 36 credit hours, at least six must be at the graduate level. At least three credit hours in a course with strong engineering or mathematical theory content at the 600-level must be taken.

Summer is spent working in a biomedical laboratory to gain experience and to seek out a suitable thesis research area. By the beginning of the third year, students should start original research leading to the dissertation. Students must fulfill a modest teaching requirement during one year of their program. The remaining time is spent in thesis research. The program typically takes five to six years to complete.

The student must pass a preliminary oral examination which will be a Graduate Board examination. This is taken no later than the end of the second year. The student must then conduct original research, describe it in a dissertation, and pass a final oral examination that is a defense of the dissertation. There is a minimum residency requirement of two consecutive academic years.
Integrated M.D./Ph.D. Program

Candidates for the Ph.D. in biomedical engineering who wish to apply jointly for the M.D. degree must apply directly through the School of Medicine. Although the combined programs would normally require at least seven years to execute sequentially, the combined program can ordinarily be completed in six years, with appropriate planning. Good preparation in biology and chemistry as well as mathematics, engineering, and the physical sciences is essential. Life science graduate requirements are met by the first-year program of the School of Medicine. This program is more arduous than the Ph.D. program alone, but it may have marked advantages for students interested in clinical research and applications in hospital systems and in the delivery of health care. The catalog for the School of Medicine should be consulted for admissions requirements and procedures.

Information about applying to the combined M.D.-Ph.D. program can be found at www.hopkinsmedicine.org/mdphd/admissions (http://www.hopkinsmedicine.org/mdphd/admissions). Applications submitted for consideration of the combined degree will be reviewed by the Medical School admissions committee. If the Medical School admissions committee accepts the application, it is then passed along to the Biomedical Engineering Ph.D. Program admissions committee for review. A student applying to the combined program who wishes to be considered for the straight Ph.D. program must submit a written request to have his or her application forwarded to the Biomedical Engineering Ph.D. Program office for consideration if his or her application is not accepted by the Medical School admissions committee.

For current faculty and contact information go to http://www.bme.jhu.edu/people/completefacultylist.php

Faculty

Chair
Michael I. Miller
Bessie Massie Professor and Director: computational anatomy, medical imaging, image understanding.

Professors

Joel S. Bader
Bioinformatics, computational biology, systems biology, synthetic biology.

Kathleen E. Cullen
Multisensory integration for action and perception, neural mechanisms of motor learning, neural prosthesis and rehabilitation, computational neuroscience.

Jennifer H. Elisseeff
Morton Goldberg Professor: tissue engineering, biomaterials, cartilage regeneration.

Andrew P. Feinberg
Bloomberg Distinguished Professor: epigenetics of development and disease; stochasticity in development and cancer.

Jordan J. Green
Cellular engineering, nanobiotechnology, biomaterials, controlled drug delivery and gene delivery.

Taekjip Ha
Bloomberg Distinguished Professor: single molecule engineering and biophysics, DNA/RNA nanotechnology, cell mechanics, super-resolution microscopy.

Xingde Li
Endomicroscopy technologies, nanobiophotonics and molecular imaging, early detection (cancer, cardiovascular diseases, wound healing).

Aleksander S. Popel
Physiological flows and molecular transport, microcirculation, cell mechanics.

Steven L. Salzberg
Bloomberg Distinguished Professor: bioinformatics and computational biology.

Reza Shadmehr
Human motor control and learning in health and disease, functional imaging of the brain, human neurophysiology, computational and theoretical neuroscience.

Jeffrey H. Siewerdsen
John C. Malone Professor; BME Vice Chair Clinical and Industrial Translation: medical imaging, image-guidance, flat-panel imagers, cone-beam CT, volume imaging, MRI, image science, imaging performance, radiation therapy.

Nitish V. Thakor
Medical instrumentation, medical micro and nanotechnologies, neurological instrumentation, signal processing, and neural prostheses.

Natalia Trayanova
Murray B. Sachs Professor: computational cardiac electrophysiology and electro-mechanics, mechanisms of arrhythmogenesis and cardiac anti-arrhythmia therapies, cardiac dyssynchrony and resynchronization, development of cardiac models from imaging modalities.

Leslie Tung
Functional electro-physiology of cultured cardiac cell networks, cardiac arrhythmias, analysis of multicellular structure, stem cell-derived cardiac cells.

Rene Vidal
Herschel L. Seder Professor: computer vision (camera sensor networks, recognition of human activities, dynamic scene analysis, structure from motion), biomedical imaging (processing of high angular resolution diffusion imaging, registration and segmentation of diffusion MRI, segmentation and fiber tracking of cardiac MRI, interactive medical image segmentation), machine learning (generalized principal component analysis, manifold learning and clustering, classification of dynamical systems), signal processing (consensus on manifolds, distributed optimization, compressive sensing).

Xiaojin Wang
Neurophysiology of the auditory cortex, neural mechanisms of speech perception and learning, computational neuroscience.

Raimond L. Winslow
Raj and Neera Singh Professor of Biomedical Engineering; BME Vice Chair of Academic Programs; Director, BME Masters Program: computational cell biology, systems biology, cardiac electrophysiology.

Associate Professors

Michael A. Beer
Genomics and computational molecular biology.

Harry R. Goldberg
Assistant Dean of the School of Medicine: virtual learning systems, student learning, web-based instruction.
Biomedical Engineering

Warren L. Grayson
Tissue engineering, stem cells, bioreactors, biomaterials, orthopaedics.

Rachel Karchin
Computational molecular biology, bioinformatics, genetic variation.

Scot C. Kuo
Cell motility and mechanics, nanoscale biophysics, laser-based bioinstrumentation, advanced multiphoton and confocal microscopy.

Feilim Mac Gabhann
BME Director of Graduate Affairs: computational modeling of growth factor-receptor networks, personalized medicine, individualized medicine, experimental studies of interindividual variation, therapeutic cardiovascular remodeling, novel methods for data visualization and automated image analysis, computational models of virus-host interactions.

Sridevi Sarma
Co-Director, Institute for Computational Medicine: closed-loop deep brain stimulation, control theory, computational neuroscience and large-scale optimization.

Kevin J. Yarema
Director of the Biomedical Engineering MSE Program: metabolic glycoengineering, glycobiology, systems biology of glycosylation, carbohydrate-based cancer drug design and delivery, cellular responses to static magnetic fields.

Kechen Zhang
Theoretical neuroscience, computational neuroscience, neural computation.

Assistant Professors

Angelo Homayoun All
Spinal cord injury, stem cells, electrophysiology, imaging.

Alexis Battle
Genomics, machine learning, probabilistic methods to analyze genetic data.

Patrick Cahan
Computational biology, stem cell biology, and single cell genomics.

Vikram Chib
Decision-making, motivation, movement, neuroscience, robotics, neuroeconomics.

Nicholas J. Durr
Medical imaging, biomedical optics, endoscopy, ocular diagnostics, biomicroscopy, and medical device design.

Daniel Herzka
Cardiac magnetic resonance imaging, self-navigation, open-ended imaging, fast imaging, high resolution imaging, applications of MRI in cardiac electrophysiology, kinematic imaging, and fetal imaging.

Jamie Spangler
Structural and molecular immunology, protein engineering, therapeutic antibody discovery and design, targeted drug development.

J. Webster Stayman
Imaging physics, 3D image reconstruction, novel imaging systems, image-guided interventions and diagnostic imaging.

Winston Timp
Epigenetics, single cell analysis, single molecule biophysics, nanotechnology, systems biology, computational biology/bioinformatics.

Joshua T. Vogelstein
Big data science, connectomics, statistical neuroscience.

Youseph Yazdi
Medical instrumentation, medical device design, translation and commercialization of medical devices, biophotonics, optical spectroscopy.

Wojciech B. Zbijewski
System modeling for optimization of x-ray CT imaging chain, integration in novel reconstruction algorithms.

Professors Emeriti

Richard J. Johns
University Distinguished Service Professor: Industrial liaison.

Lawrence P. Schramm
Spinal cord injury and regeneration, neural regulation of the circulation.

Artin A. Shoukas
Systems analysis of circulatory systems, systems physiology.

Eric D. Young
Auditory neurophysiology, neural modeling, sensory processes.

Adjunct Professor

Elliot R. McVeigh
Imaging.

Adjunct Associate Professors

Xiaofeng Jia
Novel application of neuro-electrophysiology for detection and restoration of peripheral nerve and spinal cord injury, basic and clinical investigations in neurological injuries and therapeutic hypothermia of brain and spinal cord after asphyxial cardiac arrest.

Scott Paul
Rehabilitation medicine and engineering.

Joseph M. Smith
Healthcare innovations and technologies.

Adjunct Assistant Professors

Erhan Bas
Neuronal reconstruction from large scale volumes.

Manu Ben-Johny
Quantitative physiology, molecular biophysics

Ivy Dick
Ca2+ signaling mechanisms in neuronal and cardiac systems, Ca2+ channels, electrophysiology, channelopathies.

Thomas W. Gilbert
Extracellular matrix scaffold materials for development of regenerative medicine.

Research Professor

Kenneth Boheler
Cardiovascular molecular and cellular biology.

Timothy Harris
Immunotherapy, radiotherapy and the application of novel technologies and combined therapies in the management of CNS and pediatric malignancies.

Andre Levchenko
Intracellular signal transduction, cell engineering, cancer research.

Alexander A. Spector
Biosolid mechanics, cell mechanics and biophysics, membrane mechanics, mechanotransduction, molecular motors, mathematical and computational modeling.

Associate Research Professor
J. Tilak Ratnamather
Computational anatomy, biomedical imaging, numerical analysis, mathematical biology of the cochlea.

Assistant Research Professor
Soumyadippta Acharya
Director of the Master’s degree program in Bioengineering Innovation and Design: Biomedical instrumentation, medical device innovation, neuroprosthetics, brain machine interfaces, computational neuroscience.

Siamak Ardekani
Image-based (multi-detector CT and MRI) shape and motion analysis of cardiac disease using mathematical models, analysis of brain development and aging process using diffusion MRI and deformation based morphometry.

Research Associate
Grace Gang
Development of mathematical models of image quality for advanced x-ray imaging systems.

Michael Osmanski
Auditory neuroscience, perception and cortical representation of complex sounds, acoustic communication, comparative and evolutionary biology of hearing.

Niranjan Pandey
Novel therapeutics for diseases such as age-related macular degeneration, diabetic retinopathy, various types of solid tumors, and immunological diseases.

Kunal Parikh
Mucus-penetrating particles for tuberculosis.

Alejandro Sisniega-Crespo
Development of high-performance Monte Carlo simulation methods for 3D imaging, including GPU implementations for high-fidelity, high-speed x-ray scatter simulation, dose calculation, and dual-energy imaging.

Stephany Tzeng
Biomaterials for gene and drug delivery, cancer therapy, nanomedicine for cellular engineering, controlled drug release.

Qihong Wang
Micosurgery.

Scott Wu Yuan
Endoscopic OCT technologies, high resolution endoscopic imaging, and biomedical applications.

Senior Lecturers
Eileen Haase

Director of the Undergraduate Program in Biomedical Engineering; Chair of Applied Biomedical Engineering, Engineering for Professionals: Freshmen Modeling and Design, System Bioengineering Laboratory I and II, Cell and Tissue Engineering Laboratory, Molecules and Cells, BME Teaching Practicum.

Lecturers
Elizabeth A. Logsdon
Director, BME Undergraduate Affairs; Director, BME Design Studio: engineering design education, online learning.

Amir Manbachi
Medical imaging, neurosurgery, spine interventions, and medical device design.

Visiting Assistant Professor
Erika Moore
Biofunctional materials.

Joint, Secondary, Part-Time, and Visiting Appointments
Mohamad E. Allaf
Associate Professor (Urology): laparoscopic and robotic surgery.

William S. Anderson
Associate Professor (Neurological Surgery): cerebrospinal fluid disorders and movement disorders.

Muyinatu A. Lediju Bell
Assistant Professor (Electrical and Computer Engineering): ultrasonic imaging, photoacoustic imaging, coherence-based beamforming, image formation, image quality, light delivery systems, medical robotics, image-guided surgery, image-guided interventions, speckle tracking, technology development, medical device design, clinical translation.

Ronald D. Berger
Professor (Cardiology): mechanisms of sudden cardiac death, new modalities of ablation therapy, device development, signal processing.

Dan E. Berkowitz
Professor (Anesthesiology and Critical Care Medicine): molecular mechanisms of cardiovascular deconditioning in rodent models of microgravity, vasoregulatory dysfunction associated with obesity, diabetes, the role of leptin in vasoregulatory changes.

Paul A. Bottomley
Professor (Radiology): magnetic resonance imaging and spectroscopy, medical imaging.

Henry Brem
Professor (Neurosurgery): clinical treatments for brain tumor, anti-angiogenesis therapies, computer navigation systems used during surgery, brain tumor vaccines.

John A. Carrino
Associate Professor (Radiology and Radiological Science): spine imaging novel MRI techniques, health services research informatics.

Jiande Chen
Professor (Gastroenterology): electrogastrography.

Charles C. Della Santina
Professor (Otolaryngology-Head and Neck Surgery): electrical stimulation of the inner ear for restoring balance function, neurophysiology, vestibular function testing.

Andrew S. Douglas
Vice Dean for Faculty for the Whiting School of Engineering, Professor (Mechanical Engineering): nonlinear solid mechanics, soft tissue mechanics, mechanics of active materials.

Laura Ensign-Hodges
Associate Professor (Nanoscience): nanomedicine, drug delivery systems.

Andrew Ewald
Professor (Cell Biology and Oncology): cellular mechanisms and molecular regulation of epithelial morphogenesis in development and cancer.

Gene Fridman
Associate Professor (Otolaryngology-Head and Neck Surgery): novel methods and devices for neural interfacing

Paul A. Fuchs
Professor (Otolaryngology-Head and Neck Surgery): biophysics and sensory physiology of sensory hair cells and neurons on the inner ear.

Israel Gannot
Professor (Electrical and Computer Engineering): optical biopsy-optical diagnostic methods in medicine, laser tissue interaction, fibers and waveguides for medical applications, lasers and optics in medicine.

Donald Geman
Professor (Applied Mathematics and Statistics): statistical learning, visual recognition, computational genomics.

Sharon Gerecht
Professor (Chemical and Biomolecular Engineering): embryonic and adult stem cells, vascular regeneration, micro/nano fabrication, biomaterials, tissue engineering.

John Goutsias
Professor (Electrical and Computer Engineering): signal and image processing, computational systems biology, bioinformatics, modeling and analysis of complex networked systems.

Henry R. Halperin
Professor (Cardiology): cardiovascular medicine, MR compatible devices.

Justin Hanes
Professor (Ophthalmology): drug and gene delivery, biomaterials synthesis, particle transport through biological barriers.

Kalina Hristova
Professor (Materials Science and Engineering): biomolecular materials, biomembranes, biosensor development, signal transduction across biological membranes.

Chao-Wei Hwang
Assistant Professor (Cardiology): optimization of PCI and stent-based drug delivery using computational fluid dynamics, cell-based therapy for the heart and peripheral vasculature, active sensing drug delivery systems.

Pablo A. Iglesias
Professor (Electrical and Computer Engineering): computational biology, models of cellular signal transduction, directed cell motility, cell division, control systems.

Takanari Inoue
Professor (Cell Biology): directed cell migration, tumor metastasis, primary cilia, synthetic chemical biology, technology development.

David A. Kass
Professor (Cardiology): molecular pathophysiology of heart failure and hypertrophy, pathobiology of cardiac dyssynchrony and resynchronization, cardiac stress regulation by phosphodiesterase 5, nitric oxide synthase uncoupling, structure-function of sarcomeric proteins to cardiac mechanics, heart failure with preserved ejection fraction.

A. Jay Khanna
Professor (Orthopaedic Surgery): spine surgery, minimally invasive, musculoskeletal imaging, image guidance for surgery, MRI, biomechanics, clinical outcomes.

Konstantinos Konstantopoulos
Professor (Chemical and Biomolecular Engineering): cell adhesion and microfluidics, nanoscale mechanics, receptor biochemistry, quantitative modeling and functional genomics.

Alain Labrique
Associate Professor (International Health and Epidemiology): application of information and communication technologies (ICTs) to strengthen health systems in resource-limited settings.

Albert C. Lardo
Associate Professor (Cardiology): cardiovascular MRI, cardiovascular CT, image guided therapy.

Rong Li
Bloomberg Distinguished Professor (Cell Biology): cellular dynamics in space, time, and adaptation.

Hanzhang Lu
Associate Professor (Radiology): development of novel MRI technologies and applications for the measurement of vital physiological and biophysical parameters.

Hai-Quan Mao
Professor (Materials Science and Engineering): nanomaterials, electrospinning, nanofibers, biomimetic matrix, stem cell expansion and differentiation, nerve regeneration, micellar nanoparticle, therapeutic delivery, biodegradable polymers.

Wayne Mitzner
Professor (Environmental Health Sciences, Program in Respiratory Biology and Lung Disease): modeling lung function, lung structure-function interactions, mechanical aspects of lung disease.

Hien Nguyen
Assistant Professor (Surgery): clinical outcomes in hernia surgery, critical care medicine, bariatric surgery and metabolic syndrome.

Devin O'Brien-Coon
Assistant Professor (Plastic and Reconstructive Surgery): tissue engineering, regenerative medicine, materials science for customized surgical applications, clinical outcomes and novel techniques in gender surgery, analysis of disparities in transgender healthcare.

Arvind P. Pathak
Associate Professor (Radiology): functional and molecular imaging, systems biology, tumor microenvironment, multiscale imaging, computational and visualization tools.

Martin Pomper
Professor (Radiology): techniques and agents to study human disease through imaging.

Jerry L. Prince
Professor (Electrical and Computer Engineering): image processing and computer vision with application to medical imaging.

Lewis H. Romer
Professor (Anesthesiology and Critical Care Medicine, Cell Biology, and Pediatrics, and the Center for Cell Dynamics): tissue engineering the micro-vasculature, extracellular matrix as an instructive environment, biophysics and biochemistry of matrix assembly, interactions between tyrosine kinases and Rho family GTPases in cell matrix adhesion, mechanochemical coupling in cell-matrix adhesion signaling, harnessing stem and progenitor cells for microvascular restitution.

Lakshmi Santhanam
Assistant Professor (Anesthesiology and Critical Care Medicine): molecular mechanisms of vascular stiffness.

Akira Sawa
Professor (Psychiatry and Behavioral Sciences): pathogenesis of mental illnesses, especially schizophrenia and mood disorders, at the molecular level.

Lew Schon
Associate Professor (Orthopaedic Surgery): surgical delivery systems for stem cells and bioactive molecules.

Ken Katsuyuki Taguchi
Associate Professor (Radiology): computed tomography (CT) image science, 3-D and 4-D image reconstruction, CT data acquisition, photon counting and spectral CT.

Nicholas Theordore
Professor (Neurosurgery and Orthopedics): brain and spinal cord injury, minimally invasive spine surgeries, robotics.

Benjamin M.W. Tsui
Professor (Radiology): molecular imaging including SPECT, PET and CT, anatomical and physiological models of humans and small animals, simulation of imaging systems and processes, quantitative image reconstruction methods, image quality assessment.

Jeff Tza-Huei Wang
Professor (Mechanical Engineering): bioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Clifford R. Weiss
Associate Professor (Radiology and Surgery): Clinical Director of the Johns Hopkins Center for Bioengineering, Innovation and Design (CBID).

Thomas B. Wooff
Professor (Physiology): molecular dynamics calculations, membrane biophysics, computational neurosciences.

Laurent Younes
Professor (Applied Mathematics and Statistics): statistical properties of Markov random fields, image analysis, deformation analysis-shape recognition.

Elias Zerhouni
Professor (Radiology): imaging.

For current course information and registration go to https://sis.jhu.edu/classes/

Courses

EN.530.627. Intermediate Fluid Mechanics (graduate). 3.0 Credits.
Instructor(s): G. Tryggvason.

EN.540.691. Chemical Engineering Modeling and Design for Graduate Students. 3.0 Credits.
This course guides student through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue.

EN.580.105. Basic Intellectual Property Law for Scientists and Engineers: Patents, Copyrights and Trademarks. 3.0 Credits.
The course will outline the basics of intellectual property laws with an emphasis on practical aspects of protection of IP for scientists and engineers. Most of the course will cover the basics of patent law, but introductions will also be given to trademarks and copyrights. Specific problems in the areas of biotechnology, computer science and the Internet will also be highlighted. It is hoped that the attendees will obtain a basic understanding of how intellectual property is protected. No prior legal background is required.
Instructor(s): J. Szipl
Area: Social and Behavioral Sciences.

EN.580.111. BME Modeling and Design. 2.0 Credits.
Working in teams with upperclassmen this course (1) introduces biomedical engineering freshmen to an orderly method for analyzing and modeling biological systems and (2) introduces engineering principles to solve design problems that are biological, physiological, and/or medical. Freshmen are expected to use the informational content being taught in calculus, physics and chemistry and to apply this knowledge to the solution of practical problems encountered in biomedical engineering. BME Freshmen only.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): E. Haase; E. Logsdon; P. Boyle
Area: Engineering, Natural Sciences.

EN.580.112. BME Design Group. 3.0 Credits.
A two-semester course sequence where freshmen work with groups of BME upperclassmen mentors, and learn to use engineering principles to solve design problems that are biological, physiological, and/or medical. Freshmen are expected to use the informational content being taught in calculus, physics, and chemistry and apply this knowledge to the solution of practical problems encountered in biomedical engineering.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.
EN.580.117. Introductory Lab Skills. 1.0 Credit.
This course aims to familiarize first-year undergraduates with the basic lab skills necessary to work in a wet-lab. Specific skills covered will include pipetting, microscopy, PCR, gel electrophoresis, basic cell culture, simple microfluidics, and more! This hands-on experience will fully immerse students in the basics of laboratory research and should help prepare students looking for research or internship opportunities in the upcoming spring or summer semester.
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

This course is an introduction to scientific programming and computing designed for first-year students. The aim is to develop core computer skills required to succeed in research. Programming projects are drawn from current biomedical applications within BME. Emphasis is on algorithm development, large scale data analysis, and effective visualization of results, using MATLAB, Python, and R. Prior programming experience is not required.
Instructor(s): W. Timp
Area: Engineering.

EN.580.202. Bme In The Real World. 1.0 Credit.
Open only to engineering students; A series of weekly lectures to inform students about careers in biomedical engineering and to discuss technological, social, ethical, legal, and economic issues relevant to the profession. Topics include academic careers in biomedical engineering; biomedical engineering in industry (large corporations to sole entrepreneurship); health care delivery; ethical issues; legal issues (patenting, licensing, product liability); standards and government regulations; and economic issues in biomedical engineering industry (start-up companies, global businesses).
Instructor(s): A. Popel.
Area: Engineering.

EN.580.211. BME Design Group. 3.0 Credits.
Sophomore-level version of EN.580.311-312 or Perm. Req’d
Instructor(s): A. Manbachi; E. Logsdon; N. Durr
Area: Engineering, Natural Sciences.

EN.580.212. BME Design Group. 3.0 Credits.
Sophomore-level version of EN.580.111-112. Permission of course directors required.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.

EN.580.220. he Science of Medicine: Thinking Critically. 3.0 Credits.
This course investigates some of the most pressing issues in biomedical science with direction from leading clinicians, scientists, policy experts, and industry professionals. The underlying science and ethical implications for topics such as “Rogue Clinics and Designer Babies: How can I decide the genotype of my offspring – and should I;” “Mosquito-borne Diseases: Fighting an enemy that outnumbers us 15,000 to one with genetics;” and “HIV. Pushing for a cure versus settling for a treatment: What makes healthcare sufficient” are explored. The class is taught in a flipped method: students will be expected to listen to presentations at home so that class time can be devoted to problem solving activities, experimental design, debates, and discussion. The goal of this course is to teach students how to think critically and to expose students to the great unknowns that remain in science today.
Instructor(s): C. Hanlon; E. Haase; H. Goldberg
Area: Natural Sciences.

EN.580.221. Molecules and Cells. 4.0 Credits.
An introduction to modern molecular and cellular biology in the context of potential biomedical engineering applications. Topics covered: reactions between molecules, including receptor-ligand and antigen-antibody specificity, protein structure, enzyme catalysis, genetic information, protein processing and secretion, cell physiology and cell functions. Along with detailed study of molecular pathways and cellular behavior, we will discuss the quantitative study of molecular and cellular biology.
Recommended Course Background: AS.030.101 and AS.030.104
Instructor(s): E. Haase; F. Macgabhann; K. Yarem
Area: Natural Sciences.

EN.580.222. Systems and Controls. 4.0 Credits.
An introduction to linear systems: analysis, stability and control. Topics include first and second order systems, linear time invariant discrete and continuous systems, convolution, Fourier series, Fourier transforms, Laplace transforms, stability of linear systems, input output and state space representation of linear systems, stability, observability, controlability, and PID controller design. Recommended Course Background: AS.171.102 and AS.110.201, AS.110.302 or EN.553.291
Instructor(s): M. Miller; S. Sarma
Area: Engineering.

EN.580.223. Models and Simulations. 4.0 Credits.
This course introduces students to modeling and analysis of biological systems. The first portion of the course focuses on linear systems. Topics include harmonic oscillators, pharmacokinetics, reaction-diffusion equation, heat transfer, and fluid flow. The second half of the course focuses on non-linear systems. Topics include iterated maps, bifurcations, chaos, stability of autonomous systems, the Hodgkin-Huxley model, bistability, limit cycles, and the Poincare-Bendixson theorem.
The course also introduces students to the Matlab programming language, which allows them to implement the models discussed in class. Recommended Course Background: AS.110.201, AS.110.302, or EN.553.291
Instructor(s): A. Popel; M. Beer
Area: Engineering.

EN.580.230. Introduction to Genomic Data Analysis. 2.0 Credits.
This class will provide an introduction to analysis of genomic data, with a focus on practical applications and research appropriate for students with no experience. It will include directed readings, discussion, and hands-on experience in genomic research projects. Permission of instructor.
Instructor(s): A. Battle
Area: Engineering.

EN.580.237. Neuro Data Design I. 3.0 Credits.
In this year long course, students will work together in small teams to design, develop, and deploy a functioning tool for practicing brain scientists, either for accelerating research or augmenting the clinic. The first semester will focus on scoping the tool, including determining feasibility (for us in a year) and significance (for the targeted brain science community), as well as a statement of work specifying deliverables and milestones. The second semester will focus on developing the tool, getting regular feedback, and iterating, using the agile/lean development process. This version of Neuro Data Design is designed for students with less coding experience who wish to develop their writing skills.
Instructor(s): J. Vogelstein
Area: Engineering
Writing Intensive.
EN.553.291. Linear Algebra and Differential Equations. and PID controller design. Recommended course background: systems. topics include LaPlace transforms, input output and state space
An introduction to the analysis and synthesis of controllers for linear
EN.580.246. Systems and Controls. 2.0 Credits.
EN.580.248. Systems Biology of the Cell. 2.0 Credits.
Cellular systems biology provides a theoretical and quantitative understanding of the interactions between DNA, RNA, and proteins that create the well-regulated system we call life. This course develops first-principles models for the central dogma of molecular biology: information flow through protein signal transduction pathways, gene regulation by protein-DNA physical interactions, transcription of DNA to RNA, translation of RNA to protein, and feedback regulation that closes the cycle. Topics include complex analysis and contour integrals, spectral transforms, linear models for cell signaling, positive and negative feedback, non-linearities introduced by saturation and cooperativity, information content and combinatorial regulation, and instabilities leading to cell fate specification. Recommended Course Background: Linear Algebra, Systems and Controls and programming.
Instructor(s): J. Bader
Area: Engineering, Natural Sciences.
EN.580.256. Rehabilitation Engineering Seminar. 3.0 Credits.
The primary objective of this course is to introduce students to the challenges of engineering solutions for persons functioning with disabilities. In order to achieve this goal, other objectives include: gaining a basic appreciation of the modalities used to treat impairments, the opportunities for application of engineering to improve treatment delivery, understanding the science and engineering applied to helping persons with disabilities function in the everyday world and an basic knowledge of the legal, ethical issues and employment opportunities in rehabilitation engineering. Students must attend at least 70% of lectures to receive a satisfactory (S) grade.
Instructor(s): S. Paul
EN.580.302. Careers in Biomedical Engineering. 1.0 Credit.
This course is designed for upperclassmen that wish to meet with weekly speakers to discuss careers issues. A series of weekly lectures to inform students about careers in biomedical engineering and to discuss technological, social, ethical, legal, and economic issues relevant to the profession. Topics include academic careers in biomedical engineering; biomedical engineering in industry (large corporations to sole entrepreneurship); health care delivery; ethical issues; legal issues (patenting, licensing, product liability); standards and government regulations; and economic issues in biomedical engineering industry (start-up companies, global businesses). Junior/Senior Engineers only. Instructor(s): A. Popel
EN.580.311. BME Design Group. 3.0 Credits.
A two-semester course sequence where juniors and seniors work with a team leader and a group of BME freshmen and sophomores, to solve open-ended problems in biomedical engineering. Upperclassmen are expected to apply their general knowledge and experience, and their knowledge in their concentration area, to teach lower classmen and to generate the solution to practical problems encountered in biomedical engineering. Students must attend at least 70% of lectures to receive a satisfactory (S) grade.
Instructor(s): A. Manbachi, E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.
EN.580.312. BME Design Group. 3.0 Credits.
A two-semester course sequence where juniors and seniors work with a team leader and a group of BME freshmen and sophomores, to solve open-ended problems in biomedical engineering. Upperclassmen are expected to apply their general knowledge and experience, and their knowledge in their concentration area, to teach lower classmen and to generate the solution to practical problems encountered in biomedical engineering.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering, Natural Sciences.
EN.580.321. Statistical Mechanics and Thermodynamics. 4.0 Credits.
Basic principles of statistical physics and thermodynamics with application to biological systems. Topics include fundamental principles of thermodynamics, chemical equilibrium and thermodynamics of reactions in solutions, and elementary statistical mechanics.
Recommended Course Background: AS.110.108-AS.110.109, AS.030.101-AS.030.102, AS.171.101-AS.171.102; Freshman/Sophomore Chemistry and Physics
Instructor(s): M. Beer
Area: Engineering, Natural Sciences.

EN.580.407. Design Team Clinical Immersion. 1.0 Credit.
In this course design team leaders will undergo training in clinical need identification through clinical immersion in the Johns Hopkins Hospital System. Leaders will learn observation techniques, survey methods, mind-mapping and root-cause analysis. Dates: Tues 1/17- Friday 1/20, Monday 1/23 - Friday 1/27 The schedule for this class will change with clinical practice but will generally fall within the hours of 6am - 6pm.
Instructor(s): E. Logsdon; N. Durr.

EN.580.408. Design Team Leader Seminar. 1.0 Credit.
This course prepares undergraduate students to lead teams for the subsequent Design Teams course. This course will teach leadership skills, expose students to project options and clinical sponsors, and prepare them to plan and execute a biomedical design project. Course will meet in the Clark Hall Design Studio and the Carnegie Building (SoM) Design Studio.
Instructor(s): E. Logsdon; N. Durr.

EN.580.410. Effective Teaching and Management of Engineering Teams. 2.0 Credits.
Senior biomedical engineering students will assist the core course instructors and PhD students in managing the sections and recitations and or lab component of a course. Permission required.
Instructor(s): E. Haase.

EN.580.411. BME Design Group. 3.0 Credits.
Perm. Req’d. Senior-level version of EN.580.311-312.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering.

EN.580.412. BME Design Group. 3.0 Credits.
Senior-level version of EN.580.311-312. Permission of course directors required.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering.

EN.580.413. Design Team, Team Leader Seminar. 1.0 Credit.
This course is for Design Team leaders actively leading a team for the academic year. This course focuses on development of leadership, communication and team management skills in the context of biodesign.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr
Area: Engineering.

EN.580.414. Design Team, Team Leader Seminar. 1.0 Credit.
This course is for Design Team leaders actively leading a team for the academic year. This course focuses on development of leadership, communication and team management skills in the context of biodesign.
Instructor(s): A. Manbachi; E. Logsdon; N. Durr; R. Allen
Area: Engineering.

EN.580.415. Ethics of Biomedical Engineering Innovation. 3.0 Credits.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others.
Instructor(s): F. Macgabhann
Area: Social and Behavioral Sciences Writing Intensive.

EN.580.416. BME Advanced Teaching Practicum. 3.0 Credits.
Senior biomedical engineering students will assist the core course instructors in managing the sections, recitations, or lab component of a course. Permission required.
Instructor(s): E. Haase.

EN.580.418. Principles of Pulmonary Physiology. 3.0 Credits.
This course will provide students with an introduction to concepts in the structure and function of the respiratory system. Topics to be covered will include basic anatomy, lung mechanics, gas exchange, tests of pulmonary function and cardiopulmonary exercise, and the effects of disease on aspects of the respiratory system. Class sessions will mix both lecture and hands-on measurement, and will include discussion of instrumentation used in pulmonary measurements and a field trip to a clinical physiology laboratory at JHH. Recommended background: Chemistry, Physics, and Calculus II, and EN.580.222 Systems and Controls or equivalent.
Instructor(s): D. Shade
Area: Engineering, Natural Sciences.
EN.580.420. Build-a-Genome. 4.0 Credits.
Must understand fundamentals of DNA structure, DNA electrophoresis and analysis, Polymerase Chain Reaction (PCR) and must be either a) Experienced with molecular biology lab work or b) Adept at programming with a biological twist. In this combination lecture/laboratory "Synthetic Biology" course students will learn how to make DNA building blocks used in an int'l. project to build the world's first synthetic eukaryotic genome, Saccharomyces cerevisiae v. 2.0. Please study the wiki www.syntheticyeast.org for more details about the project. Following a biotechnology boot-camp, students will have 24/7 access to computational and wet-lab resources and will be expected to spend 15-20 hours per week on this course. Advanced students will be expected to contribute to the computational and biotech infrastructure. Successful completion of this course provides 3 credit hours toward the supervised research requirement for Molecular and Cellular Biology majors, or 2 credit hours toward the upper level elective requirement for Biology or Molecular and Cellular Biology majors.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Bader; K. Zeller
Area: Engineering, Natural Sciences.

EN.580.421. Systems Bioengineering I. 4.0 Credits.
A quantitative, model-oriented investigation of the cardiovascular system. Topics are organized in three segments. (1) Molecular/cellular physiology, including electrical signaling and muscle contraction. (2) Systems cardiovascular physiology, emphasizing circuit-diagram analysis of hemodynamics. (3) Cardio-vascular horizons and challenges for biomedical engineers, including heart failure and its investigation/treatment by computer simulation, by gene-array analysis, by stem-cell technology, and by mechanical devices (left-ventricular assist and total-heart replacement). Recommended Course Background: EN.580.221 and EN.580.222
Instructor(s): N. Trayanova; R. Vidal
Area: Engineering, Natural Sciences.

EN.580.422. Systems Bioengineering II. 4.0 Credits.
A quantitative, model-oriented approach to the study of the nervous system. Topics include functional anatomy of the central and autonomic nervous systems, neurons and networks, learning and memory, structure and function of the auditory and visual systems, motor systems, and neuro-engineering. Recommended Course Background: EN.580.221, EN.580.222, EN.580.223, AS.110.302, EN.580.421; Corequisite: EN.580.424
Instructor(s): E. Haase; X. Wang
Area: Engineering, Natural Sciences.

EN.580.423. Systems Bioengineering Lab I. 2.0 Credits.
A two-semester laboratory course in which various physiological preparations are used as examples of problems of applying technology in biological systems. The emphasis in this course is on the design of experimental measurements and on physical models of biological systems. Priority to Junior BME majors. Recommended Corequisite: EN.580.421.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): B. Bejar Haro; E. Haase
Area: Natural Sciences.

EN.580.424. Systems Bioengineering Lab. 2.0 Credits.
A laboratory course in which various physiological preparations are used as examples of problems of applying technology in biological systems. The emphasis in this course is on the design of experimental measurements and on physical models of biological systems. Recommended Corequisite: EN.580.422
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): E. Haase.

EN.580.425. Ion Channels in Excitable Membranes. 3.0 Credits.
Ion channels are key signaling molecules that support electrical communication throughout the body. As such, these channels are a central focus of biomedical engineering as it relates to neuroscience, computational biology, biophysics, and drug discovery. The course introduces the engineering and molecular strategies used to understand the function of ionic channels. The course also surveys key papers that paint the current picture of how ion channels open and conduct ions. Biological implications of these properties are emphasized throughout. Finally, the course introduces how optical and electrophysiological methods now promise to revolutionize understanding of ionic channels. This course can be seen as a valuable partner of Models of the Neuron (EN.580.439). Recommended Course Background: EN.580.421 and EN.580.422 or equivalent, AS.110.201, AS.110.302
Area: Engineering, Natural Sciences.

EN.580.429. Systems Bioengineering III. 4.0 Credits.
Computational and theoretical systems biology at the cellular and molecular level. Topics include organizational patterns of biological networks; analysis of metabolic networks, gene regulatory networks, and signal transduction networks; inference of pathway structure; and behavior of cellular and molecular circuits. Recommended Course Background: EN.580.221 and EN.580.222 or Permission Required.
Instructor(s): J. Bader
Area: Engineering, Natural Sciences.
EN.580.430. Systems Pharmacology and Personalized Medicine. 3.0 Credits.
We have moved beyond the ‘one-size-fits-all’ era of medicine. Individuals are different, their diseases are different, and their responses to drugs are different too. This variability is not just from person to person; heterogeneity is observed even between tumors within the same person, and between sites within the same tumor. These levels of variability among the human population must be accounted for to improve patient outcomes and the efficiency of clinical trials. Some of the ways in which this is being explored include: drugs are being developed hand-in-hand with the tests needed to determine whether or not they will be effective; tumor fragments excised from patients are being cultured in the lab for high-throughput testing of drugs and drug combinations; data-rich assays such as genomics and proteomics identify thousands of potentially significant differences between individuals; and computational models are being used to predict which therapies will work for which patients. This course will focus on the applications of pharmacokinetics and pharmacodynamics to simulating the effects of various drugs across a heterogeneous population of diseased individuals. Such computational approaches are needed to harness and leverage the vast amounts of data and provide insight into the key differences that determine drug responsiveness. These approaches can also explore the temporal dynamics of disease and treatment, and enable the modification of treatment during recovery.
Recommended background: 110.201 Linear Algebra, 110.302 Differential Equations, and 553.311 Probability and Statistics (or equivalent).
Instructor(s): F. Macgabhann
Area: Engineering.

EN.580.431. Introduction to Computational Medicine I. 4.0 Credits.
Computational medicine is an emerging discipline in which computer models of disease are developed, constrained using data measured from individual patients, and then applied to deliver precision health care. Introduction to Computational Medicine I is the first in a sequence of two courses on computational medicine. It covers the core concepts of computational physiological medicine and computational anatomy. The first half of this course will cover computational physiological medicine. Students will learn how to: use biophysical laws and data to formulate computational models of physiological systems in health and disease; analyze the behaviors of these models using analytical and simulation approaches; apply models to understand their use in diagnosing and treating disease. The second half of this course will cover computational anatomy. Students will learn how to: model anatomies using magnetic resonance imaging data; compare anatomies via mappings onto anatomical atlases; discover anatomical biomarkers of disease; analyze changes in the connectivity of anatomies in disease. Class time will emphasize hands-on learning through data analysis, software development, and simulation. All instructional materials will be made available at the beginning of the course. Recommended Course Background: C++, Matlab or Python.
Prerequisites: (AS.110.107 OR AS.110.109 OR AS.110.113) AND (EN.553.310 OR EN.553.311 OR EN.553.420 OR EN.553.430)
Instructor(s): M. Miller; R. Winslow.

EN.580.434. Bioelectricity. 3.0 Credits.
This course has been revised to include numerous examples of bioelectrically active tissues and organs, complemented by relevant engineering principles. Topics include bioelectric currents and potentials, measurements of biological electric fields, wound repair in skin and epithelia, early history of bioelectricity, volume conductor theory, cardiac electrogram and lead theory, electromanipulation of cells, galvanotaxis, stem cell development, bone repair, and neuronal growth. Recommended Prereqs: EN.580.421 and EN.580.422.
Instructor(s): L. Tung
Area: Engineering.

EN.580.435. Applied Bioelectrical Engineering I. 1.5 Credits.
The course is offered in two parts, each a half semester long (1.5 credits each). EN.580.435 explores diverse applications of bioelectrical measurements and manipulation in modern engineering practice. Topics include functional electrical stimulation, deep brain stimulation, cardiac pacing and defibrillation, tissue ablation and cancer treatment. The second part of the course, EN.580.436, is optional and will consist of a lab project involving the physical manipulation of cells, mentored by the instructors and carried out by the entire class. Recommended Course Background: EN.580.421 and EN.580.422.
Instructor(s): D. Hunter; L. Tung
Area: Engineering.

EN.580.436. Applied Bioelectrical Engineering II. 1.5 Credits.
The course is offered in two parts, each a half semester long (1.5 credits each). EN.580.435 explores diverse applications of bioelectrical measurements and manipulation in modern engineering practice. Topics include functional electrical stimulation, deep brain stimulation, cardiac pacing and defibrillation, tissue ablation and cancer treatment. The second part of the course, EN.580.436, is optional and will consist of a lab project involving the physical manipulation of cells, mentored by the instructors and carried out by the entire class. Recommended Course Background: EN.580.421 and EN.580.422.
Instructor(s): D. Hunter; L. Tung
Area: Engineering.

EN.580.437. Neuro Data Design I. 4.0 Credits.
In this year long course, students will work together in small teams to design, develop, and deploy a functioning tool for practicing brain scientists, either for accelerating research or augmenting the clinic. The first semester will focus on designing the tool, including determining feasibility (for us in a year) and significance (for the targeted brain science community), as well as a statement of work specifying deliverables and milestones. The second semester will focus on developing the tool, getting regular feedback, and iterating, using the agile/lean development process. Recommended Course Background: numerical programming.
Instructor(s): J. Vogelstein
Area: Engineering, Natural Sciences.
EN.580.438. Neuro Data Design II. 4.0 Credits.
In this year long course, students will work together in small teams to design, develop, and deploy a functioning tool for practicing brain scientists, either for accelerating research or augmenting the clinic. The first semester will focus on scoping the tool, including determining feasibility (for us in a year) and significance (for the targeted brain science community), as well as a statement of work specifying deliverables and milestones. The second semester will focus on developing the tool, getting regular feedback, and iterating, using the agile/lean development process. Recommended background: numerical programming.
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.439. Models of the Neuron. 4.0 Credits.
Single-neuron modeling, emphasizing the use of computational models as links between the properties of neurons at several levels of detail. Topics include thermodynamics of ion flow in aqueous environments, biology and biophysics of ion channels, gating, nonlinear dynamics as a way of studying the collective properties of channels in a membrane, synaptic transmission, integration of electrical activity in multi-compartment dendritic tree models, and properties of neural networks. Students will study the properties of computational models of neurons; graduate students will develop a neuron model using data from the literature. Recommended Course Background: AS.110.302 or equivalent.
Meets with EN.580.639
Instructor(s): R. Winslow; S. Sarma
Area: Engineering, Natural Sciences.

EN.580.441. Cellular Engineering. 3.0 Credits.
This course focuses on principles and applications in cell engineering. Class lectures include an overview of molecular biology fundamentals, protein/ligand binding, receptor/ligand trafficking, cell-cell interactions, cell-matrix interactions, and cell adhesion and migration at both theoretical and experimental levels. Lectures will cover the effects of physical (e.g. shear stress, strain), chemical (e.g. cytokines, growth factors) and electrical stimuli on cell function, emphasizing topics on gene regulation and signal transduction processes. Furthermore, topics in metabolic engineering, enzyme evolution, polymeric biomaterials, and drug and gene delivery will be discussed. This course is intended as Part 1 of a two-semester sequence recommended for students in the Cell and Tissue Engineering focus area. Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306 or equivalent and AS.030.205
Meets with EN.580.641
Instructor(s): J. Green; K. Yarema
Area: Engineering, Natural Sciences.

EN.580.442. Tissue Engineering. 3.0 Credits.
This course focuses on the application of engineering fundamentals to designing biological tissue substitutes. Concepts of tissue development, structure and function will be introduced. Students will learn to recognize the majority of histological tissue structures in the body and understand the basic building blocks of the tissue and clinical need for replacement. The engineering components required to develop tissue-engineered grafts will be explored including biomechanics and transport phenomena along with the use of biomaterials and bioreactors to regulate the cellular microenvironment. Emphasis will be placed on different sources of stem cells and their applications to tissue engineering. Clinical and regulatory perspectives will be discussed. Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306, AS.030.205 Recommended EN.580.441/EN.580.641 Co-listed with EN.580.642
Instructor(s): J. Elisseef; W. Grayson
Area: Engineering.

EN.580.443. Advanced Orthopaedic Tissue Engineering. 3.0 Credits.
This course is intended to provide a comprehensive overview on the current state of the field of Orthopaedic Tissue Engineering. Students will apply engineering fundamentals learned in the Tissue Engineering course (EN.580.442/642) with special emphasis on how they apply to bone, cartilage, and skeletal muscle tissue engineering. The development, structure, mechanics, and function of each of these tissues will be discussed. Key articles from the last three decades that focus on stem cell- and cell-free, biomaterial-based approaches to regenerate functional tissues will be presented and analyzed. Practical (regulatory/commercial) considerations that restrict the translation of therapies to the clinic will be discussed.
Prerequisites: Grade of B or higher in EN.580.442 OR EN.580.642
Instructor(s): W. Grayson
Area: Engineering.

EN.580.444. Biomedical Applications of Glycoengineering. 3.0 Credits.
This course provides an overview of carbohydrate-based technologies in biotechnology and medicine. The course will begin by briefly covering basics of glycobiology and glycochemistry followed by detailed illustrative examples of biomedical applications of glycoengineering. A sample of these applications include the role of sugars in preventative medicine (e.g., for vaccine development and probiotics), tissue engineering (e.g., exploiting natural and engineered polysaccharides for creating tissue or organs de novo in the laboratory), regenerative medicine (e.g., for the treatment of arthritis or degenerative muscle disease), and therapy (e.g., cancer treatment). A major part of the course grade will be based on class participation with each student expected to provide a "journal club" presentation of a relevant paper as well as participate in a team-based project designed to address a current unmet clinical need that could be fulfilled through a glycoengineering approach. Recommended Course Background: EN.580.221 Molecules and Cells
Instructor(s): K. Yarema
Area: Engineering, Natural Sciences.

EN.580.445. Networks. 3.0 Credits.
Networks are ubiquitous in our modern society. The World Wide Web that links us to and enables information flows with the rest of the world is the most visible example. It is, however, only one of many networks within which we are situated. Our social life is organized around networks of friends and colleagues. These networks determine our information, influence our opinions, and shape our political attitudes. They also link us, often through important but weak ties, to everybody else in the United States and in the world. Economic and financial markets also look much more like networks than anonymous marketplaces. Firms interact with the same suppliers and customers and use Web-like supply chains. Financial linkages, both among banks and between consumers, companies and banks, also form a network over which funds flow and risks are shared. Systemic risk in financial markets often results from the counterparty risks created within this financial network. Food chains, interacting biological systems and the spread and containment of epidemics are some of the other natural and social phenomena that exhibit a marked networked structure. This course will introduce the tools for the study of networks. It will show how certain common principles permeate the functioning of these diverse networks and how the same issues related to robustness, fragility, and interlinkages arise in several different types of networks. Biological applications will be highlighted as material is presented. Recommended Course Background: EN.580.222
Instructor(s): S. Sarma
Area: Engineering.
EN.580.446. Physical Epigenetics. 3.0 Credits.
Epigenetics describes information heritable during cell division other than DNA sequence per se. Recent advances show the critical role of epigenetics in controlling gene expression, embryonic development, and common human diseases such as cancer. This course will introduce fundamental epigenetic principles with a focus on mechanisms, modeling, and physical principles, relationship to genetics, and application to understanding human disease mechanisms. Recommended Course Background: EN.580.221 Molecules and Cells or equivalent (molecular and cell biology), college level calculus and calculus-based general physics.
Instructor(s): A. Feinberg; T. Ha
Area: Engineering, Natural Sciences.

EN.580.452. Cell and Tissue Engineering Lab. 3.0 Credits.
This laboratory course will consist of three experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Spring semester only.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

EN.580.457. Introduction to Rehabilitation Engineering: Design Lab. 3.0 Credits.
The primary objective of this course is to introduce biomedical engineering students to the challenges of engineering solutions for persons functioning with disabilities and apply that knowledge to the development of a new, improved device to be used for measurement or treatment of an impairment or disability. In order to achieve this goal, the objectives of the fall semester include: gaining a basic appreciation of the modalities used to treat impairments, the opportunities for application of engineering to improve treatment delivery, understanding the science and engineering applied to helping persons with disabilities function in the everyday world and an basic knowledge of the legal, ethical issues and employment opportunities in rehabilitation engineering. By the conclusion of this class, students should be able to: • Understand the breadth and scope of physical impairment and disability, including its associated pathophysiology • Characterize the material and design properties of current evaluation tools for assessment of impairments and adaptations for disability • Characterize the material and design properties of current modalities of treatment of impairments and adaptations for disability • Apply engineering analysis and design principles to critique current solutions for persons with disabilities in order to suggest improvements In the spring semester (in course EN.580.457), students will learn the biomedical engineering design process and its application to persons with disabilities. Working in groups of four to five, teams will work on a project derived from a needs analysis based on their visits to rehabilitation centers in the fall semester. Project will require instructor approval before the beginning of the spring semester. Each project will consist of a proposal for design of a new device or solution to a problem faced by persons with disabilities, preliminary "virtual" (e.g., CAD), and actual proof of concept working prototype.
Prerequisites: EN.580.422
Instructor(s): S. Paul
Area: Engineering.
EN.580.460. Theory of Cancer. 3.0 Credits.
The course will deal with important problems in cancer and how they can be approached using mathematical and computational modeling. The course will be organized around introductory material describing the biological and clinical problem and the mathematical and computational methodology that will be used for its analysis. This will be followed by analysis of key modeling papers dealing with the problem. An important part of the course will be a computational modeling project (small group or individual) dealing with modeling of cancer in which the students will extend existing models or formulate novel models of cancer, including cancer therapeutics. The students will strive to create models leading to new discoveries.
Instructor(s): A. Popel
Area: Engineering.

EN.580.462. Representations of Choice. 3.0 Credits.
In this course we will examine key computational topics from the nascent fields of decision neuroscience and neuroeconomics. After taking this course students will have an understanding of how the field emerged and will develop a critical appreciation of the advantages and limitations of different analytical approaches. Students will also be able to discuss the current knowledge on processes of valuation, value-learning and decision-making in relation to their computational representations at the behavioral and neural level. Linear Algebra and programming experience (python, matlab, or C) recommended.
Instructor(s): V. Chib
Area: Engineering.

EN.580.466. Statistical Methods in Imaging. 3.0 Credits.
Denosing, segmentation, texture modeling, tracking, object recognition are challenging problems in imaging. We will present a collection of statistical models and methods in order to adress these, including the E.M algorithm, Maximum Entropy Modeling, Markov Random Fields, Markov Chain Monte Carlo, Boltzmann Machines and Multilayer Perceptrons. Recommended Course Background: AS.110.202 and EN.553.310 or equivalent.
Instructor(s): B. Jedynak
Area: Engineering, Quantitative and Mathematical Sciences.

EN.580.468. The Art of Data Science. 3.0 Credits.
In this course, we will cover the fundamentals of doing data science research, explaining "best practices" for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) posing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Note that this course will largely be project based; each student will be expected to complete each of the above steps on some real data of interest to the student. Lectures will be minimal, giving introductory explanations one day, hopefully only part of the time. The rest of the time, we will work independently or in small groups to complete the weekly portion of the overall project. Please come ready to do science! If you don't have questions that you want answered, you can work in small groups, but each student will need to write the code and reports on their own. Recommended Course Background: No courses are formally required, though students will need to write numerical code (in R, Python, or Julia), and make reports using LaTeX, knitr, or Jupyter notebooks or similar.
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.471. Principles of Design of BME Instrumentation. 4.0 Credits.
This core design course will cover lectures and hands-on labs. The material covered will include fundamentals of biomedical sensors and instrumentation, FDA regulations, designing with electronics, biopotentials and ECG amplifier design, recording from heart, muscle, brain, etc., diagnostic and therapeutic devices (including pacemakers and defibrillators), applications in prosthetics and rehabilitation, and safety. The course includes extensive laboratory work involving circuits, electronics, sensor design and interface, and building complete biomedical instrumentation. The students will also carry out design challenge projects, individually or in teams (examples include "smart cane for blind," "computer interface for quadriplegic"). Students satisfying the design requirement must also register for EN.580.571. Lab Fee: $150.
Recommended Course Background: EN.520.345
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): N. Thakor
Area: Engineering, Natural Sciences.

EN.580.472. Medical Imaging Systems. 3.0 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): M. Bell
Area: Engineering.
EN.580.473. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.520.434 Recommended course background: EN.520.432 or EN.580.472
Prerequisites: Students may not have taken EN.580.773.
Instructor(s): B. Tsui
Area: Engineering, Natural Sciences.

EN.580.476. Magnetic Resonance in Medicine. 3.0 Credits.
This course provides the student with a complete introduction to the physical principles, hardware design, and signal processing used in magnetic resonance imaging and magnetic resonance spectroscopy. The course is designed for students who wish to pursue research in magnetic resonance. Recommended course background: EN.580.222 or EN.520.214. Co-listed with EN.580.673.
Instructor(s): M. Schar; P. Bottomley
Area: Engineering.

EN.580.479. X-ray Imaging and Computed Tomography. 3.0 Credits.
This course provides students with an intermediate-level understanding of the physics, engineering, algorithms, and applications of medical x-ray imaging and computed tomography (CT). It is intended for senior undergraduates (EN.580.479) and/or graduate students (EN.580.679) in Biomedical Engineering, Computer Science, Electrical and Computer Engineering, or related fields in science and engineering. Topics include the physics of x-ray interaction and detection, image quality modeling and assessment, 3D image reconstruction (including analytical and iterative approaches), and applications in diagnostic and image-guided procedures. Recommended Course Background: EN.580.472 and/or EN.580.473 and familiarity with Matlab.
Instructor(s): J. Siewerdsen
Area: Engineering.

EN.580.480. Precision Care Medicine. 3.0 Credits.
Precision Care Medicine is a two-semester project-based learning course. Projects will use methods of machine learning and mechanistic and statistical modeling to develop novel data-driven solutions to important health care problems that arise in anesthesiology and critical care medicine. The scope of such problems is vast, and few have been approached before. Examples include data- and modeling-driven approaches to: optimal selection of patients to be admitted to ICUs; optimal determination of when it is safe to discharge a patient from an ICU; early prediction of pending changes in the clinical state of patients in an ICU; data-driven selection of patient therapy; and others. In the first semester, students will assemble into teams of 3-4, and will work with their project mentors (clinical faculty in the ACCM Department; Drs. Winslow and Sarma) to develop a project work plan. In the remainder of the course, they will apply engineering approaches to solve the important health care problems in their projects. Class time will include: lectures and tutorials covering the physiology, medicine, and engineering principles relevant to each project; project work in a setting where faculty are available to assist students with challenges. Each team will present project updates to the entire class at regular intervals so that every student becomes familiar with each project. Teams will also be charged with designing, validating and deploying a web-application that delivers the computational method for solving the underlying healthcare problem to the user. HIPAA regulations, use of human subjects data, and requirements for FDA Class II and Medical Device Data Systems approval will be covered.
Instructor(s): R. Winslow; S. Sarma
Area: Engineering.

EN.580.481. Precision Care Medicine. 3.0 Credits.
Precision Care Medicine is a two-semester project-based learning course. Projects will use methods of machine learning and mechanistic and statistical modeling to develop novel data-driven solutions to important health care problems that arise in anesthesiology and critical care medicine. The scope of such problems is vast, and few have been approached before. Examples include data- and modeling-driven approaches to: optimal selection of patients to be admitted to ICUs; optimal determination of when it is safe to discharge a patient from an ICU; early prediction of pending changes in the clinical state of patients in an ICU; data-driven optimal selection of patient therapy; and others. HIPAA regulations, use of human subjects data, and requirements for FDA Class II and Medical Device Data Systems approval will be covered.
Area: Engineering.
EN.580.483. Nuclear Medicine Imaging. 3.0 Credits.
This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473
Instructor(s): A. Rahmim; B. Tsui; E. Frey; Y. Du
Area: Engineering.

EN.580.488. Foundations of Computational Biology and Bioinformatics II. 3.0 Credits.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Foundations of Computational Biology I is not a preq. Recommended Course Background: Math through linear algebra and differential equations, EN.580.221 or equivalent, EN.601.226 or equivalent
Instructor(s): R. Karchin
Area: Engineering, Natural Sciences.

EN.580.491. Learning Theory. 3.0 Credits.
The course introduces the probabilistic foundations of learning theory. We will discuss topics in regression, estimation, optimal control, system identification, Bayesian learning, and classification. Our aim is to first derive some of the important mathematical results in learning theory, and then apply the framework to problems in biology, particularly animal learning and control of action. Recommended Course Background: AS.110.201 and AS.110.302
Instructor(s): R. Shadmehr
Area: Engineering.

EN.580.492. Build-a-Genome Mentor. 4.0 Credits.
In addition to producing and sequencing DNA segments like regular B-a-G students, mentors will help prepare and distribute reagents, and maintain a Moddle site to track student reagent use and productivity. Mentors will also be expected to mentor specific students who are learning new techniques for the first time, contribute to the computational and biotech infrastructure associated with Build-a-Genome, and pursue at least one independent research project. Successful completion of this course provides 3 credit hours toward the supervised research requirement for Molecular and Cellular Biology majors. Co-listed AS.020.451 Permission Required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Bader; K. Zeller
Area: Engineering, Natural Sciences.

EN.580.493. Imaging Instrumentation. 4.0 Credits.
This course is intended to introduce students to imaging instrumentation. The class will be lab-oriented, giving hands-on experience with data collection and processing using a configurable optical system. Specific topics will include the programming and control of electromechanical elements, imaging data acquisitions, image formation and processing (e.g. 3D reconstruction), and imaging system analysis and optimization. Recommended Course Background: EN.580.222 Systems and Controls or EN.520.214 Signals and Systems. Programming experience highly desirable.
Instructor(s): J. Stayman
Area: Engineering.

EN.580.495. Microfabrication Lab. 4.0 Credits.
This laboratory course introduces the principles used in the construction of microelectronic devices, sensors, and micromechanical structures. Students will work in the laboratory on the fabrication and testing of a device. Accompanying lecture material covers basic processing steps, design and analysis CAD tools, and national foundry services. Co-listed with EN.530.495 and EN.520.495 Seniors only. Permission Required.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.

EN.580.497. Advanced Design Projects: Instrumentation. 3.0 Credits.
This course will provide project-specific mentorship and guidance for a team to complete a sophisticated prototype and demonstrate technical feasibility towards impacting a clinical problem. Prototyping and testing tools and procedures will be taught and employed on a per-project basis. Documentation of progress through a design history file and course report is required. Teams will be meet biweekly with course faculty through a Desk Review format. Students are expected to work in teams between desk reviews and present progress updates as well as short- and long-term action plans at each desk review. A final presentation is expected at the end of the semester that will involve course faculty as well as a clinical sponsor (called a committee meeting in Design Teams). Additionally, each team must identify a domain expert from the WSE faculty that agrees to attend the final presentation and at least 2 desk reviews. This faculty will focus on guiding and assessing the team's technical achievements within the context of biomedical instrumentation.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): A. Manbachi; N. Durr
Area: Engineering.
EN.580.498. Adv. Design Projects: Instrumentation. 3.0 Credits.
This course will provide project-specific mentorship and guidance for a
team to complete a sophisticated prototype and demonstrate technical
feasibility towards impacting a clinical problem. Prototyping and testing
tools and procedures will be taught and employed on a per-project basis.
Documentation of progress through a design history file and course
report is required. Teams will be meet biweekly with course faculty
through a Desk Review format. Students are expected to work in teams
between desk reviews and present updates as well as short-
and long-term action plans at each desk review. A final presentation is
expected at the end of the semester that will involve course faculty as
well as a clinical sponsor (called a committee meeting in Design Teams).
Additionally, each team must identify a domain expert from the WSE
faculty that agrees to attend the final presentation and at least 2 desk
reviews. This faculty will focus on guiding and assessing the team’s

EN.580.501. Fall BME Research - Freshman/Sophomore. 3.0 Credits.
Instructor(s): Staff.
EN.580.502. Spring BME Research - Freshman/Sophomore. 1.0 - 4.0
Credits.
Practicum in Biomedical Engineering Research projects or engineering
design projects under the supervision of any member of the BME faculty.
Instructor(s): Staff.
EN.580.510. Biomedical Engineering Undergraduate Research. 1.0 - 3.0
Credits.
Student participation in ongoing research activities. Research is
carried out under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.511. Biomedical Engineering Undergraduate Research. 1.0 - 3.0
Credits.
Student participation in ongoing research activities. Research is
carried out under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.512. Spring BME Independent Study - Freshman/Sophomore. 0.0
- 4.0 Credits.
Directed readings or other literature research under the direction of any
member of the BME faculty.
Instructor(s): Staff.
EN.580.531. Fall BME Research - Junior/Senior. 3.0 Credits.
Instructor(s): Staff.
EN.580.532. Spring BME Research - Junior/Senior. 3.0 Credits.
Research projects or engineering design projects under the supervision of
any member of the BME faculty.
Instructor(s): Staff.
EN.580.541. Fall BME Independent Study - Junior/Senior. 3.0 Credits.
Directed readings or other literature research under the direction of any
BME faculty member. Junior or Senior standing.
Instructor(s): Staff.
EN.580.542. Spring BME Independent Study - Junior/Senior. 0.0 - 4.0
Credits.
Directed readings or other literature research under the direction of any
BME faculty member.
Instructor(s): Staff.
EN.580.550. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.551. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.552. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.553. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.554. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.555. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.556. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.
Student participation in ongoing research activities. Research is
conducted under the supervision of a faculty member and often in
conjunction with other members of the research group.
Instructor(s): Staff.
EN.580.557. Biomedical Engineering Group Undergraduate Research. 1.0
- 3.0 Credits.

Instructor(s): Staff.
EN.580.565. Advanced Focus Area Research: Imaging & Sensors/Instrumentation/Micro-Nano Technology. 3.0 Credits.
This course provides students with the opportunity to consider unsolved issues within their focus area, delve into the current cutting-edge research, and provide a synopsis of the next steps required to advance a particular field. "Advanced Focus Area Research" is a one-semester course in which students complete a research project, present their work, and write a publication ready manuscript under the guidance of their Primary Investigator (PI) and a Focus Area mentor. Priority to Junior and Senior BME majors. Recommended Course Background: Previous research experience. Students must complete the online Undergraduate Lab safety courses available through "MyLearning" including Bloodborne Pathogens, HIPAA, and any other online training as needed.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.
Instructor(s): E. Haase
Area: Engineering, Quantitative and Mathematical Sciences.

EN.580.567. Advanced Focus Area Research: Systems Biology. 3.0 Credits.
This course provides students with the opportunity to consider unsolved issues within their focus area, delve into the current cutting-edge research, and provide a synopsis of the next steps required to advance a particular field. "Advanced Focus Area Research" is a one-semester course in which students complete a research project, present their work, and write a publication ready manuscript under the guidance of their Primary Investigator (PI) and a Focus Area mentor. Priority to Junior and Senior BME majors. Recommended Course Background: Previous research experience. Students must complete the online Undergraduate Lab safety courses available through "MyLearning" including Bloodborne Pathogens, HIPAA, and any other online training as needed.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.
Instructor(s): E. Haase
Area: Engineering, Quantitative and Mathematical Sciences.

EN.580.571. Honors Instrumentation. 2.0 Credits.
Student must have taken 580.471/771. Students will develop a term paper and patent application and carry out a hands-on individual or team project throughout the semester. Previous projects include design of EEG amplifier, voltage clamp and patch clamp, vision aid of blind, pacemaker/defibrillator, sleep detection and alert device, glucose sensor and regulation, temperature controller, eye movement detection and device control, ultrasound ranging and tissue properties, impedance plethysmography, lie detector, blood alcohol detector, pulse oximeter, etc.
Instructor(s): N. Thakor.

EN.580.580. Senior Design Project. 3.0 Credits.
Per Independent or team design project to design and evaluate a system. The design should demonstrate creative thinking and experimental skills, and must draw upon advanced topics of biomedical and traditional engineering. Permission Required.
Instructor(s): A. Manbach; Y. Yazdi.

EN.580.581. Senior Design Project. 3.0 Credits.
Independent or team design project to design and evaluate a system. The design should demonstrate creative thinking and experimental skills, and must draw upon advanced topics of biomedical and traditional engineering. Permission Required.
Instructor(s): A. Manbach.

EN.580.590. Biomedical Internship. 1.0 Credit.
Instructor(s): Staff.

EN.580.591. Advanced Focus Area Research: Cell/Tissue/Biomaterials. 3.0 Credits.
This course provides students with the opportunity to consider unsolved issues within their focus area, delve into the current cutting-edge research, and provide a synopsis of the next steps required to advance a particular field. "Advanced Focus Area Research" is a one-semester course in which students complete a research project, present their work, and write a publication ready manuscript under the guidance of their Primary Investigator (PI) and a Focus Area mentor. Instructor(s): E. Haase.
EN.580.603. Special Topics in Bioengineering Innovation & Design. 1.0 Credit.
This year long seminar series features experts from the medical device industry, venture capital firms, FDA, patent attorneys, entrepreneurs, and many more. They will share their real-world insights into the medical device innovation and commercialization process. Some of the topics covered will include bioethics, regulatory and reimbursement planning, medical device recalls, good design practices, and entrepreneurial success stories. The overarching philosophy of this seminar series is to complement the theoretical and practical aspects of the program curriculum, by learning from the experiences and insights of professionals in the field. For CBID MSE students only.
Instructor(s): S. Acharya.

EN.580.607. Regulation of Medical Devices. 1.0 Credit.
This course introduces graduate students in Bioengineering Innovation and Design to the medical device regulatory framework, as it pertains to bringing a medical device from concept to market. Topics covered include, FDA Design Controls; Regulatory Approval mechanisms, including the 510k and PMA process; Investigational Device exemption (IDE); planning clinical trials needed for bringing a medical device to market; and postmarket surveillance. Students learn from a series of invited lecturers from the FDA as well as professionals from the medical device industry. This summer course is required for CBID masters students and is not open to any other students.
Instructor(s): S. Acharya.

EN.580.608. Identification and Validation of Medical Device Needs. 6.0 Credits.
This course teaches the art and skill of identifying medical device opportunities by experiencing real world scenarios in an immersive clinical environment. Students rotate through multiple clinical disciplines and become part of the team of senior clinicians, surgeons, residents, fellows, nurses and medical technologists. They learn to identify unmet medical device needs through direct observations in a variety of clinical settings including the hospital ward and operating room, interviews (with patients, doctors, nurses, hospital administration), literature survey, and more. Concurrently, they learn the process of filtering all observations to a few valid medical device opportunities by assessing the market size, intellectual property landscape, regulatory framework, and competitor dynamics in addition to the clinical impact that such a device could have. The ability to identify a relevant medical device need is an important first step in the medical device innovation cycle; this course aims to provide students with practical hands-on training in that process.
Instructor(s): C. Weiss; H. Nguyen; S. Acharya.

EN.580.609. BME Teaching Practicum. 3.0 Credits.
Instructor(s): E. Haase.

EN.580.611. Medical Device Design and Innovation. 4.0 Credits.
For CBID MSE students only. Registration with instructor's permission only.
Instructor(s): S. Acharya.

EN.580.612. Medical Device Design and Innovation. 4.0 Credits.
For CBID MSE students only.
Instructor(s): S. Acharya.

EN.580.618. Needs Identification and Validation for Global Health Innovation. 4.0 Credits.
Limited to CBID students only
Instructor(s): S. Acharya.
EN.580.619. Bioengineering Innovation and Design - Global Health. 4.0 Credits.
For CBID MSE students only. Registration with instructor's permission only.
Instructor(s): S. Acharya.

EN.580.620. Principles and Practice of Global Health Innovation and Design. 4.0 Credits.
For CBID MSE students only. Instructor's Permission Required.
Instructor(s): S. Acharya.

EN.580.621. Insight Informed Innovation I. 3.0 Credits.
For CBID MSE students only. Registration with instructor's permission only.
Instructor(s): B. Craft; P. Fears.

EN.580.623. Insight Informed Innovation II. 3.0 Credits.
This course is intended to equip students with a structured process and the tools required to: 1. Identify opportunities for new medical devices through unmet, unarticulated and underserved stakeholder needs. 2. Link these insights to an exhaustive set of potential solutions. 3. Synthesize solutions and features into product concepts. Recommended Course Background: Insight Informed Innovation I (summer)
Instructor(s): B. Craft; P. Fears.

EN.580.625. Structure and Function of the Auditory and Vestibular Systems. 3.0 Credits.
This course will cover basic functions of the auditory and vestibular pathways responsible for perception of sound and balance. Topics include: hair cell structure and mechanotransduction, hair cell electromotility and cochlear active force production, hair cell synaptic signaling, cochlear development and role of glia in the inner ear, primary auditory and vestibular stimulus encoding, afferents and the first-order brainstem nuclei, as well as clinical consequences of peripheral damage, physiology of hearing loss, vestibular loss, tinnitus, hair cell regeneration and gene therapy. Moving more centrally, synaptic transmission and signal processing in central neurons, and complex sound perception and movement control will be discussed. Aspects such as speech perception, sound localization, vestibular reflexes, vestibular compensation, and self-motion perception are discussed with an integrated perspective covering perceptual, physiological, and mechanistic data. Grades will be based on participation in class, homework, and first-half and second-half exams (both in class, closed book, short answer/essay types). Offered in odd-numbered years. This course will meet in 529 Ross Research Bldg. at the School of Medicine campus. Recommended Background: general introduction to Neuroscience. Undergraduates with knowledge in Neuroscience welcome.
Instructor(s): K. Cullen; P. Fuchs.

EN.580.626. Structure & Function of the Auditory and Vestibular Brain. 3.0 Credits.
Brain mechanisms and perception of sound and balance. This course is an accompaniment for EN.580.625, although the courses can be taken in either order. Topics include representation of sound and balance in neural discharge patterns, anatomy of the central auditory and vestibular systems, synaptic transmission and signal processing in central neurons, and complex sound perception and movement control. Aspects such as speech perception, sound localization, vestibular reflexes and vestibular compensation are discussed with an integrated perspective covering perceptual, physiological, and mechanistic data. Recommended Course Background: EN.580.222 and EN.580.422 or equivalent. Taught at the School of Medicine, Traylor Bldg. 529.
Instructor(s): X. Wang.

EN.580.628. Topics in Systems Neuroscience. 1.0 Credit.
This course consists of weekly discussions of current literature in systems neuroscience. The selected readings will focus on neural mechanisms for perception, attention, motor behavior, learning, and memory, as studied using physiological, psychophysical, computational, and imaging techniques. Students are expected to give presentations and participate in discussions. Recommended Course Background: AS.110.302, EN.520.214, EN.580.421 or equivalent. Students will have to attend the organizational meeting to be able to enroll. The course is run by the Neuroscience department. Enrollment numbers may be limited by the course directors, and priority will be given to Neuroscience graduate students. Please contact the Neuroscience department for more information and the date of the organizational meeting.
Instructor(s): K. Zhang; X. Wang.

EN.580.630. Theoretical Neuroscience. 3.0 Credits.
Theoretical methods for analyzing information encoding and functional representations in neural systems. Models of single and multiple neural spike trains based on stochastic processes and information theory; detection and estimation of behaviorally relevant parameters from spike trains; system theoretic methods for analyzing sensory receptive fields; network models of neural systems. Both theoretical methods and the properties of specific well-studied neural systems will be discussed. Recommended Course Background: EN.580.422 or equivalent, EN.553.420 or equivalent, EN.580.222 or equivalent.
Instructor(s): K. Zhang; X. Wang.

EN.580.631. Introduction to Computational Medicine I. 4.0 Credits.
Computational medicine is an emerging discipline in which computer models of disease are developed, constrained using data measured from individual patients, and then applied to deliver precision health care. Introduction to Computational Medicine I is the first in a sequence of two courses on computational medicine. It covers the core concepts of computational physiological medicine and computational anatomy. The first half of this course will cover computational physiological medicine. Students will learn how to: use biophysical laws and data to formulate computational models of physiological systems in health and disease; analyze the behaviors of these models using analytical and simulation approaches; apply models to understand their use in diagnosing and treating disease. The second half of this course will cover computational anatomy. Students will learn how to: model anatomies using magnetic resonance imaging data; compare anatomies via mappings onto anatomical atlases; discover anatomical biomarkers of disease; analyze changes in the connectivity of anatomies in disease. Class time will emphasize hands-on learning through data analysis, software development, and simulation. All instructional materials will be made available at the beginning of the course. Recommended Course Background: C++, Matlab or Python.
Instructor(s): M. Miller; R. Winslow.
EN.580.632. Ionic Channels in Excitable Membranes. 3.0 Credits.
Ion channels are key signaling molecules that support electrical communication throughout the body. As such, these channels are a central focus of biomedical engineering as it relates to neuroscience, computational biology, biophysics, and drug discovery. The course introduces the engineering and molecular strategies used to understand the function of ionic channels. The course also surveys key papers that paint the current picture of how ion channels open and conduct ions. Biological implications of these properties are emphasized throughout. Finally, the course introduces how optical and electrophysiological methods now promise to revolutionize understanding of ionic channels. This course can be seen as a valuable partner of Models of the Neuron (EN.580.439). Recommended Course Background: EN.580.421 and EN.580.422 or equivalent. AS.110.201, AS.110.302
Instructor(s): D. Yue
Area: Engineering, Natural Sciences.

EN.580.638. Neuro Data Design II. 4.0 Credits.
In this year long course, students will work together in small teams to design, develop, and deploy a functioning tool for practicing brain scientists, either for accelerating research or augmenting the clinic. The first semester will focus on scoping the tool, including determining feasibility (for us in a year) and significance (for the targeted brain science community), as well as a statement of work specifying deliverables and milestones. The second semester will focus on developing the tool, getting regular feedback, and iterating, using the agile/lean development process. Recommended background: numerical programming.
Instructor(s): J. Vogelstein.

EN.580.639. Models of the Neuron. 4.0 Credits.
Single-neuron modeling, emphasizing the use of computational models as links between the properties of neurons at several levels of detail. Topics include thermodynamics of ion flow in aqueous environments, biology and biophysics of ion channels, gating, nonlinear dynamics as a way of studying the collective properties of channels in a membrane, synaptic transmission, integration of electrical activity in multi-compartment dendritic tree models, and properties of neural networks. Students will study the properties of computational models of neurons; graduate students will develop a neuron model using data from the literature. Differs in that an advanced modeling project using data from the literature is required. Graduate version of EN.580.439. Recommended Course Background: AS.110.302 or equivalent.
Instructor(s): R. Winslow; S. Sarma.

EN.580.640. Systems Pharmacology and Personalized Medicine. 3.0 Credits.
We have moved beyond the 'one-size-fits-all' era of medicine. Individuals are different, their diseases are different, and their responses to drugs are different too. This variability is not just from person to person; heterogeneity is observed even between tumors within the same person, and between sites within the same tumor. These levels of variability among the human population must be accounted for to improve patient outcomes and the efficiency of clinical trials. Some of the ways in which this is being explored include: drugs are being developed hand-in-hand with the tests needed to determine whether or not they will be effective; tumor fragments excised from patients are being cultured in the lab for high-throughput testing of drugs and drug combinations; data-rich assays such as genomics and proteomics identify thousands of potentially significant differences between individuals; and computational models are being used to predict which therapies will work for which patients. This course will focus on the applications of pharmacokinetics and pharmacodynamics to simulating the effects of various drugs across a heterogeneous population of diseased individuals. Such computational approaches are needed to harness and leverage the vast amounts of data and provide insight into the key differences that determine drug responsiveness. These approaches can also explore the temporal dynamics of disease and treatment, and enable the modification of treatment during recovery. Recommended background: 110.201 Linear Algebra, 110.302 Differential Equations, and 553.311 Probability and Statistics (or equivalent).
Instructor(s): F. Macgabhann.

EN.580.641. Cellular Engineering. 4.0 Credits.
This course focuses on principles and applications in cell engineering. Class lectures include an overview of molecular biology fundamentals, protein/ligand binding, receptor/ligand trafficking, cell-cell interactions, cell-matrix interactions, and cell adhesion and migration at both theoretical and experimental levels. Lectures will cover the effects of physical (e.g. shear stress, strain), chemical (e.g. cytokines, growth factors) and electrical stimuli on cell function, emphasizing topics on gene regulation and signal transduction processes. Furthermore, topics in metabolic engineering, enzyme evolution, polymeric biomaterials, and drug and gene delivery will be discussed. This course meets with EN.580.441 but includes additional requirements designed for the core curriculum of the RIE (Regenerative and Immune Engineering) track of the BME masters program. The course is also appropriate for Cell & Tissue Engineering Ph.D. students and may be taken by advanced undergraduate students upon permission of the instructor. Prerequisites: Graduate standing with background in cell biology and biochemistry or EN.580.221 or AS20.305 and AS.020.306 (or equivalent) and AS.030.205 or permission of the instructor.
Instructor(s): J. Green; K. Yarema.
EN.580.642. Tissue Engineering. 3.0 Credits.
This course focuses on the application of engineering fundamentals to designing biological tissue substitutes. Concepts of tissue development, structure and function will be introduced. Students will learn to recognize the majority of histological tissue structures in the body and understand the basic building blocks of the tissue and clinical need for replacement. The engineering components required to develop tissue-engineered grafts will be explored including biomechanics and transport phenomena along with the use of biomaterials and bioreactors to regulate the cellular microenvironment. Emphasis will be placed on different sources of stem cells and their applications to tissue engineering. Clinical and regulatory perspectives will be discussed. Co-listed with EN.580.442.
Recommended Course Background: EN.580.221 or AS.020.305 and AS.020.306, AS.030.205, EN.580.441/EN.580.641
Area: Engineering.

EN.580.643. Advanced Orthopaedic Tissue Engineering. 3.0 Credits.
This course is intended to provide a comprehensive overview on the current state of the field of Orthopaedic Tissue Engineering. Students will apply engineering fundamentals learned in the Tissue Engineering course (580.442/580.642) with special emphasis on how they apply to bone, cartilage, and skeletal muscle tissue engineering. The development, structure, mechanics, and function of each of these tissues will be discussed. Key articles from the last three decades that focus on stem cell- and cell-free, biomaterial-based approaches to regenerate functional tissues will be presented and analyzed. Practical (regulatory/commercial) considerations that restrict the translation of therapies to the clinic will be discussed. Undergraduate by permission only. Recommend Course Background: EN.580.442 or EN.580.642.
Instructor(s): W. Grayson.

EN.580.644. Biomedical Applications of Glycoengineering. 3.0 Credits.
This course provides an overview of carbohydrate-based technologies in biotechnology and medicine. The course will begin by briefly covering basics of glycobiology and glycochemistry followed by detailed illustrative examples of biomedical applications of glycoengineering. A sample of these applications include the role of sugars in preventative medicine (e.g., for vaccine development and probiotics), tissue engineering (e.g., exploiting natural and engineered polysaccharides for creating tissue or organs de novo in the laboratory), regenerative medicine (e.g., for the treatment of arthritis or degenerative muscle disease), and therapy (e.g., cancer treatment). A major part of the course grade will be based on class participation with each student expected to provide a “journal club” presentation of a relevant paper as well as participate in a team-based project designed to address a current unmet clinical need that could be fulfilled through a glycoengineering approach. Recommended Course Background: EN.580.221 Molecules and Cells or equivalent (molecular and cell biology), college level calculus and calculus-based general physics.
Instructor(s): K. Yarema
Area: Engineering, Natural Sciences.

EN.580.646. Molecular Immunoengineering. 3.0 Credits.
An in-depth study of the use of biomolecular engineering tools and techniques to manipulate immune function for clinical translation. The course will begin with a brief overview of the immune system, placing a particular emphasis on the molecular-level interactions that determine phenotypic outcomes. The remainder of the curriculum will address ways in which integrative approaches incorporating biochemistry, structural biophysics, molecular biology, and engineering have been used either to stimulate the immune response for applications in cancer and infectious disease, or to repress immune activation for autoimmune disease therapy. Recommended background: Biochemistry and Cell Biology or the BME Molecules and Cells. Those without recommended background should contact the instructor prior to enrolling.
Instructor(s): J. Spangler
Area: Engineering, Natural Sciences.

EN.580.647. Computational Stem Cell Biology. 3.0 Credits.
This course will provide the student with a mechanistic and systems biology-based understanding of the two defining features of stem cells: multipotency and self-renewal. We will explore these concepts across several contexts and perspectives, emphasizing seminal and new studies in development and stem cell biology, and the critical role that computational approaches have played. The course will start with an introduction to stem cells and a tutorial covering computational basics. The biological contexts that we will cover thereafter include "Cell Identity", "Pluripotency and multipotency", "Stem cells and their niche", "Modeling cell fate decisions", and "Engineering cell fate". This class is heavily weighted by individual computational assignments. The motivation for this strategy is that regularly occurring, moderately-sized computational projects are the most efficient way to impart an understanding of our models of this extraordinary class of cells, and to inspire a sense of excitement and empowerment. Preferred background: 580.221 Molecules and Cells or equivalent and familiarity with the UNIX shell.
Prerequisites: Students may earn credit for EN.580.447 or EN.580.647, but not both.
Instructor(s): P. Cahan
Area: Engineering, Natural Sciences.

EN.580.656. Introduction to Rehabilitation Engineering. 3.0 Credits.
The primary objective of this course is to introduce biomedical engineering students to the challenges of engineering solutions for persons functioning with disabilities. In order to achieve this goal, other objectives include: gaining a basic appreciation of the modalities used to treat impairments, the opportunities for application of engineering to improve treatment delivery, understanding the science and engineering applied to helping persons with disabilities function in the everyday world and an basic knowledge of the legal, ethical issues and employment opportunities in rehabilitation engineering. By the conclusion of this class, students should be able to: understand the breadth and scope of physical impairment and disability, including its associated pathophysiology; characterize the material and design properties of current evaluation tools for assessment of impairments and adaptations for disability; characterize the material and design properties of current modalities of treatment of impairments and adaptations for disability; apply engineering analysis and design principles to critique current solutions for persons with disabilities in order to suggest improvements.
Instructor(s): S. Paul
Area: Engineering.
EN.580.668. The Art of Data Science. 3.0 Credits.
In this course, we will cover the fundamentals of doing data science research, explaining "best practices" for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) positing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Note that this course will largely be project based; each student will be expected to complete each of the above steps on some real data of interest to the student. Lectures will be minimal, giving introductory explanations one day, hopefully only part of the time. The rest of the time, we will work independently or in small groups to complete the weekly portion of the overall project. Please come ready to do science! If you don't have questions that you want answered, you can work in small groups, but each student will need to write the code and reports on their own. Recommended background: No courses are formally required, though students will need to write numerical code (in R, Python, or Julia), and make reports using LaTeX, knitr, or Jupyter notebooks or similar.
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.673. Magnetic Resonance in Medicine. 3.0 Credits.
This course provides the student with a complete introduction to the physical principles, hardware design, and signal processing used in magnetic resonance imaging and magnetic resonance spectroscopy. The course is designed for students who wish to pursue research in magnetic resonance. Recommended course background: EN.580.222 or EN.520.214. Co-listed with EN.580.476.
Instructor(s): M. Schar; P. Bottomley.

EN.580.674. Introduction to Neuro-Image Processing. 3.0 Credits.
Developments in medical image acquisition systems such as magnetic resonance imaging (MRI) and computed tomography (CT) have resulted in large number of clinical images with rich information regarding structure and function of nervous system. A challenging task is to extract clinically relevant information from the raw images that can be used to characterize structural alteration of brain in disease state. This course introduces the underlying physical foundation of different image modalities that are used to study neurological disorders followed by presentation of concepts and techniques that are used to process and extract information from medical images, in particular MRI. Topics that are covered include medical image formats, enhancement, segmentation, registration, and visualization. Suggest Course Background: Mathematical Methods For Engineers or equivalent course, Signals and Systems, and Probability
Instructor(s): S. Ardekani.

EN.580.678. Biomedical Photonics. 4.0 Credits.
This course will cover the basic optics principles including geometric, beam and wave description of light. The course will also cover the basic generation and detection techniques of light and the principles of optical imaging and spectroscopy. After the basis is established, we will focus on some commonly employed optical techniques and tools for biomedical research including various optical microscopy technologies, fiber optics, Raman spectroscopy, Fluorescence (lifetime), FRAT, FRET and FCS. The recent development in tissue optics, biomedical optical imaging/ spectroscopy techniques (such as OCT, multiphoton fluorescence and harmonics microscopy, Structured Illumination, light scattering, diffuse light imaging and spectroscopy, optical molecular imaging, photo-acoustic imaging) will also be discussed. Representative biomedical applications of translational biomedical photonics technologies will be integrated into the corresponding chapters.
Instructor(s): X. Li
Area: Engineering.

EN.580.679. X-ray Imaging and Computed Tomography. 3.0 Credits.
This course provides students with an intermediate-level understanding of the physics, engineering, algorithms, and applications of medical x-ray imaging and computed tomography (CT). It is intended for senior undergraduates (EN.580.479) and/or graduate students (EN.580.679) in Biomedical Engineering, Computer Science, Electrical and Computer Engineering, or related fields in science and engineering. Topics include the physics of x-ray interaction and detection, image quality modeling and assessment, 3D image reconstruction (including analytical and iterative approaches), and applications in diagnostic and image-guided procedures. Recommended Course Background: EN.580.472 and/or EN.580.473 and familiarity with Matlab.
Instructor(s): W. Zbijewski
Area: Engineering.

EN.580.680. Precision Care Medicine. 4.0 Credits.
Precision Care Medicine is a two-semester project-based learning course. Projects will use methods of machine learning and mechanistic and statistical modeling to develop novel data-driven solutions to important health care problems that arise in anesthesiology and critical care medicine. The scope of such problems is vast, and few have been approached before. Examples include data- and modeling-driven approaches to: optimal selection of patients to be admitted to ICUs; optimal determination of when it is safe to discharge a patient from an ICU; early prediction of pending changes in the clinical state of patients in an ICU; data-driven optimal selection of patient therapy; and others. In the first semester, students will assemble into teams of 3-4, and will work with their project mentors (clinical faculty in the ACCM Department; Drs. Winslow and Sarma) to develop a project work plan. In the remainder of the course, they will apply engineering approaches to solve the important health care problems in their projects. Class time will include: lectures and tutorials covering the physiology, medicine, and engineering principles relevant to each project; project work in a setting where faculty are available to assist students with challenges. Each team will present project updates to the entire class at regular intervals so that every student becomes familiar with each project. Teams will also be charged with designing, validating and deploying a web-application that delivers the computational method for solving the underlying healthcare problem to the user. HIPAA regulations, use of human subjects data, and requirements for FDA Class II and Medical Device Data Systems approval will be covered.
Instructor(s): R. Winslow; S. Sarma.
EN.580.681. Precision Care Medicine. 3.0 Credits.
Precision Care Medicine is a two-semester project-based learning course. Projects will use methods of machine learning and mechanistic and statistical modeling to develop novel data-driven solutions to important health care problems that arise in anesthesiaiology and critical care medicine. The scope of such problems is vast, and few have been approached before. Examples include data- and modeling-driven approaches to: optimal selection of patients to be admitted to ICUs; optimal determination of when it is safe to discharge a patient from an ICU; early prediction of pending changes in the clinical state of patients in an ICU; data-driven optimal selection of patient therapy; and others. In the first semester, students will assemble into teams of 3-4, and will work with their project mentors (clinical faculty in the ACCM Department; Drs. Class time will include: lectures and tutorials covering the physiology, medicine, and engineering principles relevant to each project; project work in a setting where faculty are available to assist students with challenges. Each team will present project updates to the entire class at regular intervals so that every student becomes familiar with each project. Teams will also be charged with designing, validating and deploying a web-application that delivers the computational method for solving the underlying healthcare problem to the user. HIPAA regulations, use of human subjects data, and requirements for FDA Class II and Medical Device Data Systems approval will be covered.

EN.580.683. Nuclear Medicine Imaging. 3.0 Credits.
This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473
Instructor(s): A. Rahmim; B. Tsui; E. Frey; Y. Du
Area: Engineering.

EN.580.688. Foundations of Computational Biology & Bioinformatics II. 3.0 Credits.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Recommended Course Background: Math through linear algebra and differential equations, EN.580.221 or equivalent, EN.601.226 or equivalent.
Instructor(s): R. Karchin.

EN.580.689. Computational Personal Genomics. 3.0 Credits.
What can we learn from the genome sequence of an individual? Genomic technology now makes it possible to generate huge amounts of DNA sequence data for a single individual at a relatively low cost. To make sense of this data, we need to employ sophisticated computational methods to identify genetic variations that influence an individual’s health. In this course, we will first review the state of the art in sequencing technology, and discuss how this technology is being applied to study human biology and disease. We will then explore the computational methods used to turn raw sequence data into knowledge. Topics will include genetic variant detection; discovery of chromosomal rearrangements and fusions; methods to measure gene expression from RNA; and measurements of the microbiome living inside our bodies. Recommended Course Background: EN.601.447/639, EN.600.363/463, EN.600.688, EN.580.688 (any one is sufficient), or permission of the instructor. Course is also open to undergraduate students.
Instructor(s): S. Salzberg
Area: Engineering.

EN.580.691. Learning Theory. 3.0 Credits.
This course introduces the probabilistic foundations of learning theory. We will discuss topics in regression, estimation, Kalman filters, Bayesian learning, classification, reinforcement learning, and active learning. Our focus is on iterative rather than batch methods for parameter estimation. Our aim is to use the mathematical results to model learning processes in the biological system. Recommended Course Background: Probability and Linear Algebra.
Instructor(s): R. Shadmehr.

EN.580.693. Imaging Instrumentation. 4.0 Credits.
This course is intended to introduce students to imaging instrumentation. The class will be lab-oriented, giving hands-on experience with data collection and processing using a configurable optical system. Specific topics will include the programming and control of electromechanical elements, imaging data acquisitions, image formation and processing (e.g. 3D reconstruction), and imaging system analysis and optimization. Recommended Course Background: EN.580.222 Systems and Controls or EN.520.214 Signals and Systems. Programming experience highly desirable.
Instructor(s): J. Stayman.

EN.580.694. Statistical Connectomics. 3.0 Credits.
This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).
Instructor(s): J. Vogelstein
Area: Engineering.
EN.580.697. Neuro Data Science I. 4.0 Credits.
In this year long course, students will work together in small teams to design, develop, and deploy a functioning tool for practicing brain scientists, either for accelerating research or augmenting the clinic. The first semester will focus on scoping the tool, including determining feasibility (for us in a year) and significance (for the targeted brain science community), as well as a statement of work specifying deliverables and milestones. The second semester will focus on developing the tool, getting regular feedback, and iterating, using the agile/lean development process. Recommended Course Background: numerical programming.
Instructor(s): J. Vogelstein.

EN.580.701. CBID Masters Advanced Project. 3.0 - 10.0 Credits.
For second year CBID students.
Instructor(s): S. Acharya.

EN.580.702. CBID Masters Advanced Project. 3.0 - 10.0 Credits.
Instructor(s): S. Acharya.

The course introduces modern techniques in mathematical analysis of biomedical data. Techniques include maximum likelihood, estimation theory via Kalman equation, state-space models, Bayesian estimation, classification of labeled data, support vector machine, dimensionality reduction via principal component analysis, clustering, expectation maximization, and dynamic programming via the Bellman equation.
Instructor(s): R. Shadmehr.

EN.580.706. Introduction to Biomedical Rodent Surgery Laboratory and Grantsmanship. 3.0 Credits.
This course has been specifically designed for students interested in understanding the translational aspects of biomedical research and pursuing research as a career. The course aims to introduce diverse yet interlinked research concepts that will equip students with the necessary knowledge and expertise to independently carry out research endeavors in the future. A part of the course includes supervised hands-on in vivo workshops, in which students will learn basic rodent anatomy, physiology and some general experimental procedures. A second component will introduce research methodology, which will enable students to develop their scientific thought process and enhance their critical thinking skills by formulating hypothesis, developing aims, searching PubMed for related literature, understanding ethical guidelines and other regulatory issues. In today's scenario, scientists also need to have a strong communication ability to ensure that their research is accessible at a global platform. This requires skill and knowledge of scientifically drafting manuscripts, writing grants and articulating business plans as well as effectively presenting their research results (presentation, poster, etc.). We will allocate necessary time to develop this science-art as well. Students' attendance and active participation will enrich this exciting and interactive course, which is entirely based on in-class learning.
Instructor(s): A. All.

EN.580.721. Systems Bioengineering I. 4.0 Credits.
A quantitative, model-oriented investigation of the cardiovascular system. Topics are organized in three segments. (1) Molecular/cellular physiology, including electrical signaling and muscle contraction. (2) Systems cardiovascular physiology, emphasizing circuit-diagram analysis of hemodynamics. (3) Cardio-vascular horizons and challenges for biomedical engineers, including heart failure and its investigation/treatment by computer simulation, by gene-array analysis, by stem-cell technology, and by mechanical devices (left-ventricular assist and total-heart replacement). Recommended Course Background: EN.580.221 and EN.580.222
Instructor(s): N. Trayanova; R. Vidal.

EN.580.722. Systems Bioengineering II. 4.0 Credits.
A quantitative, model-oriented approach to the study of the nervous system. Topics include functional anatomy of the central and autonomic nervous systems, neurons and networks, learning and memory, structure and function of the auditory and visual systems, motor systems, and neuro-engineering. Recommended Course Background: EN.580.221, EN.580.222, EN.580.223, AS.110.302, EN.580.421; Corequisite: EN.580.424
Instructor(s): E. Haase; X. Wang.

EN.580.727. Cell Engineering and Regenerative Medicine Seminar Series. 1.0 Credit.
Top researchers from around the world will present the latest research on stem cell science and clinical application followed by discussion. School of Medicine campus: PCTB, Mountcastle Auditorium
Instructor(s): J. Elisseeff.

EN.580.728. Advanced Seminar in Chemical Glycobiology & Carbohydrate Drug Design. 1.0 Credit.
This course uses the current literature to teach advanced topics in carbohydrate engineering. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: sugars as information storage entities and signaling molecules; methods to manipulate and characterize complex carbohydrates in vivo, through chemoenzymatic methods, and emerging high-throughput methodology; carbohydrate-based drug development; and the role of sugars in stem cell biology and tissue engineering.
Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): K. Yarema.

EN.580.729. Advanced Seminar in Chemical Glycobiology & Carbohydrate Drug Design. 1.0 Credit.
This course uses the current literature to teach advanced topics in carbohydrate engineering. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: sugars as information storage entities and signaling molecules; methods to manipulate and characterize complex carbohydrates in vivo, through chemoenzymatic methods, and emerging high-throughput methodology; carbohydrate-based drug development; and the role of sugars in stem cell biology and tissue engineering.
Evaluation will be both by faculty and fellow students. Spring semester only.
Instructor(s): K. Yarema.
EN.580.735. Advanced Seminars in Computational Medicine. 1.0 Credit.
In this course, students will review current literature on the most salient and interesting topics in the emerging field of Computational Medicine, which is focused on the development of quantitative approaches for understanding the mechanisms, diagnosis and treatment of human disease through applications of mathematics, engineering, and computational science. Whenever possible, the publications considered will be directly relevant to the lectures delivered by visiting scholars in the Institute for Computational Medicine’s seminar series. Students will be required to search for the most relevant papers in the current literature; read and critically interpret these papers; conduct interactive teaching sessions with the course instructor, other students, and trainees/faculty from the Institute. Potential topics will include: computational anatomy; computational molecular medicine; computational physiological medicine; and computational healthcare. Evaluation will be by the course instructor (pass/fail). Graduate level. Seniors by permission. All registrants must be approved by the course instructor.
Instructor(s): P. Boyle.

EN.580.736. Distinguished Seminar Series in Computational Medicine. 1.0 Credit.
We live in a new era in the understanding, diagnosis and treatment of human disease. Over the past ten years, extraordinary advances in modeling and computing technologies have opened the door to an array of possibilities that were previously beyond the reach of biomedical researchers. Today’s powerful computational platforms are allowing us to begin to identify, analyze, and compare the fundamental biological components and processes that regulate human diseases and their impact on the body. The next step, then, is to harness the potential of these theoretical and computational tools and theory in a meaningful way - that is, to apply this “new medicine” to the exploration and treatment of many of our current diseases. This lecture series will feature world experts in computational medicine as well as laboratories at JHU’s Institute for Computational Medicine (ICM). Fall semester only. S/U grading only.
Instructor(s): F. Macgabhann; S. Sarma.

EN.580.737. Distinguished Seminar Series in Computational Medicine. 1.0 Credit.
We live in a new era in the understanding, diagnosis and treatment of human disease. Instructor(s): F. Macgabhann; S. Sarma.

EN.580.738. Advanced Seminars in Cardiac Electrophysiology and Mechanics. 1.0 Credit.
This course uses the current literature to teach advanced topics in cardiac electrophysiology and mechanics. Students will be required to read current articles and then conduct interactive teaching sessions with faculty and other students. Potential topics will include: ion channels, cardiac excitation-contraction coupling, myofilament regulation, cardiac arrhythmias, heart failure, therapies for arrhythmias and pump dysfunction. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): N. Trayanova; P. Boyle.

EN.580.739. Advanced Seminars in Cardiac Electrophysiology and Mechanics. 1.0 Credit.
This course uses the current literature to teach advanced topics in cardiac electrophysiology and mechanics. Students will be required to read current articles and then conduct interactive teaching sessions with faculty and other students. Potential topics will include: ion channels, cardiac excitation-contraction coupling, myofilament regulation, cardiac arrhythmias, heart failure, therapies for arrhythmias and pump dysfunction. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission only (signed add/drop form). Spring semester only.
Instructor(s): N. Trayanova; P. Boyle.

EN.580.740. Surgery For Engineering. 3.0 Credits.
This course provides an introduction to basic principles and emerging techniques in surgery, interventional radiology, and radiation therapy for engineering students. Basic principles include introduction to fundamental surgical approaches and tools as well as sub-specialties, including neurosurgery, orthopaedic surgery, ENT surgery, thoracic surgery, and laparoscopic surgery as well as minimally invasive (body and neurovascular) interventional radiology as well as radiotherapy (external beam and brachytherapy). Introduction to cutting edge and emerging technologies include intraoperative imaging (all modalities), surgical navigation, and robotics. Requisite background for engineering students includes analytic geometry, linear algebra, computing (Matlab, Python, or C++), and basic familiarity with the physics of medical imaging. Safety Training: certificate in Bloodborne Pathogens and HIPAA & Research. Recommended course background: 580.472, 601.455
Instructor(s): J. Siewerdsen.

EN.580.741. Models of Cardiac Electrophysiology and Arrhythmia. 1.0 Credit.
This course will cover the fundamentals of different experimental and computational models of cardiac electrophysiology and when particular models are appropriate for use. Students will be required to read review articles and engage in interactive discussion with faculty and other students, with some projects and presentations to reinforce important concepts. Topics will include measurement of cardiac electrical signals, stimulation of cardiac tissue, single cell and tissue level electrical properties, excitation-contraction coupling, and mechanisms of arrhythmia. Seniors by permission.
Instructor(s): L. Tung.
EN.580.742. Neural Implants and Interfaces. 3.0 Credits.
This course will focus on invasive neural implants that electrically interface with the peripheral or central nervous system. We will investigate the different types of recording and stimulating neural interface technologies currently in use in patients as well as coverage of the biophysics, neural coding, and hardware. We will also cover computational modeling of neurophysiology in the context of implantable devices and their neural interfaces. A final group project will be required for simulating a neural interface system. Recommended course background includes cell biology, physics with electromagnetics (or electrical circuits), chemistry, differential equations, and computer programming.
Instructor(s): G. Fridman.

EN.580.745. Mathematics of Deep Learning. 1.5 Credits.
The past few years have seen a dramatic increase in the performance of recognition systems thanks to the introduction of deep networks for representation learning. However, the mathematical reasons for this success remain elusive. For example, a key issue is that the training problem is nonconvex, hence optimization algorithms are not guaranteed to return a global minima. Another key issue is that while the size of deep networks is very large relative to the number of training examples, deep networks appear to generalize very well to unseen examples and new tasks. This course will overview recent work on the theory of deep learning that aims to understand the interplay between architecture design, regularization, generalization, and optimality properties of deep networks.
Instructor(s): R. Vidal.

EN.580.746. Imaging Science Seminar. 1.0 Credit.
Fall semester only.
Instructor(s): M. Miller; R. Vidal.

EN.580.747. Imaging Science Seminar. 1.0 Credit.
Spring semester only.
Instructor(s): M. Miller; R. Vidal.

EN.580.748. Advanced Seminars in Magnetic Resonance Imaging. 3.0 Credits.
This course uses the current literature to teach advanced topics in magnetic resonance imaging. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: image artifacts, effect of motion, resolution and SNR, realtime imaging, clinical applications. Evaluation will be both by faculty and fellow students. Graduate Level. Seniors by permission. Fall semester only.
Instructor(s): E. McVeigh.

EN.580.749. Advanced Seminars in Magnetic Resonance Imaging. 3.0 Credits.
This course uses the current literature to teach advanced topics in magnetic resonance imaging. Students will be required to read current papers, selected textbook chapters and online content to prepare for interactive teaching sessions with faculty and other students. Potential topics will include: image artifacts, effect of motion, resolution and SNR, realtime imaging, clinical applications. Evaluation will be both by faculty and fellow students. Spring semester only.
Instructor(s): D. Herzka.

EN.580.751. Cell & Tissue Engineering Lab. 4.0 Credits.
Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. This course includes an 'advanced topics' component designed to fulfill toe core curriculum requirements of the RIE (Regenerative and Immune Engineering) track of the BME masters program. Offered the first half of fall semester only.
Instructor(s): E. Haase; K. Yarema.

EN.580.771. Principles of the Design of Biomedical Instrumentation. 4.0 Credits.
This course is designed for graduate students interested in learning basic biomedical instrumentation design concepts and translating these into advanced projects based on their research on current state-of-the-art. They will first gain the basic knowledge of instrumentation design, explore various applications, and critically gain hands-on experience through laboratory and projects. At the end of the course, students would get an excellent awareness of biological or clinical measurement techniques, design of sensors and electronics (or electromechanical/ chemical, microprocessor system and their use). They will systematically learn to design instrumentation with a focus on the use of sensors, electronics to design a core instrumentation system such as an ECG amplifier. Armed with that knowledge and lab skills, students will be encouraged to discuss various advanced instrumentation applications, such as brain monitor, pacemaker/defibrillator, or prosthetics. Further, they will be "challenged" to come up with some novel design ideas and implement them in a semester-long design project. Students will take part in reading the literature, learning about the state-of-the-art through journal papers and patents, and discussing, critiquing, and improving on these ideas. Finally, they will be implementing a selected idea into a semester-long advanced group project. Meets with 580.471 Graduate students only
Instructor(s): N. Thakor.

EN.580.773. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Recommended course background:
EN.520.432 or EN.580.472
Prerequisites: Students may not have taken EN.580.473.
Instructor(s): B. Tsui
Area: Engineering.
EN.580.779. Systems Bioengineering III. 4.0 Credits.
Computational and theoretical systems biology at the cellular and molecular level. Topics include organizational patterns of biological networks; analysis of metabolic networks, gene regulatory networks, and signal transduction networks; inference of pathway structure; and behavior of cellular and molecular circuits. Recommended Course Background: EN.580.221 and EN.580.222 or Permission Required. Instructor(s): J. Bader.

EN.580.781. Biomedical Engineering Seminar. 1.0 Credit.
Instructor(s): W. Grayson.
EN.580.782. Biomedical Engineering Seminar. 1.0 Credit.
Instructor(s): W. Grayson.
EN.580.788. Biomedical Photonics II. 4.0 Credits.
This course serves as the continuation of 580.678 (520.678), Biomedical Photonics I. It will cover the advanced topics on biomedical photonics, including, but not limited to, light scattering (Rayleigh and Mie scattering), photon diffusion, polarization (birefringence), fluorescence, lifetime measurements, confocal microscopy, optical coherence tomography, nonlinear microscopy, and super-resolution microscopy. Representative biomedical applications of some of these technologies will be integrated into the relevant chapters. A hand-on lab section (optional) for students to design and build an imaging instrument, space permitting.
Instructor(s): X. Li.

EN.580.791. Biomedical Engineering Project Design and Proposal Development I. 2.0 Credits.
The goal of this class is to provide students with experience in designing and implementing a biomedical engineering research project. Students will select a laboratory to host their research rotation within the first two weeks (ideally, before the start of the term) and will participate in lab-related activities for a minimum of 6 hours a week that involve “in person” interaction between the PI or other members of the sponsoring lab and the student. Activities will include attendance at lab meetings, preparation of a research proposal, and “hands on” experimental, computational, or modeling tasks. In addition, attendance at research seminars and class meetings is expected. Finally, periodic reports on your research project and progress, as well providing feedback on your ‘colleagues’ projects and proposals will also be expected. A final research proposal (to be presented in the format of a NIH R21-type grant application) will provide evidence that a student is capable of carrying out advanced research by identifying a significant biomedical problem, developing innovative approaches to solve it, and then designing a relevant and implementable research plan.
Instructor(s): K. Yarema.

EN.580.821. Applied Research and Grant Methodology I. 3.0 Credits.
Students will select a laboratory to host their research rotation within the first two weeks (ideally, before the start of the term) and will participate in lab-related activities for a minimum of 12 hours a week; at least 6 hours a week is expected to involve “in person” interaction between the PI or other members of the sponsoring lab and the student. Activities will include attendance at lab meetings, preparation of a research proposal, and “hands on” experimental, computational, or modeling tasks: in addition, attendance at department research seminars and class meetings is required. Periodic reports on your research proposal/project and progress, as well providing feedback on your ‘colleagues’ projects and proposals will also be expected. A final research proposal (to be presented in the format of a NIH F31 (or NSF equivalent) grant application will be required (it is expected that the application will be submitted to the funding agency for students interested in continuing their research career); it is anticipated that this proposal will include data generated by the student over the Fall, Interim session, or Spring term(s).
Prerequisites: EN.580.821 OR EN.580.706
Instructor(s): K. Yarema.

EN.580.780. BME MSE Research Practicum. 6.0 Credits.
BME MSE Research Practicum For Thesis-Track Students
Instructor(s): K. Yarema.

Cross Listed Courses
General Engineering
EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.
EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biорobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.

Electrical Computer Engineering
EN.520.315. Intro. to Bio-Inspired Processing of Audio-Visual Signals. 3.0 Credits.
An introductory course to basic concepts of information processing of human communication signals (sounds, images) in living organisms and by machine. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473
Prerequisites: Students may not have taken EN.520.634
Instructor(s): B. Tsui.

EN.520.445. Audio Signal Processing. 3.0 Credits.
This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, acoustics, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing.
Prerequisites: Students make take EN.520.445 or EN.520.645, but not both.
Instructor(s): M. Elhilali
Area: Engineering.

EN.520.622. Principles of Complex Networked Systems. 3.0 Credits.
By employing fundamental concepts from diverse areas of research, such as statistics, signal processing, biophysics, biochemistry, cell biology, and epidemiology, this course introduces a multidisciplinary and rigorous approach to the modeling and computational analysis of complex interaction networks. Topics to be covered include: overview of complex nonlinear interaction networks and their applications, graph-theoretic representations of network topology and stoichiometry, stochastic modeling of dynamic processes on complex networks and master equations, Langevin, Poisson, Fokker-Plank, and moment closure approximations, exact and approximate Monte Carlo simulation techniques, time-scale separation approaches, deterministic and stochastic sensitivity analysis techniques, network thermodynamics, and reverse engineering approaches for inferring network models from data.
Instructor(s): J. Goutsias.

Mechanical Engineering
EN.530.410. Biomechanics of the Cell. 3.0 Credits.
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. Discussion of the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models.
Instructor(s): S. Sun
Area: Engineering, Natural Sciences.

EN.530.426. Biofluid Mechanics. 3.0 Credits.
Course will cover selected topics from physiological fluid dynamics, including respiratory flow patterns, blood flow and pulse propagation, aerodynamics of phonation and speech, rheology of blood flow in the microcirculation, aquatic animal propulsion, and animal flight.
Instructor(s): R. Mittal
Area: Engineering.

EN.530.448. Biosolid Mechanics. 3.0 Credits.
This class will introduce fundamental concepts of statics and solid mechanics and apply them to study the mechanical behavior bones, blood vessels, and connective tissues such as tendon and skin. Topics to be covered include concepts of small and large deformation, stress, constitutive relationships that relate the two, including elasticity, anisotropy, and viscoelasticity, and experimental methods. Recommended Course Background: AS.110.201 and AS.110.302, as well as a class in statics and mechanics
Instructor(s): T. Nguyen
Area: Engineering.
APPLIED MATHEMATICS STATISTICS

EN.553.450. Computational Molecular Medicine. 4.0 Credits.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional "omics" data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful).
Prerequisites: (EN.553.420 OR EN.553.620) AND (EN.553.430 OR EN.553.630) OR equivalent courses in probability and statistics. Students may receive credit for EN.550.450/EN.553.450 or EN.553.650, but not both.
Instructor(s): D. Geman; J. Bader
Area: Engineering, Quantitative and Mathematical Sciences.

EN.553.650. Computational Molecular Medicine. 4.0 Credits.
Computational systems biology has emerged as the dominant framework for analyzing high-dimensional "omics" data in order to uncover the relationships among molecules, networks and disease. In particular, many of the core methodologies are based on statistical modeling, including machine learning, stochastic processes and statistical inference. We will cover the key aspects of this methodology, including measuring associations, testing multiple hypotheses, and learning predictors, Markov chains and graphical models. In addition, by studying recent important articles in cancer systems biology, we will illustrate how this approach enhances our ability to annotate genomes, discover molecular disease networks, detect disease, predict clinical outcomes, and characterize disease progression. Whereas a good foundation in probability and statistics is necessary, no prior exposure to molecular biology is required (although helpful). Recommended Course Background: EN.553.620 AND EN.553.630.
Prerequisites: Students may receive credit for EN.550.450/EN.553.450 or EN.553.650, but not both.
Instructor(s): D. Geman
Area: Engineering, Quantitative and Mathematical Sciences.

COMPUTER SCIENCE

EN.601.450. Introduction to Genomic Research. 3.0 Credits.
This course will use a project-based approach to introduce undergraduates to research in computational biology and genomics. During the semester, students will take a series of large data sets, all derived from recent research, and learn all the computational steps required to convert raw data into a polished analysis. Data challenges might include the DNA sequences from a bacterial genome project, the RNA sequences from an experiment to measure gene expression, the DNA from a human microbiome sequencing experiment, and others. Topics may vary from year to year. In addition to computational data analysis, students will learn to do critical reading of the scientific literature by reading high-profile research papers that generated groundbreaking or controversial results. [Applications] Recommended Course Background: Knowledge of the Unix operating system and programming expertise in a language such as Perl or Python.
Instructor(s): S. Salzberg
Area: Engineering.

EN.601.448. Computational Genomics: Data Analysis. 3.0 Credits.
Genomic data has the potential to reveal causes of disease, novel drug targets, and relationships among genes and pathways in our cells. However, identifying meaningful patterns from high-dimensional genomic data has required development of new computational tools. This course will cover current approaches in computational analysis of genomic data with a focus on statistical methods and machine learning. Topics will include disease association, prediction tasks, clustering and dimensionality reduction, data integration, and network reconstruction. There will be some programming and a project component. [Applications] Prerequisites: EN.601.226 or other programming experience, probability and statistics, linear algebra or calculus.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.

EN.601.461. Computer Vision. 3.0 Credits.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] Prerequisites: intro programming, linear algebra, and prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.361, EN.600.461, EN.600.661, EN.601.461, EN.601.661.
Instructor(s): H. Ali
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.476. Machine Learning: Data to Models. 3.0 Credits.
How can robots localize themselves in an environment when navigating? Can we predict which patients are at greatest-risk for complications in the hospital? Which movie should I recommend to this user given his history of likes? Many such big data questions can be answered using the paradigm of probabilistic models in machine learning. These are especially useful when common off-the-shelf algorithms such as support vector machines and k-means fail. You will learn methods for clustering, classification, structured prediction, recommendation and inference. We will use Murphy's book, Machine Learning: a Probabilistic Perspective, as the text for this course. Assignments are solved in groups of size 1-3 students. The class will have 4 interactive sessions during which we brainstorm how to solve example open-ended real-world problems with the tools learnt in class. Students are also required to do a project of their choice within which they experiment with the ideas learnt in class. [Analysis or Applications] Prerequisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in stats.
Instructor(s): S. Saria
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.748. Computational Genomics: Data Analysis. 3.0 Credits.
Graduate level version of EN.601.448. [Applications] Recommended Course Background: EN.601.226 or other programming experience, probability and statistics, linear algebra or calculus. Students may receive credit for EN.601.448 or EN.601.748 but not both.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.
EN.601.776. Machine Learning: Data to Models. 3.0 Credits.
Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. One should have taken at least an introductory course in probability theory and linear algebra. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Requistes include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria.

Center for Leadership Education
https://engineering.jhu.edu/cle/

The Center for Leadership Education (CLE) at Johns Hopkins is comprised of several academic programs including the Entrepreneurship and Management minor, the Marketing and Communications minor, the Professional Communication Program, the Professional Development Program and the Masters of Science in Engineering Management. Additionally, the CLE hosts a variety of experiential programs that offer students an opportunity to gain real-world business and leadership experience.

CLE Experiential Programs Include
Competitions and Other Educational Opportunities:

• The Annual JHU Business Plan Competition: Students compete for cash prizes for best business plans in several different categories. The competition is open to students from all divisions of the university. http://bpc.jhu.edu

• Elevator Pitch Competition: AKPsi runs this event, supported by the CLE, giving students the opportunity to compete for cash prize for the best elevator pitch. The competition is open to undergraduates from the Homewood Campus. Students will submit their 90 second video pitch. The selected finalists will then present before a judging panel.

• Consulting Club Case Competition: The Johns Hopkins Undergraduate Case Competition provides students with the opportunity to learn, collaborate and share ideas with their peers in order to solve a real world business case. The competition is designed to not only develop their professional, communication and business acumen but also to connect students with Hopkins alumni in the consulting industry.

• Internships: Students can apply for sponsorship for academic credit of unpaid business-related internships during the spring, summer or fall semester.

• Intersession Courses: including P.R. and Media in the Big Apple, featuring a two-day visit to P.R. firms in NYC.

Professional Associations:

• American Marketing Association Student Chapter: Students run a chapter of this national marketing organization. https://engineering.jhu.edu/cle/beyond-the-classroom/professional-associations/

Social Entrepreneurship:

• Students Consulting for Non-Profit Organizations: A national organization of undergraduate students committed to developing communities through pro bono consulting engagements with non-profit organizations. https://johnshopkins.campuslabs.com/engage/organization/scno

• TCO: A non-profit organization focused on fostering entrepreneurship at JHU and getting students involved in Baltimore’s innovation community. https://tcolabs.org/

Other Experiential Opportunities:

• Hopkins Student Enterprises: Students have the ability start and manage businesses that provide services to the campus and surrounding communities. HSE currently has 8 successful student run business serving the Homewood Campus. http://hse.jhu.edu

• JHU TAMID: JHUTAMID provides undergraduate students with an education on the Israeli and American economies. Members of JHUTAMID will have the unique opportunity to consult for major Israeli tech firms and help run an investment fund that specializes in the Tel Aviv Stock Exchange. http://jhatamid.johnshopkins.edu

• JHU Undergraduate Consulting Club: JHUC’s aim is to help the undergraduate student body at Johns Hopkins learn more about consulting as a career track, by providing events and resources that will give students insight into the field of consulting and connect them with recruiters from firms. https://www.facebook.com/jhucc

• Marshal Salant Student Investment Team: The team was founded with a generous $100K donation by alumnus Marshal L. Salant. The team portfolio is currently valued at over $250K. Profits from the portfolio are used to fund student scholarships. https://engineering.jhu.edu/cle/beyond-the-classroom/marshal-l-salant-student-investment-team/

• Business Roundtable: Alpha Kappa Psi, Students Consulting for Nonprofit Organizations (SCNO), and the American Marketing Association (AMA) co-host this annual networking event every November. This event allows undergraduates to network with JHU alumni who are currently working in fields such as consulting, finance, and marketing. The event is set up in a roundtable format to allow students to connect with alumni on a more personal level in which students are able to ask alumni questions about their experiences in their respective industries.

• Women in Business: Women in Business (WIB) provides the women of Hopkins the opportunities necessary to advance their professional and personal development. https://alumni.jhu.edu/affinitygroups/womeninbusiness

Director
Pamela Sheff
Director of Center for Leadership Education and Master of Science in Engineering Management Program & Senior Lecturer

Program Directors
Lawrence Aronhime
Senior Lecturer & Director of International Programs: accounting, finance, entrepreneurship, technology commercialization.

Annette Leps
Senior Lecturer & Director of Entrepreneurship & Management Program: accounting, finance, management

Julie Reiser
Senior Lecturer & Director of The Professional Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice
Senior Lecturer & Director of Graduate Programs: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

William Smedick
Senior Lecturer. Leadership Programs

Full Time Faculty
Illysa Izenburg
Lecturer: engineering management

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing.

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric

Trevor Mackesey
Lecturer: professional writing and communication

Part Time Faculty
Michael Agronin
Lecturer: product development

Jennifer Bernstein
Lecturer: communications

Alexander Cocron
Lecturer: management and technology consulting

Sue Conley
Lecturer: marketing

Laura Davis
Lecturer: communications, ESL

Kevin Dungey
Senior Lecturer: communications

David Fisher
Lecturer: business law

Mark Franceschini
Senior Lecturer: business ethics, internet law

Sean Furlong
Lecturer: accounting

Guido Galvez
Lecturer: business law

Jason Heiserman
Lecturer: communications

Chris Jeffers
Lecturer: business law, patent & IP law

Andrew Kulanko
Senior Lecturer: communications

Denise Link-Farajali
Lecturer: communications, ESL

David Long
Lecturer: management and technology consulting

Dave Mahoney
Lecturer: marketing

Marco Priolo
Lecturer: accounting, finance

Bryan Rakes
Lecturer: business law

Joshua Reiter
Senior Lecturer: business process, quality management

Douglas Sandhaus
Senior Lecturer: business ethics, internet law

Adam Trieser
Lecturer: business analytics

Caroline Wilkins
Lecturer: communications

Courses

EN.660.100. Hopkins Leadership Challenge Seminar. 1.0 Credit.
The Hopkins Leadership Challenge seminar is designed specifically for all incoming freshman. The classroom content will include discussions with current university leaders and will serve as an introduction to the history, services and involvement opportunities open to JHU undergraduates. The seminars will include discussion and assignments from The Leadership Challenge by Kouzes and Posner. The experiential component of the course will include programs designed to enhance classroom content and expose students to the on campus and off campus involvement opportunities available.
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.104. Exploring Leadership: For Hopkins Students Who Want to Make a Difference. 1.0 Credit.
Seminar is designed specifically for second year undergraduates at JHU and is limited to that population. An eight-week seminar and experiential program designed to provide the following learning outcomes for students enrolled: 1. Understand self-others and how to work effectively in communities 2. Understand the importance of integrity, moral purpose, and positive change. 3. Understand how change occurs and why people resist or promote change. 4. Understand the importance of enhancing and applying individual team strengths, developing greater levels of well being for you and in others, and thriving together as individuals and organizations. 5. Form positive connections and relationships with upper class students and alumni in areas of career interests. Sophomores only. S/U only.
Instructor(s): Staff.
EN.660.105. Introduction to Business. 4.0 Credits.
This course is designed as an introduction to the terms, concepts, and values of business and management. The course comprises three broad categories: the economic, financial, and corporate context of business activities; the organization and management of business enterprises; and, the marketing and production of goods and services. Topic specific readings, short case studies and financial exercises all focus on the bases for managerial decisions as well as the long and short-term implications of those decisions in a global environment. No audits.
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.106. Clark Scholars Leadership Challenge. 1.0 Credit.
The Clark Scholars Leadership Challenge is a one credit pass/fail seminar and is designed specifically for the Clark Scholars at JHU who are interested in developing their leadership skills and applying those skills to Hopkins life. The seminar includes both a classroom component and an experiential component. The classroom content includes leadership topics, discussions with university leaders and serves as an introduction to the history, services and involvement opportunities at Hopkins. The experiential component includes programs such as JHU history, faculty student interaction, visits to other JHU campuses and more! Clark Scholars only. S/U only.
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.107. Leadership Concepts. 1.0 Credit.
Leadership Concepts is a seminar designed specifically for second year undergraduates at JHU and is limited to that population. A seven-week seminar and experiential program designed to provide the following learning outcomes for students enrolled: 1. Understand self-others and how to work effectively in communities. 2. Understand the importance of integrity, moral purpose, and positive change. 3. Understand how change occurs and why people resist or promote change. 4. Understand the importance of enhancing and applying individual team strengths, developing greater levels of well being for you and in others, and thriving together as individuals and organizations. 5. Form positive connections and relationships with upper class students and alumni in areas of career interests.
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.111. Civic Engagement Service and Leadership. 1.0 Credit.
Civic Engagement Service and Leadership is a seminar designed specifically for first and second year undergraduates at JHU and is limited to that population. A seven-week seminar and experiential program designed to provide the following learning outcomes for students enrolled: 1. Understand self-others and how to work effectively in communities. 2. Understand the importance of integrity, moral purpose, and positive change. 3. Understand how change occurs and why people resist or promote change. 4. Understand the importance of enhancing and applying individual team strengths, developing greater levels of well being for you and in others, and thriving together as individuals and organizations. 5. Form positive connections and relationships with upper class students and alumni in areas of career interests.

Area: Social and Behavioral Sciences.

EN.660.200. Principles of Finance. 3.0 Credits.
This course covers central issues in financial management and corporate finance. Students will learn how financial managers make investment, financing and other decisions and what are the tools they use to reach such decisions. Topics covered include time value of money, risk, valuation, capital structure, capital budgeting, dividend policy and mean-variance portfolio selection. The course provides the analytical tools and the financial theories needed to implement sound financial decisions within a corporation (and outside of a corporation). Ideas are presented in a cohesive way within the framework of the no-arbitrage principle, the fundamental principle shaping all aspects of modern finance. Command of the subject is crucially important for anyone considering a career not only in investment banking, investment management or trading, but also in general management, corporate strategy, management consulting, entrepreneurship, and the non-profit world.
Prerequisites: EN.660.105 OR AS.180.102
Instructor(s): Staff.

EN.660.203. Financial Accounting. 3.0 Credits.
The course in Financial Accounting is designed for anyone who could be called upon to analyze and/or communicate financial results and/or make effective financial decisions in a for-profit business setting. No prior accounting knowledge or skill is required for successful completion of this course. Because accounting is described as the language of business, this course emphasizes the vocabulary, methods, and processes by which all business transactions are communicated. The accounting cycle, basic business transactions, internal controls, and preparation and understanding of financial statements including balance sheets, statements of income and cash flows are covered. No audits.
Instructor(s): Staff.

EN.660.250. Principles Of Marketing. 3.0 Credits.
This course explores the role of marketing in society and within the organization. It examines the process of developing, pricing, promoting and distributing products to consumer and business markets and shows how marketing managers use the elements of the marketing mix to gain a competitive advantage. Through interactive, application-oriented exercises, case videotapes, a guest speaker (local marketer), and a group project, students will have ample opportunity to observe key marketing concepts in action. The group project requires each team to research the marketing plan for an existing product of its choice. Teams will analyze what is currently being done by the organization, choose one of the strategic growth alternatives studied, and recommend why this alternative should be adopted. The recommendations will include how the current marketing plan will need to be modified in order to implement this strategy and will be presented to the instructor in written form and presented to the class. No audits.
Instructor(s): Staff.

EN.660.270. Clark Scholar Engineering Design I. 1.0 Credit.
In this course, Clark Scholar students will learn and practice the first stages of design thinking. Students will engage with both industry and academic professionals to identify new innovation targets for future design projects. Additional topics will include multifaceted problem assessment and project selection for Engineering Design II.
Instructor(s): Staff.
EN.660.300. Managerial Finance. 3.0 Credits.
This course is designed to familiarize the student with the basic concepts and techniques of financial management practice. The course begins with a review of accounting, securities markets, and the finance function. The course then moves to discussion of financial planning, financial statement analysis, time value of money, interest rates and bond valuation, stock valuation, and concludes with capital budgeting and project analysis. A combination of classroom discussions, problem sets, and case studies will be used. No audits.
Prerequisites: EN.660.203
Instructor(s): Staff.

EN.660.303. Managerial Accounting. 3.0 Credits.
This course introduces management accounting concepts and objectives including planning, control, and the analysis of sales, expenses, and profits. Major topics include cost behavior, cost allocation, product costing (including activity based costing), standard costing and variance analysis, relevant costs, operational and capital budgeting, and performance measurement. Note: not open to students who have taken EN.660.204 Managerial Accounting. No audits.
Prerequisites: EN.660.203
Instructor(s): Staff.

EN.660.308. Business Law I. 3.0 Credits.
This course is designed to provide students an introduction to legal reasoning and analysis. Content distinguishes forms of business, civil versus criminal law, and agency principles; intellectual property concepts, contract Law, the UCC (Uniform Commercial Code) and consumer protection are explored and discussed in the context of assigned legal cases which are intended to develop a student’s ability to analyze and apply law. Note: not open to students who have taken 660.205 Business Law I. No audits.
Prerequisites: EN.660.105
Instructor(s): Social and Behavioral Sciences.

EN.660.309. Case Studies in Business Ethics. 3.0 Credits.
This course is designed as a workshop using case studies to introduce students to the ethical concepts that are relevant to resolve moral issues in contemporary business and social settings—both global and personal in nature. Students will learn the reasoning and analytical skills needed to apply ethical concepts to their own decision-making, to identify moral issues involved in the management of specific problem areas in business and society, and to understand the social and natural environments which give rise to moral issues. The course focus is on performance articulated by clear reasoning and effective verbal and written communication concerning ethical issues in business and society. Not open to students who have taken EN.660.231 Case Studies in Business Ethics. No audits.
Prerequisites: EN.660.105
Instructor(s): Staff
Area: Humanities.

EN.660.311. Law and the Internet. 3.0 Credits.
Sometimes called “Cyber law” this course uses the case study method to examine some of the most significant and compelling legal aspects, issues, and concerns involved with operating a business enterprise in an Internet environment. Some of the issues likely to be covered include jurisdiction, resolution of online disputes, trademarks, copyright, licenses, privacy, defamation, obscenity, the application of traditional concepts of tort liability to an Internet context, computer crime, information security, taxation, international considerations, and an analysis of other recent litigation and/or statutes. Pre-requisite of EN.660.205 or EN.660.308 or by permission of instructor. Note: not open to students who have taken EN.660.306 Law and the Internet. No audits.
Prerequisites: EN.660.205 OR EN.660.308
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.329. Social Entrepreneurship Theory and Practice. Community Based Learning. 3.0 Credits.
Learn the principles, values and skills necessary to lead and succeed in organizations that make a positive difference in today’s world. The course is designed to help students identify and provide opportunities to enhance their leadership skills. A “Blueprint for Success” will provide the framework for students to cultivate their own ideas for new socially conscious entrepreneurial ventures. Students will hear from successful current leaders in the field of social entrepreneurship and be provided the opportunity to network with JHU alumni, faculty and staff who are working or volunteering in for-profit or non-profit entities through occupations that make a difference.
Instructor(s): Staff
Area: Social and Behavioral Sciences Writing Intensive.

EN.660.331. Leading Teams. 3.0 Credits.
This course will allow students to develop the analytical skills needed to effectively lead and work in teams. Students will learn tools and techniques for problem solving, decision-making, conflict resolution, task management, communications, and goal alignment in team settings. They will also learn how to measure team dynamics and performance, and assess methods for building and sustaining high-performance teams. Students will also explore their own leadership, personality and cognitive styles and learn how these may affect their performance in a team. The course will focus on team-based experiential projects and exercises as well as provide opportunities to individually reflect and write about the concepts explored and skills gained throughout the course. No Audits. Recommended Course Background: EN.660.332 or EN.660.333.
Instructor(s): Staff.

EN.660.332. Leadership Theory. 3.0 Credits.
Students will be introduced to the history of Leadership Theory from the “Great Man” theory of born leaders to Transformational Leadership theory of non-positional learned leadership. Transformational Leadership theory postulates that leadership can be learned and enhanced. The course will explore the knowledge base and skills necessary to be an effective leader in a variety of settings. Students will assess their personal leadership qualities and develop a plan to enhance their leadership potential.
Instructor(s): Staff
Area: Social and Behavioral Sciences Writing Intensive.
EN.660.333. Leading Change. 3.0 Credits.
In this course, we will use a combination of presentation, discussion, experiential learning, research and self-reflection to investigate issues surrounding leadership and change in communities and the economy. While considering both for-profit and non-profit entities, we will pursue topics including understanding and using theories of change; finding competitive advantage and creating strategic plans; making decisions, even in uncertain times; valuing differences; employing leadership styles; giving and receiving feedback; understanding employee relations; creating performance measures; and developing organizational cultures; and using the dynamics of influence. No audits.
Instructor(s): Staff
Writing Intensive.

EN.660.335. Negotiation and Conflict Resolution. 3.0 Credits.
The focus of this class is the nature and practice of conflict resolution and negotiation within and between individuals and organizations.
The primary format for learning in this class is structured experimental exercises designed to expose students to different aspects of negotiation and to build tangible skills through interpersonal exchange. While some class time is devoted to presentations on theories and approaches, the class method primarily relies on feedback from fellow classmates on their observations of negotiation situations and on personal reflections by students after each structured experience. Topics include conflict style, negotiation, and group conflict. No audits. Recommended Course Background: EN.660.105, an additional course in the Entrepreneurship and Management Program or in the social sciences.
Instructor(s): Staff.

EN.660.340. Principles of Management. 3.0 Credits.
This course introduces the student to the management process. The course takes an integrated approach to management by examining the role of the manager from a traditional and contemporary perspective while applying decision-making and critical-thinking skills to the challenges facing managers in today's globally diverse environment. The course examines the techniques for controlling, planning, organizing resources and leading the workforce. Not open to students who have taken EN.660.220 Principles of Management. No audits.
Prerequisites: EN.660.105
Instructor(s): Staff.

EN.660.341. Business Process and Quality Management. 3.0 Credits.
This course focuses on both quantitative and qualitative analytical skills and models essential to operations process design, management, and improvement in both service and manufacturing oriented companies. The objective of the course is to prepare the student to play a significant role in the management of a world-class company which serves satisfied customers through empowered employees, leading to increased revenues and decreased costs. The material combines managerial issues with both technical and quantitative aspects. Practical applications to business organizations are emphasized. Recommended Course Background: EN.660.105 Introduction to Business or EN.660.241 IT Management. No audits
Instructor(s): Staff
Writing Intensive.

EN.660.343. Operations and Service Management. 3.0 Credits.
This course aims to (1) direct your attention to fundamental problems and issues confronting all operations managers, (2) provide you with language, concepts, and insights which will help you to deal with these issues in order to gain competitive advantage through operations, and (3) further develop your ability to use analytical approaches and tools to understand and handle various managerial situations. Because the course deals with the management of "processes", it applies to both for-profit and non-profit organizations, to both service and manufacturing organizations, and to virtually any functional area or industry.
Prerequisites: EN.660.105 OR AS.180.102
Instructor(s): Staff.

EN.660.352. New Product Development. 3.0 Credits.
New product development is the ultimate interdisciplinary entrepreneurial art, combining marketing, technical, and managerial skills. A successful product lies at the intersection of the user's need, a technical solution, and compelling execution. This class will bootstrap your experience in the art through exercises and team projects. We will examine products and services, consumer and industrial, simple and technologically complex. Case studies will feature primary sources and the instructor's personal experiences as an inventor for a major consumer products company. Topics will span the product development cycle: identifying user needs, cool-hunting, brainstorming, industrial design, prototyping techniques, market research to validate new ideas, and project management -- especially for managing virtual teams and foreign manufacturers. No audits.
Prerequisites: EN.660.250 OR EN.500.101 OR EN.510.106 OR EN.520.137 OR EN.530.111 OR EN.560.141 OR EN.570.108 OR EN.580.111
Instructor(s): Staff
Area: Engineering.

EN.660.355. Sports Marketing. 3.0 Credits.
This course will allow students to apply marketing principles and concepts to the sports marketing environment while gaining an understanding of how event sponsorships, endorsements, licensing and naming rights are used to achieve business objectives. Through case studies and a group project, students will be exposed to a broad range of sports entities including professional sports teams, governing organizations and sports media.
Prerequisites: EN.660.250
Instructor(s): Staff.

EN.660.358. International Marketing. 3.0 Credits.
This course covers product, pricing, promotion, distribution, market research, organization and implementation and control policies relating to international marketing. It also explores the economic, cultural, political and legal aspects of international marketing. Through interactive and application-oriented assignments and cases, students will gain hands-on experience in analyzing and developing marketing strategies for organizations that market both consumer and business products/services internationally. A group project will involve the development of an international marketing plan for a specific product. One or more local international marketers will be invited to speak to the class. No audits.
Prerequisites: EN.660.250
Instructor(s): Staff.
EN.660.361. Engineering Business and Management. 3.0 Credits.  
When engineers become working professionals, especially if they become managers, they must juggle knowledge of and tasks associated with operations, finance, ethics, strategy, team citizenship leadership and projects. While engineers’ success may depend on their direct input → the sweat of their own brow – managers’ success depends on their ability to enlist the active involvement of others: direct reports, other managers, other team members, other department employees, and those above them on the organizational chart. You will learn these concepts and skills in this course. In this course, you will learn about teamwork and people management, and gain an introduction to strategy, finance, and project management. You will practice writing concise persuasive analyses and action plans and verbally defending your ideas. Cross-listed with Mechanical Engineering.  
Instructor(s): Staff  
Area: Engineering.

EN.660.363. Leadership & Management in Materials Science and Engineering. 3.0 Credits.  
In this course, you will learn about leadership, social responsibility, strategy, finance, project management and people management specifically in the materials science and engineering fields. You will practice writing concise persuasive analyses and action plans and verbally defending your ideas. You will learn the ethical guidelines for the materials science profession, to resolve team conflicts and co-lead self-managed work teams, and determine how materials science supports society’s sustainability goals and the social responsibilities of materials scientists. Our class time will feel like a business meeting, and we will refer to class periods as meetings. When you complete this course, you will be prepared to be a working professional. Your Teaching Team looks forward to seeing you develop into a career engineer, scientist, manager, entrepreneur, professor or other professional over the years.  
Instructor(s): Staff  
Area: Engineering, Natural Sciences.

EN.660.380. Clark Scholar Engineering Design II. 1.0 Credit.  
In this course Clark Scholar students will continue their training in design thinking. Students will focus on both the identification of needs and the assessment of these needs for project selection. This course will consist of in class workshops and field immersion exercises.  
Instructor(s): Staff.

EN.660.400. Practical Ethics for Future Leaders. 2.0 Credits.  
This is an interdisciplinary course on leadership, decision making, and the application of ethics to real world problems. JHU students are future leaders of innovation across many fields, including but not limited to engineering, business, law, journalism, government, science and medicine. The awesome power of emerging technologies to modify our world - our food supply, our health, even people - will only increase and become more pressing in coming years. The goal of this course is to give students a deep and practical grounding in how leaders make decisions, and in particular difficult decisions where there is no clearly right answer. In this two-credit course, we will cover important concepts in the practical application of ethics; in decision making; and leadership. There is a companion 1-credit course, EN.660.406 which forms a second part of the course, and which will take a deep look at a major ethical issue resulting from the newfound capabilities made possible by emerging technologies. Students of EN.660.400 can choose whether or not to register for EN.660.406. This course includes online lectures, readings and substantial discussion components, as well as weekly meetings in small sections. The course spans the first two thirds of the semester, leaving the final third of the semester available for the 1-credit EN.660.406.  
Instructor(s): Staff  
Area: Humanities.

EN.660.404. Business Law II. 3.0 Credits.  
Building on the material from Business Law I, topics examined include entrepreneurship, business entities and business formation, principles of agency, real property, personal property, bailments, bankruptcy, secured transactions, employment discrimination, business financing, investor protection, antitrust and environmental law. No audits.  
Prerequisites: EN.660.205 OR EN.660.308  
Instructor(s): Staff  
Area: Social and Behavioral Sciences.

EN.660.406. Practical Ethics for Future Leaders - Special Topic. 1.0 Credit.  
This is a one-credit course that serves as a companion and second part to the Practical Ethics course EN.660.400, which is a co-requisite for this course. In this one-credit course, we will take a deep look at a major ethical issue resulting from the newfound capabilities made possible by emerging technologies. The students will work together in small groups, across multiple meetings with flexible scheduling, to discuss and make decisions on real-world decisions. Previous years topics included the release of genetically modified mosquitoes in Florida, and the presence of human decision-makers’ in the loop’ for military and surgical autonomous robots. This course takes place in the final one third of the semester, leaving the first two-thirds of the semester available for the 2-credit EN.660.400. Students should register for the same section number in EN.660.406 as they do for EN.660.400.  
Corequisites: EN.660.400 must be taken during the same semester as EN.660.406.  
Instructor(s): Staff  
Area: Humanities.
EN.660.410. Computer Science Innovation and Entrepreneurship. 3.0 Credits.
This course is designed to give students in CS the requisite skills to generate and screen ideas for new venture creation and then prepare a business plan for an innovative technology of their own design. These skills include the ability to incorporate into a formal business case all necessary requirements, including needs identification and validation; business and financial models; and, market strategies and plans. Student teams will present the business plan to an outside panel made up of practitioners, industry representatives, and venture capitalists. In addition, this course functions as the first half of a two course sequence, the second of which will be directed by CS faculty and focus on the actual construction/programming of the business idea. Restricted to Juniors and Seniors majoring in Computer Science or by permission of instructor. Instructor(s): Staff.

EN.660.414. Financial Statement Analysis. 3.0 Credits.
This course is designed to increase a student's ability to read and interpret financial statements and related information under both GAAP and IFRS (International Financial Reporting Standards). In addition to a review of the basic financial statements and accounting principles, the course will use industry and ratio analysis in addition to benchmarking and modeling techniques to encourage students to think in a more creative way when analyzing historic information or when forecasting financial statements. Students will assess firm profitability and risk, value assets and use spreadsheet models for financial forecasting and decision making. Not open to students who have taken EN.660.304 Financial Statement Analysis. No audits.
Prerequisites: EN.660.203
Instructor(s): Staff.

EN.660.420. Marketing Strategy. 3.0 Credits.
This writing intensive course helps students develop skills in formulating, implementing, and controlling a strategic marketing program for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization and support these decisions with quantitative analyses. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations, including financial projections, and presenting them to the class. No audits.
Prerequisites: EN.660.250
Instructor(s): Staff
Writing Intensive.

EN.660.446. Multidisciplinary Technical Teams. 3.0 Credits.
Leaders – whether of a team or an organization—are charged with setting, communicating, and overseeing the implementation of a vision. Leaders ensure sustainable growth and targeted change. Leaders and members of teams that are integrated across multiple engineering and science disciplines, face special challenges regarding managing innovation, creating a team environment that facilitates experimentation, providing a balance of autonomy and collegial support, maintaining technical expertise, and facilitating inter-disciplinary communication. Instructor(s): Staff
Area: Engineering, Natural Sciences
Writing Intensive.

EN.660.450. Advertising & Integrated Marketing Communication. 3.0 Credits.
This course builds on the promotional mix concepts covered in Principles of Marketing (EN.660.250) – advertising, public relations, sales promotion and personal selling. Students will learn how marketers are changing the ways they communicate with consumers and the ways in which promotional budgets are allocated—and how this impacts the development of marketing strategies and tactics. Working with a client (provided by EdVenture Partners) that has chosen this JHU class as its "advertising agency" and an actual budget provided by the firm, the class will form small teams to mirror the functional organization of an actual ad agency (market research, media strategy/planning, copywriting/design, public relations, etc.). Student teams will then develop a promotional plan and corresponding budget to reach the desired target market (JHU undergrads who meet the client’s criteria), implement the plan and then evaluate its effectiveness through pre- and post campaign market research conducted on the target consumer. Note: Not open to students who have taken EN.660.450 as Advertising and Promotion. No audits. (Formerly Advertising and Promotion.)
Prerequisites: EN.660.250
Instructor(s): Staff.

EN.660.453. Social Media and Marketing. 3.0 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.661.453.
Prerequisites: EN.660.250
Instructor(s): Staff.

EN.660.459. Entrepreneurial Spirits. 3.0 Credits.
Have you noticed the growth of consumer-focused, alcohol related enterprises? New wineries, breweries, distilleries and cidersies abound in response to continuing growth in customer demand. Have you contemplated starting this type of enterprise? If so, this may be a course for you!! We explore the background, opportunities and challenges in each of these spirit arenas as we investigate questions one must answer to make an informed decision about starting or joining such an enterprise. Among the topics we will study are the styles of products, vessels, production processes, costs/returns, sources of raw materials, laws and regulations, marketing options, food pairings, customers and the like. Expect to make several local field trips. Also expect to perform several individual and group assignments, the results of which you will be required to share with classmates. Instructor(s): Staff.
EN.660.460. Entrepreneurship. 3.0 Credits.
This course provides students with a solid introduction to the entrepreneurial process of creating new businesses. Students will gain an appreciation for the investors' perspective in assessing opportunities, evaluating strategies, and valuing the new enterprise. The course will cover the principal components of building a successful venture including management, market analysis, intellectual property protection, legal and regulatory issues, operations, entrepreneurial financing, and the role of the capital markets. Course work will include case studies and creation of investor marketing materials. Open to Juniors and Seniors. No Audits. Recommended Course Background: EN.660.203
Prerequisites: EN.660.105 OR EN.660.250
Instructor(s): Staff.
EN.660.500. Business Internship. 1.0 Credit.
Students may qualify for an internship with one of the many local employers with whom CLE works or they may arrange a non-local internship on their own. For non-paid internships only, students may apply for sponsorship for academic credit through CLE. Applications must include a resume, transcript and written essay and will be evaluated on the basis of work experience, GPA, writing sample, and course work. Students are expected to complete two reports assigned by the internship coordinator. S/U only.
Instructor(s): Staff.
EN.660.503. Practicum in Leadership. 1.0 Credit.
Students work on an existing leadership plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. S/U only.
Instructor(s): Staff.
EN.660.567. Leadership Theory Independent Study. 3.0 Credits.
Students will be introduced to the history of Leadership Theory from the "Great Man" theory of born leaders to Transformational Leadership theory of non-positional learned leadership. Transformational Leadership theory postulates that leadership can be learned and enhanced. The course will explore the knowledge base and skills necessary to be an effective leader in a variety of settings. Students will assess their personal leadership qualities and develop a plan to enhance their leadership potential. Recommended Course Background: EN.660.105 or EN.660.220/EN.660.340. No audits.
Instructor(s): Staff.
EN.660.604. Business of Bioengineering Innovation & Design I. 3.0 Credits.
This course comprises two distinct, but related, components. The first is a broad introduction to the terms, concepts, and values of business and management. Particular emphasis will be placed on the economic, financial, and corporate contexts of our business culture, and how they impact the organization, strategy, and decision-making of business firms. The second component is an introduction to the sociological and economic forces that shape the development and diffusion of new technologies. This part is primarily designed to provide a framework for determining the commercial viability of new medical devices and the best path for realizing their value, including how to develop a compelling value proposition, analyze markets and competitors, and protect intellectual property. Throughout, the course utilizes individual exercises, case analyses, and team projects. CBID MSE Students Only
Instructor(s): Staff.
EN.660.606. Business of Bioengineering Innovation & Design. 3.0 Credits.

EN.661.128. Improvisational Techniques for Communication. 3.0 Credits.
Science and engineering are disciplines which mandate immersive study, attention to detail, and extreme forethought. Is it possible, then, that as students condition themselves to meet these needs, they compromise their ability to navigate impromptu social situations, public speaking events, and the like? Following the lead of innovative communities and businesses, this class turns to improvisation techniques to develop communication skills, encourage creative problem solving, and support teamwork. Through imaginative movement and play, improv encourages students to hone their abilities to initiate, listen, react, and connect. Using the power of “Yes, And…”, improv’s most famous aphorism, students learn to respond confidently and spontaneously to unforeseen challenges.
Instructor(s): Staff

EN.661.129. Improv for Entrepreneurs and Leaders. 3.0 Credits.
Improv is about finding the fullest potential in what is readily available. In fact, all 7 billion people on this planet improvise every single day, but only a few of us improvise well. It’s imperative that tomorrow’s leaders and entrepreneurs navigate and adapt to the changing world with extemporaneous finesse. To achieve such outcomes this class takes the theory behind theatrical improv, and applies it to the everyday, fostering communication and collaboration ideal for the work environment, where such skills are often overlooked in favor of the purely technical. Designed for students without any acting experience, there are no prerequisites to participate. This class will push the boundaries of your thought, facilitate greater awareness and expose you to powerful creative tools to enhance your professional and entrepreneurial success.
Instructor(s): Staff

EN.661.250. Oral Presentations. 3.0 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. No audits. Not open to students that have taken EN.661.150.
Prerequisites: Students make take EN.661.250 or EN.661.150, but not both.
Instructor(s): Staff
Writing Intensive.

EN.661.251. Oral Presentations for International Students. 3.0 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience’s attention. Special attention will be placed on diction, pronunciation, tone, pace and emphasis of language. Additional attention also will be given to syntax as well as non-verbal communication patterns. No audits. Not open to students that have taken EN.661.151.
Prerequisites: Students may take EN.661.251 or EN.661.151, but not both.
Instructor(s): Staff
Writing Intensive.

EN.661.271. Communicating as Scientists and Engineers. 3.0 Credits.
This course explores how to effectively communicate technical subjects to diverse audiences. Students will engage scientific and engineering communications from multiple genres, including popular articles, long form journalism, fiction, technical reports, and TED Talks, to analyze what makes technical communication successful. In addition to honing their communication skills through writing assignments, response papers, and brief presentations, students will apply what they’ve learned by writing a scientific or engineering article and delivering a technical presentation based on their area of study.
Instructor(s): Staff
Writing Intensive.

EN.661.301. Writing for the Law. 3.0 Credits.
This course teaches students to communicate effectively in various modes of legal discourse that are fundamental to the practice of law. Students will engage in writing nearly every session and will learn the basics of legal writing, editing (both the student’s and others’ work), and written/oral advocacy skills. Students can expect to work with litigation-related documents such as pleadings, preliminary and dispositive motions, and appellate briefs as well as non-litigation-related documents such as opinion articles, publications, essays, and various business-related contracts.

Writing Intensive.

EN.661.306. Special Topics in Professional Writing: Freelance Travel Writing. 3.0 Credits.
Are you interested in doing travel writing but can’t go abroad? Fear not! Some of the best travel writing happens when writers turn their gaze locally and write from the place they know best: their hometown. This eight-week, online class is designed to help you leverage whatever summer location you find yourself in—your hometown, your lab in Baltimore, or somewhere fabulous—to create high-impact, salable travel pieces. Each week, you’ll watch new recorded lectures on Blackboard, Skype with the instructor for 30 minutes, discuss a classic piece of travel writing, and interact with your peers—all from the comfort of your own home at your own pace. After gaining familiarity with the genre by reading several classics of travel writing and a selection of exemplary magazine articles, we will learn how to brainstorm ideas, plan research, interview skillfully, take useable photos with smartphones, polish pitches to editors, and write/revise/submit work for publication.

EN.661.315. Culture of the Engineering Profession. 3.0 Credits.
This course focuses on building understanding of the culture of engineering while preparing students to communicate effectively with the various audiences with whom engineers interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students will engage in discussion, argument, case study and project work to investigate: the engineering culture and challenges to that culture, the impacts of engineering solutions on society, the ethical guidelines for the profession, and the ways engineering information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication within the engineering culture through a series of short papers and presentations associated with analysis of the writings and cases. No audits. WSE juniors and seniors or by instructor approval.
Instructor(s): Staff
Area: Social and Behavioral Sciences
Writing Intensive.
EN.661.317. Culture of the Medical Profession. 3.0 Credits.
This course builds understanding of the culture of medicine as well as the ways in which different strata within society have access to and tend to make decisions about health and health related services while preparing students to communicate effectively with the various audiences with whom medical professionals interact. Working from a base of contemporary science writing (monographs, non-fiction, popular literature and fiction), students engage in discussion, argument, case study and project work to investigate topics such as the medical culture, the ways medicine is viewed by different segments of society, issues associated with access to health care, ethical dilemmas and guidelines for medical decisions, the impacts of medical and engineering solutions on society, decision making within client/patient groups, social and cultural differences that effect behavioral change, and the ways medical information is conveyed to the range of audiences for whom the information is critical. Additionally, students will master many of the techniques critical to successful communication through a series of short papers and presentations associated with analysis of the writings and cases. For sophomores, juniors, and seniors or by permission of instructor. No audits.

Writing Intensive.

EN.661.329. Improv for Science, Technology and Industry. 3.0 Credits.
It’s not what you say, it’s how you say it. In competitive STEM and industrial fields communication is essential. Effectively disseminating and receiving information not only affects the fields themselves, but each professional in those respective fields. In this class students will expound upon improv techniques to strengthen their ability to share scientific and technical information fluently and spontaneously without confusion or ambiguity. Additionally, this class will build upon students’ oratory and collaborative skills using theatrical exercises and improv comedy to cultivate powerful, thoughtful and authentic voices.
Prerequisites: EN.661.128 or EN.661.129
Instructor(s): Staff

EN.661.360. Marketing Your Start-up. 3.0 Credits.
This course provides students who have an enterprise or business idea with a road map for developing a complete marketing plan for their venture. From conducting industry and competitor analyses to formulating a marketing program with corresponding projections, students will have developed a professional marketing plan upon the conclusion of the course. Lecture content will be supplemented by guest speaker presentations by local entrepreneurs and marketing practitioners.
Prerequisites: EN.660.250 OR EN.660.105
Instructor(s): Staff.

EN.661.361. Corporate Communications & P.R.. 3.0 Credits.
This course focuses on the ways that organizations, both for-profit and non-profit, manage their communications to deliver strategic, coherent and compelling messages to their varied stakeholders. Using case studies and team-based, real world projects, we will explore topics including public and media relations, corporate image, branding, advertising, internal and external communications, crisis management, investor relations, ethics and social responsibility. In the process, we will consider issues ranging from organizational culture and leadership styles to defining strategy, managing conflict, defending positions and disagreeing agreeably. No audits. Recommended Course Background: AS.220.105, EN.661.110, AS.060.113 or AS.060.114, AS.060.215, EN.660.250, EN.660.105, and EN.661.250
Instructor(s): Staff
Writing Intensive.

EN.661.370. Visual Rhetoric. 3.0 Credits.
This course introduces students to basic concepts in visual communication. Students use principles of design thinking to produce projects that are both conceptually and visually compelling. Along the way, they learn design tools and techniques that help them refine their schemes. They also develop their vocabularies in visual communication so that they can better discuss their own work. Topics include: visual perception, composition/form, color theory, typography, photography, text, layers, grids and other systems of visual information architecture.
Instructor(s): Staff.

EN.661.380. Business Analytics. 3.0 Credits.
In this course students learn the procedures and processes that researchers use to determine answers to questions such as how to price a product, how to differentiate one product from another, and how to evaluate customer response to an offering. The materials combine fundamentals of research design with statistics procedures to answer the questions that entrepreneurs and marketing managers must answer as they write business plans, develop their product mix, set prices, create advertising and test products. The course combines case study, simulated situations, lecture, discussion and real-time projects to produce answers using the techniques, tools and procedures typically used in North American enterprises.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.661.500. Catalyst: A Student Run Magazine Independent Study. 1.0 - 3.0 Credits.
Students enrolled in this independent study will work as writers and editors for the student-run magazine. They will collaborate with the editorial team to produce content, develop magazine policies, and ensure that student work adheres to those policies. They may also create/direct artwork as needed.
Instructor(s): Staff.
EN.661.713. Advanced Communication for International Students: Financial Math. 1.5 Credits.

This course is designed to help only those international students studying in a special cohort toward a Master’s Degree in Financial Math. It teaches advanced ESL students to communicate more effectively with a wide variety of specialized and non-specialized audiences in a professional setting with ESL-specific intensive help in grammar, pronunciation, idiomatic phrasing, and overall clarity for students whose native language is not English. Projects include meet-and-greets, effective e-mails, memos, resumes, cover letters, reports, oral presentations, and building an overall comfort level with oral communication in English. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating real world environments in which most communication occurs. P/F grading only.
Instructor(s): Staff.

EN.662.611. Strategies: Accounting & Finance. 3.0 Credits.

This course includes a review of financial accounting with an emphasis on the implications of GAAP selections and other managerial decisions on the financial statements. Historic financial performance is assessed using ratio analysis. Relevant cash flows are used in capital budgeting situations; projects are analyzed using discounted cash flow techniques as a measure of valuation. Managerial accounting topics of financial forecasting, cost accumulation, cost allocation, product costing, and variance analysis are used in decision making. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): Staff.

EN.662.692. Strategies for Innovation & Growth. 3.0 Credits.

This course requires participants to work in groups to address, design and plan a business solution for an engineering problem with social implications. More specifically, students will work on cross-disciplinary teams to develop a commercially viable new technology. They must select a problem amenable to an engineering solution, investigate the problem, research the issues and potential, develop a design for the technology, investigate the competitive advantage, and create and present a business plan for the idea. Course content will address many of the issues that will be encountered during the process of bringing an idea to fruition. For M.S. in Engineering Management only; graded (not P/F); no audits.
Instructor(s): Staff.

EN.663.622. Professional Presentations for Graduate Students. 3.0 Credits.

This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. MSEM students only. Not open to undergraduates.
Instructor(s): Staff.

EN.663.600. Ethical Decision-making in Business and Science. 1.5 Credits.

This course introduces the student to concepts relevant to resolving ethical issues in business, science, and society. Students will learn ethical reasoning skills and frameworks to aid decision-making and to discuss ethical questions with their leaders, whether in a business, consulting or engineering firm, a science lab, or the communities within which they live and work.
Instructor(s): Staff.

EN.663.615. Building Effective Posters and Slides. 1.5 Credits.

This course teaches techniques in visual communication geared to suit emerging scientists. Students will learn the fundamentals of visual design, including theories of form, color and visual perception. The course will cover principles of typography, grid systems and other methods of establishing visual hierarchy. There will also be a short unit on commercial photography. Students will put this knowledge to work in the classroom to produce slides, conference posters and data visualizations. Grading: P/F or for letter grades.
Instructor(s): Staff.

EN.663.617. Information Visualization and Storytelling. 1.5 Credits.

This course explores the process of developing compelling visual stories based on data and information. Students will learn to edit, contextualize, sequence and compare data more effectively. They will also learn to use visual design tools to clarify the message they wish to convey about their data. Topics will include design thinking, visual perception, design theory, color theory, spatial relationships, pattern recognition, page layout, and basic probability and statistic concepts commonly used in the visualization process.
Instructor(s): Staff.

EN.661.713. Advanced Communication for International Students: Financial Math. 1.5 Credits.

This course is designed to help only those international students studying in a special cohort toward a Master’s Degree in Financial Math. Instructor(s): Staff.
EN.663.623. Professional Writing and Communication for International Students: Financial Math. 1.5 Credits.

This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that “edge” you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester. Financial Math students only. P/F only.

Instructor(s): Staff.

EN.663.624. Advanced Communication for International Students: Financial Math. 1.5 Credits.

This course is designed to help only those international students studying in a special cohort toward a Master's Degree in Financial Math. It teaches advanced ESL students to communicate more effectively with a wide variety of specialized and non-specialized audiences in a professional setting with ESL-specific intensive help in grammar, pronunciation, idiomatic phrasing, and overall clarity for students whose native language is not English. Projects include meet-and-greets, effective e-mails, memos, resumes, cover letters, reports, oral presentations, and building an overall comfort level with oral communication in English. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating real world environments in which most communication occurs. P/F grading only.

Instructor(s): Staff.

EN.663.626. Improvisation for Enhanced Teamwork and Communication. 1.5 Credits.

Following the lead of innovative communities and businesses, this course turns to improvisation techniques to develop communication skills, encourage creative problem solving, and support teamwork. Designed for students without any acting experience, there are no prerequisites to participate. In a non-threatening, judgment-free atmosphere, we begin with improv fundamentals to help students master the subtleties of communication through voice, expression, and body language. As students experiment with imaginative movement and play, they learn to respond spontaneously and confidently to unforeseen challenges. Working together in pairs and small groups, students build trust and operate as fluid and dynamic team members. Throughout the course students build skills to minimize stress, overcome rejection, find comfort in fear, unleash creativity, and trust in their ability to communicate effectively.

Instructor(s): Staff.

EN.663.630. Business Creation and Contracts. 1.5 Credits.

Introduces participants to the fundamental aspects of law associated with developing and bringing new products to the marketplace. Arranged in modules and taught largely through the case method, the course features the following topics: creating and forming businesses and contracts. GRADING: P/F for most students; letter grades for MSEM students.

Instructor(s): Staff.

EN.663.631. Intellectual Property Law. 1.5 Credits.

Arranged in modules and taught largely through the case method, the course features the following topics: intellectual property, principal-agent relations; and product liability. Not only will participants learn the principles associated with each topic, but also they will master the questions and concerns to use when working with legal counsel on these issues in the future. GRADING: P/F for most students; letter grades for MSEM students.

Instructor(s): Staff.

EN.663.633. Regulatory Writing. 1.5 Credits.

Regulatory writing explores the preparation of clinical documents throughout the life cycle of a (potential) treatment, starting with describing and reporting data from clinical trials, through preparing regulatory submission documents. Clinical documents to be discussed include clinical trial protocols, clinical trial informed consents (ICFs), investigator brochures (IBs), and clinical study reports (CSRs) among others. Essential skills for creating clear and readable documents including basic grammar and usage as well as sentence structure will also be reviewed.

Instructor(s): Staff.

EN.663.634. Improvisation for Communication. 3.0 Credits.

It's not what you say, it's how you say it. Science and Engineering are disciplines which mandate immersive study, attention to detail, and extreme forethought. Is it possible, then, that as students condition themselves to meet these needs, they compromise their ability to navigate impromptu social situations, public speaking events, and the like? In this class, students will expound upon improv techniques to strengthen their ability to share scientific and technical information fluently and spontaneously without confusion or ambiguity. This class turns to improvisation techniques to develop communication skills, encourage creative problem solving, and support teamwork.

Instructor(s): Staff.

EN.663.640. Writing Grant and Contract Proposals. 1.5 Credits.

Almost regardless of professional setting, proposals are used to secure work. They are the basis of funding in consulting, academic research, many social enterprises, business-to-business commerce, and government contracting. They require huge amounts of time and energy, yet success is far from guaranteed. In this module, you will master some of the techniques required for proposal writing success. Among the topics addressed are funding sources, writing skills that work, required content for all proposals, creating one voice in shared documents, dealing with "best-and-final negotiations and other important topics. Expect to complete several writing assignments for class including at least part of your own proposal.

Instructor(s): Staff.

EN.663.641. Improving Presentation Skills for International Students. 1.5 Credits.

This course is designed to help scientists and engineers who are non-native English speakers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded.

Instructor(s): Staff.
EN.663.643. Science Outreach: Communicating Science to the Public. 1.5 Credits.
This course teaches students to communicate effectively with a non-specialized audience including the “voting public,” teachers and high school students. Class projects include developing materials for mainstream science news outlet and a hands-on presentation. Class content emphasizes writing clearly for a non-technical audience, creating appropriate visuals and hands-on manipulatives, developing oral presentation skills, giving and receiving feedback, and simulating the real world environment in which most communication occurs. This is a 7-week course and is not open to undergraduates.
Instructor(s): Staff.

EN.663.644. Writing Articles and Technical Reports. 1.5 Credits.
Professionals in almost every occupation write – for multiple audiences in various information formats and for many reasons. Estimates of time spend writing in various occupations range from 25% to 35% of total work time. With so much time invested in the activity, it is imperative to learn to write effectively and efficiently. This Module addresses critical skills including how to find and qualify publishing opportunities; understanding and adjusting to different requirements; matching text to various audiences; developing striking visuals; and dealing with issues of clarity, coherence and style. This is a 7-week course and is not open to undergraduates.
Instructor(s): Staff.

EN.663.645. Improving Presentation Skills for Scientists and Engineers. 1.5 Credits.
This course is designed to help scientists and engineers improve their oral presentation skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both technical and non-technical audiences, and create clear, compelling PowerPoint presentations. All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course and is not open to undergraduates.
Instructor(s): Staff.

EN.663.646. Improving Presentation and Interview Skills for Humanities Students. 1.5 Credits.
This course is designed to give Humanities students an opportunity to refine their lecturing and interviewing skills in a practice-intensive environment. Students will learn how to hone their message, to craft presentations that address both expert and non-expert audiences, and create clear, compelling PowerPoint presentations (if appropriate). All presentations will be recorded for self-evaluation, and students will receive extensive instructor and peer feedback. Graduate students only. This is a 7-week course that begins halfway through the semester and is not open to undergraduates. Second 7 Weeks, Wednesday 4 – 6:30 pm.
Instructor(s): Staff.

EN.663.648. Introduction to Dissertation Writing. 1.5 Credits.
This course is designed to help students in any discipline and in any phase of the dissertation process move their work forward. Whether you are a beginning student who has no idea what your topic is or an advanced student facing the submission process in a few months, you will be able to use this workshop to help you focus your efforts more effectively and find out best practices for doing dissertation writing here at JHU. PhD students only.
Instructor(s): Staff
Area: Engineering, Natural Sciences.

EN.663.649. Continuing Dissertation Writing Workshop. 1.5 Credits.
This workshop provides continuing dissertation writers with the structure of a traditional classroom environment to help facilitate work on the dissertation and to provide a framework of personal accountability in meeting personal writing goals. This course is only open to students who have taken EN.663.648 Introduction to Dissertation Writing. PhD students only.
Prerequisites: EN.663.648
Instructor(s): Staff
Area: Engineering, Natural Sciences.

EN.663.651. The Entrepreneurial Cycle and Developing Effective Business Plans. 1.5 Credits.
So you have an idea for a business – now what? How do you convert your idea to a plan? What factors must you consider and how should you do that? How do you think about customers and competition? How much money do you need and where can you find it? How do you pitch your idea for maximum impact? Answers to these questions and more are the topics of concern for this module. Expect to build at least several sections of a business plan for your idea with the time period of the class. Graduate students only.
Instructor(s): Staff.

EN.663.652. Emotional and Cultural Competency. 1.5 Credits.
We live in increasingly diverse society and an increasingly connected world. Times require new skills and awareness; “smarts” as defined by IQ is no longer sufficient for success. Instead, an understanding of other cultures, a willingness to exercise empathy, and the ability to identify and work with the feelings of self and others are keys to successful participation in the workforce. This Module addresses these skills in theoretical and practical ways so as to expand the awareness and capacities of participants.
Instructor(s): Staff.

EN.663.653. Innovation and Entrepreneurship. 3.0 Credits.
This two-semester course in innovation and entrepreneurship is designed to give students the requisite skills to generate and screen ideas for new venture creation and then prepare the business plan for an innovative technology of their own design. The curriculum will focus on the ability of students to identify market needs, validate those needs, develop appropriate solutions, and construct the business case. Students will form multi-disciplinary teams to explore specific market spaces, usually provided by outside sponsors. The first semester will focus on identifying problems worth solving. During the second semester, teams will 1) select one problem, 2) design and build the solution to that problem, 3) identify the inherent commercial opportunities, and 4) formulate the business plan.
Instructor(s): Staff.

EN.663.654. Commercializing Your Invention or Idea. 1.5 Credits.
It is one thing to have an idea and quite another to move the idea from idea and basic research to use in the world of business or manufacturing. This course addresses the process and skills required to make that transition. Among the topics addressed in this class are the following: recognizing the potential of ideas, addressing the patent landscape, understanding markets, determining resource requirements, design and prototypes, and finding financing. Graduate and Post Doc Only.
Instructor(s): Staff.

EN.663.655. Social Media Integration for Entrepreneurship. 1.5 Credits.
Graduate students only.
Instructor(s): Staff.
EN.663.657. Innovation and Entrepreneurship II. 3.0 Credits.

This two-semester course in innovation and entrepreneurship is designed to give students the requisite skills to generate and screen ideas for new venture creation and then prepare the business plan for an innovative technology of their own design. The curriculum will focus on the ability of students to identify market needs, validate those needs, develop appropriate solutions, and construct the business case. Students will form multi-disciplinary teams to explore specific market spaces, usually provided by outside sponsors. The first semester will focus on identifying problems worth solving. During the second semester, teams will 1) select one problem, 2) design and build the solution to that problem, 3) identify the inherent commercial opportunities, and 4) formulate the business plan.

Prerequisites: EN.663.653
Instructor(s): Staff.

EN.663.660. Managing People and Resolving Conflicts. 1.5 Credits.

Have you ever had to deal with a difficult person at work or in the lab? Have you been a member of a team on which team dysfunction was so bad that it makes television sitcoms look normal? Why are some companies much more productive and pleasant to work with than others? Do you understand techniques of persuasion and how to participate effectively in negotiations? These topics are among the ideas we develop and practice in this class, using a combination of seminar style reading and discussion, lecture and in-class activity. Graduate students only.

Prerequisites: Students may take EN.663.660 or EN.663.663, but not both.
Instructor(s): Staff
Area: Engineering, Natural Sciences.

EN.663.663. The People Side of Work: Management, Conflict Resolution and Negotiation. 1.5 Credits.

Graduate and Post Doc Only.
Instructor(s): Staff.

EN.663.664. Marketing Strategies. 1.5 Credits.

This course, designed for students who have no prior instruction or experience in marketing, provides students with the opportunity to develop skills in formulating, implementing, and controlling a strategic marketing program (including sales and profit forecasts) for a given product-market entry. Using a structured approach to case analysis, students will learn how to make the kinds of strategic marketing decisions that will have a long-term impact on the organization. Through textbook readings, students will learn how to identify appropriate marketing strategies for new, growth, mature, and declining markets and apply these strategies as they analyze a series of marketing cases. The supplementary readings, from a broad spectrum of business periodicals, are more applied and will allow students to see how firms are addressing contemporary marketing challenges. And, one or more guest speakers from different functional areas of marketing, will be invited to speak to the class. In addition to analyzing cases individually, each student will be part of a team that studies a case during the latter half of the semester, developing marketing strategy recommendations with corresponding financials and presenting them to the class.

Instructor(s): Staff.

EN.663.666. Managing Personal Finances. 1.5 Credits.

The class in Managing Personal Finance is designed to familiarize the student with the basic concepts and quantitative techniques of personal financial planning and financial literacy. The course begins with a discussion of budgeting and the time value of money and moves on to the basic principles of financial planning in the areas of taxation, consumer credit, housing decisions, insurance, investing fundamentals and retirement planning. Graduate students only. No undergrads.
Instructor(s): Staff.

EN.663.670. Project Management. 1.5 Credits.

Projects are temporary activities devised to achieve very specific goals in a designated timeframe for a specified amount of resources. Often they involve disparate activities, frequently separated by distance and sometimes involving different staff and materials. For the project to successfully meet its objectives, all these items must be planned, coordinated and orchestrated. This module explores the processes and tools available to those who must manage projects to optimize outcomes within the primary constraints of time, quality, scope and budget. Class time involves presentations, examples and discussion.

Instructor(s): Staff.

EN.663.671. Leading Change. 1.5 Credits.

Change happens, like it or not!! It is necessary for progress and the result of innovation, yet change makes individuals and organizations so uncomfortable that most people and groups within organizations vigorously resist change. So the questions become how to cause, how to embrace and how to lead constructive change in our selves, our organizations and our communities – in ways that colleagues and would-be colleagues support and contribute toward success. The primary format for learning in this course is seminar style with reading, researching and sharing of information as well as structured, experiential activities designed to build skills through practice and interpersonal exchange. Class time is devoted to discussion, observation, feedback, additional exercises and presentation. Additionally participants engage in reflection and explanation of their considerations as the course progresses. GRADING: P/F for most students; letter grades for MSEM students. No undergraduates allowed except enrolled MSEM combined bachelor’s/master’s students.

Instructor(s): Staff.

EN.663.672. Management and Technology Consulting. 1.5 Credits.

Management consulting, an American innovation in organizational development, now has world-wide practice and effects. Almost every business sector— including private, governmental and NGO’s— employs consultants. Consultants must be able to effectively frame problems, understand their context, generate solutions, and protect the client and stakeholders, as well as work in a team environment and deliver a quality product. This class addresses the fundamental skills and expectations of working in this profession through a combination of lecture, discussion and exercise.

Instructor(s): Staff.
EN.663.673. Leading Teams in Virtual, International and Local Settings. 1.5 Credits.

Team-based leadership takes place in many different groups. Basic principles related to all contexts will be discussed. The nuances of leading in teams in different environments including face to face, virtual teams such as Skype, Google Chat, etc., and culturally different/global teams will be explored and practiced. The class environment will be discussion, team and practically based. The primary format for learning in this course is seminar style with reading, researching and sharing of information as well as structured, experiential activities designed to build skills through practice and interpersonal exchange. Class time is devoted to discussion, observation, feedback, additional exercises and presentation. Additionally, participants engage in reflection and explanation of their consideration as the course progresses. Further, participants read several texts and articles as well as perform extensive research in preparation for assignments.

Area: Engineering, Natural Sciences.

EN.663.674. Fundamentals of Management. 1.5 Credits.

Managers must juggle knowledge of and tasks associated with operations, finance, information technology, strategy, and projects. Much of managerial success, however, depends less on managers’ direct input – the sweat of their brows – than on their ability to enlist the active involvement of others: direct reports, other managers, other team members, and those above them on the organizational chart. It is imperative that managers be adept at influencing those over whom they have no formal authority as well as guiding and directing those who report to them. In this course, you will learn and practice the concepts and skills necessary to manage, direct, and guide others as well as content associated with building strategy and structure in organizations.

Instructor(s): Staff.

EN.663.675. Communicating in a Crisis. 1.5 Credits.

A crisis is a major occurrence with potentially negative consequences. In Chinese, the word “crisis” means “dangerous opportunity” signifying that an individual or an organization can emerge stronger from a crisis – not without damage but stronger – with the right management and communication deployed effectively to the right audiences in the right channel. In this course, we will explore what managing a crisis well actually means. Who do you need to communicate with? What channels are appropriate? What messaging works for different audiences? Using the case method, live simulations, and real-world examples we will distinguish the factors that create opportunities from crises from those that deepen the danger.

Instructor(s): Staff.

EN.663.676. Demand Discovery: Finding and Creating Customer Value. 1.5 Credits.

Do you love your smartphone? You're not alone. Steve Jobs knew how to design products that customers fell in love with. So did Henry Ford. So why is it so hard? This course focuses on real-world methods of discovering and profitably delivering value to customers. At the heart of any successful business is the identification and profitable satisfaction of unique customer needs. And the ongoing process of identifying, developing, and delivering new value propositions is the basis for continued growth. But this formula can be elusive for new ventures and existing businesses alike. The course presents leading edge methods and techniques to identify sources of opportunity, design new value propositions, and develop profitable and scalable business models—all while reducing venture risk. Developed from techniques used by entrepreneurs and innovative product managers, this course teaches key principles of offering development and innovation, through a combination of readings, case studies, and real-world exercises. The course will involve practical projects for students to identify and design offering concepts, as well as to test and price them. It is designed for students interested in business, entrepreneurship, intrapreneurship, product management, technology management, venture capital, and management consulting.

Instructor(s): Staff.

Cross Listed Courses

Entrepreneurship and Management

EN.660.321. Managing & Marketing Social Enterprises. 3.0 Credits.

This course focuses on preparing students to engage in and lead social enterprises as we explore the options for creating social value. Using a combination of lecture, case study and project work, we investigate both for-profit and non-profit models for creating social value with special emphasis on the non-profit community. Particular emphasis is placed on the management challenges of social enterprises such as creating and conveying their message, options for dealing with finances, relationships within communities, and methods for building constituencies. Additionally, we address critical issues such as measures of success, scale, replication and failure. The class requires contact with organizations in the community as well as one long weekend away from campus. Recommended Course Background: EN.660.105 or EN.660.333 or EN.660.220/EN.660.340. No audits.

Instructor(s): Staff

Writing Intensive.

EN.660.357. Copywriting and Creative Strategy. 3.0 Credits.

Uncover the process of creative thinking for innovation and conceiving “big ideas” in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. No audits.

Instructor(s): Staff

Writing Intensive.
EN.660.405. Intellectual Property Law. 3.0 Credits.
This course explores the acquisition, protection and commercialization of intellectual property, such as patents, trademarks, copyrights and trade secrets, and its impact on businesses and organizations. The course addresses critical issues such as the various types of intellectual property, the protection and commercialization of intellectual property by business and legal means, and the valuation of intellectual property. In addition, the tension between exclusive rights in intellectual property and free competition will be discussed throughout this course. Through interactive class discussions and a group project, students will have ample opportunity to develop a better understanding pertaining to the different types of intellectual property and to develop an intellectual property strategic plan for protecting an intellectual property portfolio. Specifically, the group project requires each team to research a selected Maryland based company's intellectual property, its plan for protection and commercialization and its business goals, products and services. Each team will then analyze how well the company's current business goals relate to its intellectual property portfolio, and recommend changes to better meet these company's goals. Not open to students who have taken EN.660.305 Intellectual Property Law. No audits.
Prerequisites: EN.660.205 Business Law I
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.660.461. Engineering Business and Management. 3.0 Credits.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): Staff
Area: Engineering.

EN.660.501. Practicum In Entrepreneurship and Management. 3.0 Credits.
Students work on an existing business or marketing plan/case project under the close supervision of an Entrepreneurship and Management faculty member. Students must apply by submitting a cover letter, resume, unofficial transcript, and essay describing the business concept/marketing plan. Applications must be approved by both the faculty member and director of CLE. Students are expected to meet regularly with the faculty member and complete assigned readings and projects. Permission required. S/U only.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

EN.661.150. Oral Presentations. 3.0 Credits.
This course is designed to help students push through any anxieties about public speaking by immersing them in a practice-intensive environment. They learn how to speak with confidence in a variety of formats and venues - including extemporaneous speaking, job interviewing, leading a discussion, presenting a technical speech, and other relevant scenarios. Students learn how to develop effective slides that capture the main point with ease and clarity, hone their message, improve their delivery skills, and write thought-provoking, well-organized speeches that hold an audience's attention. No audits.
Instructor(s): Staff
Writing Intensive.

EN.661.355. Special Topics in Professional Writing: Blogging about Food and Culture. 3.0 Credits.
Explore Baltimore's thriving food and restaurant scene while learning the art of criticism and best practices for blogging. In this journalism class taught by former New York Times Magazine editor Sarah Smith, students will study the work of some of the best writers in the field, from Laurie Colwin to Pete Wells, and using that work as a guide, write their own essays, reviews and features, which the class will discuss in a workshop setting. Instruction will include the basics of reporting and research; differences in writing for print and online media; ethics and legal concerns; and practical advice for pitching editors and setting up blogs. Recommended Course Background: At least one previous writing course.
Instructor(s): Staff
Writing Intensive.

EN.661.375. Copywriting & Creative Strategy. 3.0 Credits.
Uncover the process of creative thinking for innovation and conceiving "big ideas" in marketing. Students will be exposed to creative theory and practice as they select a consumer product and determine strategic market positioning, target demographics, media vehicles and creative guidelines. Then students will learn the craft of advertising copywriting for print, broadcast and digital media as they develop finished creative executions for the chosen organization that all build to a complete integrated marketing campaign. Co-listed with EN.660.357. No audits.
Prerequisites: EN.660.250 Principles of Marketing
Instructor(s): Staff
Writing Intensive.

EN.661.400. Practical Applications of Business Analytics. 3.0 Credits.
With higher transparency and increased sophistication in data collection, modern technology has become a central component in decision-making in all sectors of business. Unfortunately, most casual observers of this critical data are ill-equipped to meaningfully analyze this new information. This course will provide students with an overview of best practices in the field coupled with real-world examples and case studies. Recommended Course Background: EN.661.203 Business Analytics or a statistics based course prior to this course.
Instructor(s): Staff
Area: Social and Behavioral Sciences.

EN.661.425. Ethics of Biomedical Innovation. 3.0 Credits.
Engineers confront problems and make decisions that hold long term social consequences for individuals, organizations, communities and the profession. For biomedical engineers, these decisions may relate to: inventions such as medical devices and pharmaceuticals; neural prosthetics and synthetic biological organisms; responsible and sustainable design; availability of biotechnology in the developing world. Using a combination of cases, fieldwork and readings, we examine the ethical issues, standards, theory and consequences of recent and emerging engineering interventions as a way to understand the profession and to form a basis for future decisions. In addition students will learn and practice multiple forms of communication, including oral, visual and written rhetoric. A particular focus will be communication targeted to different stakeholders including other professionals and the public. Students will apply good communication principle to the discussion of biomedical engineering ethics, develop their own ethical case studies and participate in group projects to aid ethical decision-making, and to improve communication of complex biomedical ethical issues to others. Co-listed with EN.580.425.
Instructor(s): Staff
Area: Social and Behavioral Sciences
Writing Intensive.
EN.661.453. Social Media and Marketing. 3.0 Credits.
This course explores strategies for monitoring and engaging consumers in digital media. Students will gain practical knowledge about developing, implementing, and measuring social media marketing campaigns. They will learn how to analyze what consumers are saying and connect with them by leveraging word of mouth, viral and buzz marketing through sites like Facebook, Twitter and YouTube. A series of assignments build upon each other toward a final social media marketing plan for a selected consumer product or service. Co-listed with EN.660.453. No audits. 
Prerequisites: EN.660.250 Principles of Marketing; Students may receive credit for EN.661.453 or EN.660.453 but not both. 
Instructor(s): Staff
Writing Intensive.

EN.661.454. Blogging and Digital Copywriting. 3.0 Credits.
Learn how to develop, write and manage content for marketing communication on the Web and build an online presence through search engine optimization (SEO) and search engine marketing (SEM). Each student will create his/her own professional WordPress blog and gain knowledge on how to market it. They will also learn copywriting for various digital formats including Email marketing, website copy and social media while gaining an understanding of web analytics, conversion optimization, writing for keywords and mobile marketing. Recommended Course Background: one writing course in any discipline (professional communication, expository writing, or writing seminars). No audits. 
Prerequisites: EN.660.250
Instructor(s): Staff
Writing Intensive.

EN.661.610. Research Writing for International Students. 3.0 Credits.
This course is designed to help ESL writers succeed in writing, editing, and completing a large research project specific to their discipline. This could be a research report, journal article, literature review, dissertation chapter, grant proposal, or other relevant document. The course provided intensive help with grammar, idiomatic phrasing, and overall clarity for writers whose native language is not English. The course includes both individual consultation and group workshops. P/F grading only (students may elect to take this course for a traditional letter grade if their departments require them to do so; students must inform the instructor by the second week of class). No audits. 
Instructor(s): Staff
Writing Intensive.

EN.661.611. Professional Communication for ESL. 3.0 Credits.
This course teaches ESL students to communicate effectively with a wide variety of specialized and non-specialized audiences and will provide ESL-specific help with grammar, pronunciation, and idiomatic expression in these different contexts. Projects include production of resumes, cover letters, proposals, instructions, reports, and other relevant documents. Class emphasizes writing clearly and persuasively, creating appropriate visuals, developing oral presentation skills, working in collaborative groups, giving and receiving feedback, and simulating the real world environment in which most communication occurs. Not open to students who have taken EN.661.110 as Technical Communication or Professional Communication for Science, Business, and Industry or EN.661.120 Business Communication. Co-listed with EN.661.411. 
Instructor(s): Staff.

EN.661.612. Professional Writing and Communication for International Students: Financial Math. 1.5 Credits.
This course will prepare you to be competitive in the world of business by offering you some of the oral and written communication techniques you need to be successful. While working to enhance pronunciation, grammar, idiomatic expressions, and business vocabulary, you will work to speak comfortably in business social settings and meetings and to write effectively in a variety of modes not limited to e-mails, memoranda, resumes, and summary reports. The overall goal for all assignments is to speak and to write in clear, effective English. Moreover, improving oral and written communications will give you confidence, help you to make a good impression, and just maybe give you that “edge” you need to get the job you want or the project you desire once employed. Finally, individual pronunciation conferences will be scheduled with each of you throughout the semester. Financial Math students only. P/F only. No audits. 
Instructor(s): Staff.

Engineering Management
This course is designed to introduce students to key marketing, communications, and strategic issues surrounding the process of bringing new products to the marketplace. Through cases, readings, discussion and hands-on team projects, students develop a flexible approach to thinking about marketing problems, maximizing resources and creating strategic solutions. Written and oral work focuses on communicating effectively with target audiences using integrated media and developing interpersonal skills essential for managers, including presenting to a hostile audience, running meetings, listening, and contributing to group decision-making. For M.S. in Engineering Management only; graded (not P/F); no audits. 
Instructor(s): Staff.

Accounting & Financial Management

Accounting & Financial Management program offers Johns Hopkins Arts & Sciences, Engineering, and Peabody students a focused, quantitative minor that will prepare them more effectively for careers in small companies, major corporations, and consultancies as well as acceptance into graduate programs in accountancy and business.

The objective of the Minor in Accounting and Financial Management is to enable students in all disciplines to complement their major fields of study with academic training that will help them prepare for and compete within this expanding marketplace. The minor is not only relevant for students who plan to seek employment but critical for those who plan to attend graduate programs in accounting and business immediately after graduation. The Accounting and Financial Management Minor will help the CLE's graduates prepare for career opportunities in several fields that have high salaries and are predicted to grow substantially.

Students completing multiple minors:
Students must take at least three unique upper level* electives for each minor they undertake. *as defined by the CLE.

See the Undergraduate tab above for specific requirements for the minor.

Accounting & Financial Management Minor Requirements

- Four core courses: Introduction to Business, Financial Accounting, Professional Writing & Communication OR Oral Presentations & Business Analytics*
• Three upper-level courses; one course must be at the 400-level.

**Students completing multiple minors:**

Students must take at least three unique upper level* electives for each minor they undertake. *as defined by the CLE.

**Core Requirements:**

All four courses are required.

**Course and Grade Rules and Limitations:**

The Accounting & Financial Management minor requires a minimum of 22 credits.

A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the A&FM minor.

A maximum of 3 credits may be taken on an S/U basis, after freshman Fall semester.

All courses applied to the A&FM minor must be completed with a grade of C- or above.

**Master of Science in Engineering Management**

https://engineering.jhu.edu/cle/programs-minors/em_minor/

The Master of Science in Engineering Management (MSEM) degree program combines advanced course work in highly-specialized technical fields with a professional education in contemporary business, entrepreneurship, and management practices. Graduates of the program will be provided with the educational background to pursue professional management roles in industry.

**Facilities**

The MSEM program has a dedicated seminar room housed in Whitehead 105. Students are able to study, conduct research and build prototypes within this space.

**Graduate Requirements**

Please consult directly with the MSEM program director or MSEM academic advisor to confirm the below requirements; changes may have occurred since this annual publication.

Students in the MSEM program take ten courses to fulfill degree requirements, with the following guidelines:

- Five advanced courses in the engineering/technical concentration
- Three full-fall semester management courses, fall and spring MSEM Seminar courses, two half-semester required courses in the spring plus students may choose from a list of approved half-semester courses to complete their electives.
- No grade lower than C may be applied to the program
- Courses must be at the graduate level
- Departments sponsoring technical concentrations may impose stricter requirements for course work within the concentration
- Students are additionally required to complete Academic Ethics (EN.500.603), which does not count towards the degree requirements above.

At the discretion of the student’s advisors, an MSEM student may be permitted to double-count up to two JHU courses (one for the technical concentration and one for the management concentration) or apply graduate courses taken at JHU or elsewhere but not applied to a degree, in accordance with conditions in the WSE Policy on Double-Counting Courses.

**Advising**

MSEM students will receive advising on the engineering/technical concentration from a designated faculty member affiliated with that concentration. MSEM students will be advised regarding the management concentration by members of the Center for Leadership Education faculty.

**Faculty**

Faculty members teaching the technical concentration courses are listed in their respective engineering departments elsewhere in this catalog.
Faculty members teaching the management concentration courses are listed in the Center for Leadership Education section of this catalog.

Management Concentration
The Center for Leadership Education has constructed a five-course program tailored to the needs of future engineering managers. MSEM students will participate in a cohort program, which begins each fall, where all students in an entering class will take the following suite of management courses together:

In addition, all MSEM students are required to attend the MSEM Seminar course while enrolled in the program. This will meet weekly and addresses three important content areas: Innovation and design thinking; personal skills and development especially in the communication arena; and talks with practicing engineering managers. The Engineering Management program reserves the right to change the list of eligible courses at its discretion.

Internship Option
MSEM Course # EN.662.802: Engineering Management Internship Assessment

This course involves the assessment of a student's internship experience via a report and oral presentation. The questions and general format of the report and presentation will be provided by the instructor (http://memp.pratt.duke.edu/sites/memp.pratt.duke.edu/files/EGRMgmt_551_External.doc). The report and presentation will be evaluated by the instructor and both must be approved to obtain credit for this course. One full course may count toward graduation.

Technical Concentrations
In addition to fulfilling the management concentration requirements, MSEM students must complete the requirements for one of fifteen technical concentrations. These are:

- Biomaterials
- Chemical & Biomolecular Engineering
- Civil Engineering
- Communications Science
- Computer Science
- Fluid Mechanics
- Materials Science and Engineering
- Mechanical Engineering
- Mechanics and Materials
- Nano-Biotechnology
- Nanomaterials and Nanotechnology
- Operations Research
- Probability and Statistics
- Smart Product and Device Design
- Environmental Systems Analysis, Economics and Public Policy

Biomaterials
(Sponsored by the Department of Materials Science & Engineering (p. 911))

Prerequisites
- UG calculus, chemistry, biology, physics and introductory biomaterials course equivalent to EN.510.316 Biomaterials I

Required Courses (3)

</tr>
</tbody>
</table>

Substitutions for required courses can be made at the advisor's discretion.

**Computer Science**  
*(Sponsored by the Department of Computer Science (p. 821))*

Curricular Requirements

- Any five regular graduate courses approved by the advisor, 400-level or higher, from the Department of Computer Science, not including the senior thesis. Three 1-credit graduate courses may be combined to constitute one regular graduate course.

**Fluid Mechanics**  
*(Sponsored by the Department of Mechanical Engineering (p. 932))*

Any five courses in Fluid Mechanics or closely related discipline, at the 400-level or higher, as approved by the Faculty advisor. At least two of the required technical courses must be at the 600-level or higher.

**Materials Science & Engineering**  
*(Sponsored by the Department of Materials Science & Engineering (p. 911))*

**Prerequisites**

- UG calculus, chemistry and physics; biology is recommended

**Required Courses (1)**

<table>

Operations Research

(Sponsored by the Department of Applied Mathematics & Statistics (p. 691))

Prerequisites

Calculus-based background in Probability and Statistics. Students wishing to strengthen their background in this area may enroll in EN.553.420 Introduction to Probability and/or EN.553.430 Introduction
to Statistics, but these courses may not be used in fulfillment of this concentration's requirements.

Substitutions for required courses can be made at the advisor's discretion.

Elective Courses (2)
Any two courses from the following list, or a substitution as approved by the student's concentration advisor. As course offerings vary over time, an updated list of acceptable courses will be maintained on the MSEM program website.

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>

<td>4</td>
</tr>
<tr>
<td>EN.553.762</td>
<td>Nonlinear Optimization II</td>
<td>3</td>
</tr>
</tbody>
</table>

Alternative selections can be made at the advisor's discretion.

Probability and Statistics
(Sponsored by the Department of Applied Mathematics & Statistics (p. 691))

Admissions Requirements
- One upper-division undergraduate course in probability (equivalent to EN.553.420 Introduction to Probability)
- One upper-division undergraduate course in mathematical statistics (equivalent to EN.553.430 Introduction to Statistics)

Curricular Requirements
Any five (5) of the following courses, approved by the faculty advisor.

Additional Requirements
- An overall GPA of 3.0 must be maintained in courses used to meet the program's technical requirements. At most two course grades of C or C+ are allowed to be used, and the rest of the course grades must be B- or better.
- Students must satisfy the department's graduate student computing requirement.
- With advisor's approval, one non-departmental course containing appropriate mathematical or statistical content can be counted to satisfy the five course requirement.

Smart Product and Device Design
(Sponsored jointly by the Department of Mechanical Engineering (p. 932) and the Department of Electrical & Computer Engineering (p. 854))

Required Courses
<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.530.646</td>
<td>Robot Devices, Kinematics, Dynamics, and Control</td>
<td>4</td>
</tr>
<tr>
<td>EN.530.414</td>
<td>Computer-Aided Design</td>
<td>3</td>
</tr>
<tr>
<td>or EN.520.491</td>
<td>CAD Design of Digital VLSI Systems I (Juniors/Seniors)</td>
<td></td>
</tr>
<tr>
<td>EN.530.421</td>
<td>Mechatronics</td>
<td>3</td>
</tr>
</tbody>
</table>

Substitutions for required courses can be made at the advisor's discretion.

Elective Courses
Any two (2) courses approved by the faculty advisor.

Environmental Systems Analysis, Economics and Public Policy
(Sponsored by the Department of Environmental Health and Engineering (p. 878))

Required Courses (3)
At least one course from each of the three following groups:

- Economics (with calculus)—acceptable courses include EN.570.493 Economic Foundations for Environmental Engineering and Policy Design or equivalent. (This requirement may be waived if the student has already had an intermediate microeconomics course accepted by their advisor)
- Mathematics of Decision Making—acceptable courses include EN.570.495 Environmental Health and Engineering Systems Design and EN.570.497 Risk and Decision Analysis
- Policy—EN.570.607 Energy Policy and Planning Models

Substitutions for required courses can be made at the advisor's discretion.

Elective Courses (2)
Any of the courses listed in the Mandatory list (see Part A above)

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.570.496</td>
<td>Urban and Environmental Systems</td>

</tr>
<tr>
<td>EN.570.676</td>
<td>Stochastic Programming</td>
<td>3</td>
</tr>
</tbody>
</table>

Other courses in environmental economics, systems, or policy, as approved by the advisor.

Additional Notes
- All courses must be approved by the student's advisor.
- All course must be at the graduate level
- Students with a background in quantitatively rigorous economics sufficient for the economics requirement to be waived must still take five (5) courses in this area of concentration.
- No more than one course in environmental engineering may be used to fulfill the area of concentration and only with careful consultation with the student's advisor. Candidate courses in environmental engineering include:
  - EN.570.446 Biological Process of Wastewater Treatment, EN.570.490 Solid Waste Engineering and Management, EN.570.491 Hazardous Waste Engineering and Management, EN.570.647 Hydrologic Transport in the Environment, EN.570.657 Air Pollution, etc.
- No more than one C may be used toward the degree in this concentration.

Senior Lecturer
Lawrence Aronhime
W.P. Carey Minor in Entrepreneurship and Management

http://engineering.jhu.edu/cle

The Entrepreneurship & Management (E&M) program offers Johns Hopkins Arts & Sciences, Engineering, and Peabody students a broad array of courses designed to equip them to lead in business, professional, and academic arenas. Some students simply take a course or two. Many choose to fulfill the seven-course E&M minor, pairing it with their engineering, liberal arts, or public health major. The minor's three core courses, Introduction to Business, Financial Accounting, and Marketing Principles, provide a strong foundation in the fundamentals of entrepreneurial enterprises. Students can then select any three upper-level courses (plus the required work in statistics) to complete the minor or elect to focus further in Accounting and Finance, Business Law, Leadership and Organizational Behavior, or Professional Communication.

The minor in entrepreneurship and management focuses on business and management from a multidisciplinary viewpoint, with a quantitative emphasis. The program, part of the Center for Leadership Education (p. 758), offers students a diversified learning experience that emphasizes the concepts, practices, and skills necessary for effective leadership as managers and entrepreneurs in the public and private sectors.

The primary goal of the program is to provide Hopkins students with the knowledge and skills to become effective leaders and entrepreneurs. Individuals with excellent technical training and abilities often move into management positions or start new ventures. As their careers progress, they will be better prepared for success if they have the ability to understand financial reports, interpret statistical data, organize and effectively lead a team, design strategy, analyze and correct problems in the firm’s operations, and understand the dynamics of the marketplace.

The minor is purposely designed to serve different types of students. The program will help prepare students for entrance to law school, an MBA program, or other graduate school. After graduation, other students will start working in engineering or technical positions, then later move into management or start their own businesses. A third group of students is primarily interested in gaining knowledge to follow more generalized careers in finance and business.

Students completing multiple minors:

Students must take at least three unique upper level* electives for each minor they undertake. *as defined by the CLE.

Core Requirements
1. Statistics - These courses expose students to the foundations of statistics that are used extensively in business decision-making. These topics include correlation, estimation, hypothesis testing, linear regression, prediction, and forecasting. Students may take either two elementary statistics courses or one intermediate/advanced calculus-based statistics course from the list below.

Option One: Two Elementary Statistics Courses (EN.550.112 is the required second course). Credit earned for AP Statistics (equivalent to EN.550.111) will satisfy the first of the two required courses.

EN.553.111 Statistical Analysis I 4
or AS.230.205 Introduction to Social Statistics
or AS.280.345 Public Health Biostatistics
EN.553.112 Statistical Analysis II 4

Option Two: One Intermediate/Calculus-Based Course (must have Calculus as a prerequisite)

EN.553.211 Probability and Statistics for the Life Sciences 4
or EN.553.310 Probability & Statistics
or EN.553.311 Probability and Statistics for the Biological Sciences and Engineering
or EN.553.430 Introduction to Statistics
or EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers
or EN.560.348 Probability & Statistics in Civil Engineering

2. Entrepreneurship and Management Fundamentals - Students must complete three fundamental courses in entrepreneurship and management. These courses are:

EN.660.105 Introduction to Business 4
EN.660.203 Financial Accounting 3
EN.661.110 Professional Writing and Communication 3
or EN.661.250 Oral Presentations

3. Upper-Level Elective Courses in Entrepreneurship and Management
Students must complete three upper level courses in entrepreneurship and management. Courses may be chosen from a number of areas, including:

**Accounting & Finance** - These courses educate students about financial concepts, investments, and financial markets. This information is valuable for the entrepreneur starting a new venture, a manager to be effective with a corporation, and management consultants.

**Business Law** - These courses educate students about legal issues in business and how the law is used to protect intellectual property.

**Leadership & Organizational Behavior** - These courses provide knowledge of both general principles and specific practices needed for working effectively with people in an organization. These courses focus on leadership, team building, ethics, and psychology.

Students who wish to complete a focus area in one of the areas listed above must complete three courses from that area, with at least one at the 400-level.

Lists of acceptable courses are provided below. These lists are regularly updated and may be obtained at the Center for Leadership Education office or on the center’s website [https://engineering.jhu.edu/cle/programs-minors/em_minor](https://engineering.jhu.edu/cle/programs-minors/em_minor).

### Course and Grade Rules and Limitations

The E&M minor requires a minimum of 22 credits.

A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the E&M minor.

One course may be taken on an S/U basis.

All courses applied to the E&M minor must be completed with a grade of C- or above.

For current faculty and contact information go to [http://engineering.jhu.edu/cle/faculty](http://engineering.jhu.edu/cle/faculty)

### Faculty

**Director**

Timothy Weihs

Director of CLE, Professor of Materials Science & Engineering.

**Program Directors**

Lawrence Aronhime

Senior Lecturer & Director of International Programs: accounting, finance, entrepreneurship, technology commercialization.

Annette Leps

Senior Lecture and Director of Entrepreneurship & Management Program: accounting, finance, management.

Julie Reiser

Senior Lecturer & Director of Marketing & Communications: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice

Senior Lecturer & Director of Graduate Programs: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.

Pamela Sheff

Senior Lecturer & Director of Master of Science in Engineering Management Program: business and technical communication, marketing, public relations, science and scientific writing, oral
presentations, higher education in prisons, community-based learning, entrepreneurship.

**Full Time Faculty**

Bob Graham  
Lecturer: entrepreneurship, professional communication, oral presentations.

Illysa Izenberg  
Lecturer: engineering management.

Leslie Kendrick  
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing, internships.

Charlotte O'Donnell  
Lecturer: oral presentations, professional communication, visual rhetoric.

William Smedick  
Senior Lecturer: leadership theory, leadership in teams.

**Part Time Faculty**

Michael Agronin  
Lecturer: new product development.

Justin Beauchamp  
Lecturer: Leadership

Jennifer Bernstein  
Lecturer: professional communication.

Susan Conley  
Lecturer: Marketing

Laura Davis  
Lecturer: Professional communication for ESL and Oral presentations for ESL.

Marci DeVries  
Lecturer: marketing.

Kevin Dungey  
Senior Lecturer: oral presentations.

Sean Furlong  
Lecturer: Financial Accounting

David Fisher  
Lecturer: business law.

Mark Franceschini  
Senior Lecturer: business law, business ethics, Internet law.

Mary Beth Furst  
Lecturer: Introduction to Business.

Guido Galvez  
Lecturer: business.

Jeremy Gorelick  
Lecturer: business analytics, business development.

Christine Grillo  
Lecturer: writing articles, writing technical reports.

Jason Heiseman  
Lecturer: oral presentations.

Christopher Jeffers  
Lecturer: business law.

Mark Kennedy  
Lecturer: copywriting.

Andrew Kulanko  
Senior Lecturer: oral presentations.

Andres Lares  
Lecturer: sports negotiation.

Seth LeJacq  
Lecturer: communication

Denise Link-Farajali  
Lecturer: professional communication: financial math for ESL, research writing for ESL.

David Mahoney  
Lecturer: social media, marketing.

Michael Mattia  
Lecturer: leadership.

Lindsay Monti  
Lecturer: business law.

Marco Priolo  
Lecturer: managerial finance.

Bryan Rakes  
Lecturer: business law.

Joshua J. Reiter  
Senior Lecturer: business process management, total quality management, information technology management, Internet-based business applications, creativity and innovation, entrepreneurship.

Elaine Richman  
Lecturer: writing articles, writing technical reports.

Tiffany Sanchez  
Lecturer: leadership.

Douglas Sandhaus  
Senior Lecturer: business law, business ethics, Internet law.

Dennis Sullivan  
Lecturer: marketing.

Jay Thompson  
Lecturer: professional communication.

Adam Treiser  
Lecturer: business analytics.

Tamara Warren-Chinyani  
Lecturer: emotional intelligence, diversity.

Caroline Wilkins  
Lecturer: professional communication.
Marketing and Communications

The Marketing & Communications (M&C) program offers Johns Hopkins Arts & Sciences, Engineering and Peabody students a broad array of courses designed to equip them to lead in the marketing and communications fields, and complements major courses of study in departments across campus. Students who opt to declare the minor will choose between two tracks: the Marketing Management track and the Integrated Marketing Communications track. Courses are also open to students who choose not to declare the minor.

The Marketing Management track is geared towards students who wish to pursue a career in product or marketing management at a large-scale enterprise. This track emphasizes learning how to manage both the message and the financial impact of marketing campaigns, as well as how to manage a product line from development to launch.

The Integrated Marketing Communications track is designed for students who want to be more involved in the creative side of the marketing field, including areas such as advertising, public relations and social media. This track emphasizes forming marketing messages, and the production of creative content and deliverables for a variety of different industries.

See the Undergraduate tab above for specific requirements for the minor.

Marketing and Communications Minor Requirements

• Three core courses  
• One foundational course  
• Four upper-level courses in the desired track; one course must be at the 400-level.

Please note: Students must take at least three unique upper-level electives* for each minor they undertake within the CLE.

*as defined by the CLE

Core courses; all three required

Course and Grade Rules and Limitations

The Marketing and Communications minor requires 25 credits for the Marketing Management track and 28 credits for the Integrated Marketing Communications track.

A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the M&C minor.

A maximum of three credits may be taken on an S/U basis.

All courses applied to the M&C minor must be completed with a grade of C- or above.

Faculty

Director

Pamela Sheff

Program Directors

Lawrence Aronhime  
Senior Lecturer & Director of International Programs: accounting, finance, entrepreneurship, technology commercialization.

Annette Leps  
Senior Lecturer & Director of the Accounting & Financial Management and Entrepreneurship & Management Programs: accounting, finance, management.

Julie Reiser  
Senior Lecturer & Director of the Marketing & Communication Program: technical communication, oral presentations, research writing, dissertation writing, American literature and critical theory.

Eric Rice  
Senior Lecturer & Director of the Professional Development Program: organizational behavior, social entrepreneurship, management, negotiation and conflict management, leadership, public speaking, professional writing.
Marketing and Communications

Pamela Sheff
Senior Lecturer & Director of the Master of Science in Engineering Management Program: business and technical communication, marketing, public relations, science and scientific writing, oral presentations, higher education in prisons, community-based learning, entrepreneurship.

Full Time Faculty
Bob Graham
Lecturer: entrepreneurship, professional communication, oral presentations.

Illysa Izenberg
Lecturer: engineering management.

Leslie Kendrick
Senior Lecturer: marketing strategy, integrated marketing communications, sports marketing, international marketing, internships.

Charlotte O'Donnell
Lecturer: oral presentations, professional communication, visual rhetoric.

William Smedick
Senior Lecturer: leadership theory, leadership in teams.

Part Time Faculty
Michael Agronin
Lecturer: new product development.

Jennifer Bernstein
Lecturer: professional communication.

Alexander Cocron
Lecturer: management, technology consulting.

Mary Clare Coghlan
Lecturer: leadership.

Anne Colgan
Lecturer: ESL consulting.

Susan Conley
Lecturer: marketing.

Laura Davis
Lecturer: professional communication for ESL, oral presentations for ESL.

Kevin Dungey
Senior Lecturer: oral presentations.

Shelley Etzine
Lecturer: professional communication for ESL.

David Fisher
Lecturer: business law.

Tavish Forsyth
Lecturer: improv.

Mark Franceschini
Senior Lecturer: business law, business ethics, Internet law.

Sean Furlong
Lecturer: financial accounting.

Guido Galvez
Lecturer: business.

Herman Goodyear
Lecturer: project management.

Daniel Hake
Margaret Hart
Lecturer: communications.

Michael Hartwell
Lecturer: improv.

Jason Heiserman
Lecturer: oral presentations.

Christopher Jeffers
Lecturer: business law.

Andrew Kulanko
Senior Lecturer: oral presentations.

Andres Lares
Lecturer: sports negotiation.

Denise Link-Farajali
Lecturer: professional communication: financial math for ESL, research writing for ESL.

David Long
Lecturer: management, technology consulting.

Trevor Mackesey
Lecturer: communications, oral presentations.

David Mahoney
Lecturer: social media, marketing.

Lindsay Monti
Lecturer: business law.

Heather Parker
Lecturer: dissertation writing.

Marco Priolo
Lecturer: managerial finance.

Bryan Rakes
Lecturer: business law.

Joshua J. Reiter
Senior Lecturer: business process management, total quality management, information technology management, Internet-based business applications, creativity and innovation, entrepreneurship.

Tiffany Sanchez
Lecturer: leadership.

Douglas Sandhaus
Senior Lecturer: business law, business ethics, Internet law.

Adam Treiser
Lecturer: business analytics.

Caroline Wilkins
Lecturer: professional communication.
Professional Communication Program

https://engineering.jhu.edu/cle/

Strong communications skills are the key to success in any discipline. The Professional Communication Program (PCP) offers Johns Hopkins undergraduates a variety of hands-on courses designed to develop their abilities to research, write, speak, and display data persuasively. Starting with the highly popular foundation courses EN.661.110 Professional Writing and Communication and EN.661.150 Oral Presentations, the program expands to specialized workshops and seminars on topics ranging from science and research writing, engineering culture and ethics to entrepreneurship, public relations and social media. PCP students create journals, write blogs, present pitches and posters, and conduct multimedia PR campaigns. All PCP courses are small—19 or fewer students—ensuring that everyone receives the skilled attention necessary to grow as a writer and presenter. Since many of our students are international, PCP offers English as a Second Language (ESL) sections of Professional Writing and Communication and Oral Presentations as well as free ESL tutoring.

For current faculty and contact information go to https://engineering.jhu.edu/cle/faculty/

Trevor Mackesey
Lecturer: professional communication.

Caroline Wilkins
Lecturer: professional communication.

Professional Development Program

The Professional Development Program (PDP) answers the need to broaden graduate education as expressed in many recent academic articles. For example, The Commission on Pathways Through Graduate School (http://pathwaysreport.org) noted in their final report that more than one-half of all doctoral degree holders in science, engineering or health fields work outside the academy. And while employers believe these graduates bring value, recent graduates lack skills and knowledge in areas like working on teams, entrepreneurship, communication, and project management.

The Professional Development Program is designed to address these needs. The program currently offers a series of some twenty, 7-week courses in topics such as writing business plans, managing people, writing winning proposals and improving presentations. Courses are open to all full time graduate students (masters, PhD and post-doctoral fellows) at Johns Hopkins. A small and growing number of masters degree programs in the Whiting school (only) accept a limited number of these courses as elective credits. Speak with your degree advisor to learn more.

For more information, including a current class schedule and a listing of all modules, visit: engineering.jhu.edu/pdp

Senior Lecturer: business process, quality management.

Chemical and Biomolecular Engineering

http://www.jhu.edu/chembe/

Chemical and Biomolecular Engineering (ChemBE) is dedicated to the design and exploitation of chemical, biological, and to the study of phenomena for chemical and biological applications. As a result of the scope and breadth of this rigorous undergraduate program, our students commonly secure employment in industries such as chemical and pharmaceutical production, biomedicine, biotechnology, material design, food, and energy. Graduates may embark on a career to explore new products such as:

- Novel polymers and materials
- Biopharmaceuticals
- Biofuels
- Drugs and Vaccines
- Gene Therapy Products
- Drug Delivery Devices
- Cells and Tissues
- Semiconductors
- Nanodevices
- Food, Beverage, and Health Care Products
- Cells and Tissues
- Gene Therapy Products
- Drug Delivery Devices
- Cells and Tissues
- Semiconductors
- Nanodevices
- Food, Beverage, and Health Care Products

The demands on the modern engineer are high, and graduates must possess a wide range of skills in order to be competitive in a global market. The ChemBE program successfully satisfies these demands. Students take advanced courses in chemistry, physics, mathematics, and biology. Additionally, students are trained in transport, kinetics, and thermodynamics, which are essential to solving real-world engineering problems. Students also hone their professional and communication skills (report writing, oral presentations, and teamwork) in courses involving experimental projects, process design and product design.

Depending on their interests and future career goals, students can choose electives from exciting areas including green engineering, nanotechnology, and bioengineering. These courses, along with undergraduate research opportunities offered by our faculty, are designed to prepare graduates for careers in the chemical industry, biotechnology, pharmaceuticals or microelectronics. The curriculum also offers an outstanding foundation for advanced graduate studies in chemical and biomolecular engineering, biomedical engineering, materials engineering, or for medical, law, or business school.

Students also have the opportunity to develop more in-depth specialty in one or two areas within chemical and biomolecular engineering. Our two tracks are Interfaces and Nanotechnology (IN) and Molecular and Cellular Bioengineering (MCB).

Interfaces and Nanotechnology (IN) Track
Interesting and new physics exist at nanometer length scales, as the surface area of an object begins to approach and exceed its volume. In this focus area, students are trained in the fundamental sciences used to solve problems in nanotechnology and interfacial science. Students take a chemistry course in Materials and Surface Characterization, an advanced physical chemistry laboratory course, and two electives such as Colloids and Nanoparticles, Supramolecular Materials and Nanomedicine and Micro/Nanotechnology.

Molecular and Cellular Bioengineering (MCB) Track
Fields in biotechnology and biomedicine often involve processes at biological, cellular and molecular levels. Common areas utilizing skills in the MCB focus area include the genetic manipulation of cells for protein and vaccine production, and the study and treatment of diseases such as arteriosclerosis and cancer. Students in this focus area must take a

Students also have the opportunity to develop more in-depth specialty in one or two areas within chemical and biomolecular engineering. Our two tracks are Interfaces and Nanotechnology (IN) and Molecular and Cellular Bioengineering (MCB).

Interfaces and Nanotechnology (IN) Track
Interesting and new physics exist at nanometer length scales, as the surface area of an object begins to approach and exceed its volume. In this focus area, students are trained in the fundamental sciences used to solve problems in nanotechnology and interfacial science. Students take a chemistry course in Materials and Surface Characterization, an advanced physical chemistry laboratory course, and two electives such as Colloids and Nanoparticles, Supramolecular Materials and Nanomedicine and Micro/Nanotechnology.

Molecular and Cellular Bioengineering (MCB) Track
Fields in biotechnology and biomedicine often involve processes at biological, cellular and molecular levels. Common areas utilizing skills in the MCB focus area include the genetic manipulation of cells for protein and vaccine production, and the study and treatment of diseases such as arteriosclerosis and cancer. Students in this focus area must take a
laboratory course in Biochemistry, and two electives such as Metabolic Systems Biotechnology, The Design of Biomolecular Systems, and Computational Protein Structure Prediction. In addition, students will take the Biomolecular Engineering Laboratory to learn the hands-on skills required for future careers in biological systems at the molecular and cellular level.

Our mission is to define and educate a new archetype of innovative and fundamentally-grounded engineer at the undergraduate and graduate levels through the fusion of fundamental chemical engineering principles and emerging disciplines. We will nurture our passion for technological innovation, scientific discovery, and leadership in existing and newly created fields that transcend traditional boundaries. We will be known for developing leaders in our increasingly technological society who are unafraid to explore uncharted engineering, scientific, and medical frontiers that will benefit humanity. Recent graduates of the Chemical and Biomolecular Engineering program will attain within a few years of graduation:

- succeed in careers in industrial, academic or government organizations in which they apply their chemical and biomolecular engineering skills to solve diverse long-standing or emerging problems
- excel in their graduate program, medical school or other professional education
- be recognized as future leaders in their chosen field
- perpetuate the JHU legacy of passion for learning, technical excellence, community service and research innovation to foster knowledge creation, lead discovery and impact society.

The department also offers graduate programs leading to the Master of Science and Ph.D. degrees. These programs emphasize research leading to a written thesis.

Undergraduate students strongly involved in research may be interested in our B.S./M.S.E. program in Chemical and Biomolecular Engineering that allows students to obtain a master’s of science in engineering immediately after completion of their bachelors.

**Facilities**
The offices and state-of-the-art laboratories of Chemical and Biomolecular Engineering are located in Maryland Hall on the Homewood campus. The research laboratories are well-equipped for studies in the areas of biochemical engineering, cell and tissue engineering, phase equilibria, membrane science, polymer science, interfacial phenomena, separation processes, fluid mechanics, and nucleation phenomena. The Milton S. Eisenhower Library on the Homewood campus contains over two million volumes and access to more than 325 electronic journals. The university’s other libraries located at the School of Medicine and at the Applied Physics Laboratory are also available to students. Through close collaborations with scientists at the National Institutes of Health, and the National Institute of Standards and Technology, The Institute for Genomic Research, Human Genome Sciences, Inc., and the Food and Drug Administration, students and faculty also have access to a variety of world-class facilities and other resources for research.

**Financial Aid**
Undergraduate scholarships and financial assistance are described on the Student Financial Services (http://finaid.johnshopkins.edu) website. Part-time work is available in the Chemical and Biomolecular Engineering research laboratories on research projects supported by grants and contracts. There also is a federally sponsored work-study program for qualified students.

Financial assistance to graduate students is available in the forms of research assistantships, teaching assistantships, fellowships, and partial or full tuition remission. The financial aid package is specified following acceptance into the graduate program.

**Undergraduate Programs**
Graduates receive a Bachelor of Science degree in Chemical and Biomolecular Engineering accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org. As permitted under the ABET guidelines, we are continually updating our undergraduate programs to include the latest advances in chemical and biomolecular engineering. Such modifications will enable us to offer the best possible educational experience to our undergraduates. For the latest chemical engineering educational programs, potential applicants are referred to our website at http://www.jhu.edu/chembe/

**Requirements for the B.S. Degree**
(See also General Requirements for Departmental Majors (p. 7))

The Bachelor of Science degree requires a minimum of 128 credits. Additional details are given in the Chemical and Biomolecular Engineering Undergraduate Advising Manual available from the department or online. The 128 credits must include:

</tbody>
</table>
### Advanced Chemistry and Biology Courses **

- AS.020.305 Biochemistry  
- EN.540.307 Cell Biology for Engineers (Optional; students must take this or EN.540.204)  
- AS.020.315 Biochemistry Project lab  
- or AS.030.307 Experiments in Physical Chemistry for Engineers  
- or AS.250.253 Protein Engineering and Biochemistry Lab  
- EN.540.204 Applied Physical Chemistry  
- or EN.540.307 Cell Biology for Engineers

### Mathematics Requirement ***

- AS.110.108 Calculus I  
- AS.110.109 Calculus II (For Physical Sciences and Engineering)  
- AS.110.202 Calculus III  
- or AS.110.211 Honors Multivariable Calculus  
- AS.110.302 Differential Equations and Applications  
- AS.110.302 Differential Equations and Applications  
- AS.110.302 Differential Equations and Applications

### Humanities and Social Sciences/ Writing Requirements

- EN.661.315 Culture of the Engineering Profession  
- Humanities and Social Sciences Courses. Eighteen credits designated as Humanities or Social and Behavioral Sciences are required. At least one of these courses must be an advanced course at the 300-level or higher in addition to Culture of Engineering. See the Chemical and Biomolecular Engineering Undergraduate Advising Manual for more details.  
- Writing Courses. Two writing-intensive courses are required. One of the courses must be EN.661.315 Culture of the Engineering Profession. The courses that are taken to satisfy the university writing requirement must be passed with a grade of C- or better.  
- The departmental computing requirement is satisfied by EN.540.305 Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers. This course can be substituted with a statistics course paired with a programming course such as EN.500.112 Gateway Computing.  
- Undesignated Electives. A minimum of 128 credits is required for the degree. Therefore, in addition to all the credits taken to fulfill the requirements mentioned in the various sections above (e.g., chemical engineering core courses, engineering electives, basic science, advanced chemistry electives, mathematics requirement, and Humanities and Social and Behavioral Sciences courses) additional credits (called undesignated credits) are required.

* Students also must have a grade point average of at least 2.00 in the chemical and biomolecular engineering core courses to graduate. The core courses for GPA calculation comprise all of the above courses except for EN.540.101 Chemical Engineering Today and EN.540.490 Introduction to Chemical Process Safety.  
** Students need additional courses beyond these courses. Requirements include additional courses in Chemistry and Biology. Students who are pursuing tracks in Molecular and Cellular Bioengineering or Interfaces and Nanotechnology have additional and/or alternate requirements.  
*** Calculus is so essential to Chemical Engineering that a grade of C- or better in both Calculus I and Calculus II is required.

Total Credits: 127-129

**Tracks**

Students pursuing a degree in Chemical and Biomolecular Engineering have the option of concentrating on specific fields including Interfaces and Nanotechnology and Molecular and Cellular Bioengineering. Students completing a track will have this fact designated on their official university checklist. These focus areas have additional and/or alternate requirements, as described.

**Molecular and Cellular Bioengineering (MCB) Track**

Students must fulfill the following requirements:

- Students take either AS.020.306 Cell Biology or EN.540.307 Cell Biology for Engineers.
- The Advanced Chemistry and Biology laboratory requirement is fulfilled with AS.020.315 Biochemistry Project lab or AS.250.253 Protein Engineering and Biochemistry Lab.
- Six credits of bioengineering electives are required. See department for a list of approved electives.
- Students take EN.540.313 Projects in ChemBE Unit Operations with Experiments instead of EN.540.311 Projects in ChemE Unit Operations with Experiments.

## Interfaces and Nanotechnology (IN) Focus Area

Students must fulfill the following requirements:

- Students take EN.540.204 Applied Physical Chemistry.
- The Advanced Chemistry and Biology laboratory requirement is fulfilled with AS.030.305 Physical Chemistry Instrumentation Laboratory I.
- AS.030.452 Materials & Surface is required and satisfied three credits of the advanced chemistry electives.
- Six credits of interfaces and nanotechnology electives are required. See department for a list of approved electives.

B.S./M.S.E. Program in Chemical and Biomolecular Engineering

The B.S./M.S.E. program in Chemical and Biomolecular Engineering allows students to obtain a master of science in engineering immediately after the bachelor of science degree by adding at least a year of study. For students who qualify academically, the Whiting School of Engineering allows a 50 percent waiver after the completion of eight semesters or having received the Bachelor of Science degree.

Graduate Programs

Master of Science in Engineering

Students have two options in pursuing an M.S.E. in Chemical and Biomolecular Engineering: (a) a coursework-only MSE, or (b) an essay-based MSE (which entails obtaining approval to work under the guidance of a ChemBE faculty advisor to create and document original research to be submitted in an essay).

1. Essay-Based Master of Science in Engineering Checklist
   - The student must complete six graduate level, i.e. 600 and above, courses approved by the student’s research advisor and the Director of the Master's Program. The student and research advisor select these courses to design a curriculum appropriate for the student’s research interest and educational goals.
   - These six courses cannot include seminars, independent study, graduate research or special studies. They should be at least 3 credit hours per course. Students are allowed to substitute any combination of 1-2 credit hour courses (not to include seminars, independent study, graduate research, or special studies) for one of their 3 credit hour courses with advisor approval.
   - At least four of the six courses must be in the Chemical and Biomolecular Engineering Department (540.xxx or 545.xxx). Exceptions to this rule must be approved by the Director of the Master’s Program. A course from a department other than ChemBE may be allowed to count as one of the four courses only if the course has significant Chemical and Biomolecular Engineering content, is 3 credit hours (or the student intends to use their one allowable substitution on a set of courses that add to three credit hours), and is consistent with the student’s research interests or educational goals.
   - Of the four ChemBE courses, 3 must be the MSE core courses:
     - Thermodynamics in Practice (Offered in the Fall)
     - Kinetics and Reactor Design (Offered in the Spring)
     - Transport and Numerical Tools (Offered in the Spring)
   - Students are allowed to count 400-level courses towards their MSE degree if the course is not offered at the 600-level. Courses offered at both the 400- and 600-level must be taken at the 600-level to fulfill MSE course requirements. All ChemBE coursework must be taken at the 600-level.
   - The student must also enroll in at least one semester of graduate seminars (540.600/601) throughout his or her tenure.
   - Students must have a B average in coursework to complete this degree.
   - No D grade in ChemBE courses can be counted toward the requirements. In a given semester the receipt of a single D, F, or 2 C grades result in probation. Once in probation an additional C grade or below will result in termination from the program. A student will remain on academic probation until the courses with the D or F grades have been re-taken for a higher grade or (if no D or F grades were present) the student attains a B average in their coursework.
   - Students must remain in good research standing with their research advisor. Failure to do so will result in probation and transfer to the coursework MSE program.
   - The student must write an essay based on original research and literature review and present his or her results at an open seminar attended by the faculty and students. The essay must be approved by the departmental graduate committee, which consists of the graduate research advisor and at least one more faculty member from the Department of Chemical and Biomolecular Engineering.
   - In a semester where the student is solely pursuing research, the student must maintain full-time registration.
   - Completion of Responsible Conduct of Research training. For complete information, see eng.jhu.edu/wse/page/conduct-of-research-training
   - Completion of Academic Ethics (EN.500.603)
   - Please obtain verification and approval to take courses before registering.

2. Coursework-Only Master of Science in Engineering Checklist
   - The student must complete ten graduate level, i.e. 600 and above, courses approved by the Director of the Master’s program. These courses must be worth 3 credit hours per course. The student and the academic advisor select these courses to design a curriculum appropriate for the student’s interest and educational goals.
   - These ten courses cannot include seminars, independent study, graduate research or special studies.
   - At least six of the ten courses must be in the Chemical and Biomolecular Engineering Department (540.6xx and 545.6xx). Exceptions to this rule must be approved by the Director of the Master’s Program. A course from a department other than ChemBE may be allowed to count as one of the six courses only if the course has significant Chemical and Biomolecular Engineering content and is consistent with the student’s educational goals and is 3 credit hours. Students are allowed to substitute any combination of 1-2 credit hour courses (not to include seminars, independent study, graduate research, or special studies) for one of their 3 credit hour courses.
   - Of the six ChemBE courses, 3 must be the core courses:
• Thermodynamics in Practice (Offered in the Fall)
• Kinetics and Reactor Design (Offered in the Spring)
• Transport and Numerical Tools (Offered in the Spring)

• Students are allowed to count 400-level courses towards their MSE degree if the course is not offered at the 600-level. Courses offered at both the 400- and 600-level must be taken at the 600-level to fulfill MSE course requirements. All ChemBE coursework must be taken at the 600-level.

• The student must also enroll in at least one semester of graduate seminars (540.600/601) throughout his or her tenure in the Department of Chemical and Biomolecular Engineering at Johns Hopkins University.

• Students must have a B average in coursework to complete this degree.

• No D grade in ChemBE courses can be counted toward the requirements. In a given semester the receipt of a single D, F, or 2 C grades result in probation. Once in probation an additional C grade or below will result in termination from the program. A student will remain on academic probation until the courses with the D or F grades have been re-taken for a higher grade or (if no D or F grades were present) the student attains a B average in their coursework.

• Completion of Academic Ethics (EN.500.603)

Additional information and requirements can be found in the department Graduate Handbook.

Doctor of Philosophy

The Ph.D. degree is awarded for original research performed under the guidance of a thesis advisor. The formal requirements for this degree are:

1. Completion of six graduate-level courses including the four required core courses.
2. Completion of an annual research evaluation each year.
3. Serve as a teaching assistant for at least two required courses.
4. Completion in the first semester of departmental safety requirements (see Handbook for more information).
5. Attend graduate seminars (540.600/601) every semester. Students are expected to enroll and attend department seminars throughout their tenure in the department.
7. Completion of an original research project, documented in a dissertation that is defended by the candidate in a public presentation.
8. Completion of Responsible Conduct of Research training. For complete information, see eng.jhu.edu/wse/page/conduct-of-research-training
9. Completion of Academic Ethics (EN.500.603)
10. Application for Graduation submitted to Registrar's office.

Ph.D. Course Work

Students must successfully complete six graduate-level courses including the four required core courses listed below:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.540.630</td>
<td>Thermodynamics, Statistical Mechanics, and Kinetics</td>
<td>3</td>
</tr>
<tr>
<td>EN.540.652</td>
<td>Advanced Transport Phenomena</td>
<td>3</td>
</tr>
<tr>
<td>EN.540.602</td>
<td>Metabolic Systems Biotechnology</td>
<td>3</td>
</tr>
<tr>
<td>EN.540.615</td>
<td>Interfacial Science with Applications to Nanoscale Systems</td>
<td>3</td>
</tr>
</tbody>
</table>

Ph.D. Students are strongly encouraged to take the four required courses in the first fall semester. However, students who do not have an undergraduate degree in Chemical Engineering or a closely related field may need additional course and should discuss an appropriate course plan with the Director of the Graduate Program at the start of their first semester.

The remaining two engineering or science courses are chosen with the help of the student’s advisor to design a curriculum appropriate for the student’s research interest. These two courses cannot include seminars, independent study, graduate research or special studies.

Each of the six courses must be passed with a letter grade of B- or higher. In addition, the student must maintain an overall grade point average (GPA) of 3.0 or better. If the student’s GPA falls below 3.0, the student must re-take one or more of the courses and earn a higher grade. All grades remain on graduate students transcripts. If a student receives a grade of C+ or lower in a required core course, the student will be allowed to re-take the course once to achieve a grade of B- or higher. Failure to receive a B- or better the second time will be cause for dismissal from the program. Receipt of grades of C+ or lower in two or more required courses will ordinarily be cause for dismissal from the program without the opportunity to re-take those courses.

Ph.D. Thesis Criteria and Graduate Board Oral Exam

Candidates must write a dissertation conforming to university requirements that describes the students work and results in detail. A public defense of the dissertation is required, and will be followed by a closed examination session. Because the closed examination session fulfills the university Graduate Board Oral (GBO) examination requirement, all procedures pertaining to GBOs as established by the University Graduate Board must be followed.

Additional information can be found in the department Graduate Handbook.

For current faculty and contact information go to http://www.jhu.edu/chembe/faculty-staff/

Faculty

Chair
Paulette Clancy
Head

Professors
Michael J. Betenbaugh
Professor: genomics, recombinant DNA biotechnology, biopharmaceuticals, metabolic engineering, insect and mammalian cell culture, glycosylation engineering, and cell death processes.

Michael A. Bevan
Professor and Director of Graduate Studies: colloidal interactions, dynamics, assembly, nanoparticle materials and devices, biomacromolecular interactions

Marc D. Donohue
Professor: phase equilibria, statistical thermodynamics, kinetics of diffusion and phase transitions, adsorption.

Sharon Gerecht
Professor: embryonic and adult stem cells, vascular regeneration, micro/nano fabrication, biomaterials, tissue engineering

David H. Gracias
Professor: phase equilibria, statistical thermodynamics, kinetics of diffusion and phase transitions, adsorption.

Michael Tsapatis
Bloomberg Distinguished Professor: zeolite synthesis, separations, catalysis

Denis Wirtz
Professor and Vice Provost for Research: cell adhesion and migration, cell mechanics, cytoskeleton, receptor-ligand interactions, cancer, particle tracking, new proteomics tools.

Associate Professors
Stavroula Sofou
Associate Professor: heterogeneous lipid bilayers, drug delivery/nanobiomaterials, targeted chemotherapy, alpha-particle therapy.

Honggang Cui
Associate Professor: nanoscience and nanotechnology, biomolecular engineering, peptide synthesis and assembly, drug delivery, supramolecular polymers, nanoparticle imaging, diagnosis, and cancer therapeutics.

Joelle Frechette
Associate Professor and Director of Master’s Studies: properties of surfaces, thin films; fluid interfaces and confined fluids; measurements of surface forces and adhesion; micro and nanotechnology; microfluidics; nanoparticles.

Rebecca Schulman
Associate Professor: nanotechnology, self-assembly, theory and experiment, nucleation, biomanufacturing, DNA, nanoelectronics, biomolecular engineering, single-molecular analysis.

Assistant Professors
Jamie Spangler
Assistant Professor: structural and molecular immunology, protein engineering, therapeutic antibody discovery and design, targeted drug development.

Chao Wang
Assistant Professor: heterogenous catalysis, renewable energy technologies e.g., photoelectrochemical solar cells and lithium batteries, and green chemical engineering.

Senior Lecturer
Lise Dahuron
Senior Lecturer and Director of Undergraduate Studies: separations, distillation, membrane technology, new product development, process design.

Carmo Pereira
Senior Lecturer: catalysis and reaction engineering in chemical engineering practice.

Lecturer
Sakul Ratanalert
Lecturer: Engineering Education, Unit Operations, Process Design, Thermodynamics, DNA Nanotechnology

Professor Emeritus
Joseph L. Katz
Professor Emeritus: nucleation processes (e.g., condensation of supersaturated vapors, boiling of superheated liquids and its applications, e.g., the Ouzo effect, parts per quadrillion detection) formation of nanosized ceramic oxide powders in flames, new proteomics tools.

Research Professor
Gregory Aranovich
Research Professor: molecular thermodynamics, phase equilibria, adsorption phenomena, separation processes, and diffusion.

Assistant Research Professor
Daniele Gilkes

Eva Lai
Assistant Research Professor: biomedical sciences, biomonitoring technologies, regenerative medicine, tissue engineering.

Joint, Part-Time and Visiting Appointments
Steven An
Associate Professor, Johns Hopkins University Bloomberg School of Public Health

Patrick Breysse
Professor, Johns Hopkins University School of Medicine, Division of Environmental Health Engineering

Jennifer Elisseeff
Professor, Johns Hopkins University School of Medicine, Department of Ophthalmology
Director of the Translational Tissue Engineering Center
Jonah Erlebacher
Professor & Chair, Johns Hopkins University Whiting School of Engineering, Materials Science and Engineering
Justin Hanes
Lewis J. Ort Professor of Ophthalmology, Johns Hopkins University School of Medicine, Ophthalmology
John Isaacs
Professor, Johns Hopkins University, School of Medicine
Kenneth Pienta
Professor, Johns Hopkins University School of Medicine, Urology
Research
Martin Pomper
Professor, Johns Hopkins University School of Medicine, Radiology
Kai Qi
Adjunct Assistant Professor
Kannan Rangaramanujam
Professor, Johns Hopkins University School of Medicine, Ophthalmology
Doug Robinson
Professor, Johns Hopkins University School of Medicine, Cell Biology
Peter Searson
Professor, Johns Hopkins University Whiting School of Engineering, Materials Science and Engineering
Joy Yang
Visiting Associate Professor
Jin Zhang
Professor, Johns Hopkins University School of Medicine, Pharmacology
For current course information and registration go to https://sis.jhu.edu/courses/

Courses

EN.540.101. Chemical Engineering Today. 1.0 Credit.
A series of weekly lectures to introduce students to chemical and biomolecular engineering and its role as a profession in addressing contemporary technological, social, ethical, and economic issues in today’s world. The lectures will include examples of how chemical and biomolecular engineers apply the principles of physics and chemistry to develop new products, improve process efficiencies, and alleviate the strain on the ecosystem through the design of novel environmentally conscious processes. In addition, the lectures will highlight exciting new areas now being advanced by chemical and biomolecular engineers, such as biochemical engineering, tissue engineering, nanoparticle fabrication, and processing smart polymers for applications in computer technology and as sensors. Freshmen Only.
Instructor(s): X. Wan
Area: Engineering.

EN.540.111. Matlab Made Easy. 1.0 Credit.
Computer programming is as crucial a tool for modern engineering as calculus. Engineers use computers for almost everything: from design and manufacturing in industry to data collection and analysis in research. In this course, students will use a piece of popular engineering software, Matlab, to learn the fundamentals of programming. We will start simple, exploring such questions as: What is a program? How can we use loops and branches to accomplish a task? What exactly is Matlab doing when it’s running a script? Finally, we will build upon the fundamentals of programming to tackle relevant engineering problems. This course will help ChemBE students excel in subsequent engineering courses, such as Modeling and Statistics for ChemBEs, Separations, and Chemical Kinetics, by giving students’ knowledge of the tool that helps solve complex engineering problems.
Instructor(s): E. Volkova; H. Zierden; S. Schaffter
Area: Engineering.

EN.540.202. Introduction to Chemical & Biological Process Analysis. 4.0 Credits.
Introduction to chemical and biomolecular engineering and the fundamental principles of chemical process analysis. Formulation and solution of material and energy balances on chemical processes. Reductionist approaches to the solution of complex, multi-unit processes will be emphasized. Introduction to the basic concepts of thermodynamics as well as chemical and biochemical reactions.
Prerequisites: (AS.030.101 OR AS.030.103) AND (AS.171.101 OR AS.171.107) AND (AS.030.102 OR AS.030.103 OR AS.110.109 OR AS.171.102)
Instructor(s): J. Gray
Area: Engineering.

EN.540.203. Engineering Thermodynamics. 3.0 Credits.
Formulation and solution of material, energy, and entropy balances with an emphasis on open systems. A systematic problem-solving approach is developed for chemical and biomolecular process-related systems. Extensive use is made of classical thermodynamic relationships and constitutive equations for one and two component systems. Applications include the analysis and design of engines, refrigerators, heat pumps, compressors, and turbines.
Prerequisites: EN.540.202;AS.110.202
Instructor(s): J. Frechette; M. Bevan
Area: Engineering.

EN.540.204. Applied Physical Chemistry. 3.0 Credits.
The topics in this course include thermodynamic models for multicomponent phase equilibrium including vapor liquid equilibrium, phase diagrams, activity models and colligative properties in both non-electrolyte and electrolyte solutions. A link between average thermodynamic properties and microstates and molecular interactions is made via a discussion of intermolecular forces and the partition function. Also covered are thermodynamic relationships to describe chemical equilibria, and basic concepts in quantum mechanics and statistical mechanics.
Prerequisites: EN.540.203 AND EN.540.305
Instructor(s): D. Gracias
Area: Engineering.
EN.540.290. Chemical Engineering Modeling and Design for Sophomores. 3.0 Credits.
The courses EN.540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.291. Chemical Engineering Modeling and Design for Sophomores. 3.0 Credits.
The courses 540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.301. Kinetic Processes. 4.0 Credits.
Review of numerical methods applied to kinetic phenomena and reactor design in chemical and biological processes. Homogeneous kinetics and interpretation of reaction rate data. Batch, plug flow, and stirred tank reactor analyses, including reactors in parallel and in series. Selectivity and optimization considerations in multiple reaction systems. Non isothermal reactors. Elements of heterogeneous kinetics, including adsorption isotherms and heterogeneous catalysis. Coupled transport and chemical/biological reaction rates.
Prerequisites: EN.540.203 AND EN.540.303; EN.540.305 or programming course
Instructor(s): H. Cui
Area: Engineering.

EN.540.303. Transport Phenomena I. 3.0 Credits.
Molecular mechanisms of momentum transport (viscous flow), energy transport (heat conduction), and mass transport (diffusion). Isothermal equations of change (continuity, motion, and energy). The development of the Navier Stokes equation. The development of non isothermal and multi component equations of change for heat and mass transfer. Exact solutions to steady state, isothermal unidirectional flow problems, to steady state heat and mass transfer problems. The analogies between heat, mass, and momentum transfer are emphasized throughout the course.
Prerequisites: AS.110.302
Instructor(s): J. Frechette
Area: Engineering.

EN.540.304. Transport Phenomena II. 4.0 Credits.
Prerequisites: EN.540.303.
Instructor(s): Z. Gagnon
Area: Engineering.

EN.540.305. Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers. 3.0 Credits.
This course seeks to build the student's strength in Chemical Engineering computing and data analysis. To this end, in the first part of the course, we will become familiar with the Matlab/Octave computing environment and solve problems in Chemical Engineering that involve concepts from Process Analysis, Thermodynamics, Transport Phenomena, and Kinetics. In the subsequent part, we will build on the skills learnt earlier and tackle problems in Data Analysis and Hypothesis testing.
Prerequisites: EN.540.202 AND AS.110.302
Instructor(s): R. Schulman
Area: Engineering.

EN.540.306. Chemical & Biomolecular Separation. 3.0 Credits.
This course covers staged and continuous-contacting separations processes critical to the chemical and biochemical industries. Separations technologies studied include distillation, liquid-liquid extraction, gas absorption, membrane ultrafiltration, reverse osmosis, dialysis, adsorption, and chromatography. Particular emphasis is placed on the biochemical uses of these processes and consequently on how the treatment of these processes differs from the more traditional approach.
Prerequisites: EN.540.203 AND EN.540.305 or programming course
Instructor(s): M. Betenbaugh
Area: Engineering.

EN.540.307. Cell Biology for Engineers. 3.0 Credits.
This course explores fundamental structural details and molecular functions of different parts of the cell. Considerable emphasis is placed on experimental/quantitative approaches to answering these questions. Topics include Central dogma and the nucleus; protein trafficking; ion transporters; cytoskeleton; molecular motors; cell cycle and cell division; signal transduction, cell growth and cancer; cell death, the extracellular matrix; cell adhesion, cell junctions and epithelium; and muscle contraction, cell motility and morphogenesis.
Prerequisites: Cell Biology restriction: students who have completed AS.020.306 may not enroll.
Instructor(s): J. Yang; R. Li
Area: Natural Sciences.
EN.540.309. Product Design Part 1. 2.0 Credits.
This course guides the student through the steps of product design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments. This course is the first part of a two-semester sequence that optionally can be taken instead of EN.540.314 Chemical and Biomolecular Engineering Product Design. The material covered is the same as in EN.540.314, but more time is allowed so that laboratory tests can be performed and/or prototypes can be made. Note that students must take 540.310 to complete this sequence and before registering for this class.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.; EN.540.303 AND EN.540.490; EN.540.306 AND EN.540.301
Instructor(s): M. Donohue
Area: Engineering.

EN.540.310. Product Design Part 2. 2.0 Credits.
This course is one part of a two semester sequence that optionally can be taken instead of for This course is the second part of a two semester sequence (with EN.540.309) that optionally can be taken instead of EN.540.314 Chemical and Biomolecular Engineering Product Design. Students continue to work with their team on their product design project. Students report several times both orally and in writing on their accomplishments. The material covered is the same as in EN.540.314, but more time is allowed so that laboratory tests can be performed and/or prototypes can be made. Note that both courses, EN.540.309 and EN.540.310 must be taken to satisfy the Undergraduate degree requirement of the Chemical and Biomolecular Engineering program. The two courses can be started in any term.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.; EN.540.309
Instructor(s): M. Donohue
Area: Engineering.

EN.540.311. Projects in ChemE Unit Operations with Experiments. 6.0 Credits.
This course challenges students with laboratory projects that are not well-defined. Students work in groups to develop an effective approach to experiments. They identify the important operating variables, decide how best to obtain them using measured or calculated values. Based on their results they predict, carryout, analyze and improve experiments. Each student analyzes at least two of the following biomolecular projects: bioreactor, biocatalysis and membrane separation and one of the projects in EN.540.311. In addition to technical objectives, this course stresses oral and written communication. Students will have additional meeting times with the instructors and some writing professors outside of class.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.; EN.540.301 AND EN.540.304 AND EN.540.306 AND EN.540.490 AND EN.661.315
Instructor(s): A. Goffin; L. Dahuron; M. Ostermeier; S. Gerecht
Area: Engineering
Writing Intensive.

EN.540.312. Projects in ChemBE Unit Operations with Experiments Part 2. 3.0 Credits.
Students who, as a part of an exchange program, participated in a laboratory course at the Technical University of Denmark at Copenhagen during the summer are required to register for this course to complete their equivalency requirement for the Chemical and Biomolecular Engineering Laboratory course offered in fall at JHU. The final grade for this course will incorporate the DTU grade. In addition, students perform one experimental project and submit a full professional report along with the current Senior Lab students. Students make a 15-min presentation to the junior class about their projects and of their experience in Denmark.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.; EN.540.301 AND EN.540.304 AND EN.540.306 AND EN.540.490 AND EN.661.315
Instructor(s): C. Pereira; L. Dahuron
Area: Engineering
Writing Intensive.

EN.540.313. Projects in ChemBE Unit Operations with Experiments. 6.0 Credits.
This course challenges students with laboratory projects that are not well-defined. Students work in groups to develop an effective approach to experiments. They identify the important operating variables, decide how best to obtain them using measured or calculated values. Based on their results they predict, carryout, analyze and improve experiments. Each student analyzes at least two of the following biomolecular projects: bioreactor, biocatalysis and membrane separation and one of the projects in EN.540.311. In addition to technical objectives, this course stresses oral and written communication. Students will have additional meeting times with the instructors and some writing professors outside of class.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.; EN.540.301 AND EN.540.304 AND EN.540.306 AND EN.540.490 AND EN.661.315
Instructor(s): A. Goffin; L. Dahuron; M. Ostermeier; S. Gerecht
Area: Engineering
Writing Intensive.

EN.540.314. ChemBE Product Design. 2.0 Credits.
This course guides the student through the contrasting aspects of product design and of process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Process design concerns the quantitative description of processes, which serve to produce many commodity chemicals, the estimation of process profitability, and the potential for profitability improvement through incremental changes in the process. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments.
Prerequisites: EN.540.303; EN.540.306 AND EN.540.301
Instructor(s): A. Goffin; C. Pereira; T. Fekete
Area: Engineering.

EN.540.315. Process Design with Aspen. 2.0 Credits.
Prerequisites: EN.540.303; EN.540.306 AND EN.540.301
Instructor(s): A. Goffin; L. Dahuron
Area: Engineering.
EN.540.390. Chemical Engineering Modeling and Design for Juniors. 3.0 Credits.
The courses EN.540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.391. Chemical Engineering Modeling and Design for Juniors. 3.0 Credits.
The courses 540.290, 291, 390, and 391 guide the students through the open-ended problems in product and process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the creation of new products to fulfill a societal need. Process design concerns the quantitative description of processes which serve to produce chemically-derived materials and the estimation of process profitability. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the principles of unit operations and design. Students report weekly both orally and in writing on their accomplishments. Some projects are single semester, but others can be multi-semester. Students can start in any semester and can work on projects for as many semesters as they want.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.400. Project in Design: Pharmacokinetics. 3.0 Credits.
This is a design course in which the design projects will be to develop pharmacokinetic models of the human body that can be used to understand the temporal distribution, spatial distribution and bioavailability of pharmaceutical drugs. The course (and software to be developed) will cover the spectrum of factors affecting pharmaceutical bioavailability including drug formulation, mode of dosing and dosing rate, metabolism and metabolic cascades, storage in fatty tissues, and diffusional limitations (such as in crossing the blood-brain barrier or diffusional differences between normal and cancerous cells). The goal is to develop process models of the human body that will predict pharmaceutical bioavailability as a function of time and organ (or cell) type that will work for a wide variety of pharmaceuticals including small molecules, biologics, and chemotherapy agents. This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 90 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week's topic or their progress on their project.
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.401. Projects in Design: Alternative Energy. 3.0 Credits.
This course is a group design project (i.e. not a lecture course) to use chemical process simulation tools to model a real-world, alternative-energy process of interest to Chemical and Biomolecular Engineers. The goal of the project will be to develop a process model that is sufficiently complete and robust that it can be used to understand the important factors in the process design and/or operation. This design project is focused on the role alternative energy will play in our country's future. About a third of the course will be devoted to understanding the role of energy and alternative energy in the US and world economies. The remainder of the course will be devoted to a technical and economic analysis of the an alternative energy technology. This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 60 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week's topic or their progress on their project.
Meets with EN.540.619
Prerequisites: EN.540.202 AND EN.540.203 AND EN.540.301 AND EN.540.305
Instructor(s): M. Donohue
Area: Engineering.

EN.540.402. Metabolic Systems Biotechnology. 3.0 Credits.
The aim of this course is to provide a fundamental understanding of the quantitative principles and methodologies of systems biology and biochemical engineering of metabolism. This includes concepts of cellular growth, cellular stoichiometric models, metabolic networks, metabolite fluxes, and genome-scale metabolic models. Quantitative methods and systems biology approaches for metabolic flux analysis and metabolic control theory will be included as well as an analysis of biochemical systems and bioreactors including a consideration of mass transport processes.
Prerequisites: AS.020.306 OR ( EN.580.440 OR EN.580.441 ) OR EN.540.307
Instructor(s): M. Betenbaugh
Area: Engineering.

EN.540.403. Colloids and Nanoparticles. 3.0 Credits.
Fundamental principles related to interactions, dynamics, and structure in colloidal, nanoparticle, and interfacial systems. Concepts covered include hydrodynamics, Brownian motion, diffusion, sedimentation, electrophoresis, colloidal and surface forces, polymeric forces, aggregation, deposition, and experimental methods. Modern topics related to colloids in nano- science and technology will be discussed throughout the course with frequent references to recent literature.
Meets with EN.540.603
Instructor(s): M. Bevan
Area: Engineering.
EN.540.405. The Design of Biomolecular Systems. 3.0 Credits.
This course covers new topics in the design of systems of biomolecules, both in vitro and in vivo, for decision making and control. The course will begin with an overview of how logical decision making and control with biomolecules as is achieved in biology and then proceed to consider various strategies of engineering similar systems. The focus of the course will be on systems level principles rather than the biochemistry of molecule design. Topics will include engineering of transcriptional networks and genetic control for logically programming of cells, the design of in vitro mimics of genetic controls, molecular computing and systems aspects of metabolic engineering. The course will also cover quantitative and computational techniques for the simulation and analysis of biomolecular systems. Co-listed with EN.540.605
Instructor(s): R. Schulman
Area: Engineering.

EN.540.409. Dynamic Modeling and Control. 4.0 Credits.
Introduction to modeling, dynamics, and control. Unsteady state analysis of biomolecular and chemical process control systems. State space and Laplace transform techniques, block diagram algebra, and transfer functions. Feedback and feedforward control. Frequency response and stability analysis. Applications in chemical engineering (chemical reactors and separative processes) as well as biomolecular engineering (biosynthesis, pharmacokinetic modeling and biomolecular modeling based upon central dogma/gene expression). Introduction to nonlinear dynamics.
Prerequisites: EN.540.301 AND EN.540.306
Instructor(s): A. Goffin
Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.414. Computational Protein Structure Prediction and Design. 3.0 Credits.
This class will introduce the fundamental concepts in protein structure, biophysics, optimization and informatics that have enabled the breakthroughs in computational structure prediction and design. Problems covered will include protein folding and docking, design of ligand-binding sites, design of turns and folds, design of protein interfaces. Class will consist of lectures and hands-on computer workshops. Students will learn to use molecular visualization tools and write programs with the PyRosetta protein structure software suite, including a computational project. Programming experience is recommended.
Instructor(s): J. Gray
Area: Engineering.

EN.540.415. Interfacial Science with Applications to Nanoscale Systems. 3.0 Credits.
Nanostructured materials intrinsically possess large surface area (interface area) to volume ratios. It is this large interfacial area that gives rise to many of the amazing properties and technologies associated with nanotechnology. In this class we will examine how the properties of surfaces, interfaces, and nanoscale features differ from their macroscopic behavior. We will compare and contrast fluid-fluid interfaces with solid-fluid and solid-solid interfaces, discussing fundamental interfacial physics and chemistry, as well as touching on state-of-the-art technologies.
Instructor(s): J. Frechette
Area: Engineering.

EN.540.418. Projects in the Design of a Chemical Car. 2.0 Credits.
Ready to put those concepts from class into practice? Members work over the course of the semester to design and build a chemically powered vehicle that will compete with other college teams at the American Institute of Chemical Engineers (AIChE) Regional Conference. In this course, the students work in small groups to design and construct the chassis along with chemically powered propulsion and break mechanisms within the constraints of the competition. In addition, students will give oral presentation, write reports, and do thorough safety analysis of their prototypes. Both semesters (EN.540.418 and EN.540.419) must be completed with passing grades to receive credit. This course may be repeated.
Instructor(s): L. Dahuron
Area: Engineering.

EN.540.419. Projects in the Design of a Chemical Car. 2.0 Credits.
Ready to put those concepts from class into practice? Members work over the course of the semester to design and build a chemically powered vehicle that will compete with other college teams at the American Institute of Chemical Engineers (AIChE) Regional Conference. In this course, the students work in small groups to design and construct the chassis along with chemically powered propulsion and break mechanisms within the constraints of the competition. In addition, students will give oral presentation, write reports, and do thorough safety analysis of their prototypes. Both semesters (EN.540.418 and EN.540.419) must be completed with passing grades to receive credit. This course may be repeated.
Instructor(s): L. Dahuron
Area: Engineering.

EN.540.421. Project in Design: Pharmacodynamics. 3.0 Credits.
It is a design course in which the design projects will be to develop pharmacodynamic models of the human body that can be used to understand the physiologic effects of drugs on the body. The course (and software to be developed) will cover the spectrum of ways in which pharmaceuticals affect human physiology. The goal is to develop process models of the human body that will predict pharmaceutical effects as a function of time and organ (or cell) type that will work for a wide variety of pharmaceuticals including small molecules, biologics, and chemotherapy agents. This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 90 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week's topic or their progress on their project. Prerequisites 540.421 has a prerequisite of 540.400 Pharmacokinetics
Prerequisites: EN.540.400
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.
EN.540.422. Introduction to Polymeric Materials. 3.0 Credits.
Polymeric materials are ubiquitous in our society from Nature-made proteins and polysaccharides to synthetic plastics and fibers. Their applications range from day-to-day consumables to high performance materials used in critically demanding areas, such as aviation, aerospace and medical devices. The objective of this course is to provide an introductory overview on the field of polymer science and engineering. Students will learn some basic concepts in polymer synthesis, characterization, and processing. With the basic concepts established, industrial applications of polymeric materials will be discussed in two categories: structural polymers and functional polymers. Structural polymers, including plastics, fibers, rubbers, coatings, adhesives, and composites, will be discussed in terms of their structure, processing, and property relationship with a flavor of industrial relevant products and applications. Future trends in developing environmentally friendly polymers from renewable resources ("green polymer chemistry") will also be covered. Lectures on functional polymers will be focused on their unique properties that are enabled by rational molecular design, controlled synthesis and processing (e.g. supramolecular assembly, and microfabrication). This class of specialty materials can find their use in high performance photovoltaics, batteries, membranes, and composites, and can also serve as "smart" materials for use in coatings, sensors, medical devices, and biomimicry. 
Instructor(s): H. Cui; K. Qi
Area: Engineering.

EN.540.428. Supramolecular Materials and Nanomedicine. 3.0 Credits.
Nanomedicine is a quickly growing area that exploits the novel chemical, physical, and biological properties of nanostructures and nanostructured materials for medical treatments. This course presents basic design principles of constructing nanomaterials for use in drug delivery, disease diagnosis and imaging, and tissue engineering. Three major topics will be discussed, including 1) nanocarriers for drug delivery that are formed through soft matter assembly (e.g., surfactants, lipids, block copolymers, DNA, polyelectrolytes, peptides), 2) inorganic nanostructures for disease diagnosis and imaging (e.g., nanoparticles of gold and silver, quantum dots and carbon nanotubes), and 3) supramolecular scaffolds for tissue engineering and regenerative medicine. Students are expected to learn the physical, chemical and biological properties of each nanomaterial, the underlying physics and chemistry of fabricating such materials, as well as their advantages and potential issues when used for biomedical applications. This course will also provide students opportunities for case studies on commercialized nanomedicine products. After this class, students should gain a deeper understanding of current challenges in translating nanoscience and nanotechnology.
Instructor(s): H. Cui
Area: Engineering.

EN.540.436. Design: Pharmacokinetics/Dynamics. 3.0 Credits.
This is a one semester overview of year long course; students that want a comprehensive understanding of pharmacokinetics and pharmacodynamics should take the 2 courses EN.540.400 and EN.540.421. This course covers the principles of pharmacokinetics and pharmacodynamics. Computer models of pharmacokinetic and pharmacodynamic behavior will be developed and then used to design better drug delivery regimens and to analyze drug chemistry modifications. The course (and software to be developed) will cover the spectrum of factors affecting pharmaceutical effects on physiology including drug formulation, mode of dosing and dosing rate, metabolism and metabolic cascades, storage in fatty tissues, and diffusional limitations (such as in crossing the blood-brain barrier or diffusional differences between normal and cancerous tissues). This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 90 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week's topic or their progress on their project. Prerequisites 540.436 has a prerequisite of 540.301 Kinetic Processes.
Prerequisites: EN.540.301
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.437. Application of Molecular Evolution to Biotechnology. 3.0 Credits.
One of the most promising strategies for successfully designing complex biomolecular functions is to exploit nature's principles of evolution. This course provides an overview of the basics of molecular evolution as well as its experimental implementation. Current research problems in evolution-based biomolecular engineering will be used to illustrate principles in the design of biomolecules (i.e. protein engineering, RNA/ DNA engineering), genetic circuits and complex biological systems including cells. Meets with EN.540.637
Prerequisites: AS.020.305 OR EN.580.221 OR permission of instructor.
Instructor(s): M. Ostermeier
Area: Engineering, Natural Sciences.

EN.540.438. Advanced Topics in Pharmacokinetics and Pharmacodynamics I. 3.0 Credits.
This course involves a semester-long project in pharmacodynamics. Topics are chosen in consultation with instructor.
Prerequisites: EN.540.400 AND (EN.540.421 OR EN.540.436)
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.439. Advanced Topics in Pharmacokinetics and Pharmacodynamics II. 3.0 Credits.
This course involves a semester-long project in pharmacodynamics. Topics are chosen in consultation with instructor.
Prerequisites: EN.540.421 OR EN.540.436
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.
EN.540.440. Micro/Nanotechnology: The Science and Engineering of Small Structures. 3.0 Credits.
The field of micro / nanotechnology has been gaining tremendous momentum as evidenced by an explosive rise in the number of publications, patents and commercial activities. This is an introductory course intended to expose students to the field as well as real world applications. Lectures will include an overview of scaling of material properties at the nanoscale, micro and nanofabrication methods and essential analytical tools of relevance to the field. All through the course, we will go over electronic, optical and biological applications of emerging micro and nanoscale devices and materials. Co-listed with EN.540.640.
Instructor(s): D. Gracias
Area: Engineering.

EN.540.452. Eukaryotic Cell Biotechnology. 2.0 Credits.
This course involves integrated lecture/discussion and laboratory components to review and participate in current and emerging topics involving eukaryotic biotechnology. Lectures and discussions review how fundamentals of biochemical kinetics and biomolecular engineering are connected to emerging problems in mammalian, algal, and stem cell biotechnology. Laboratory activities are connected to diverse scientific and technological fundamental topics on these same themes. Journal article and research presentations provide a context for laboratory activities with respect to emerging industrial applications for eukaryotic cell types. Research design and strategy is discussed in terms of its ultimate implementation in laboratory, pilot plant, and eventually manufacturing facilities. Methodologies implemented include cell and metabolic engineering for improving yields and production rates of proteins, cells, and tissues. Example topics include expansion of mammalian, stem cells, and algae for the production of membrane proteins, biologics, biofuels, and complex metabolites. Consent of instructor only.
Instructor(s): M. Betenbaugh
Area: Engineering.

EN.540.455. Current Topics in DNA Nanotechnology Practicum. 3.0 Credits.
Research laboratory elective course where students can learn DNA nanotechnology and build nanostructures.
Instructor(s): R. Schulman.

EN.540.460. Polymer Physics. 3.0 Credits.
This course will cover the physics aspect of macromolecular/polymeric materials. We will discuss the molecular origin of key physical phenomena, such as chain relaxation, time temperature superposition, free volume, high strain rate behavior, phase transitions, flow and fracture as well as physical aging. Many real world examples will be used throughout the course. We will also discuss the recent advances in biopolymers, polymers for 3D printing, electro-spinning and polymers for tissue engineering. Students should have introductory training in Materials Science.
Prerequisites: AS.030.101 AND AS.171.101
Instructor(s): Z. Xia
Area: Engineering, Natural Sciences.

EN.540.462. Polymer Design and Bioconjugation. 3.0 Credits.
This course will focus on conventional to most recent inventions on polymer and conjugation chemistry. The weekly lectures will include the reaction strategy, designs and characterization techniques, structure-property relationship, simplistic approaches and versatile application oriented-solutions to Biomaterials and Tissue engineering related challenges. Students will learn how to devise creative strategies, process design and product development. Preliminary knowledge of organic chemistry is expected.
Instructor(s): A. Singh
Area: Engineering, Natural Sciences.

EN.540.465. Engineering Principles of Drug Delivery. 3.0 Credits.
Fundamental concepts in drug delivery from an engineering perspective. Biological organisms are viewed as highly interconnected networks where the surfaces/interfaces can be activated or altered ‘chemically’ and ‘physically/mechanically’. The importance of intermolecular and interfacial interactions on drug delivery carriers is the focal point of this course. Topics include: drug delivery mechanisms (passive, targeted); therapeutics modalities and mechanisms of action; engineering principles of controlled release and quantitative understanding of drug transport (diffusion, convection); effects of electrostatics, macromolecular conformation, and molecular dynamics on interfacial interactions; thermodynamic principles of self-assembly; chemical and physical characteristics of delivery molecules and assemblies (polymer based, lipid based); significance of biodistributions and pharmacokinetic models; toxicity issues and immune responses.
Prerequisites: Students may take EN.540.465 or EN.540.665, but not both.
Instructor(s): S. Sofou
Area: Engineering, Natural Sciences.

EN.540.468. Introduction to Nonlinear Dynamics and Chaos. 3.0 Credits.
An introduction to the phenomenon of nonlinear dynamic behavior with emphasis on models of actual physical, chemical, and biological systems, involving an interdisciplinary approach to ideas from mathematics, computing, and modeling. The common features of the development of chaotic behavior in both mathematical models and experimental studies are stressed, and the use of modern data-mining tools to analyze dynamic data will be explored. Knowledge of Linear Algebra and Ordinary Differential Equations is a prerequisite (at an undergraduate level); Some computing experience is desirable. Emphasis will be placed on the geometric/visual computer-aided description and understanding of dynamics and chaos.
Prerequisites: Students may receive credit for only one of EN.553.473 OR EN.553.673 OR EN.540.468 OR EN.540.668;((AS.110.201 OR AS.110.212) AND (AS.110.302 OR AS.110.306)) OR EN.553.291
Instructor(s): Y. Kevrekidis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.490. Introduction to Chemical Process Safety. 1.0 Credit.
An elementary introduction to chemical process safety, this course covers a selection of topics in chemical process safety analysis and management, taken against the backdrop of real processes and process accidents. Topics include materials compatibility, risk assessment, reactive chemical hazard, process hazard analysis via the HAZOP method, fire/explosion and toxic release incidents, incident investigation, inerting with nitrogen, and Inherently Safer Design
Prerequisites: EN.540.203 AND EN.540.303
Instructor(s): D. Kuespert
Area: Engineering.

EN.540.501. Independent Research. 3.0 Credits.
Instructor(s): Staff.
EN.540.602. Independent Study. 0.0 - 3.0 Credits.
Instructor(s): J. Frechette; K. Konstantopoulos; M. Donohue; M. Ostermeier; S. Gerecht.

EN.540.503. Independent Research. 0.0 - 3.0 Credits.
Instructor(s): Staff.

EN.540.509. Undergraduate Internship. 1.0 Credit.
Internship unpaid and approved by ChemBE faculty.

EN.540.511. Group Undergraduate Research. 1.0 - 3.0 Credits.
Students do individual projects (or in collaboration with faculty and/or graduate students) in areas basic to chemical engineering. This section has weekly research group meeting that students are expected to attend. Instructor(s): Staff.

EN.540.513. Group Undergraduate Research. 1.0 - 3.0 Credits.
Students do individual projects (or in collaboration with faculty and/or graduate students) in areas basic to chemical engineering. This section has weekly research group meeting that students are expected to attend. Instructor(s): Staff.

EN.540.522. Independent Research. 0.0 - 3.0 Credits.
Instructor(s): Staff.

EN.540.596. Summer Internship.
Summer internship paid and approved by ChemBE faculty. Instructor(s): Staff.

EN.540.597. Research. 3.0 Credits.
Instructor(s): Staff.

EN.540.598. Summer Internship. 1.0 Credit.
Summer internship unpaid and approved by ChemBE faculty. Instructor(s): D. Wirtz; G. Drazer; H. Cui.

EN.540.599. Independent Study - Summer. 0.0 - 3.0 Credits.
Instructor(s): Staff.

EN.540.600. Chemical and Biomolecular Engineering Seminar. 1.0 Credit.
Lectures are presented on current subjects relevant to chemical engineering. Attendance at 80% of departmental seminars is required to receive credit for this class. Instructor(s): C. Wang; S. Sofou Area: Engineering.

EN.540.601. Chemical and Biomolecular Engineering Seminar. 1.0 Credit.
Instructor(s): C. Wang; S. Sofou Area: Engineering.

EN.540.602. Metabolic Systems Biotechnology. 3.0 Credits.
The aim of this course is to provide a fundamental understanding of the quantitative principles and methodologies of systems biology and biochemical engineering of metabolism. This includes concepts of cellular growth, cellular stoichiometric models, metabolic networks, metabolite fluxes, and genome-scale metabolic models. Quantitative methods and systems biology approaches for metabolic flux analysis and metabolic control theory will be included as well as an analysis of biochemical systems and bioreactors including a consideration of mass transport processes. Instructor(s): M. Betenbaugh Area: Engineering.

EN.540.603. Colloids and Nanoparticles. 3.0 Credits.
Fundamental principles related to interactions, dynamics, and structure in colloidal, nanoparticle, and interfacial systems. Concepts covered include hydrodynamics, Brownian motion, diffusion, sedimentation, electrophoresis, colloidal and surface forces, polymeric forces, aggregation, deposition, and experimental methods. Modern topics related to colloids in nano-science and technology will be discussed throughout the course with frequent references to recent literature. Meets with EN.540.403 Instructor(s): M. Bevan Area: Engineering.

EN.540.604. Transport Phenomena in Practice. 3.0 Credits.
Required course for ChemBE Masters students Instructor(s): L. Santhanam Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.605. The Design of Biomolecular Systems. 3.0 Credits.
This course covers new topics in the design of systems of biomolecules, both in vitro and in vivo, for decision making and control. The course will begin with an overview of how logical decision making and control with biomolecules as is achieved in biology and then proceed to consider various strategies of engineering similar systems. The focus of the course will be on systems level principles rather than the biochemistry of molecule design. Topics will include engineering of transcriptional networks and genetic control for logically programming of cells, the design of in vitro mimics of genetic controls, molecular computing and systems aspects of metabolic engineering. The course will also cover quantitative and computational techniques for the simulation and analysis of biomolecular systems. Co-listed with EN.540.405 Instructor(s): R. Schulman Area: Engineering.

EN.540.606. Chemical & Biomolecular Separation. 3.0 Credits.
This course covers staged and continuous-contacting separations processes critical to the chemical and biochemical industries. Separations technologies studied include distillation, liquid-liquid extraction, gas absorption, membrane ultrafiltration, reverse osmosis, dialysis, adsorption, and chromatography. Particular emphasis is placed on the biochemical uses of these processes and consequently on how the treatment of these processes differs from the more traditional approach. Only with permission of the instructor. Co-listed with EN.540.306 Instructor(s): M. Betenbaugh.

EN.540.610. Chemical and Biomolecular Engineering Design: Spring. 3.0 Credits.
This course is one part of a two semester sequence. This course guides the student through the contrasting aspects of product design and of process design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill the needs. Process design concerns the quantitative description of processes which serve to produce many commodity chemicals, the estimation of process profitability, and the potential for profitability improvement through incremental changes in the process. Students work in small teams to complete a major project demonstrating their understanding of and proficiency in the primary objectives of the course. Students report several times both orally and in writing on their accomplishments. Laboratory tests can be performed and/or prototypes can be made. Note that both courses, 540.609 and 540.610 must be taken, the two courses can be started in any term. Instructor(s): M. Donohue Area: Engineering.
EN.540.614. Computational Protein Structure Prediction and Design. 3.0 Credits.
This class will introduce the fundamental concepts in protein structure, biophysics, optimization and informatics that have enabled the breakthroughs in computational structure prediction and design. Problems covered will include protein folding and docking, design of ligand-binding sites, design of turns and folds, design of protein interfaces. Class will consist of lectures and hands-on computer workshops. Students will learn to use molecular visualization tools and write programs with the PyRosetta protein structure software suite, including a computational project. Programming experience is recommended.
Instructor(s): J. Gray
Area: Engineering.

EN.540.615. Interfacial Science with Applications to Nanoscale Systems. 3.0 Credits.
Nanostructured materials intrinsically possess large surface area (interface area) to volume ratios. It is this large interfacial area that gives rise to many of the amazing properties and technologies associated with nanotechnology. In this class we will examine how the properties of surfaces, interfaces, and nanoscale features differ from their macroscopic behavior. We will compare and contrast fluid-fluid interfaces with solid-fluid and solid-solid interfaces, discussing fundamental interfacial physics and chemistry, as well as touching on state-of-the-art technologies.
Instructor(s): J. Frechette
Area: Engineering.

EN.540.619. Projects in Design: Alternative Energy. 3.0 Credits.
This course is a group design project (i.e. not a lecture course) to use chemical process simulation tools to model a real-world, alternative-energy process of interest to Chemical and Biomolecular Engineers. The goal of the project will be to develop a process model that is sufficiently complete and robust that it can be used to understand the important factors in the process design and/or operation. This design project is focused on the role alternative energy will play in our country's future.
About a third of the course will be devoted to understanding the role of energy and alternative energy in the US and world economies. The remainder of the course will be devoted to a technical and economic analysis of an alternative energy technology. This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 60 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week’s topic or their progress on their project.
Graduate level. Meets with EN.540.401
Prerequisites: EN.540.202 AND EN.540.203 AND EN.540.301 AND EN.540.305
Instructor(s): M. Donohue
Area: Engineering.

EN.540.621. Project in Design: Pharmacodynamics. 3.0 Credits.
This course covers pharmacodynamics, i.e. how pharmaceuticals affect biological processes. The course will use MatLab to aid in the design of new drug formulations.
Prerequisites: EN.540.632
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.622. Introduction to Polymeric Materials. 3.0 Credits.
Polymeric materials are ubiquitous in our society from Nature-made proteins and polysaccharides to synthetic plastics and fibers. Their applications range from day-to-day consumables to high performance materials used in critically demanding areas, such as aviation, aerospace and medical devices. The objective of this course is to provide an introductory overview on the field of polymer science and engineering. Students will learn some basic concepts in polymer synthesis, characterization, and processing. With the basic concepts established, industrial applications of polymeric materials will be discussed in two categories: structural polymers and functional polymers. Structural polymers, including plastics, fibers, rubbers, coatings, adhesives, and composites, will be discussed in terms of their structure, processing, and property relationship with a flavor of industrial relevant products and applications. Future trends in developing environmentally friendly polymers from renewable resources ("green polymer chemistry") will also be covered. Lectures on functional polymers will be focused on their unique properties that are enabled by rational molecular design, controlled synthesis and processing (e.g. supramolecular assembly, and microfabrication). This class of specialty materials can find their use in high performance photovoltaics, batteries, membranes, and composites, and can also serve as "smart" materials for use in coatings, sensors, medical devices, and biomimicry.
Instructor(s): H. Cui; K. Qi
Area: Engineering.

EN.540.628. Supramolecular Materials and Nanomedicine. 3.0 Credits.
Nanomedicine is a quickly growing area that exploits the novel chemical, physical, and biological properties of nanostructures and nanostructured materials for medical treatments. This course presents basic design principles of constructing nanomaterials for use in drug delivery, disease diagnosis and imaging, and tissue engineering. Three major topics will be discussed, including 1) nanocarriers for drug delivery that are formed through soft matter assembly (e.g., surfactants, lipids, block copolymers, DNA, polyelectrolytes, peptides), 2) inorganic nanostructures for disease diagnosis and imaging (e.g., nanoparticles of gold and silver, quantum dots and carbon nanotubes), and 3) supramolecular scaffolds for tissue engineering and regenerative medicine. Students are expected to learn the physical, chemical and biological properties of each nanomaterial, the underlying physics and chemistry of fabricating such material, as well as their advantages and potential issues when used for biomedical applications. The class will also provide students opportunities for case studies on commercialized nanomedicine products. After this class, students should gain a deeper understanding of current challenges in translating nanoscience and nanotechnology into medical therapies.
Instructor(s): H. Cui
Area: Engineering, Natural Sciences.
EN.540.630. Thermodynamics, Statistical Mechanics, and Kinetics. 3.0 Credits.
In this course we will aim for understanding the thermodynamics of chemical and bio-molecular systems. We will first review classical, macroscopic thermodynamics covering concepts such as equilibrium, stability and the role of thermodynamic potentials. Our goal will be to gain a feel for the generality of thermodynamics. Statistical mechanics provides a link between the mechanics of atoms and macroscopic thermodynamics. We will introduce this branch in two distinct ways: 1) following standard methods of developing concepts such as ensembles and partition functions, and 2) where we will treat the basis of statistical mechanics as a problem in inference. With this foundation, we will consider concepts relevant to understanding the liquid state. Chemical transformations in a liquid are of importance in much of chemistry and biology; quasi-chemical generalizations of the potential distribution theorem will be introduced to present these ideas. We hope to give an overview of modern developments relating equilibrium work to non-equilibrium work, as these are of increasing importance in studies on single molecule systems. Registration by instructor permission only. Instructor(s): C. Wang
Area: Engineering.

EN.540.632. Project in Design: Pharmacokinetics. 3.0 Credits.
This is a design course in which the design projects will be to develop pharmacokinetic models of the human body that can be used to understand the temporal distribution, spatial distribution and bioavailability of pharmaceutical drugs. The course (and software to be developed) will cover the spectrum of factors affecting pharmaceutical bioavailability including drug formulation, mode of dosing and dosing rate, metabolism and metabolic cascades, storage in fatty tissues, and diffusional limitations (such as in crossing the blood-brain barrier or diffusional differences between normal and cancerous cells). The goal is to develop process models of the human body that will predict pharmaceutical bioavailability as a function of time and organ (or cell) type that will work for a wide variety of pharmaceuticals including small molecules, biologics, and chemotherapy agents. This course is organized to replicate group project work as it is practiced in industry. The class is divided into groups (typically 3 or 4 students) and each group will meet separately each week with the instructor. Hence, there is no regularly scheduled class times; student groups sign up for weekly meeting times using Starfish in Blackboard. These meetings typically will be 90 minutes long. The expectations and assignments for this course are quite different from most other courses. There are no weekly lectures by the instructor. Rather, each week each group will make a PowerPoint presentation on the week’s topic or their progress on their project.
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.636. Design: Pharmacokinetics/Dynamics. 3.0 Credits.
One semester overview of year long course, students that want a comprehensive understanding of pharmacokinetics and pharmacodynamics should take the 2 all 540.632 Projects in Design: Pharmacokinetics Spring 540.621 Projects in Design: Pharmacodynamics. This course covers the principles of pharmacokinetics and pharmacodynamics. Computer models of the pharmacokinetic and pharmacodynamic behavior will be developed and then used to design better drug delivery regimens and to analyze drug chemistry modifications.
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.637. Application of Molecular Evolution to Biotechnology. 3.0 Credits.
One of the most promising strategies for successfully designing complex biomolecular functions is to exploit nature’s principles of evolution. This course provides an overview of the basics of molecular evolution as well as its experimental implementation. Current research problems in evolution-based biomolecular engineering will be used to illustrate principles in the design of biomolecules (i.e. protein engineering, RNA/ DNA engineering), genetic circuits and complex biological systems including cells. A course in Biochemistry or Molecular Biology is recommended. Meets with EN.540.437
Instructor(s): M. Ostermeier
Area: Engineering, Natural Sciences.

EN.540.638. Advanced Topics in Pharmacokinetics and Pharmacodynamics I. 3.0 Credits.
This course involves a semester-long project in pharmacodynamics. Topics are chosen in consultation with instructor.
Prerequisites: EN.540.400 AND EN.540.421 OR EN.540.436
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.639. Advanced Topics in Pharmacokinetics and Pharmacodynamics II. 3.0 Credits.
This course involves a semester-long project in pharmacodynamics. Topics are chosen in consultation with instructor.
Prerequisites: EN.540.400 AND EN.540.421 OR EN.540.436
Instructor(s): M. Donohue
Area: Engineering, Natural Sciences.

EN.540.640. Micro/Nanotechnology: The Science and Engineering of Small Structures. 3.0 Credits.
The field of micro / nanotechnology has been gaining tremendous momentum as evidenced by an explosive rise in the number of publications, patents and commercial activities. This is an introductory course intended to expose students to the field as well as real world applications. Lectures will include an overview of scaling of material properties at the nanoscale, micro and nanofabrication methods and essential analytical tools of relevance to the field. All through the course, we will go over electronic, optical and biological applications of emerging micro and nanoscale devices and materials. Co-listed with EN.540.440.
Instructor(s): D. Gracias.

EN.540.652. Advanced Transport Phenomena. 3.0 Credits.
It is the goal of this course to move the graduate student (and advanced undergraduate student) from the introductory level of transport phenomena (undergraduate) to a level that will allow them to be effective in researching transport-related topics in a variety of biomedical, chemical and biochemical engineering areas. The basic equations that govern mass, momentum, and energy transport will be derived and used to solve problems that demonstrate the physical insight necessary to apply these equations to original situations. Some topics include solution techniques utilizing expansions of harmonic functions, singularity solutions, lubrication theory for flow in confined geometries, boundary layer theory, Stokes flow, forced convection, buoyancy-driven flow, Taylor-Aris dispersion, and reaction-diffusion.
Instructor(s): Z. Gagnon
Area: Engineering.
EN.540.660. Polymer Physics. 3.0 Credits.
This course will cover the physics aspect of macromolecular/polymeric materials. We will discuss the molecular origin of key physical phenomena, such as chain relaxation, time temperature superposition, free volume, high strain rate behavior, phase transitions, flow and fracture as well as physical aging. Many real world examples will be used throughout the course. We will also discuss the recent advances in biopolymers, polymers for 3D printing, electro-spinning and polymers for tissue engineering. Students should have introductory training in Materials Science.
Instructor(s): Z. Xia
Area: Engineering, Natural Sciences.

EN.540.661. Nanobioengineering Laboratory. 3.0 Credits.
Students explore different experimental methodologies in Nanobioengineering. Students work in small teams to complete one or more major projects expanding their understanding and applying their theoretical knowledge to practical problems. The course will employ a variety of experimental methods, from material synthesis to biological applications. Students report several times either orally and in writing on their accomplishments. Project meetings may be held outside of the appointed class time. Graduate students only.
Instructor(s): A. Goffin; X. Wan.

EN.540.662. Polymer Design and Bioconjugation. 3.0 Credits.
This course will focus on conventional to most recent inventions on polymer and conjugation chemistry. The weekly lectures will include the reaction strategy, designs and characterization techniques, structure-property relationship, simplistic approaches and versatile application oriented-solutions to Biomaterials and Tissue engineering related challenges. Students will learn how to devise creative strategies, process design and product development.
Instructor(s): A. Goffin; X. Wan.

EN.540.663. Thermodynamic Independent Study. 3.0 Credits.
In this course, we will discuss the important role that thermodynamics plays in chemical engineering practice. After a short review of the first and second laws, we will examine how thermodynamic concepts affect mass and energy balances. We will discuss the properties of systems containing pure species and mixtures and how to analyze the behavior of ideal and real systems. We will estimate heat effects associated with temperature change, phase change, and chemical reaction. The theory associated with properties of pure fluids will be discussed along its application to flow processes. We will present the framework for understanding solution thermodynamics and mixing. Applications of thermodynamics especially important to chemical engineers, such as vapor-liquid equilibrium in distillation and chemical reaction equilibrium in kinetics and reaction engineering, will be discussed. Examples will serve to illustrate how thermodynamic calculations are an integral part of the design and optimization of chemical processes.
Instructor(s): C. Pereira
Area: Engineering.

EN.540.665. Engineering Principles of Drug Delivery. 3.0 Credits.
Fundamental concepts in drug delivery from an engineering perspective. Biological organisms are viewed as highly interconnected networks where the surfaces/interfaces can be activated or altered 'chemically' and 'physically/mechanically'. The importance of intermolecular and interfacial interactions on drug delivery carriers is the focal point of this course. Topics include: drug delivery mechanisms (passive, targeted); therapeutic modalities and mechanisms of action; engineering principles of controlled release and quantitative understanding of drug transport (diffusion, convection); effects of electrostatics, macromolecular conformation, and molecular dynamics on interfacial interactions; thermodynamic principles of self-assembly; chemical and physical characteristics of delivery molecules and assemblies (polymer based, lipid based); significance of biodistributions and pharmacokinetic models; toxicity issues and immune responses.
Prerequisites: Students may take EN.540.465 or EN.540.665, but not both.
Instructor(s): S. Sofou
Area: Engineering, Natural Sciences.

EN.540.666. Introduction to Nonlinear Dynamics and Chaos. 3.0 Credits.
An introduction to the phenomenology of nonlinear dynamic behavior with emphasis on models of actual physical, chemical, and biological systems, involving an interdisciplinary approach to ideas from mathematics, computing, and modeling. The common features of the development of chaotic behavior in both mathematical models and experimental studies are stressed, and the use of modern data-mining tools to analyze dynamic data will be explored. Knowledge of Linear Algebra and Ordinary Differential Equations is a prerequisite (at an undergraduate level); Some computing experience is desirable. Emphasis will be placed on the geometric/visual computer-aided description and understanding of dynamics and chaos.
Prerequisites: Students may receive credit for only one of EN.553.473 OR EN.553.672 OR EN.540.468 OR EN.540.668.;((AS.110.201 OR AS.110.302 OR AS.110.306) OR EN.553.291)[C]
Instructor(s): Y. Kevrekidis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.671. Advanced Thermodynamics in Practice. 3.0 Credits.
In this course, we will discuss the important role that thermodynamics plays in chemical engineering practice. After a short review of the first and second laws, we will examine how thermodynamic concepts affect mass and energy balances. We will discuss the properties of systems containing pure species and mixtures and how to analyze the behavior of ideal and real systems. We will estimate heat effects associated with temperature change, phase change, and chemical reaction. The theory associated with properties of pure fluids will be discussed along its application to flow processes. We will present the framework for understanding solution thermodynamics and mixing. Applications of thermodynamics especially important to chemical engineers, such as vapor-liquid equilibrium in distillation and chemical reaction equilibrium in kinetics and reaction engineering, will be discussed. Examples will serve to illustrate how thermodynamic calculations are an integral part of the design and optimization of chemical processes.
Instructor(s): C. Pereira.
EN.540.673. Advanced Chemical Reaction Engineering in Practice. 3.0 Credits.
Chemical reaction engineering deals with the analysis on data and the design of equipment in which reactions occur. Reactors may contain one or more phases and be used to conduct chemical or biochemical transformations. The course will cover the fundamental aspects of kinetics, data acquisition, data interpretation, heterogeneous catalysis and heat and mass transfer for each type of reactor. Special emphasis will be placed on the practical application of reaction engineering in the petrochemical, chemical, biochemical and materials industries. The course will make student aware of the needs and opportunities for chemical reaction engineering in industry.
Instructor(s): C. Pereira
Area: Engineering, Quantitative and Mathematical Sciences.

EN.540.674. Special topics in Chemical and Biomolecular Engineering: Interfaces and Nanotechnology. 3.0 Credits.
In this course, students will explore a range of advanced topics in Chemical and Biomolecular engineering. Interfacial phenomena, nanotechnology, physical chemistry, catalysis, transport phenomena and the interplay between these topics will be studied.
Instructor(s): Staff.

EN.540.675. Special topics in Chemical and Biomolecular Engineering: Molecular and Cellular Bioengineering. 3.0 Credits.
Student will study a variety of topics in molecular and cellular bioengineering. Cellular Biology, protein engineering, drug delivery, tissue engineering and polymer design are a selection of subjects that will be addressed in this course.
Instructor(s): Staff.

EN.540.690. Chemical and Biomolecular Engineering Design. 3.0 Credits.
This course is one part of a two semester sequence in Chemical and Biomolecular Engineering Product Design. It is intended for students in the ChemBE master's program. This course guides the student through the complex process of new product design. Product design concerns the recognition of customer needs, the creation of suitable specifications, and the selection of best products to fulfill needs. Students work in small teams to develop a new product idea, design the product and then iterate on prototype development. Students report several times both orally and in writing on their accomplishments. Time is allowed so that laboratory tests can be performed and/or prototypes can be built. Note that generally both courses, 540.609 and 540.610 must be taken to complete the prototype development. The two courses can be started in any term.
Instructor(s): M. Donohue
Area: Engineering.

EN.540.801. Graduate Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.540.803. Independent Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

Cross Listed Courses
Chemistry
Principles and methods for the design and optimization of new biological systems, from a molecular perspective. Topics include: introduction to genetic parts and modern methods for their assembly; synthesis and incorporation of nucleic acids at the level of nucleotides, genes, and genomes; design of genetic programs; library generation and screening; directed evolution and its application to create new proteins and metabolic pathways; computational design of protein and RNA using physical and bioinformatic approaches; non-canonical amino acids and genetic code expansion. This course will also feature critical evaluation of the primary literature in this fast-paced field, and practical experience with relevant software and computational tools.
Instructor(s): S. Fried.

Biomedical Engineering
EN.580.646. Molecular Immunoenengineering. 3.0 Credits.
An in-depth study of the use of biomolecular engineering tools and techniques to manipulate immune function for clinical translation. The course will begin with a broad overview of the immune system, placing a particular emphasis on the molecular-level interactions that determine phenotypic outcomes. The remainder of the curriculum will address ways in which integrative approaches incorporating biochemistry, structural biophysics, molecular biology, and engineering have been used either to stimulate the immune response for applications in cancer and infectious disease, or to repress immune activation for autoimmune disease therapy. Recommended background: Biochemistry and Cell Biology or the BME Molecules and Cells. Those without recommended background should contact the instructor prior to enrolling.
Instructor(s): J. Spangler
Area: Engineering, Natural Sciences.

Institute for NanoBio Technology
EN.670.619. Fundamental Physics and Chemistry of Nanomaterials. 3.0 Credits.
This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeuticst. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microchrology. Patternning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.

Civil Engineering
http://www.civil.jhu.edu/

Civil engineers apply sophisticated analysis and design techniques to advance the needs of society for shelter, infrastructure, and a safe environment. Graduates are employed in the fields of structural analysis and design, soil mechanics and foundation design, environmental engineering and policy, materials engineering, and coastal and ocean engineering, and increasingly are taking on far-reaching management roles in infrastructure, hazard mitigation, sustainability, and technical roles in the planning, design, and construction of large-scale engineered systems. In addition, a civil engineering degree provides exposure to
broad societal challenges and the logical thinking necessary for pursuing careers in other professional fields, such as law, business, and medicine.

The Department of Civil Engineering offers programs at the undergraduate, graduate, and postdoctoral levels. Civil Engineering at Hopkins offers a unique balance centered in mechanics fundamentals, and enriched by state-of-the-art tools in modeling, simulation, and physical experimentation. The small size of the CE Department fosters a collegial, close-knit relationship between the students, staff, and faculty, while our partnerships with other Johns Hopkins departments provide a wide range of collaborative opportunities that span the larger disciplines of systems, structures, and materials. A wide range of research opportunities distinguishes the program. Students have participated in projects on structural reliability, earthquake resistance of structures, testing and analysis of historic bridges, computational design of materials, failure of brittle materials, cold-formed steel members and their connections, and structural fire to name a few. A five-year bachelor’s/master’s degree program is also offered. Graduates of Johns Hopkins University have traditionally risen to leadership roles in education, research, industry, and government.

The department sponsors an undergraduate and graduate seminar series, as well as the Richard J. Carroll endowed lectureship; all of which are designed to bring prominent civil engineers to campus to speak with students and faculty.

Facilities
The Department’s teaching and research labs are located in Latrobe Hall. Teaching laboratories include a modern multi-use facility for exploring experiments in statics, mechanics of materials, dynamics and other courses, and a dedicated soil mechanics laboratory. Research laboratories include the Thin-walled Structures Laboratory, Structural Testing Laboratory, a Structural Materials at High Temperature Laboratory. The Department also possesses its own 3-D printer, fabrication facilities for the purposes of building and maintaining equipment and experiments. The Civil Engineering High Performance Cluster (CE-HPC) is a medium scale high performance computing cluster used primarily for undergraduate research. We are also pleased to provide an undergraduate-only Design Studio and computer lab, as well as office space for doctoral students and a graduate student lounge.

Undergraduate Programs
The Department of Civil Engineering offers an undergraduate program that strives to educate intellectual leaders of the profession by instilling in them a fundamental understanding of the mathematical and physical principles that underlie civil engineering science, an appreciation for the challenges of creative engineering design, and a sense of responsibility for professional service. Civil Engineering is a broad field with many subdisciplines. The Civil Engineering curriculum exposes students to the fields of structural engineering, engineering mechanics, systems engineering, environmental engineering, water resources, and geotechnical engineering.

The program has the following as its objectives:

1. That within a few years of graduation, our graduates will attain one of a. - d. listed below
   a. an advanced degree in engineering or
   b. required experience toward professional licensure as an engineer, or
   c. an advanced degree in a field other than engineering, or
   d. a position within an organization that broadly supports the goals of civil engineering;

2. a position or degree that values adaptability and innovation in their work.

Students graduating with a B.S. in civil engineering will have demonstrated:

- an ability to apply knowledge of mathematics, science, and engineering
- an ability to design and conduct experiments, as well as to analyze and interpret data
- an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- an ability to function on multidisciplinary teams
- an ability to identify, formulate, and solve engineering problems
- an understanding of professional and ethical responsibility
- an ability to communicate effectively
- the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in lifelong learning
- a knowledge of contemporary issues
- an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

The program has been accredited by the Engineering Accreditation Commission of ABET since 1936.

Requirements for the B.S. Degree
The B.S. degree in civil engineering requires 128 credits. A brief summary of the requirements are listed below. For more detailed information students should look at the Department of Civil Engineering website (http://engineering.jhu.edu/civil/undergraduate-studies). Each student is assigned a faculty advisor who provides the guidance needed to meet these requirements.

Note that no course listed as a requirement may be taken as Satisfactory/Unsatisfactory (S/U) and a maximum of 3 credits from the Humanities and Social Science (H/S) requirements may be taken S/U. Technical electives may be taken S/U only with the approval of the advisor. No more than two grades of D in the required engineering and technical electives may be counted.

Sample B.S. Program

To view a sample civil engineering program, visit the Civil Engineering website and click on Undergraduate Studies, Academic Advising or click here. (https://engineering.jhu.edu/civil/undergraduate-studies/sample-curriculum) This sample illustrates the general sequence of courses; individual programs may vary as a result of AP credits, study abroad, or pursuit of a minor in another department.

Minor in Civil Engineering

This program is available to nondepartmental majors only who would like an overview of the principles of civil engineering. In addition to the prerequisite courses of AS.171.101 General Physics: Physical Science Major I for Physical Science Majors, AS.110.108 Calculus I, and AS.110.109 Calculus II (For Physical Sciences and Engineering), 17 credits are required for the minor, including 11 credits from fundamental civil engineering courses and 6 credits from a two-course sequence in one of three civil technical areas (geotechnical engineering, structural engineering, or systems engineering). No D grades can be counted toward the minor.

EN.560.141 Perspectives on the Evolution of Structures 3
EN.560.201 Statics & Mechanics of Materials 4
EN.560.206 Solid Mechanics & Theory of Structures 3
EN.560.491 Civil Engineering Seminar I .5
EN.560.492 Civil Engineering Seminar II .5

Students must choose to focus in one of the following three technical areas, completing two courses in one area of their choice.

Structural Engineering

EN.560.320 Structural Design I 3
EN.560.325 Structural Design II 3
EN.560.445 Advanced Structural Analysis 3

combined-bachelors-masters/.

Combined Bachelor's/Master's Programs

The Department of Civil Engineering offers combined bachelor's/master's
degrees. One program combines a B.S. in Civil Engineering with a Master
of Science in Engineering (M.S.E.) in Civil Engineering. For students who
are admitted to this program, the two degrees typically require five years
total to complete. The other option combines a B.S. in Civil Engineering
with a Master of Science in Engineering Management (M.S.E.M.) (http://
msem.engineering.jhu.edu). Formal application through the M.S.E.M.
Department (http://msem.engineering.jhu.edu) is required. Students
enrolled in a Combined B.S./M.S.E. program are awarded a Dean's
Master's Fellowship, covering half their tuition, after they have completed
eight semesters of undergraduate study. More information about these
programs can be found at http://engineering.jhu.edu/academics/

Financial Aid

Scholarships and other forms of financial assistance for undergraduates
are described under Admissions and Finances (p. 6). In addition, some
undergraduate students are employed by departmental faculty to provide
assistance on research projects.

Graduate Programs

Civil engineering today is a dynamic, complex, and technologically
sophisticated field. Powerful computational methods and high-strength
materials offer new opportunities and new challenges. The Department
of Civil Engineering offers a graduate program that is based primarily in
mechanics of materials, systems, and structures. Fundamental to these
areas is research in solid, structural, and stochastic mechanics. The
graduate program is designed to instill in the student the fundamental
theoretical concepts of mechanics as well as practical knowledge of
modern materials, systems, and structural engineering. To be admitted
to the program, students are expected to have graduated with an
outstanding record in an appropriate undergraduate program.

Master's Program

Our Master of Science and Engineering (M.S.E.) Program develops a
sound understanding of the scientific principles upon which engineering
research and practice are based. Different aspects of learning are
integrated through classroom, laboratory instruction, and independent
study experiences. Graduates of the program possess critical thinking
skills, the ability for both independent and team problem-solving, and
a sense of the excitement of engineering creativity and design. The
program also develops communication skills necessary for its graduates
to function in teams and to deal with other professions in public and
private arenas. Its progressive education furthers student understanding
of the context in which engineering is practiced in modern society. Thus,
the program educates leaders for tomorrow, providing the tools and
perspectives for a lifetime of learning, opportunities, and professional
advancement.

Requirements for the M.S.E. Degree

After admission to the M.S.E. program, students must successfully
comeplete one of two requirements in order to obtain the M.S.E. degree:

Course-Only MSE Requirements

The most common path for JHU Civil Engineering MSE graduates is
to complete the degree through coursework alone. The MSE degree
requirements are as follows:

- 8 courses, 7 of which must be technical.
- All courses must be completed at the 600-level or above.
- 4 of the 8 courses must be from Civil Engineering (EN.560.XXX or
  EN.565.XXX).
- First three semesters must be full-time. The fourth semester can be
  part-time if student satisfies all eligibility requirements.
- No more than one course with a grade lower than a B- may be
counted toward the course requirements. No course with a grade
lower than a C- may be counted toward the degree requirements.
- Transfer credits are not permitted.
- Enrollment in Civil Engineering Graduate Seminar (Fall – EN.560.691,
  Spring – EN.560.692) is required for two semesters.
- Completion of the Academic Ethics short course EN.500.603.
- Completion of Responsible Conduct of Research short course (if
  required) AS.360.624 or AS.360.625.
- Academic advisors, in consultation with the faculty in the Department
  of Civil Engineering, will determine whether the 8 courses leading
to this degree are appropriate and if they have been completed
satisfactorily.
- Students must comply with all requirements stipulated by the Whiting
  School of Engineering Academic Policies and Procedures as outlined
at https://engineering.jhu.edu/graduate-studies/academic-policies-

MSE with Thesis Requirements

The MSE with thesis option is primarily intended for students interested
in pursuing a Ph.D. The requirements are as follows:

- 7 courses (6 of which must be technical).
- Enroll in a two-semester research sequence with research advisor.
- All courses must be completed at the 600-level or above.
- 4 of the 7 courses must be from Civil Engineering (EN.560.XXX or
  EN.565.XXX).
- First three semesters must be full-time. The fourth semester can be
  part-time if student satisfies all eligibility requirements.
- No more than one course with a grade lower than a B- may be
counted toward the course requirements. No course with a grade
lower than a C- may be counted toward the degree requirements.

Scholarships and other forms of financial assistance for undergraduates
are described under Admissions and Finances (p. 6). In addition, some
undergraduate students are employed by departmental faculty to provide
assistance on research projects.

Combined Bachelor's/Master's Programs

The Department of Civil Engineering offers combined bachelor's/master's
degrees. One program combines a B.S. in Civil Engineering with a Master
of Science in Engineering (M.S.E.) in Civil Engineering. For students who
are admitted to this program, the two degrees typically require five years
total to complete. The other option combines a B.S. in Civil Engineering
with a Master of Science in Engineering Management (M.S.E.M.) (http://
msem.engineering.jhu.edu). Formal application through the M.S.E.M.
Department (http://msem.engineering.jhu.edu) is required. Students
enrolled in a Combined B.S./M.S.E. program are awarded a Dean's
Master's Fellowship, covering half their tuition, after they have completed
eight semesters of undergraduate study. More information about these
programs can be found at http://engineering.jhu.edu/academics/

Financial Aid

Scholarships and other forms of financial assistance for undergraduates
are described under Admissions and Finances (p. 6). In addition, some
undergraduate students are employed by departmental faculty to provide
assistance on research projects.

Graduate Programs

Civil engineering today is a dynamic, complex, and technologically
sophisticated field. Powerful computational methods and high-strength
materials offer new opportunities and new challenges. The Department
of Civil Engineering offers a graduate program that is based primarily in
mechanics of materials, systems, and structures. Fundamental to these
areas is research in solid, structural, and stochastic mechanics. The
graduate program is designed to instill in the student the fundamental
theoretical concepts of mechanics as well as practical knowledge of
modern materials, systems, and structural engineering. To be admitted
to the program, students are expected to have graduated with an
outstanding record in an appropriate undergraduate program.

Master's Program

Our Master of Science and Engineering (M.S.E.) Program develops a
sound understanding of the scientific principles upon which engineering
research and practice are based. Different aspects of learning are
integrated through classroom, laboratory instruction, and independent
study experiences. Graduates of the program possess critical thinking
skills, the ability for both independent and team problem-solving, and
a sense of the excitement of engineering creativity and design. The
program also develops communication skills necessary for its graduates
to function in teams and to deal with other professions in public and
private arenas. Its progressive education furthers student understanding
of the context in which engineering is practiced in modern society. Thus,
the program educates leaders for tomorrow, providing the tools and
perspectives for a lifetime of learning, opportunities, and professional
advancement.

Requirements for the M.S.E. Degree

After admission to the M.S.E. program, students must successfully
comeplete one of two requirements in order to obtain the M.S.E. degree:

Course-Only MSE Requirements

The most common path for JHU Civil Engineering MSE graduates is
to complete the degree through coursework alone. The MSE degree
requirements are as follows:

- 8 courses, 7 of which must be technical.
- All courses must be completed at the 600-level or above.
- 4 of the 8 courses must be from Civil Engineering (EN.560.XXX or
  EN.565.XXX).
- First three semesters must be full-time. The fourth semester can be
  part-time if student satisfies all eligibility requirements.
- No more than one course with a grade lower than a B- may be
counted toward the course requirements. No course with a grade
lower than a C- may be counted toward the degree requirements.
- Transfer credits are not permitted.
- Enrollment in Civil Engineering Graduate Seminar (Fall – EN.560.691,
  Spring – EN.560.692) is required for two semesters.
- Completion of the Academic Ethics short course EN.500.603.
- Completion of Responsible Conduct of Research short course (if
  required) AS.360.624 or AS.360.625.
- Academic advisors, in consultation with the faculty in the Department
  of Civil Engineering, will determine whether the 8 courses leading
to this degree are appropriate and if they have been completed
satisfactorily.
- Students must comply with all requirements stipulated by the Whiting
  School of Engineering Academic Policies and Procedures as outlined
at https://engineering.jhu.edu/graduate-studies/academic-policies-

MSE with Thesis Requirements

The MSE with thesis option is primarily intended for students interested
in pursuing a Ph.D. The requirements are as follows:

- 7 courses (6 of which must be technical).
- Enroll in a two-semester research sequence with research advisor.
- All courses must be completed at the 600-level or above.
- 4 of the 7 courses must be from Civil Engineering (EN.560.XXX or
  EN.565.XXX).
- First three semesters must be full-time. The fourth semester can be
  part-time if student satisfies all eligibility requirements.
- No more than one course with a grade lower than a B- may be
counted toward the course requirements. No course with a grade
lower than a C- may be counted toward the degree requirements.
The relationship between the students, staff, and faculty, while our management, and systems engineering.

The small size of the CE Department fosters a collegial, close-knit relationship between the students, staff, and faculty, while our society. Focal research areas in the Department include structural mechanics, probabilistic methods, hazards engineering, and structural study of the built environment that underpins our society. Its graduates have an appreciation of professional ethics and the value of service to their profession and society through participation in technical activities, and in community, state and national organizations.

Requirements for the Ph.D. Degree

There are a number of Whiting School of Engineering policies related to Ph.D. students, which are listed at http://engineering.jhu.edu/graduate-policies. Ph.D. student requirements for the Civil Engineering Department include:

- 8 Courses, at the 600- or 700-level, completed with a grade of B or better
- Department Qualifying Examination (DQE)
- Graduate Board Oral Examination (GBO)
- Responsible Conduct of Research short course (AS.360.625) and...
- Final Ph.D. Thesis Defense

Typical Timeline for Ph.D. Students

**Year 1 Fall:**
- Arrival prior to start of classes
- Selection of first semester courses (typically 4) with Director of Graduate Studies or research advisor
- Language/communication testing and placement for International Students
- Responsible Conduct of Research (AS.360.625) short course
- Academic Ethics (EN.500.603) short course
- Department Qualifying Examination (DQE) (completed in early January)
- Determination of permanent advisor in first semester

**Year 1 Intersession:**
- Intersession research
- Department Qualifying Exam (DQE) (completed in early January)
- Annual review completed by January 31

**Year 1 Summer:**
- Research

**Year 2 Fall:**
- Research
- Coursework (typically finishing up this semester)
- Ph.D. Thesis Committee Meeting required prior to end of Fall semester

**Year 2 Intersession:**
- Research

Transfer credits are not permitted.

Enrollment in Civil Engineering Graduate Seminar (Fall – EN.560.691, Spring – EN.560.692) is required for two semesters.

Completion of the Academic Ethics short course EN.500.603.

Creation of the Responsible Conduct of Research short course (required) AS.360.624 or AS.360.625.

The student must write a final thesis that is approved by the research advisor and one additional reader who will typically be a full-time Johns Hopkins Civil Engineering faculty member. Any external reader must be approved by the Chair of the Department of Civil Engineering.

The student must present their research in a public forum attended by two members of the WSE faculty or other faculty approved by the Chair of the Department of Civil Engineering.

Academic advisors, in consultation with the faculty in the Department of Civil Engineering, will determine whether the courses leading to this degree are appropriate and if they have been completed satisfactorily.

Students must comply with all requirements stipulated by the Whiting School of Engineering Academic Policies and Procedures as outlined at https://engineering.jhu.edu/graduate-studies/academic-policies-procedures-graduate/.

The MSE with thesis program is expected to be completed in 3-4 semesters with the student enrolled in 2-3 courses per semester in addition to research. Summer research is typical but not necessary and is left to the discretion of the student and advisor.

Note: Seminars, Academic Ethics (EN.500.603) and Responsible Conduct of Research (AS.360.624/625) courses are less than 3 credits each and do not count towards minimum course requirements.

Typically limited financial support is available for M.S.E. students. Funding decisions will be made on an individual basis by the Department of Civil Engineering and will be communicated during the admissions process.

Combined Bachelor’s/Master’s Program

All Combined Bachelor’s/Master’s students must meet the requirements stipulated above for the respective MSE program (course-only or thesis program) with the following exception:

- The Department of Civil Engineering will accept one course from JHU undergraduate studies at the 400-level or above toward the course requirements listed above.

Note: Seminars, Academic Ethics (EN.500.603) and Responsible Conduct of Research (AS.360.624/625) courses are less than 3 credits each and do not count towards minimum course requirements.

1 See the Department Academic Program Coordinator, or Director of Graduate Studies to determine if you are eligible for part-time status.

Ph.D. Program

The PhD program at the Johns Hopkins University Department of Civil Engineering aims to inspire the leaders of tomorrow to take on the challenge of creating and sustaining the built environment that underpins our society. Focal research areas in the Department include structural engineering, structural mechanics, probabilistic methods, hazards management, and systems engineering.

The small size of the CE Department fosters a collegial, close-knit relationship between the students, staff, and faculty, while our partnerships with the Mechanical Engineering, Biomedical Engineering, Materials Science & Engineering, Applied Mathematics & Statistics, Departments of Environmental Health and Engineering, Emergency Medicine, Public Health, and other John Hopkins groups provide a wide range of opportunities that surpasses those of much larger programs.

Students graduate from the program with a sense of the responsibility that the civil engineering profession accepts for applying the principles of engineering sciences for the betterment of the built environment and society. Its graduates have an appreciation of professional ethics and the value of service to their profession and society through participation in technical activities, and in community, state and national organizations.
Year 2 Summer:
- Research

Year 3:
- Research (Year-round)
- Ph.D. Thesis Committee Meeting
- Annual review completed by January 31
- GBO: Exact timing determined by advisor in consultation with the student

Year 4 and Beyond:
- Research (Year-round)
- Ph.D. Thesis Committee Meeting every Fall prior to the end of the semester
- Annual review completed by January 31

Final semester:
- Thesis Defense

Note: Teaching assistant duties may also be assigned during one or more semesters.

Language/Communication Testing and Placement
All Ph.D. students who do not have a prior degree from an English speaking university must take an English Language Assessment. If it is determined at the assessment that the student needs further English language instruction, he/she will be required to take 370.602 or equivalent.

Determination of Permanent Advisor
In some cases students are admitted to work with a specific advisor, in which case the permanent advisor is the faculty member listed in the offer letter. In other cases students are not assigned a specific advisor at the time of the admission letter. During September and October of the first semester, these students should meet with the faculty, discuss their research interests, and learn more about the research being conducted by the faculty. By the beginning of November the student must state his/her preference(s) for a permanent advisor. The faculty will meet and determine the final advisor placements prior to the end of the semester. Every effort will be made to match students with their requested advisors, but financial constraints may not always make this possible.

A Ph.D. student will not be able to remain in good standing with their academic and research progress if they do not have a research advisor. A student who is without a research/dissertation advisor for a period of 3 months may be placed on probation or terminated from the Ph.D. program. Note that it is typically not the role of a department to find an advisor for a student.

Intersession
Intersession (the period between Fall and Spring terms) is an important time for research. Intersession is not a vacation. Any leave taken during intersession is subject to the policies outlined in the Graduate Student Assistant Leave Guidelines (http://engineering.jhu.edu/include/content/pdf/RA_TA%20leave%20guidelines%20(FINAL).pdf). Release time (if any) granted in that period must be approved by the advisor.

Department Qualifying Examination (DQE)

The DQE is a comprehensive oral exam designed to determine whether or not the student is properly prepared to continue in the Ph.D. program. All first-year students studying for a Ph.D. take the DQE after their first semester of enrollment, typically in early January of the first year. This exam tests whether the student is prepared to continue in their Ph.D. studies based on their grasp of basic undergraduate-level and introductory graduate-level Civil Engineering knowledge. Possible outcomes of the exam are Pass or Fail. Only an outcome of Pass will allow the student to continue in the Ph.D. program. If the outcome of the exam is Fail, the student may pursue, with approval from the chair, a M.S.E. degree. Financial support beyond the first academic year is not typical.

Annual Reviews
Reviews of all Ph.D. students in Civil Engineering must be performed annually prior to January 31, and are consistent with the WSE policy found in the Graduate Student Academic Review Policy (https://engineering.jhu.edu/include/content/pdf/Acad%20Review%20Policy%20(FINAL).pdf). The review process follows the format given in the annual review form. The completed form must be submitted to the Academic Program Coordinator by January 31. If this annual review is not completed by this date, the student’s funding may be jeopardized.

Ph.D. Thesis Committee
Every Ph.D. student must have a Thesis Committee of at least 3 faculty members. The advisor, in consultation with his/her student, selects the makeup of the committee, and this information is recorded in the student’s file. The student is encouraged to meet with this committee a minimum of once per year. The thesis committee also typically serves as a subset of the actual GBO examination committee and forms the final Ph.D. defense committee. This committee must consist of a minimum of 2 full-time faculty of the Civil Engineering Department.

Responsible Conduct of Research
Every Ph.D. student of the Whiting School of Engineering is required to take the Responsible Conduct of Research course (details on the requirement can be found on the WSE Policy on the Responsible Conduct of Research Training (http://engineering.jhu.edu/wise-research/resources-policies-forms/responsible-conduct-of-research) webpage. For Civil Engineering students, this should be completed in the Fall or Spring of the first year of studies. Students who do not complete this requirement prior to Fall of their third year of studies may put their funding in jeopardy.

GBO Examination
The University maintains complete guidelines for the Graduate Board Oral exams (http://homewoodgrad.jhu.edu/academics/graduate-board/degree-candidacy). The GBO committee consists of 5 members, (3 in Department, 2 outside) with 2 alternates (1 in Department, 1 outside) and is selected by the Chair of the Department and the Director of Graduate Studies, who will consult with the student’s advisor. When a Ph.D. student and advisor feel that the student is ready to take the GBO, the advisor should consult with the Director of Graduate Studies and the Civil Engineering Academic Program Coordinator to initiate the process of scheduling the exam. Both students and advisors should be aware that 4-6 weeks advance notice is needed in order to allow for scheduling the exam with the faculty and with the Graduate Board.

The exact format of each GBO examination is specified by the individual Chair of the GBO committee. The student may be requested to provide to the GBO committee prior to the examination some written document describing his or her research. In such cases, the latest annual Thesis Committee report and/or a recent conference or journal publication may
suffice. It is typical that the student would be asked to provide a brief presentation of research at the beginning of the examination (no more than 10 slides, no longer than 10 minutes). The examination questions may be on any topic of the committee members’ choosing, but many of the questions relate to the student's coursework and research. At the conclusion of the examination, the GBO committee may recommend pass, conditional pass, fail with re-examination, fail (final) as detailed here (http://homewoodgrad.jhu.edu/academics/graduate-board/graduate-board-oral-exams).

**M.S.E. Degree for Ph.D. Students**
Ph.D. students may petition for a M.S.E. degree following their GBO Examination. If the student passes the GBO, he/she may file for a non-terminal M.S.E. degree. If the student fails (final) the GBO, he/she may petition for a terminal M.S.E. degree. In all instances the students must have satisfied the M.S.E. degree course requirements as detailed here (http://engineering.jhu.edu/civil/graduate-studies/mse-requirements).

In instances where the research is highly interdepartmental, the student, with permission of the advisor, may request that the M.S.E. degree be awarded by another department in the Whiting School of Engineering. In such cases, the student must have satisfied M.S.E. degree requirements and receive the approval of, and an accepted application to, the awarding Department, as well as satisfied M.S.E. degree requirements of the Civil Engineering Department and receive approval from the Civil Engineering Chair. In all cases, the awarding of any JHU M.S.E. degree to a Civil Engineering Ph.D. student may only occur after the student has completed the GBO exam.

**Thesis Defense**
The Thesis Defense is the final examination before conferral of the Ph.D. degree. The student defends his/her thesis in a seminar setting that is open to the public. The seminar is followed by a comprehensive examination of the student, focused on the thesis research.

**Ethics:** The Department of Civil Engineering is dedicated to upholding the highest standards of academic and research integrity. Plagiarism, and other forms of unethical conduct, are not tolerated. Students are referred to the JHU Graduate Board Policy (http://homewoodgrad.jhu.edu/academics/policies) webpage and the Whiting School of Engineering's Responsible Conduct of Research Policy (https://engineering.jhu.edu/wp-content/uploads/2013/07/WSE_Research_Rules.pdf) for a discussion of ethics and university policies.

**Defense Committee:** A committee of at least 3 members administers the exam (typically the Ph.D. Thesis Committee). The Advisor, in consultation with the Department, selects the committee members, at least 2 of whom must be full-time faculty of the Civil Engineering Department. This should be done at the beginning of the semester in which the student plans to graduate.

**Scheduling and Pre-Defense:** The defense should be scheduled at least 3 weeks in advance through the Department’s Academic Coordinator. A complete written dissertation should be given to the committee at least 14 days in advance of the defense. Failure to meet this 2 week deadline will result in rescheduling the Ph.D. defense. The date and place of the defense, along with the thesis abstract, should be circulated 5-7 days prior to the defense.

**Post-Defense:** Completion of the Ph.D. requirements typically takes 4-8 weeks after a successful defense examination. All data and source codes related to the thesis should be properly archived according to requirements set forth by the Advisor. Any changes or additions specifically requested by the reviewers before or during the defense seminar should be incorporated into the thesis in consultation with the Advisor. A final copy of the thesis must then be made available to the reviewers for inspection no less than 48 hours before the deadline date for filing set by the Graduate Board. A receipt of ETD approval email must be sent to the Academic Program Coordinator and the Graduate Board/WSE Office of Academic Affairs (for M.S.E. students).

**Additional Information:** It is the responsibility of the student to be aware of requirements and deadlines. It is suggested that this information be obtained before the start of the semester of intended graduation. All students should plan the timing of the final defense accordingly (making sure to account for the 4-8 week period following the defense) to satisfy any deadlines related to upcoming graduation or exhaustion of funding.

University requirements for the thesis can be obtained from the Sheridan Libraries (https://www.library.jhu.edu/library-services/electronic-theses-dissertations) web site. Doctoral Theses must be submitted to the ETD (Library). The deadline date for filing is set by the Graduate Board Office (https://homewoodgrad.jhu.edu/academics/graduate-board/deadlines).

**Financial Aid**
A limited amount of financial assistance is available to Civil Engineering graduate students in the form of teaching assistantships, research assistantships, including fellowships from the Joseph Meyerhoff Scholarship Fund, the Richard D. Hickman Endowment, and the Hoomes Rich Graduate Fellowship. Fellowships and Assistantships are awarded on a competitive basis and continued support is subject to the student's performance and future availability of research or teaching assistantship funds. In some cases, partial fellowships are offered to outstanding master's students.

For current faculty and contact information go to http://engineering.jhu.edu/civil/faculty/

**Faculty**

**Chair**
Lori Graham-Brady  
Professor

**Professors**
Lori Graham-Brady  
Professor: probabilistic mechanics, finite elements, stochastic modeling of materials.  
Somnath Ghosh  
Professor: structural dynamics, earthquake engineering, analysis of uncertainties.

**Associate Professor**
James K. Guest  
Associate Professor: topology optimization, structural and material design optimization, computational mechanics, architected materials.

**Assistant Professors**
Stavros Gaitaranos
Assistant Professor: design and mechanics of cellular materials at the macro- and nanoscale.

Thomas Gernay
Assistant Professor: structural fire engineering, performance-based structural design, computational mechanics, community resilience assessment.

Michael D. Shields
Assistant Professor: stochastic simulation, uncertainty quantification, computational stochastic mechanics.

Sauleh Siddiqui
Assistant Professor: optimization, equilibrium problems, systems in energy and environmental markets, transportation, and public health.

**Lecturers**

Rachel H. Sangree
Lecturer, Program Chair EP Civil Engineering: structural engineering, historic structures.

Lucas de Melo
Lecturer (part-time): geotechnical engineering.

Matthew Farmer
Lecturer (part-time): brick, stone, and cast stone masonry; facade assessment, repair & rehabilitation design, failure investigation, structural evaluation, testing & instrumentation, historic preservation.

John A. Matteo
Lecturer (part-time): Director of Design: structural engineering and architecture, historic structures.

Edmund Meade
Lecturer (part-time): restoration and renovation, historic preservation.

Gonzalo Pita
Lecturer (part-time): disaster risk modeling, natural hazard simulations, wind and structural engineering, quantitative decision making.

Craig J. Wasilewsky
Lecturer (part-time): repair, rehabilitation and designing structures, historic preservation.

**Associate Research Professor**

Cristopher Moen
Associate Research Professor: computational and experimental mechanics of ductile and brittle materials, simulation of composite structural systems, failure assessment and prediction.

**Professor Emeritus**

Robert A. Dalrymple
Professor and Willard and Lillian Hackerman Chair in Civil Engineering: coastal engineering, water wave mechanics, fluid mechanics.

**Joint Appointment, Professor, Department of Environmental Health and Engineering:** structural health engineering, environmental systems.

Scott Levin
Joint Appointment, Professor, Department of Emergency Medicine: systems engineering in healthcare, optimization of hospital resources and patient outcomes.

Jonathan Links
Joint Appointment, Director, Center for Public Health Preparedness: environmental health sciences, imaging, dosimetry, radiation, dirty bombs, OpenCourseWare, nuclear medicine, radiological terror, public health preparedness.

Alan Stone
Joint Appointment, Professor, Department of Environmental Health and Engineering.

**Adjunct Appointments**

Shahabeddin Torabian
Adjunct Associate Research Scientist: thin-walled structures.

For current course information and registration go to [https://sis.jhu.edu/classes/](https://sis.jhu.edu/classes/)

**Courses**

**EN.560.101. Freshman Experiences in Civil Engineering. 1.0 Credit.**

An introduction to civil engineering for first-year students. This course welcomes freshmen to the major by exploring civil engineering design and the range of design projects in which professional civil engineers engage. Students will have the opportunity to practice the design process using hands-on team-based projects, with emphasis on creative design, graphical communication, and teamwork.

Prerequisites: Students must have completed Lab Safety training prior to registering for this class.

Instructor(s): R. Sangree

Area: Engineering.

**EN.560.141. Perspectives on the Evolution of Structures. 3.0 Credits.**

Why do buildings and bridges look the way they do today? Students will be provided the tools to answer this question for themselves through a study of the history of the design of buildings and bridges throughout the world from both engineering and architectural/aesthetic perspectives. Only simple mathematics is required (no calculus). Students will participate in individual and group critique of structures from engineering, architectural, and social points of view.

Instructor(s): B. Schafer, R. Sangree

**EN.560.201. Statics & Mechanics of Materials. 4.0 Credits.**

Basic principles of classical mechanics applied to the equilibrium of particles and rigid bodies at rest, under the influence of various force systems. In addition, the following topics are studied: free body concept, analysis of simple structures, friction, centroids and centers of gravity, and moments of inertia. Includes laboratory experience.

Prerequisites: Students must have completed Lab Safety training prior to registering for this class.

AS.171.101 OR AS.171.107 OR (EN.530.123 AND EN.530.124) or instructor permission.

Instructor(s): R. Sangree

Area: Engineering.

J. Hugh Ellis
EN.560.202. Dynamics. 4.0 Credits.
Basic principles of classical mechanics applied to the motion of particles, system of particles and rigid bodies. Kinematics: analytical description of motion; rectilinear and curvilinear motions of particles; rigid body motion. Kinetics: force, mass, and acceleration; energy and momentum principles. Introduction to vibration. Includes laboratory experience. **Prerequisites:** Students must have completed Lab Safety training prior to registering for this class. *(EN.560.201 OR EN.530.201) AND AS.110.109*

Instructor(s): L. Graham-Brady; S. Gaitanaros
Area: Engineering.

EN.560.204. Solid Mechanics & Theory of Structures. 3.0 Credits.
Application of the principles of structural analysis for statically determinate and indeterminate structures (trusses, cables, beams, arches, and frames). Calculation of internal forces and stresses in members and structures. Determination of deflections by equilibrium and energy methods. Analysis of indeterminate structures by flexibility and stiffness methods. **Prerequisites:** EN.560.201 OR EN.530.201

Instructor(s): M. Shields
Area: Engineering.

EN.560.205. Civil Engineering Undergraduate Research Laboratory. 1.0 Credit.
Laboratory course to be taken by Civil Engineering students concurrently with EN.560.206 (Solid Mechanics & Theory of Structures). **Prerequisites:** To be taken concurrently with EN.560.206.

Instructor(s): M. Shields
Area: Engineering.

EN.560.220. Civil Engineering Programming. 3.0 Credits.
Civil engineering problems are formulated and then solved by numerical methods. Matrix inversion, data fitting and interpolation, root-finding, and solutions of ordinary and partial differential equations are presented. Matlab programming will be introduced to facilitate the solutions. Recommended Course Background: AS.110.106/AS.110.108, AS.110.107/AS.110.109

Instructor(s): B. Schafer
Area: Engineering.

EN.560.303. Soil Mechanics. 4.0 Credits.
Basic principles of soil mechanics. Classification of soils. Compaction theory. Consolidation seepage and settlement analysis. Stress-strain and shear strength of soils. Introduction to earth pressure theories and slope stability analysis. **Prerequisites:** Students must have completed Lab Safety training prior to registering for this class. *(EN.560.206 OR EN.570.351)*

Instructor(s): L. de Melo
Area: Engineering.

EN.560.320. Structural Design I. 3.0 Credits.
Introduction to structural design using common building materials (structural steel, reinforced concrete, and wood). Emphasis will be placed on the application of solid mechanics principles to the design of structural components (beams, columns, and tension members). **Prerequisites:** EN.560.206

Instructor(s): C. Moen
Area: Engineering.

EN.560.325. Structural Design II. 3.0 Credits.
A continuation of Structural Design I, this course explores the behavior and conceptual design of structures. Emphasis is placed on identifying load paths through typical gravity and lateral load systems, modeling loads on real structures, and designing structural systems. Designing connections capable of transferring loads through a structural system will also be covered. Recommended Course Background: EN.560.320

**Prerequisites:** EN.560.320

Instructor(s): R. Sangree
Area: Engineering.

EN.560.330. Foundation Design. 3.0 Credits.
Application of soil mechanics theory and soil test results to the analysis and design of foundations for structures; retaining walls; embankments; design of pile and shallow footing foundations; slope stability. **Prerequisites:** EN.560.305

Instructor(s): L. de Melo
Area: Engineering.

EN.560.348. Probability & Statistics in Civil Engineering. 3.0 Credits.
Development and applications of the analysis of uncertainty, including basic probability, statistics and decision theory, in civil engineering systems. Recommended Course Background: AS.110.109

**Prerequisites:** Statistics Sequence restriction: Students who have completed any of these courses may not register: EN.550.310 OR EN.550.311 OR EN.560.435 OR EN.550.420 OR EN.550.430.

Instructor(s): L. Graham-Brady
Area: Engineering.

EN.560.404. Engineering Mechanics. 3.0 Credits.
This course will build a strong foundation in engineering mechanics, from fundamental theory to computational modeling. Constitutive relations governing various physical systems will be discussed, with a particular focus on constitutive symmetries and characteristic failure mechanisms corresponding to specific materials. Examples include ductile yielding and fracture in metals, shear banding in granular materials, fracture in composites, nonlinear inelasticity in biomaterials, and micro-buckling in architected materials. Finite element software will be used to model examples of these mechanisms. **Prerequisites:** EN.560.206 or permission of instructor

Instructor(s): J. Guest
Area: Engineering.

EN.560.423. Bridge Engineering. 3.0 Credits.
This course will explore bridge design and analysis by studying local bridges of various forms, materials, and load demands. Topics include an overview of the history of bridge engineering, an introduction to the AASHTO Standard Specifications for Highway Bridges, analysis techniques and load ratings, bridge details, and substructure design. **Prerequisites:** EN.560.320 AND EN.560.325

Instructor(s): R. Sangree
Area: Engineering.
EN.560.429. Preservation Engineering: Theory and Practice. 3.0 Credits.
The renovation of existing buildings often holds many advantages over new construction, including greater economy, improved sustainability, and the maintenance of engineering heritage and architectural character in our built environment. Yet, the renovation of existing structures presents many challenges to structural engineers. These challenges include structural materials that are no longer in widespread use (e.g., unreinforced masonry arches and vaults, cast iron, and wrought iron) as well as structural materials for which analysis and design practices have changed significantly over the last half-century (e.g., wood, steel, and reinforced concrete). This course will examine structures made of a wide variety of materials and instruct the student how to evaluate their condition, determine their existing capacity, and design repairs and/or reinforcement. The investigation and analysis procedures learned from this course may then be applied to create economical and durable structural alterations that allow for the reuse of older buildings. Site visits near Homewood campus will supplement lectures.
Prerequisites: EN.560.320 AND EN.560.325 or equivalent for graduate students.
Instructor(s): E. Meade; M. Farmer
Area: Engineering.

EN.560.431. Preservation Engineering II: Theory and Practice. 3.0 Credits.
Building on the content in Preservation Engineering I: Theory and Practice, this course will begin with materials introduced at the start of the Industrial Revolution--namely with the beginning of the use of iron materials as major structural elements within buildings. The course will continue with the introduction of cast iron, wrought iron, and finally, structural steel members. After introducing iron materials the course will continue with the early use of reinforced concrete as a major structural material. The course will discuss the historic structural analysis methods associated with such materials and contrast such methods with more modern analytical approaches. It will also discuss concrete deterioration and repair methods. Concepts related to masonry facade investigation and repair will be presented along with the analytical methods associated with thin-shell masonry construction from the 19th and 20th centuries. The course will conclude with a review of the assessment and retrofit of historic foundations. Course is co-listed with EN.565.431 and EN.560.631.
Prerequisites: EN.560.429 OR Permission from the instructor.
Instructor(s): E. Meade; M. Farmer
Area: Engineering.

EN.560.434. Structural Fire Engineering. 3.0 Credits.
This course will discuss the analysis and design of structures exposed to fire. It will cover the fundamentals of fire behavior, heat transfer, the effects of fire loading on materials and structural systems, and the principles and design methods for fire resistance design. Particular emphasis will be placed on the advanced modeling and computational tools for performance-based design. Applications of innovative methods for fire resistance design in large structural engineering projects, such as stadiums and tall buildings, will also be presented. Course is co-listed with graduate-level EN.560.635.
Instructor(s): T. Gernay
Area: Engineering.

EN.560.445. Advanced Structural Analysis. 3.0 Credits.
Matrix methods for the analysis of statistically indeterminate structures such as beams, plane and space trusses, and plane and space frames. Stiffness and flexibility methods. Linear elastic analysis and introduction to nonlinear analysis.
Prerequisites: EN.560.206
Instructor(s): J. Guest
Area: Engineering.

EN.560.451. Civil Engineering Design I. 2.0 Credits.
A study of the engineering design process from problem definition to the schematic or conceptual design. There are both individual and team projects which include written and oral presentations. Students’ understanding of and communication about the built environment is exercised with three languages -- Speech (written and verbal), Graphics (drawings and diagrams) and Mathematics (engineering calculations). First principles of mechanics and design procedures are connected with real world constructions and design concepts.
Instructor(s): J. Matteo
Area: Engineering.

EN.560.452. Civil Engineering Design II. 3.0 Credits.
A study of the engineering design process from conceptual to the final design. There are team projects which include written and oral presentations. A common project is defined for the class, however each group is allowed freedom to develop their designs independently, which typically demonstrates the great range of design solutions to a given problem. Work during the semester takes on a design studio approach, with team engineering and regular reviews and input from the instructor. In addition to engineering calculations, students produce a 3D digital model, engineering drawings, and presentation posters with written summary. The culmination of the semester is the final presentation of their design projects in an open forum of peers, professors, and representatives from the profession.
Instructor(s): J. Matteo
Area: Engineering.

EN.560.458. Natural Disaster Risk Modeling. 3.0 Credits.
This course will introduce the student to disaster risk modeling process, including: structure of catastrophe models and uses in loss estimation and mitigation, study and modeling of hazards (esp. hurricanes and earthquakes; also flood, landslide, and volcanic), vulnerability assessment including simulation of building damage, and estimation of post-disaster injuries and casualties. Additionally topics will include, exposure modeling (building typology distribution), introduction to disaster economic loss modeling, interpretation of risk metrics (return periods, PML, AAL, VaR, TVaR), their uncertainty, and applicability to management and financial decision making process and elements of present and future risk, such as, climate and exposure changes. Students will gain introductory experience in the use of GIS and simulation with Matlab.
Instructor(s): G. Pita
Area: Engineering.

EN.560.491. Civil Engineering Seminar I.
Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/Unsatisfactory only
Instructor(s): R. Sangree
Area: Engineering.
EN.560.492. Civil Engineering Seminar II. Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only
Prerequisites: EN.560.491
Instructor(s): R. Sangree
Area: Engineering.

EN.560.493. Civil Engineering Seminar III. Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only
Prerequisites: EN.560.492
Instructor(s): R. Sangree
Area: Engineering.

EN.560.494. Civil Engineering Seminar IV. Seminar series of speakers on various aspects of civil engineering. Juniors and Seniors in Civil Engineering are expected to enroll in this sequence; juniors and seniors receive one-half credit. Different speakers are invited each semester. Satisfactory/ Unsatisfactory only
Prerequisites: EN.560.493
Instructor(s): R. Sangree
Area: Engineering.

EN.560.501. Undergraduate Research. 0.0 - 3.0 Credits.
Research in Civil Engineering
Instructor(s): B. Schafer, J. Guest; M. Shields; R. Sangree; S. Siddiqui.

EN.560.511. Group Undergraduate Research. 0.0 - 3.0 Credits.
This section has a weekly research group meeting that students are expected to attend.
Instructor(s): B. Schafer, J. Guest; R. Sangree; S. Siddiqui.

EN.560.525. Independent Study. 1.0 - 3.0 Credits.
Instructor(s): J. Guest; R. Dalrymple; S. Siddiqui; T. Igusa.

EN.560.526. Independent Study - Civil Engineering. 0.0 - 3.0 Credits.
Instructor(s): B. Schafer, J. Guest; M. Shields; S. Siddiqui; T. Igusa.

EN.560.536. Research in Civil Engineering. 0.0 - 3.0 Credits.
Instructor(s): Staff.

EN.560.550. Civil Engineering Internship. 1.0 Credit.
Instructor(s): B. Schafer, J. Guest.

EN.560.557. Summer Research - Civil Engineering. 3.0 Credits.
Instructor(s): Staff.

EN.560.601. Applied Math for Engineers. 3.0 Credits.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Zhong
Area: Engineering, Quantitative and Mathematical Sciences.

EN.560.604. Introduction to Solid Mechanics. 3.0 Credits.
Basic solid mechanics for structural engineers. Stress, strain and constitutive laws. Linear elasticity and viscoelasticity. Introduction to nonlinear mechanics. Static, dynamic and thermal stresses. Specialization of theory to one- and two-dimensional cases: plane stress and plane strain, rods, and beams. Work and energy principles; variational formulations.
Instructor(s): S. Gaitanaros.

EN.560.608. Multilevel and Multiobjective Optimization in Systems. 3.0 Credits.
This course will introduce nonlinear optimization and convexity in higher dimensions to model large-scale systems. Graduate students only. Recommended Course Background: AS.110.201 or EN.553.291, AS.110.202.
Prerequisites: EN.560.442 OR EN.560.641
Instructor(s): S. Siddiqui
Area: Engineering.

EN.560.618. Probabilistic Methods in Civil Engineering and Mechanics. 3.0 Credits.
Covers probabilistic computational modeling in civil engineering and mechanics: Monte Carlo simulation, sampling methods and variance reduction techniques, simulation of stochastic processes and fields, and expansion methods. Applications to stochastic finite element, uncertainty quantification, reliability analysis, and model verification and validation.
Instructor(s): M. Shields.

EN.560.619. Advanced Structural Analysis. 3.0 Credits.
Matrix methods for the analysis of statistically indeterminate structures such as beams, plane and space trusses, and plane and space frames. Stiffness and flexibility methods. Linear elastic analysis and introduction to nonlinear analysis.
Instructor(s): J. Guest
Area: Engineering.

EN.560.623. Bridge Engineering. 3.0 Credits.
This course will explore bridge design and analysis by studying local bridges of various forms, materials, and load demands. Topics include an overview of the history of bridge engineering, an introduction to the AASHTO Standard Specifications for Highway Bridges, analysis techniques and load ratings, bridge details, and substructure design.
Instructor(s): R. Sangree
Area: Engineering.

EN.560.627. Topology Optimization for the Design of Materials, Devices, and Structures. 3.0 Credits.
Introduction to optimization theory and algorithms and their application to the design of structures, including structural systems, mechanisms, devices, and materials. Strong emphasis on topology optimization using finite element methods and design problems governed by solid and structural mechanics. Extensions to other physics and multiple physics are also introduced (e.g., fluids, heat transfer, optics, etc.). Course assumes familiarity with finite element methods and assumes no prior coursework in optimization.
Instructor(s): J. Guest
Area: Engineering.
EN.560.629. Preservation Engineering I: Theory and Practice. 3.0 Credits.
The renovation of existing buildings often holds many advantages over new construction, including greater economy, improved sustainability, and the maintenance of engineering heritage and architectural character in our built environment. Yet, the renovation of existing structures presents many challenges to structural engineers. These challenges include structural materials that are no longer in widespread use (e.g., unreinforced masonry arches and vaults, cast iron, and wrought iron) as well as structural materials for which analysis and design practices have changed significantly over the last half-century (e.g., wood, steel, and reinforced concrete). This course will examine structures made of a wide variety of materials and instruct the student how to evaluate their condition, determine their existing capacity, and design repairs and/or reinforcement. The investigation and analysis procedures learned from this course may then be applied to create economical and durable structural alterations that allow for the reuse of older buildings. Site visits near Homewood campus will supplement lectures. This course is co-listed with EN.565.628.
Instructor(s): E. Meade; M. Farmer
Area: Engineering.

EN.560.630. Structural Dynamics. 3.0 Credits.
Functional and computational examination of elastic and inelastic single degree of freedom systems with classical and non-classical damping subject to various input excitations including earthquakes. Extension to multi-degree of freedom systems with emphasis on modal analysis and numerical methods. Use of the principles of structural dynamics in earthquake response.
Instructor(s): C. Moen.

EN.560.631. Preservation Engineering II: Theory and Practice. 3.0 Credits.
Building on the content in Preservation Engineering I: Theory and Practice, this course will begin with materials introduced at the start of the Industrial Revolution—namely with the beginning of the use of iron materials as major structural elements within buildings. The course will continue with the introduction of cast iron, wrought iron, and finally, structural steel members. After introducing iron materials the course will continue with the early use of reinforced concrete as a major structural material. The course will discuss the historic structural analysis methods associated with such materials and contrast such methods with more modern analytical approaches. It will also discuss concrete deterioration and repair methods. Concepts related to masonry facade investigation and repair will be presented along with the analytical methods associated with thin-shell masonry construction from the 19th and 20th centuries. The course will conclude with a review of the assessment and retrofit of historic foundations. This course is co-listed with EN.560.431 and EN.565.431
Instructor(s): E. Meade
Area: Engineering.

EN.560.632. Structural Fire Engineering. 3.0 Credits.
This course will discuss the analysis and design of structures exposed to fire. It will cover the fundamentals of fire behavior, heat transfer, the effects of fire loading on materials and structural systems, and the principles and design methods for fire resistance design. Particular emphasis will be placed on the advanced modeling and computational tools for performance-based design. Applications of innovative methods for fire resistance design in large structural engineering projects, such as stadiums and tall buildings, will also be presented.
Instructor(s): T. Gernay
Area: Engineering
Writing Intensive.

EN.560.641. Equilibrium Models in Systems Engineering. 3.0 Credits.
Provide an introduction to equilibrium problems involving systems. The course will start with an introduction to optimization theory followed by various equilibrium problems including market, spatial, and network models. Solution techniques to these types of problems will be discussed, along with applications to systems engineering.
Instructor(s): S. Siddiqui
Area: Engineering.

EN.560.658. Natural Disaster Risk Modeling. 3.0 Credits.
This course will: • Introduce the student to disaster risk modeling process, including: - Structure of catastrophe models. Uses in loss estimation and mitigation. - Study and modeling of hazards (esp. hurricanes and earthquakes; also flood, landslide, and volcanic) - Vulnerability assessment: simulation of building damage, and estimation of post-disaster injuries and casualties. - Exposure modeling (building typology distribution). - Introduction to disaster economic loss modeling: - Interpretation of risk metrics (return periods, PML, AAL, VaR, TVaR), their uncertainty, and applicability to management and financial decision making process. - Elements of present and future risk: climate and exposure changes. - Student will gain introductory experience in the use of GIS and simulation with Matlab.
Instructor(s): G. Pita
Area: Engineering.

EN.560.667. Topology Optimization and Design for Additive Manufacturing. 3.0 Credits.
This course will discuss the computational design tool of topology optimization and its application to the design of "structures", including structural systems, complaint mechanisms, multifunctional devices, and material architectures. Particular emphasis will be placed on the emerging trend known as Design for Additive Manufacturing (AM), and the role of topology optimization in guiding the design of parts to be fabricated by AM processes (3D printing, Selective Laser Sintering, etc). The course will largely focus on design problems concerned with mechanical properties, with extensions to fluidic, thermal, optical, etc. properties also discussed. The course assumes some familiarity with finite element methods and assumes no prior coursework in optimization.
Instructor(s): J. Guest
Area: Engineering.

EN.560.692. Civil Engineering Graduate Seminar. 1.0 Credit.
Graduate students are expected to register for this course each semester. Both internal and outside speakers are included.

EN.560.699. Civil Engineering Graduate Seminar. 1.0 Credit.
Seminar series of speakers on various aspects of civil engineering. Different speakers are invited each semester. Full time civil engineering graduate students must enroll in the seminar course every semester unless excused by the Department.
Instructor(s): M. Shields.
EN.560.724. Cold-Formed Steel Structures. 3.0 Credits.
Practical introduction to the analysis, design, and experimentation
of cold-formed steel members and structures. Followed by an in-
depth treatment of the theories which underpin modern analytical and
computational tools used in exploring cold-formed steel behavior, and an
introduction to topics under current research.
Instructor(s): B. Schafer.

EN.560.730. Finite Element Methods. 3.0 Credits.
Variational methods and mathematical foundations, Direct and Iterative
solvers, 1-D Problems formulation and boundary conditions, Trusses,
2-D/3D Problems, Triangular elements, QUAD4 elements, Higher Order
Elements, Element Pathology, Improving Element Convergence, Dynamic
Problems.
Instructor(s): S. Ghosh.

EN.560.731. Structural Stability. 3.0 Credits.
Concepts of stability of equilibrium, stability criteria, work energy and
variational methods. Elastic buckling of columns, beams, frames, and
plates. Introduction to inelastic and dynamic buckling.
Instructor(s): B. Schafer.

EN.560.770. Advanced Finite Element Methods and Multi-Scale Methods.
3.0 Credits.
Addresses advanced topics in various areas of the finite element
methodology. Covers a range of topics, viz. element stability and
hourglass control, adaptive methods for linear and nonlinear problems,
mixed and hybrid element technology, eigen-value problems, multi-scale
modeling for composites and polycrystalline materials. Recommended
Course Background: EN.530.730 or EN.560.730
Instructor(s): S. Ghosh.

EN.570.351. Introduction to Fluid Mechanics. 3.0 Credits.
Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow.
Recommended Course Background: Statics, Dynamics, and AS.110.302
Prerequisites: Students must have completed Lab Safety training prior to
registering for this class.
Instructor(s): J. Kim
Area: Engineering, Natural Sciences.

Cross Listed Courses
Earth Planetary Sciences
AS.270.205. Introduction to Geographic Information Systems and
Geospatial Analysis. 3.0 Credits.
The course provides a broad introduction to the principles and practice
of Geographic Information Systems (GIS) and related tools of Geospatial
Analysis. Topics will include history of GIS, GIS data structures, data
acquisition and merging, database management, spatial analysis, and GIS
applications. In addition, students will get hands-on experience working
with GIS software.
Instructor(s): X. Chen
Area: Engineering, Natural Sciences.

Environmental Health and Engineering
EN.570.351. Introduction to Fluid Mechanics. 3.0 Credits.
Introduction to the use of the principles of continuity, momentum, and
energy to fluid motion. Topics include hydrostatics, ideal-fluid flow,
laminar flow, turbulent flow. Recommended Course Background: Statics,
Dynamics, and AS.110.302
Prerequisites: Students must have completed Lab Safety training prior to
registering for this class.
Instructor(s): J. Kim
Area: Engineering.

Computational Medicine
https://icm.jhu.edu/

Computational Medicine (CM) is an emerging discipline devoted to
the development of quantitative approaches for understanding the
mechanisms, diagnosis and treatment of human disease through
applications of mathematics, engineering and computational science.
The core approach of CM is to develop computional models of the
molecular biology, physiology, and anatomy of disease, and apply these
models to improve patient care. CM approaches can provide insight
into and across many areas of biology, including genetics, genomics,
molecular networks, cellular and tissue physiology, organ systems, and
whole body pharmacology.

CM research at ICM is sub-divided into four key areas: Computational
Molecular Medicine (https://icm.jhu.edu/research-areas-2/computational-
molecular-medicine); Computational Physiological Medicine
(http://icm.jhu.edu/research-areas-2/computational-physiological-
medicine); Computational Anatomy (http://icm.jhu.edu/research-
areas-2/computational-anatomy); Computational Healthcare (http://
icm.jhu.edu/research-areas-2/computational-healthcare). Techniques
for and applications in each of these four key subareas are introduced
during the required core courses, exposing students to the breadth
of Computational Medicine, and enabling each student to identify a
preferred area of interest:

- Computational Physiological Medicine develops mechanistic models
of biological systems in disease, and applies the insights gained
from these models to develop improved diagnostics and therapies.
Therapies could be diverse drugs, electrical stimulation, mechanical
support devices and more.
- Computational Molecular Medicine harnesses the enormous amount
of disease-relevant data produced by next-generation sequencing,
microarray and proteomic experiments of large patient cohorts,
using statistical models to identify the drivers of disease and the
susceptible links in disease networks.
• **Computational Anatomy** uses medical imaging to analyze the variation in structure of human organs in health and disease. Such image analysis has been integrated into clinical workflows to assist in the diagnosis and prognosis of complex diseases.

• **Computational Healthcare** is an emerging field devoted to understanding populations of patients and their interaction with all aspects of the healthcare process.

CM is distinct from Computational Biology in its focus on human health, disease, and treatment; translation to and application in the clinic is a near-term goal of all CM research. Applications of CM are as broad as medicine itself, and include: identification of optimal drugs using associated genomic and proteomic biomarkers; discovery of image-based biomarkers for diagnosis and prognosis; design and dynamic adjustment of individualized non-drug therapies such as deep brain stimulation, cardiac stimulation, and cochlear implants; modeling and learning from patient EHR data to improve patient outcomes and efficiency of care; optimization of healthcare policy decisions by quantitative analysis; and more. CM is one of the pillars of the University's Strategic Initiative in Individualized Health.

### Computational Medicine Minor

The Institute for Computational Medicine (ICM) is proud to offer an undergraduate minor in Computational Medicine, the **first educational program in CM**, reflecting Johns Hopkins University's leadership in this field. Like the ICM itself, the undergraduate minor in Computational Medicine is integrative and multidisciplinary. The 18 ICM Core Faculty who serve as advisors to the undergraduate minor hold primary and joint appointments in multiple Johns Hopkins University departments and schools including Biomedical Engineering, Computer Science, Electrical and Computer Engineering, Mechanical Engineering, Applied Mathematics and Statistics (WSE); Neurosurgery, Emergency Medicine, Medicine, and the Divisions of Cardiology and Health Sciences Informatics (SOM); and Health Policy and Management (BSPH).

With a minor in CM, undergraduates will have a solid grounding in the development and application of computational methods in multiple key areas of medicine. Specifically, undergraduates will understand how mathematical models can be constructed from biophysical laws or experimental data, and how predictions from these models facilitate diagnosis and treatment of a disease. Undergraduates will become conversant with a wide variety of statistical, deterministic and stochastic modeling methods, skills that are essential to the advancement of modern medicine, and are prized both in academic research and industrial research.

#### Minor Prerequisites

Before attempting the minor, undergraduates will have taken the following courses. For a course to count towards the minor, a minimum grade of C- is required (courses graded as 'S/U' do not satisfy prerequisites):

1. Calculus I
2. Calculus II
3. Probability and Statistics: either a single course covering both (e.g. EN.553.310 or EN.553.311) or a course devoted to each (e.g., EN.553.420 and EN.553.430) – this may be taken concurrent with core course EN.580.431
4. At least one (1) additional course in mathematics or applied mathematics (at least 3 credits)
5. At least one (1) of the following computer programming course (at least 3 credits): EN.500.112, EN.580.200, EN.601.120
6. At least one (1) biological sciences course at the 200 level or higher (at least 3 credits). AP Biology credits do not satisfy this requirement.

#### Core Courses

The required core courses for the minor are Introduction to Computational Medicine I (EN.580.431) and **one** of the following:

- Computational Molecular Medicine (EN.553.450) or Foundations of Computational Biology and Bioinformatics II (EN.580.488).

EN.580.431 covers computational anatomy and physiology and will be jointly taught by ICM faculty from multiple departments.

EN.550.450 focuses on molecular medicine and computational healthcare while EN.580.488 introduces probabilistic modeling and information theory applied to biological sequence analysis. Both courses require background in probability theory and statistics.

Core courses may not be taken concurrently.

#### Distinguished Seminar Series

Students enrolled in the Computational Medicine Minor are **REQUIRED** to attend 6 ICM Distinguished Seminars (https://icm.jhu.edu/seminar-series) in person by graduation. Documentation of seminar attendance is two-fold. For each seminar attended students must: (1) sign-in at the seminar and (2) complete an online Seminar Attendance Form (https://docs.google.com/forms/d/e/1FAIpQLSdBi2F2XW6bPTNVRzyg92EkfYs3xfkcM3hpndU868yiDnAzAoQ/viewform).

#### Elective Courses

Following satisfaction of the prerequisites, to complete the minor undergraduates must take at least 18 credits of CM courses. This includes two one-semester core courses plus approved elective courses selected from those listed below. The following restrictions are noted:

1. No more than 3 of the 18 elective credits may consist of independent research in computational medicine or approved CM-related research. Eligibility of independent research as “M”, “C”, “MC”, or neither is at the advisor’s discretion. Note: The Senior Design Project Course (EN.580.580/581) may count toward independent research, provided that the research falls within the field of computational medicine, as decided by the advisor;
2. The 18 credits will all be at 300-level or above, and courses must be passed at a C-level or above;
3. At least 1 non-core/elective courses must be outside student’s home department;
4. At least 2 non-core/elective courses must have a substantial biology or medicine component, as identified in the list below with an (M) designation;
5. At least 1 non-core course must have a significant component of “applied programming” (distinct from a course on computer language or on programming such as Intermediate Computer Programming in Computer Science) to satisfy the computational component, as identified in the list of electives with an “C” designation;
6. All courses must be passed at a C-level or above;
7. A class may not be counted as both a prerequisite and an elective.

Students may suggest elective courses to be added to the list by completing a "Class Approval Request Form". Requests should be made...
to Alecia Flynn (aflynn12@jhu.edu) and will be reviewed by the CM Minor Curriculum Committee.

### Declaring the Minor

Interested students should contact Alecia Flynn, Sr. Academic Coordinator, to receive guidance on declaring the minor:

Phone: 410-516-6892
Email: aflynn12@jhu.edu

Specific questions regarding the minor requirements and courses can be directed to Dr. Joshua Vogelstein (jovo@jhu.edu), Director of Undergraduate Studies for the CM minor.

### BME MSE Computational Medicine (CM) Focus Area

The Department of Biomedical Engineering offers a Focus Area in Computational Medicine (BME MSE CM Focus Area) as part of its Masters of Science and Engineering program. The BME MSE CM Focus Area is a course-based degree program comprising two BME core competency courses, three CM focus area courses, three CM focus area electives, and at least two electives outside the program. In addition to these 10 courses, students are also required to complete the Distinguished Seminar Series in Computational Medicine course. Required CM courses and focus area electives are taught by core faculty (https://icm.jhu.edu/people/core-faculty) of the Institute for Computational Medicine (https://icm.jhu.edu).

### To Apply

Perspective students should apply to the MSE program in the Department of Biomedical Engineering (https://www.bme.jhu.edu/graduate/mse/apply), indicating an interest in Computational Medicine.

### BME MSE CM Focus Area Curriculum Requirements

#### Core Biomedical Engineering Competency

All BME Department MSE students are expected to complete two of the following courses:

- Systems Bioengineering 1 (EN.580.721)
- Systems Bioengineering 2 (EN.580.722)
- Systems Bioengineering 3 (EN.580.779)

#### Required CM Focus Area Courses

Two of the following courses:

- Introduction to Computational Medicine I (EN.580.631)
- Choose either:
  - Foundations of Computational Biology & Bioinformatics II (EN.580.688)
  - Computational Molecular Medicine (EN.553.650)

#### CM Focus Area Electives

CM students will complete additional electives selected from the following list (choose at least three of these courses):

- Principles of Complex Networked Systems (EN.520.622)
- Advanced Topics in Pharmacokinetics and Pharmacodynamics (EN.540.639)
- Introduction to Probability (EN.553.620)
- Introduction to Stochastic Processes (EN.553.426/626)
- Modeling, Simulation, and Monte Carlo (EN.553.664)
- Models of the Neuron (EN.580.639)
Computational Medicine

- Systems Pharmacology & Personalized Medicine (EN.580.640)
- Precision Care Design I & II (EN.580.670/671)
- Computational Stem Cell Biology (EN.580.647)
- Neuro Data Design (EN.580.697/698)
- Practical Ethics for Future Leaders (EN 580.496)
- Advanced Topics in Genomic Data Analysis (EN.601.641)
- Computational Genomics: Data Analysis (EN.601.638)
- Machine Learning (EN.601.675)
- Machine Learning: Data to Models (EN.601.676)

Additional Electives
Students will select additional graduate level science, technology, engineering, or math courses with the consent of their advisor to complete the total of 10 full courses required for graduation.

The Pre-Doctoral Training Program in Computational Medicine

The Pre-Doctoral Training Program in Computational Medicine, funded by the National Institute of General Medical Sciences, supports selected trainees from the departments of Biomedical Engineering and Applied Mathematics & Statistics.

Students chosen for this Ruth L. Kirschstein National Research Service Award institutional training grant will learn through a combination of focused coursework and dissertation research alongside computational medicine training program faculty mentors from across the Johns Hopkins Whiting School of Engineering and the School of Medicine. The program is designed to prepare graduates to fill the growing need for researchers trained in computational medicine in both industry and academia.

Trainees will be part of an exceptional and distinctive community of students and faculty exploring the possibilities of computational medicine. Trainees will learn how to develop models of biological systems in health and disease, constrain these models using data collected from patients, and apply models to deliver improved diagnoses and therapies.

To Apply
Prospective trainees should apply to the PhD programs of the Departments of Biomedical Engineering (https://www.bme.jhu.edu/graduate/phd/apply) or Applied Mathematics and Statistics (https://engineering.jhu.edu/ams/graduate-studies/admissions-criteria-admission-process), indicating an interest in pursuing pre-doctoral training in Computational Medicine.

Program Milestones

Year One
By the end of the first year, trainees will complete the following:

- Introduction to Computational Medicine I (EN.580.631)
- Foundations of Computational Biology & Bioinformatics II (EN.580.688) or Computational Molecular Medicine (EN.553.650)
- Required home department course work
- At least one CM research rotation in a laboratory of participating Program Faculty

Year Two
By the end of the second year, trainees will complete:

- One clinical rotation in the laboratory of a clinician-researcher who works with patient data

Year Three and Beyond

- Graduate Board Oral (GBO) examination

Additional Requirements
Each year in the program, trainees will attend the CM Journal Club, the Distinguished Seminars in Computational Medicine, and the annual ICM Retreat.

Faculty

Director
Raimond Winslow
Director of The Institute for Computational Medicine, Director of The Pre-Doctoral Training Program in Computational Medicine, Raj and Neera Singh Professor of Biomedical Engineering

Associate Director, Institute for Computational Medicine
Sridevi Sarma
Associate Professor, Dept. of Biomedical Engineering

Co-Director, Pre-Doctoral Training Program
Feilim Mac Gabhann
Associate Professor, Dept. of Biomedical Engineering

Core Faculty

William S. Anderson
Associate Professor, Dept. of Neurosurgery, Attending Neurosurgeon at The Johns Hopkins Hospital

Joel Bader
Professor, Dept. of Biomedical Engineering, Bioinformatics and Computational Biology Lab

Patrick Boyle
Assistant Research Professor, Dept. of Biomedical Engineering

Nicolas Charon
Assistant Professor, Dept. of Applied Mathematics and Statistics, Center for Imaging Sciences

Nathan Crone
Professor, Dept. of Neurology

Donald Geman
Professor, Applied Mathematics and Statistics, Center for Imaging Sciences

Rachel Karchin
Associate Professor, Dept. of Biomedical Engineering, The William R. Brody Faculty Scholar

Michael I. Miller
Herschel and Ruth Seder Professor, Dept of Biomedical Engineering, Director of Center for Imaging Sciences

Rajat Mittal
Professor, Dept. of Mechanical Engineering

Tilak Ratnanather
Associate Research Professor, Dept. of Biomedical Engineering
Informatics, wide range of fields and disciplines such as robotics, medical and health or administration, and information security. Application areas span a conjunction with other areas. Core CS careers include (but are not limited it as a unique area. CS can be viewed as a stand-alone discipline worthy computer science.

At the center of this revolution, making it happen, are those who study now operate. Information, and its associated processing and transport, is technology-driven restructuring of the way society and most professions now operate. Information, and its associated processing and transport, is the commodity upon which corporations are built and lives are improved. At the center of this revolution, making it happen, are those who study computer science.

There are two dimensions to the field of computer science that establish it as a unique area. CS can be viewed as a stand-alone discipline worthy of study unto itself, and/or as an empowering discipline to be studied in conjunction with other areas. Core CS careers include (but are not limited to) software design and development, computer systems engineering or administration, and information security. Application areas span a wide range of fields and disciplines such as robotics, medical and health informatics, scientific research, data analytics, entrepreneurship, gaming/entertainment, and business computing to name a few.

Because computer science is a highly diverse and broadly applied field, studies can proceed in many different directions. Accordingly, the undergraduate and graduate programs in the Department of Computer Science at Johns Hopkins are flexible curricula designed to accommodate a wide range of goals. A student at Johns Hopkins can pursue appropriately customized versions of the following computer science programs: minor, bachelor of science, bachelor of arts, masters of science in engineering, and doctor of philosophy. Most of this catalog section is devoted to details regarding these programs.

Computer science research laboratories are currently active in the following areas at Hopkins: algorithm design and analysis, human-computer interaction, machine learning, data intensive computing, health informatics, computational medicine, computer vision and image processing, computer graphics, geometric modeling, programming languages, natural language and speech processing, information retrieval, cryptography and information security, secure and robust systems, storage systems, high-performance and scientific computing, computational genomics, networks and distributed systems, stream processing, parallel and distributed databases, robotics, and computer-integrated surgical systems.

Additionally, interdisciplinary research centers in the university have heavy involvement by Computer Science faculty: the Information Security Institute (ISI), the Center for Computer-Integrated Surgical Systems and Technology (CISST), the Laboratory for Computational Sensing and Robotics (LCSR), the Center for Language and Speech Processing (CLSP), the Institute for Data Intensive Engineering and Science (IDIES), the Institute for Computational Medicine (ICM), and the Malone Center for Engineering in Healthcare (MCEH). An important component of the educational process in the department is the opportunity for undergraduate and graduate student participation in the research programs of the faculty. In particular, original research in close association with individual faculty members is emphasized at the graduate level.

There are several closely related programs at the undergraduate and graduate levels which involve significant coursework and faculty involvement from the Department of Computer Science. The Laboratory for Computational Sensing and Robotics (LCSR) offers a minor in robotics and also a minor in computer integrated surgery through the Engineering Research Center for Computer Integrated Surgical Systems and Technology. Details of these programs may be found elsewhere in this catalog in the section pertaining to the Laboratory for Computational Sensing and Robotics (p. 960). Undergraduates with a strong interest in system design and performance may elect to pursue a bachelor degree in computer engineering (p. 854). This field of study includes course work in computer science, as well as electrical and computer engineering. Although jointly administered by both departments, specific goals and requirements of the computer engineering degree may be found in the catalog section pertaining to the Department of Electrical and Computer Engineering only.

At the graduate level, the LCSR (p. 960) offers a Master of Science in Engineering (M.S.E.) in Robotics, designed for students from a wide variety of engineering, scientific, and mathematical backgrounds to advance their interdisciplinary knowledge in robotics. Details of this program may be found in the LCSR section of this catalog, or on the web at www.lcsr.jhu.edu/MSE. Lastly, the Master of Science in Security Informatics (M.S.S.I.) is a specialized graduate program offered through the Information Security Institute (p. 903) (ISI) in the WSE. The field of security informatics is fundamentally based on information security and assurance technologies (hardware, software, and networks) as related to issues such as policy, management, privacy/trust, health care, and law, from both national and international perspectives. Interested students can obtain detailed information regarding the M.S.S.I. online at https://isi.jhu.edu or in the ISI section of this catalog.

For additional information regarding the academic programs available in Computer Science, and the facilities provided, please consult the sections which follow, or the departmental website www.cs.jhu.edu.

**Facilities**

The CS department is primarily housed in Malone Hall, a state of the art, open concept research facility. Additional department research space is located in the adjacent Hackerman Hall.

The general department computing facilities include numerous workstations and servers. Two undergraduate laboratories combine to provide approximately 24 Linux workstations. One of these is a collaboration room allowing students to work in a team-based environment, with several private breakout rooms as well. At the graduate level there is a Master's Lab consisting of a collaboration area and workstation area, both consisting of several Linux workstations.
All Ph.D. students are assigned dedicated desks in their research labs. Additionally, multiple high-speed networked laser printers, as well as a networked color copier and remotely accessible Linux compute servers are available to both graduate and undergraduate students.

Focused research laboratories have significant resources that provide greater specialization, including isolated networks of PCs for security studies, high-performance computing clusters, robots and computer vision systems, a mock operating room equipped with medical robots and imaging equipment, and more.

The general department computing facilities are tied together by our own LAN, and access to specialized hardware in other departments, labs, and institutions is available via the university intranet and the Internet. In addition, the university provides wireless access to the JHU intranet and the Internet, as well as server systems that provide e-mail accounts for all students.

Undergraduate Programs

(See also General Requirements for Departmental Majors (p. 7))

The objectives of our bachelor degree programs are to train computer scientists who will be able to:

- Successfully engage in professional practice in the computing sciences or apply computer science tools and techniques to another field of interest.
- Pursue advanced study in the computing sciences.
- Work successfully in both independent and team environments.
- Lead teams and provide vision for innovation.
- Behave in a professional and ethical manner.

A successful major program of study leads to either the Bachelor of Science in Computer Science (B.S.) or the Bachelor of Arts in Computer Science (B.A.). Students should decide which degree program to complete by about their junior year. Both degree programs require specific courses and/or credits in several key areas: computer science, math, basic science, humanities and social sciences. However, there is much flexibility in how these requirements are fulfilled. Undergraduate majors may choose to pursue a broad selection of computer science and distributional courses, or to pursue a particular focus area within the field. Current foci primarily reflect departmental and school research strengths: big data, computational biology, fundamentals of computing, information security, natural language processing, robotics, systems and networking; while a few are directed towards career paths: software engineering, entrepreneurship/business computing, and video game design. Further information on these focus areas may be found in the computer science undergraduate advising manual (http://www.cs.jhu.edu/undergraduate-studies/academics/ugrad-advising-manual).

Details and course recommendations for these distributional requirements are below. These requirements add up to 100 credits and fulfill general university and WSE requirements, leaving 26 pure elective credits. Except for electives, courses should not be taken on an S/U basis. By university policy, no more than 18 D- credits can be counted toward the total credit requirements for a degree. The Courses and Curriculum Planning section (https://www.cs.jhu.edu/course-info) of the departmental website has lists of course area designations (Analysis, Applications, Systems), approved science courses, and courses approved as “CS other.”

Computer Science (42 credits)

The following foundational courses in computer science must be included in a student’s program.
EN.601.104  Computer Ethics (or Practical Ethics for Future Leaders which does not count towards CS credits)  1
EN.601.107  Introductory Programming in Java (or equivalent) or EN.500.112 Gateway Computing  3
EN.601.220  Intermediate Programming  4
EN.601.226  Data Structures  4
EN.601.229  Computer System Fundamentals  3
EN.601.231  Automata & Computation Theory  3
EN.601.433  Intro Algorithms  3

At least 16 credit hours must be at the 300-level or above, including EN.601.433. At least one course in each classification area of Analysis, Applications and Systems must be chosen. An exhaustive list of the area classifications for each of our courses may be found on the department's website.

Students must take at least one of the following courses which contain oral communication components. The course satisfying the oral requirement may overlap other requirements.
EN.601.255  Introduction to Video Game Design  3
EN.601.290  User Interfaces and Mobile Applications  3
EN.601.310  Software for Resilient Communities  3
EN.601.355  Video Game Design Project  3
EN.601.411  Computer Science Innovation & Entrepreneurship I  3
EN.601.421  Object Oriented Software Engineering  3
EN.601.447  Computational Genomics: Sequences (taken 2017 or later)  3
EN.601.456  Computer Integrated Surgery II  3
EN.601.520  Senior Honors Thesis  3
EN.580.437  Neuro Data Design I (counts as "CS other")  4
EN.580.438  Neuro Data Design II (counts as "CS other")  4

Eight additional credits of Computer Science are required. ** 8

Mathematics (24 credits)
The following courses or equivalent substitutes such as AP credit must be included:
AS.110.108  Calculus I  4
AS.110.109  Calculus II (For Physical Sciences and Engineering)  4
EN.553.171  Discrete Mathematics  4

The remaining courses must be 200-level or above, chosen from Mathematics (AS.110.xxx) or Applied Math and Statistics (EN.553.xxx), and must include coverage of both probability and statistics. Note that students will need at least six courses to fulfill the credit requirement. Some highly recommended math electives are: ***
AS.110.201  Linear Algebra  4
EN.553.420  Introduction to Probability  4
EN.553.430  Introduction to Statistics  4

Basic Sciences (16 credits)
At least two semesters of physics or two semesters of chemistry, with the associated laboratories, must be included. The remaining courses must be chosen in accordance with the list posted on the department's website, which includes most 'N' (natural science) designated courses in the Sciences and Engineering, but not all. At most 2 credits from S/U intersession courses may be used to fulfill this requirement.

Humanities/Social Sciences (18 credits)

As per WSE requirements, six courses in the Humanities and Social and Behavioral Sciences must be taken, with each course at least 3 credits.**** These courses must have either Humanities ('H') or Social and Behavioral Sciences ('S') area (or both) designators on them. Foreign language courses (without an 'H' or 'S') may also be used to satisfy this requirement.

Writing Requirement
Students are required to fulfill the university's requirement of two writing intensive courses, each at least 3 credits. Students must receive at least a C- grade or better in these writing courses. At least one course must be explicitly focused on writing skills in English (eg, Expository Writing, Professional Communication, Fiction & Poetry). These courses may overlap other requirements.

Electives
Electives are to be chosen by the student with guidance and approval of his/her advisor.

* No more than 6 independent type credits (courses numbered 601.5xx) and no more than 3 credits of short courses (1-credit special topics courses) can be counted toward this requirement. However, B.S. students doing the Senior Honors Thesis (EN.601.519-EN.601.520) may use an additional three credits of independent work toward their CS requirements, for a total of 9 credits.

No courses with grades below C- or with S/U grades can be used to fulfill this requirement unless they are not offered for a grade. At most 4 S/U credits may be applied towards this requirement.

** Up to 6 of the 42 required credits may be from an approved list of relevant courses in other departments, which includes courses cross-listed in CS. These courses may only count as "CS other" credits, not upper level CS credits (regardless of course level in the other department). See department website for the list.

*** AP Statistics credits may not be used to satisfy these credit requirements; however, they do meet the need for coverage of statistics (not probability).

**** See the Distribution tab in the Requirements for a Bachelor's Degree (http://e-catalog.jhu.edu/undergrad-students/academic-policies/requirements-for-a-bachelors-degree) section for two exceptions to the rule that each H/S distribution course be at least 3 credits.

Requirements for the B.A. Degree
To meet the course credit requirements for the B.A. in computer science, the student must complete a minimum of 120 credits. The basic requirements for the B.A. degree are:

Computer Science  32
Mathematics  20
Basic Sciences  12
Humanities/Social Sciences  18
Foreign Language  6

4 Writing Intensive Courses
Electives  32

Total Credits  120

Details and course recommendations of these distributional requirements are below. These requirements add up to 88 credits and fulfill general university distribution requirements. Except for electives, courses should
not be taken on a S/U basis. By university policy, no more than 18 D or D+ credits can be counted toward the total credit requirements for a degree.

**Computer Science (32 credits)**

The following foundational courses in computer science must be included in a student's program:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.601.107</td>
<td>Introductory Programming in Java (or equivalent)</td>
<td>3</td>
</tr>
<tr>
<td>or EN.500.112</td>
<td>Gateway Computing</td>
<td></td>
</tr>
<tr>
<td>EN.601.220</td>
<td>Intermediate Programming</td>
<td>4</td>
</tr>
<tr>
<td>EN.601.226</td>
<td>Data Structures</td>
<td>4</td>
</tr>
<tr>
<td>EN.601.229</td>
<td>Computer System Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.601.231</td>
<td>Automata &amp; Computation Theory</td>
<td>3</td>
</tr>
<tr>
<td>EN.601.433</td>
<td>Intro Algorithms</td>
<td>3</td>
</tr>
</tbody>
</table>

At least 15 credit hours must be at the 300-level or above, including EN.600.433.

**Mathematics (20 credits)**

The following courses must be included:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.108</td>
<td>Calculus I</td>
<td>4</td>
</tr>
<tr>
<td>AS.110.109</td>
<td>Calculus II (For Physical Sciences and Engineering)</td>
<td>4</td>
</tr>
<tr>
<td>EN.553.171</td>
<td>Discrete Mathematics</td>
<td>4</td>
</tr>
</tbody>
</table>

The remaining courses may be chosen from Mathematics (110.xxx) or Applied Math and Statistics (553.xxx). At least one course must be 200-level or above. Strongly recommended: Linear Algebra, Probability & Statistics. Note that at least five courses will be needed to fulfill this requirement.

**Basic Sciences (12 credits)**

At least two semesters of physics or chemistry or a combination of both, with the associated laboratories, must be included. The remaining courses must be chosen in accordance with the list posted on the department website, which includes most 'N' designated courses in the Sciences and Engineering, but not all. At most 2 credits from (S/U) intersession courses may be used to fulfill this requirement.

**Humanities/Social Sciences (18 credits)**

Six courses in the Humanities/Social Sciences must be taken, with each course at least 3 credits. ** At least two 3-credit courses at the 300-level or above are required. As befits a B.A. degree, students have ample flexibility to choose courses that broaden the scope of their study, in consultation with their advisors. A subset of the courses selected to satisfy this requirement should demonstrate coherence within an area. Any course with Humanities or Social Sciences area designators may fulfill these distributional requirements.

**Foreign Language (6 credits)**

At least 6 credits in one foreign language or demonstrated proficiency at the intermediate level are required. These foreign language credits are in addition to the 18 required Humanities/Social Sciences credits.

**Writing Requirement**

All primary computer science majors pursuing a B.A. degree are required to fulfill the university's requirement of four writing intensive courses, each at least 3 credits. At least one course must be explicitly focused on writing skills in English (e.g., Expository Writing, Professional Communication, Fiction & Poetry). Students must receive at least a C- grade in these courses. These courses may overlap other requirement areas.

**Electives**

Electives are to be chosen by the student with guidance and approval of his/her advisor.

| Total Credits | 120 |

**Minor in Computer Science**

To satisfy the course credit requirements for a minor in computer science, a student must take a minimum of seven courses, with a total of at least 23 credits, earning at least a C- in each course. These must include four core courses, to provide the student with a foundation, and three upper-level courses (300-level and above), to allow the student to pursue an advanced area in depth. Short courses cannot be used toward the minor requirements. All courses must be taken for a grade, not S/U.

While not explicitly required, we also strongly recommend taking EN.553.171 Discrete Mathematics as preparation for several computer science courses, including EN.601.231 Automata & Computation Theory and EN.601.433 Intro Algorithms. However, Discrete Mathematics does not count toward the minor course requirements.

**Core Courses**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.601.107</td>
<td>Introductory Programming in Java (or equivalent)</td>
<td>3</td>
</tr>
<tr>
<td>or EN.500.112</td>
<td>Gateway Computing</td>
<td></td>
</tr>
<tr>
<td>EN.601.220</td>
<td>Intermediate Programming</td>
<td>4</td>
</tr>
<tr>
<td>EN.601.226</td>
<td>Data Structures</td>
<td>4</td>
</tr>
</tbody>
</table>

Choose one of the following:

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.601.229</td>
<td>Computer System Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.601.231</td>
<td>Automata &amp; Computation Theory</td>
<td></td>
</tr>
</tbody>
</table>

**Upper-Level Courses**

Minors must take three CS courses (EN.601.xxx) at the 300-level or above. These courses should be chosen to form a cohesive minor and must be accepted by the computer science minor advisor. It is strongly recommended that students choose all three courses from within one of the three research areas of analysis, applications, or systems.

| Total Credits | 23 |

* Each upper-level course description in this catalog includes its area for reference. In addition, a current listing of courses with area designators is provided on the departmental website. Some upper level courses have math pre-requisites as well (Probability/Statistics or Linear Algebra most commonly), so plan ahead.

Students whose primary major is in the Whiting School may use the same courses to satisfy the requirements of the primary major and also those
of a computer science minor. Students who plan to fulfill requirements for a minor must go to the Department of Computer Science director of undergraduate studies to declare the minor and be advised on course selections, and inform the Office of Academic Advising by the end of their junior year.

**Short Courses**
The Department of Computer Science offers 1-credit short courses covering a variety of topics in computer science and engineering. The purpose of the short courses is to expose students to topics of current interest in the field of computer science and engineering. Short courses are taught not only by faculty and graduate students in the Department of Computer Science and visiting faculty from other universities, but by individuals from local government or industry who have demonstrable expertise in a given area and are practicing the application of computer science theory and concepts.

Students should be aware that short course offerings are likely to change from year to year, depending on instructor commitments: there is no guarantee that the same course will be available at a later time. Students interested in getting details about a particular short course can contact the instructor through the departmental office. No more than 3 credits of short courses may be applied toward the computer science course credit requirement for the B.S. or the B.A. degrees.

**Double Majors with Computer Science**
It is possible for students to pursue a double major program in which one of the majors is computer science. The computer science requirements are flexible enough to allow for combination with most majors in the Whiting School of Engineering and the Krieger School of Arts and Sciences. Whether computer science is your primary or secondary major, you will be assigned a faculty advisor in the department. In order to declare a first or second major in computer science, students should see the Director of Undergraduate Studies before the start of senior year. Those students must also inform the Office of Academic Affairs of the Whiting School of Engineering and the Registrar of their double major status. Subject to restrictions set by the department offering a second major, students whose primary major is in the Whiting School may use courses to satisfy both the requirements of the student's primary major and those of a double major.

**Combined Bachelor's/Master's Program**
As early as the end of their sophomore year, qualified students may apply for admission to a combined bachelor's/master's program which combines a B.S. or B.A. degree (in any department) with a master of science in engineering degree in Computer Science. This program allows students to simultaneously pursue both an undergraduate and a graduate degree program of study. Generally, the combined B.S./M.S.E. or B.A./M.S.E. program is accomplished in five years, although some students take more or less time. Applicants are judged on the basis of their performance in courses and their letters of recommendation. Double counting of at most two courses is subject to current WSE and departmental policies. Students may not take a 601.3xx course as an undergraduate and the corresponding 601.4xx course for the M.S.E.; likewise for 601.4xx/6xx course offerings. Upon admission to the program students will be assigned a graduate faculty advisor in the Computer Science Department who must approve the courses to be applied toward the master’s degree. For information on the requirements of the M.S.E. degree, see the Graduate Programs tab on this page, or ask in the departmental office for the document that lists those requirements.

**Graduate Programs**
Every graduate student in the Department of Computer Science must follow a program approved by a faculty advisor in the department. The advisor assigned to a student may change, subject to the acceptance of the new advisor.

**Requirements for the M.S.E. Degree**
The Master of Science in Engineering (M.S.E.) is a daytime in-person program offered by the Department of Computer Science. Most students complete the program in three full-time semesters. Two semesters of residence as a full-time graduate student are required. Those interested in part-time evening/remote study should refer to Engineering for Professionals Program at ep.jhu.edu.

Entering students are expected to have completed a program of study equivalent to that required by the B.S. in computer science. Applicants from other disciplines are expected to have coursework (or equivalent experience) in intermediate programming (C++ and Java), data structures, computer system fundamentals, and automata theory. Upon admission to the Master of Science in Engineering program, a student is assigned a graduate advisor from the Department of Computer Science who must approve the courses to be applied to the M.S.E. degree.

The Department of Computer Science classifies its courses into three sub-areas: Analysis, Applications, and Systems. All M.S.E. candidates must complete at least two courses (3 class hours (credits) each) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators (http://cs.jhu.edu/courses/courseareas.pdf) is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. M.S.E. students must also complete an additional two elective courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) approved by the advisor, for a total of eight graduate-level courses.

In addition to the eight courses, a student must elect one of the following options in order to fulfill the degree requirements:

- Two additional (graduate-level) courses in Computer Science, approved by the advisor as above.
- A supervised research project including an approved project report that will be made publicly available.
- An original, faculty-approved master’s essay, submitted to the Milton S. Eisenhower Library.

By satisfying the Ph.D. qualifying course requirements and the first qualifying project, a student will also satisfy the M.S.E. degree requirements (unless more than two course requirements have been satisfied using courses transferred from other institutions). Please refer to the Ph.D. program information for details.

All M.S.E. degree candidates are encouraged to regularly attend the department seminars.

**Course Requirement Details**
- All courses counted toward the M.S.E. degree requirement must be taken at a graduate-appropriate level. In the Department of Computer Science, this includes courses that are 600-level and above, as well as...
400-level courses for students in the combined BS/MSE program who have not yet switched to graduate status.

- At most, two courses with grades less than B- may be counted toward the coursework requirements. No courses with grades less than C- may be counted.
- The overall grade point average of the courses counted toward the coursework requirements must be a 3.0 or higher (B average).
- At most, two independent study courses can be counted toward the course requirements.
- Other than independent study courses, no courses with grades of P or S can be counted toward the coursework requirement. Courses with grades of P or S will not be included in the grade point average calculation.
- One of the courses required for the M.S.E. degree, but only one, can be replaced by 3 credits from comparable short courses.
- A majority of the courses counted toward the degree must be taught in the Department of Computer Science.
- At most, two courses can be transferred from graduate programs of other institutions to be counted toward the degree requirements. Such transfer courses must be approved by the student’s faculty advisor and the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested.
- Students in the combined BS/MSE program may transfer up to two graduate-qualified courses which also are counted toward the undergraduate degree, as well as any other graduate-qualified courses taken while an undergraduate which are not counted toward the undergraduate degree.
- A grade of D or F can result in probation; a second D or F is cause for being dropped from the program.
- Every student must successfully pass Academic Ethics (EN.500.603).
- Any master's student engaged in research for payment or to help meet degree requirements is required to complete Responsible Conduct of Research training. Students receiving payment from NIH training grants or fellowships must take the in person course – AS.360.625 Responsible Conduct of Research. All other students can take the course online – AS.360.624 Responsible Conduct of Research (Online). Instructions for accessing and signing up for the course can be found here: http://engineering.jhu.edu/wse-research/resources-policies-forms/responsible-conduct-of-research/ online-training-course-for-the-responsible-conduct-of-research/ Additional information regarding this training can be found here: http://eng.jhu.edu/wse/page/conduct-of-research-training. Students who are required to complete this training will not receive a diploma until the course has been completed.

**Tuition Support**

M.S.E. students are not normally eligible for tuition waivers, but will be able to work on campus up to 19.99 hours per week for hourly rates if they find campus employment (see the Office of Student Employment for open positions). There are also course assistant positions available for qualified students who are seeking financial support. Those interested must apply at the start of each semester for specific courses in need.

**Requirements for the Ph.D. Degree**

The goal of the Doctor of Philosophy (Ph.D.) program in the Department of Computer Science is to prepare first-rate scholars in the analysis, systems, and applications areas of computer science. Successful graduates may assume significant positions in academia, research institutes, industry, or government laboratories.

Applications for admission to the Ph.D. program in Computer Science are reviewed by a faculty committee. Although the specific criteria are not rigid, all students admitted will exhibit exceptional intellectual achievements and promise. Applicants must submit letters of recommendation, GRE scores, and (for international applicants) TOEFL/IELTS scores. Visit grad.jhu.edu for more information on the application process.

In keeping with Hopkins’ traditions, program requirements are flexible, as described below. For more detailed policies regarding the Ph.D program, please visit the Advising Manual (http://www.cs.jhu.edu/graduate-studies/phd-requirements) on our departmental website.

**University Residency**

Two consecutive semesters of residence as a full-time graduate student are required.

**Seminar Attendance**

All Ph.D. degree candidates are required to enroll and maintain satisfactory attendance in Computer Science Seminar EN.601.801 each semester for the duration of their enrollment in the program. Although seminar attendance is required, the seminar may not be counted toward the qualifying course requirement.

**Responsible Conduct of Research and Academic Ethics**

All doctoral students are required to take AS.360.625 Responsible Conduct of Research. Students are expected to complete the course by the end of the first year but have until the start of the fourth semester to meet this requirement. Failure to do so may result in a loss of funding. Additional information regarding this requirement can be found here: Conduct of Research (https://engineering.jhu.edu/wse-research/resources-policies-forms/responsible-conduct-of-research). In addition, all doctoral students must complete the course Academic Ethics (EN.500.603).

**Qualifying Course Requirements**

The Department of Computer Science classifies its courses into three research areas: analysis, applications, and systems. All Ph.D. candidates must complete at least two courses (3 class hours each) from each of these three areas. Each upper-level course description in this catalog includes its area for reference. A course in multiple areas may only be counted toward one requirement. A current listing of courses with area designators (http://cs.jhu.edu/courses/courseareas.pdf) is provided on the departmental website. While this listing includes a few highly relevant courses outside the Department of Computer Science, only one such course may be applied toward the area requirements. Ph.D. students must also complete an additional two elective graduate courses (chosen from any CS area or from closely related departments such as Electrical and Computer Engineering, Cognitive Science, Mathematics, or Applied Mathematics and Statistics) for a total of eight courses. Computer Science graduate students may count 600-level and above graduate courses. The coursework program must be approved by the student’s faculty advisor. The overall grade point average for these eight courses must be at least equivalent to a B+. No course with a grade of less than C- may be counted toward this Ph.D. qualifying course requirement. Other than independent study courses, no courses with grades of P or S can be counted toward the coursework requirement. Courses with grades of P or S will not be included in the grade point average calculation. One of the courses required for the degree, but only one, may be replaced by 3 credits from comparable short courses.
With approval of the student's faculty advisor, up to two courses can be transferred from graduate programs of other institutions; more than two such courses can be transferred with approval of the department. It is the obligation of the student to provide all necessary data to the Department of Computer Science regarding the course(s) for which transfer credit is being requested. Students are expected to complete the course requirements by the end of their second year as a Ph.D. candidate.

Qualifying Project Requirements
A Ph.D. student must complete two projects, each under the supervision and with the written agreement of a different faculty member in the Department of Computer Science. Upon conclusion of each project, the student must write a "Project Report" describing the project in detail. This report will be a public document and will be kept on file in the department office. The supervising faculty member must approve the project report. Students are expected to complete the qualifying projects by the end of their third year as a Ph.D. candidate.

Upon completion of the Ph.D. qualifying course requirements and the first qualifying project, students are ordinarily eligible to receive a master of science in engineering degree. The degree will be awarded upon student request.

Graduate Board Oral Examination (GBO)
This examination is a university requirement, ideally taken in the student's third year. The oral exam is administered by a panel consisting of the research sponsor, two faculty members from the Department of Computer Science, and two from outside the department. The exam seeks to establish the student's readiness to conduct original research in the area of his or her "Preliminary Research Proposal," which should be distributed to the examiners in advance and presented by the student at the start of the exam.

Part-Time Ph.D.
Two consecutive semesters of residence as a full-time graduate student are required by the university. Attempting to obtain a Ph.D. is a major commitment and involves close coordination with a faculty advisor in the department. Part-time students must be able to establish and maintain these close links, therefore part-time study is by advanced permission only.

Departmental Seminar
Ph.D. students must give an official departmental seminar on their research area. This is to be done after the GBO and prior to the dissertation defense, or as part of the dissertation defense.

Dissertation and Defense
Ph.D. students must write a dissertation consisting of original research in their chosen area. They must deliver a public presentation of the dissertation before a dissertation committee consisting of the faculty advisor, a second faculty member in the Department of Computer Science (who must have a primary tenure-track appointment in the Department if the advisor does not), and one or more other members with Ph.D. degrees. In conformity with University requirements, the members of the dissertation committee must submit a referee's letter to the Graduate Board recommending that the dissertation be accepted. Completed dissertations will be formatted and submitted to the Milton S. Eisenhower Library for electronic publication (http://guides.library.jhu.edu/etd).

Teaching Requirement
All Ph.D. students are required to serve as a Teaching Assistant at least one semester during their program of study. As part of the requirement, the supervising course instructor must give the TA an opportunity to be in front of a group of students at least once during the course. Students are required to sign-up for the course EN.601.807 Teaching Practicum during the semester in which the requirement is being fulfilled, and at the end of the semester his/her performance will be evaluated by the course instructor.

Student Progress Review
Ph.D. students are reviewed annually by their advisor(s) and the department, and notified in writing as to their standing in the program. Students deemed to not be making satisfactory progress may be placed on probation.

Financial Aid
All full-time CS PhD students in good academic standing are fully-funded. Additional financial aid may be available for candidates of high promise. Fellowships provide a student with a stipend plus tuition. Research assistantships are available on sponsored research projects directed by members of the faculty. Teaching assistantships normally consist of tuition plus a stipend commensurate with the teaching or grading duties assigned. Students determined to have significant deficiency in spoken English may be required to take one or more semesters of English as a Second Language in order to qualify for employment as a teaching or research assistant.

For current faculty and contact information go to http://cs.jhu.edu/faculty/

Faculty Chair
Randal Burns
Professor: storage systems, high performance computing, and data-intensive scientific computing.

Professors
Yair Amir
Distributed systems, resilient clouds and critical infrastructure, overlay networks, distributed algorithms.

Jason M. Eisner
Computational linguistics (syntax and phonology), natural language processing, statistical machine learning, programming language design.

Gregory D. Hager
Mandell Bellmore Professor; Director, Malone Center for Engineering in Healthcare: vision, robotics, human-machine systems, computer-integrated medicine.

Philipp Koehn
Statistical machine translation.

S. Rao Kosaraju
Edward J. Schaefer Professor in Engineering: design of algorithms, pattern matching, and derandomization.

Aviel Rubin
Technical Director, Information Security Institute: system and networking security, computer privacy, applied cryptography.

Steven Salzberg
Bloomberg Distinguished Professor: genomics, bioinformatics, genome assembly, gene finding, sequence analysis algorithms.

Scott F. Smith
Programming languages, type systems, security in language design, component programming languages.

Alexander Szalay
Bloomberg Distinguished Professor: data intensive computing, theoretical astrophysics, galaxy formation.

Russell H. Taylor
John C. Malone Professor; Director, LCSR & CISST ERC: medical robotics, computer-integrated interventional medicine, medical image analysis, human-machine robotic systems.

David Yarowsky
Natural language and speech processing, information retrieval, machine translation, and machine learning.

Alan Yuille
Bloomberg Distinguished Professor: computational models of vision, mathematical models of cognition, artificial intelligence, neural networks.

Associate Professors
Mark Dredze
John C. Malone Assistant Professor: machine learning, natural language processing, health informatics.

Michael Kazhdan
Computer graphics, surface reconstruction, image and geometry processing.

Michael Schatz
Bloomberg Distinguished Associate Professor: novel algorithms for comparative genomics, human genetics, and personalized medicine.

Assistant Professors
Raman Arora
Machine learning, statistical signal processing, stochastic approximation algorithms, applications to speech and language processing.

Vladimir Braverman
Algorithms, massive data sets, data streams, and database systems.

Michael Dinitz
Theoretical computer science, approximation algorithms, applications to networks and distributed computing.

Soudeh Ghorbani
Networked systems, high-performance infrastructure, cloud applications, system design.

Matthew Green
Applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Chien-Ming Huang
John C. Malone Assistant Professor: Human robot interaction, human computer interaction, artificial intelligence, robotics.

Ryan P. Huang
Operating systems, distributed systems, software engineering, programming languages.

Abhishek Jain
Cryptography, security, theoretical computer science.

Xin Jin
Computer networking, distributed systems, software-defined networking, cloud computing, big data.

Benjamin Langmead
Computational genomics, sequence alignment, text indexing, parallel and high performance computing.

Xin Li
Theory of computation, randomness, complexity theory, distributed computing, cryptography.

Suchi Saria
John C. Malone Assistant Professor: machine learning, computational medicine, health informatics, and applications of machine learning in natural language processing, activity recognition and human-machine systems.

Ilya Shpitser
John C. Malone Assistant Professor: causal inference and missing data, graphical models, longitudinal data analysis in medicine and epidemiology.

Benjamin Van Durme
Artificial intelligence, natural language processing (computational semantics), and streaming algorithms.

Research Professors
Peter Kazanzides
Medical robots, computer-assisted surgery, real-time systems.

Nassir Navab
Augmented reality, vision, medical image computing and computer assisted interventions.

Associate Research Professors
Philippe Burlina
Computer vision, visual analysis and communications, multi-modality image exploitation, enterprise software systems for content and e-process management.

Chris Callison-Burch
Statistical natural language processing, machine translation, paraphrasing, evaluation of human language technologies.

Susan Hohenberger-Waters
Cryptography, computer security, algorithms, and complexity theory.

James Mayfield
Information retrieval, cross-language retrieval, information extraction, natural language processing.

Assistant Research Professors
Haider Ali
Computer vision, medical robotics, activity analysis, statistically-based deep learning techniques.

Kevin Duh
Natural language processing, machine learning.

Will Gray Roncal
Computer vision, image analysis, big data analytics.

Simon Leonard
Visual servoing, hand-eye coordination.

Christine Piatko
Computational geometry, information visualization, information retrieval.

Austin Reiter
Application of computer vision to robotics, machine vision, 3D reconstruction, image registration, visual recognition.

I-Jeng Wang
Wireless networking, Bayesian networks, probabilistic models.

**Associate Teaching Professors**

Sara Miner More
Foundations of computing, computer science education, cryptography, information flow.

Joanne Selinski
Director of Undergraduate Studies: CS education, software engineering.

**Associate Research Scientist**

Anton Dahbura
Executive Director, Information Security Institute: Information security, fault-tolerant computing, distributed systems, testing.

**Assistant Research Scientist**

Matt Post
Machine translation, syntax, parsing and language modeling.

**Part-time Faculty**

Ayo Akinyele
Adjunct Associate Research Engineer: applied cryptography, crypto automation, computer security.

Phillip Graff
Lecturer: machine learning.

Harold Lehmann
Lecturer; Professor (Health Sciences Informatics): medical informatics.

Timothy Leschke
Lecturer: computer ethics.

Jared Markowitz
Lecturer: machine learning.

Seth Nielson
Adjunct Associate Research Scientist: network security.

Lanier Watkins
Adjunct Associate Research Scientist: critical infrastructure security, network security.

**Visiting Faculty**

Mitra Basu
Visiting Professor: computational biology, pattern recognition, neural networks, artificial intelligence.

Kevin Kornegay
Visiting Professor: IoT device security, reverse engineering, hardware assurance, secure embedded system design, side-channel analysis, differential fault analysis.

Yansheng Li
Visiting Assistant Professor: visual saliency modeling, deep feature learning, image retrieval and classification.

Wei Shen
Visiting Assistant Professor: computer vision, deep learning, object recognition and detection.

**Adjunct Faculty**

Gabor Fichtinger
Adjunct Professor: applied surgical robotics, surgical CAD/CAM systems, percutaneous therapies, stereotactic radiosurgery.

**Joint Appointments**

Amitabh Basu
Assistant Professor (Applied Mathematics and Statistics): optimization, discrete and combinatorial geometry, operations research, convex analysis.

Alexis Battle
Assistant Professor (Biomedical Engineering): genetics of complex traits, graphical models, transfer learning, structured regularization methods.

Muynatu A. Lediju Bell
Assistant Professor (Electrical and Computer Engineering): ultrasound imaging, photoacoustic imaging, image quality improvements, advanced beamforming methods, light delivery systems, medical robotics, image-guided surgery, technology development, medical device design, clinical translation.

Emad Boctor
Assistant Professor (Radiology-Medical Imaging Physics): image-guided intervention, ultrasound imaging, elasticity, and thermal imaging.

Tamas Budavari
Assistant Professor (Applied Mathematics and Statistics): computational statistics, bayesian inference, low-dimensional embeddings, streaming and randomized algorithms.

Gregory Chirikjian
Professor (Mechanical Engineering): robotics, kinematics, dynamics, control, motion planning.

Noah Cowan
Professor (Mechanical Engineering): sensor-based control of locomotion and manipulation, and biologically inspired robotics.

Ralph Etienne-Cummings
Assistant Professor (Radiology-Medical Imaging Physics): mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

James Fill
Professor (Applied Mathematics and Statistics): probability, stochastic processes, random structures, and algorithms.

Liliana Florea
Assistant Professor (McKusick-Nathans Institute for Genetic Medicine): application of computation techniques towards modeling and solving problems in biology and genetic medicine.

Rachel Karchin
Associate Professor (Biomedical Engineering): computational molecular biology, bioinformatics, genetic variation.

Sanjeev Khudanpur
Associate Professor (Electrical and Computer Engineering): information theory, statistical language modeling for speech recognition and machine translation.

Enrique Mallada
Assistant Professor (Electrical and Computer Engineering): networked dynamics, distributed systems.

Michael I Miller
Professor (Biomedical Engineering): image understanding, computer vision, medical imaging, computational anatomy.

Mihaela Pertea
Assistant Professor (Medicine): computational tools for RNA-seq analysis, gene finding, splice site prediction, sequence motif finding.

Carey Priebe
Professor (Applied Mathematics and Statistics): computational statistics, kernel and mixture estimates, statistical pattern recognition, and statistical image analysis.

Jerry L. Prince
William B. Kouwenhoven Professor (Electrical and Computer Engineering): image processing, computer vision, medical imaging.

Rebecca Schulman
Assistant Professor (Chemical and Biomolecular Engineering): molecular programming, DNA nanotechnology, self-assembly (theory and experiment), theoretical and systems biology, smart materials, nanoscale robotics.

Ralph Semmel
Professor (Director, APL): artificial intelligence, database systems, software engineering.

Jeff Siewersden
John C. Malone Professor (Biomedical Engineering): imaging physics, diagnostic radiology, image-guided interventions.

James Taylor
Associate Professor (Biology): genome informatics.

Archana Venkataraman
John C. Malone Assistant Professor (Electrical and Computer Engineering): multimodal integration, network modeling, clinical neuroscience.

Rene Vidal
Professor (Biomedical Engineering): computer vision, machine learning, robotics, and control.

Joshua T. Vogelstein
Assistant Professor (Biomedical Engineering): big data science, connectomics, statistical neuroscience.

Louis Whitcomb
Professor (Mechanical Engineering): dynamics and control of mechanical systems.

Raimond L. Winslow
Professor (Biomedical Engineering): modeling of biological systems, nonlinear systems theory, grid computing and data management, biomedical ontologies.

For current course information and registration go to https://sis.jhu.edu/classes/

Courses
EN.601.104. Computer Ethics. 1.0 Credit.
Students will examine a variety of topics regarding policy, legal, and moral issues related to the computer science profession itself and to the proliferation of computers in all aspects of society, especially in the era of the Internet. The course will cover various general issues related to ethical frameworks and apply those frameworks more specifically to the use of computers and the Internet. The topics will include privacy issues, computer crime, intellectual property law -- specifically copyright and patent issues, globalization, and ethical responsibilities for computer science professionals. Work in the course will consist of weekly assignments on one or more of the readings and a final paper on a topic chosen by the student and approved by the instructor.
Instructor(s): T. Leschke
Area: Humanities.

EN.601.105. M & Ms: Freshman Experience. 1.0 Credit.
This course provides freshmen computer science majors with an introduction to the field and department. A variety of faculty members will provide a mix of historical context and current topics. Classes will be interactive, enabling students to think about and explore topics in a fun way, as well as get to know their classmates. CS non-freshmen and minors may enroll by permission only. Satisfactory/Unsatisfactory only.
Instructor(s): J. Selinski.

EN.601.107. Introductory Programming in Java. 3.0 Credits.
This course introduces fundamental structured and object-oriented programming concepts and techniques, using Java, and is intended for all who plan to use computer programming in their studies and careers. Topics covered include variables, arithmetic operators, control structures, arrays, functions, recursion, dynamic memory allocation, files, class usage and class writing. Program design and testing are also covered, in addition to more advanced object-oriented concepts including inheritance and exceptions as time permits. First-time programmers are strongly advised to take EN.601.108 concurrently in Fall/Spring semesters.
Prerequisites: Students may receive credit for only one of EN.600.107/EN.601.107, EN.600.112, or EN.580.200
Instructor(s): J. Selinski; S. More
Area: Engineering.

EN.601.108. Introduction to Programming Lab. 1.0 Credit.
This course is intended for novice programmers, and must be taken in conjunction with EN.601.107. The purpose of this course is to give first-time programmers extra hands-on practice with guided supervision. Students will work in pairs each week to develop working programs, with checkpoints for each development phase. Must have familiarity with computers. Satisfactory/Unsatisfactory only.
Corequisites: EN.600.107
Instructor(s): J. Selinski; P. Froehlich; S. More
Area: Engineering.

This course will give an introduction to the concepts and major elements of computer-integrated surgery (CIS) through clinical applications. Students will learn to ask questions and look for answers the way clinical engineers build and analyze CIS systems. Major topics will include medical imaging, image processing, surgical planning, surgical robotics, robot navigation, systems integration, and clinical validation. No computer programming will be necessary to complete the assignments.
Instructor(s): S. Leonard
Area: Engineering.
EN.601.220. Intermediate Programming. 4.0 Credits.
This course teaches intermediate to advanced programming, using C and C++. (Prior knowledge of these languages is not expected.) We will cover low-level programming techniques, as well as object-oriented class design, and the use of class libraries. Specific topics include pointers, dynamic memory allocation, polymorphism, overloading, inheritance, templates, collections, exceptions, and others as time permits. Students are expected to learn syntax and some fundamental programming features independently. Course work involves significant programming projects in both languages.
Prerequisites: AP Computer Science, or C+ or better in EN.600.107/EN.601.220 or EN.600.226 or EN.600.112.
Instructor(s): J. Selinski; M. Darvish Darab; S. More
Area: Engineering.

EN.601.226. Data Structures. 4.0 Credits.
This course covers the design and implementation of data structures including arrays, stacks, queues, linked lists, binary trees, heaps, balanced trees (e.g. 2-3 trees, AVL-trees) and graphs. Other topics include sorting, hashing, memory allocation, and garbage collection. Course work involves both written homework and Java programming assignments.
Prerequisites: EN.600.120 OR EN.601.220 OR EN.600.107 OR EN.601.107 or equivalent with C+ or better grades.
Instructor(s): M. Schatz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.229. Computer System Fundamentals. 3.0 Credits.
We study the design and performance of a variety of computer systems from simple 8-bit micro-controllers through 32/64-bit RISC architectures all the way to ubiquitous x86 CISC architecture. We'll start from logic gates and digital circuits before delving into arithmetic and logic units, registers, caches, memory, stacks and procedure calls, pipelined execution, superscalar architectures, memory management units, etc. Along the way we'll study several typical instruction set architectures and review concepts such as interrupts, hardware and software exceptions, serial and other peripheral communications protocols, etc. A number of programming projects, frequently done in assembly language and using various processor simulators, round out the course.
Prerequisites: EN.600.120
Instructor(s): P. Froehlich
Area: Engineering.

EN.601.231. Automata & Computation Theory. 3.0 Credits.
This course is an introduction to the theory of computing. Topics include design of finite state automata, pushdown automata, linear bounded automata, Turing machines and phrase structure grammars; correspondence between automata and grammars; computable functions, decidable and undecidable problems, P and NP problems, NP-completeness, and randomization. Students may not receive credit for EN.601.231/EN.600.271 and EN.601.631/EN.600.471 for the same degree.
Prerequisites: EN.550.171
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.255. Introduction to Video Game Design. 3.0 Credits.
A broad survey course in video game design (as opposed to mathematical game theory), covering artistic, technical, as well as sociological aspects of video games. Students will learn about the history of video games, archetypal game styles, computer graphics and programming, user interface and interaction design, graphical design, spatial and object design, character animation, basic game physics, plot and character development, as well as psychological and sociological impact of games. Students will design and implement an experimental video game in interdisciplinary teams of 3-4 students as part of a semester-long project. Section 1 requires technical skills, including at least one programming course (preferably 2 or more). Section 2 requires artistic skills, including at least one multimedia course (preferably 2 or more). Open to sophomores and above.
Corequisites: EN.601.256
Instructor(s): P. Froehlich
Area: Engineering.

EN.601.256. Introduction to Video Game Design Lab. 1.0 Credit.
A lab course in support of 601.255: Introduction to Video Game Design covering a variety of multi-media techniques and applications from image processing, through sound design, to 3D modeling and animation. See 601.255: Introduction to Video Game Design for details about enrolling.
Corequisites: EN.601.255
Instructor(s): P. Froehlich.

EN.601.290. User Interfaces and Mobile Applications. 3.0 Credits.
This course will provide students with a rich development experience, focused on the design and implementation of user interfaces and mobile applications. A brief overview of human computer interaction will provide context for designing, prototyping and evaluating user interfaces. Students will invent their own mobile applications and implement them using the Android SDK, which is JAVA based. An overview of the Android platform and available technologies will be provided, as well as XML for layouts, and general concepts for effective mobile development. Students will be expected to explore and experiment with outside resources in order to learn technical details independently. There will also be an emphasis on building teamwork skills, and on using modern development techniques and tools.
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): J. Selinski
Area: Engineering.

EN.601.295. Developing Health IT Applications. 3.0 Credits.
This course is a project-based introduction to working on successful projects in health care. In the first half of the term, students perform reading and homework assignments designed to introduce: (1) the context of health care delivery and health IT, (2) techniques to overcome challenges to conducting health care data analyses, and (3) techniques to design meaningful applications around health care data. In the second half of the term, students work in small groups to solve a real-world problem of their choosing. Includes exercises in written and oral communication and team building.
Prerequisites: (EN.600.120 OR EN.601.220) AND (EN.600.226 OR EN.601.226)
Instructor(s): C. Overby Taylor; I. Shpitser
Area: Engineering.
EN.601.310. Software for Resilient Communities. 3.0 Credits.
This is a project-based course focusing on the design and implementation of practical software systems. Students will work in small teams to design and develop useful open-source software products that support our communities. Students will be paired with community partners and will aim to develop software that can be used after the course ends to solve real problems facing those partners today. Instructors will connect with the community partners and determine viable project areas prior to the course start. Students will meet with their community partners to analyze the challenges in their project area, agree on a concrete target project outcome, and gather requirements for their project. Based on these requirements, students will design and implement open-source software systems. [Oral]
Prerequisites: EN.600.120/EN.601.220 AND EN.600.226/EN.601.226
Instructor(s): A. Babay; Y. Amir
Area: Engineering.

EN.601.315. Databases. 3.0 Credits.
Introduction to database management systems and database design, focusing on the relational and object-oriented data models, query languages and query optimization, transaction processing, parallel and distributed databases, recovery and security issues, commercial systems and case studies, heterogeneous and multimedia databases, and data mining. [Systems] [www.cs.jhu.edu/~yarowsky/cs415.html]
Prerequisites: EN.600.226; Students may receive credit for only one of EN.600.315, EN.600.415, EN.601.315, EN.601.415, EN.601.615.
Instructor(s): D. Yarowsky
Area: Engineering.

EN.601.317. Distributed Systems. 3.0 Credits.
This course teaches how to design and implement protocols that enable processes to exchange information, cooperate, and coordinate efficiently over a computer network. Topics include communication protocols, group communication, distributed databases, distributed operating systems, and security. [Systems].
Students may receive credit for EN.601.317 or EN.601.417 but not both.
Prerequisites: Students may receive credit for 600.337 or 600.437, but not both.
Instructor(s): Y. Amir
Area: Engineering.

EN.601.318. Operating Systems. 3.0 Credits.
This course covers fundamental topics related to operating systems theory and practice. Topics include processor management, storage management, concurrency control, multi-processing and multiprocessing, device drivers, operating system components (e.g., file system, kernel), modeling and performance measurement, protection and security, and recent innovations in operating system structure. Course work includes the implementation of operating systems techniques and routines, and critical parts of a small but functional operating system.
Prerequisites: EN.600.120 AND EN.600.226 AND EN.600.233; Students may receive credit for only one of EN.600.318, EN.600.418, EN.601.318, EN.601.418, EN.601.618.
Instructor(s): P. Huang
Area: Engineering.

EN.601.320. Parallel Programming. 3.0 Credits.
This course prepares the programmer to tackle the massive data sets and huge problem size of modern scientific and enterprise computing. Google and IBM have commented that undergraduate CS majors are unable to "break the single server mindset" (http://www.google.com/intl/en/press/pressrel/20071008_ibm_univ.html). Students taking this course will abandon the comfort of serial algorithmic thinking and learn to harness the power of cutting-edge software and hardware technologies. The issue of parallelism spans many architectural levels. Even "single server" systems must parallelize computation in order to exploit the inherent parallelism of recent multi-core processors. The course will examine different forms of parallelism in four sections. These are: (1) massive data-parallel computations with Hadoop; (2) programming compute clusters with MPI; (3) thread-level parallelism in Java; and, (4) GPGPU parallel programming with NVIDIA's Cuda. Each section will be approximately 3 weeks and each section will involve a programming project. The course is also suitable for undergraduate and graduate students from other science and engineering disciplines that have prior programming experience. [Systems] Prerequisite: EN.600.233/EN.601.229 and EN.601.226
Prerequisites: EN.600.226 AND EN.601.226; Students may receive credit for only one of EN.600.320, EN.600.420, EN.601.320, EN.601.420, EN.601.620.
Instructor(s): R. Burns
Area: Engineering.

EN.601.325. Declarative Methods. 3.0 Credits.
Suppose you could simply write down a description of your problem, and let the computer figure out how to solve it. What notation could you use? What strategy should the computer then use? In this survey class, you'll learn to recognize when your problem is an instance of satisfiability, constraint programming, logic programming, dynamic programming, or mathematical programming (e.g., integer linear programming). For each of these related paradigms, you'll learn to reformulate hard problems in the required notation and apply off-the-shelf software that can solve any problem in that notation -- including NP-complete problems and many of the problems you'll see in other courses and in the real world. You'll also gain some understanding of the general-purpose algorithms that power the software. [Analysis] Students can only receive credit for EN.601.325 or EN.601.425, not both.
Instructor(s): J. Eisner
Area: Engineering.

EN.601.328. Compilers and Interpreters. 3.0 Credits.
Introduction to compiler design, including lexical analysis, parsing, syntax-directed translation, symbol tables, run-time environments, and code generation and optimization. Students are required to write a compiler as a course project. [Systems] Co-listed with EN.601.428
Prerequisites: EN.600.120 AND EN.600.226; Students may receive credit for only one of EN.600.328, EN.600.428, EN.601.328, EN.601.428, EN.601.628.
Instructor(s): P. Froehlich
Area: Engineering.
EN.601.350. Introduction to Genomic Research. 3.0 Credits.
This course will use a project-based approach to introduce undergraduates to research in computational biology and genomics. During the semester, students will take a series of large data sets, all derived from recent research, and learn all the computational steps required to convert raw data into a polished analysis. Data challenges might include the DNA sequences from a bacterial genome project, the RNA sequences from an experiment to measure gene expression, the DNA from a human microbiome sequencing experiment, and others. Topics may vary from year to year. In addition to computational data analysis, students will learn to do critical reading of the scientific literature by reading high-profile research papers that generated groundbreaking or controversial results. [Applications] Recommended Course Background: Knowledge of the Unix operating system and programming expertise in a language such as Perl or Python.
Instructor(s): S. Salzberg
Area: Engineering.

EN.601.355. Video Game Design Project. 3.0 Credits.
An intensive capstone design project experience in video game development. Students will work in groups of 4-8 on developing a complete video game of publishable quality. Teams will (hopefully) include programmers, visual artists, composers, and writers. Students will be mentored by experts from industry and academia. Aside from the project itself, project management and communication skills will be emphasized. Enrollment is limited to ensure parity between the various disciplines. [General] May involve travel to MICA. Junior or senior standing recommended.
Prerequisites: EN.600.255
Instructor(s): P. Froehlich
Area: Engineering.

EN.601.356. Seminar: Computer Integrated Surgery II. 1.0 Credit.
Students may receive credit for EN.601.456 or EN.601.356, but not both. Lecture only version of EN.601.456 (no project). Recommended Course Background: EN.601.455 or instructor permission required.
Instructor(s): R. Taylor
Area: Engineering.

EN.601.359. Knowledge Discovery from Text. 3.0 Credits.
The world is full of text: webpages, emails, newspaper articles, tweets, medical records, and so on. The purpose of text is for people to convey knowledge to other people. This course focuses on how computers analyze large, potentially streaming, text collections to automatically discover knowledge on their own (and to help people better find it themselves). Lectures and assignments will cover relevant topics in automatic classification (applied machine learning), linguistics, high-performance computing, and systems engineering, working with software systems for automatic question answering, populating knowledge bases, and aggregate analysis of social media such as Twitter. [Applications]
Prerequisites: EN.600.120 AND EN.600.226
Instructor(s): B. Van Durme; T. Lippincott
Area: Engineering.

EN.601.382. Deep Learning Lab. 1.0 Credit.
This course is an optional hands-on lab supplement for a few courses in the curriculum. It will provide tutorial support and practical experience for developing deep ML systems using PyTorch and TensorFlow, and may provide exposure to some other frameworks. It will also go into detail on practical methods for scalable learning on large data sets, and other more practical issues in setting up deep learning systems.
Corequisites: Students must also register for EN.601.482 OR EN.601.682 OR EN.601.765.
Instructor(s): G. Hager
Area: Engineering.

EN.601.402. Digital Health and Biomedical Informatics. 1.0 Credit.
Advances in technology are driving a change in medicine, from personalized medicine to population health. Computers and information technology will be critical to this transition. We shall discuss some of the coming changes in terms of computer technology, including computer-based patient records, clinical practice guidelines, and region-wide health information exchanges. We will discuss the underlying technologies driving these developments - databases and warehouses, controlled vocabularies, and decision support.
Instructor(s): H. Lehmann
Area: Engineering.

EN.601.411. Computer Science Innovation & Entrepreneurship II. 3.0 Credits.
This course is the second half of a two-course sequence and is a continuation of course EN.601.410.01, CS Innovation and Entrepreneurship, offered by the Center for Leadership Education (CLE). In this sequel course the student groups, directed by CS faculty, will implement the business idea which was developed in the first course and will present the implementations and business plans to an outside panel made up of practitioners, industry representatives, and venture capitalists. [General]
Prerequisites: EN.601.410
Instructor(s): A. Dahbura; L. Aronhime
Area: Engineering.

EN.601.414. Computer Networks. 4.0 Credits.
Topics covered will include application layer protocols (e.g. HTTP, FTP, SMTP), transport layer protocols (UDP, TCP), network layer protocols (e.g. IP, ICMP), link layer protocols (e.g. Ethernet) and wireless protocols (e.g. IEEE 802.11). The course will also cover routing protocols such as link state and distance vector, multicast routing, and path vector protocols (e.g. BGP). The class will examine security issues such as firewalls and denial of service attacks. We will also study DNS, NAT, Web caching and CDNs, peer to peer, and protocol tunneling. Finally, we will explore security protocols (e.g. TLS, SSH, IPSec), as well as some basic cryptography necessary to understand these. Grading will be based on hands-on programming assignments, homeworks and two exams. [Systems]
Prerequisites: EN.600.226 AND EN.600.233; Students may receive credit for only one of EN.600.344, EN.600.444, EN.601.414, EN.601.614.
Instructor(s): M. Green; X. Jin
Area: Engineering.
EN.601.415. Databases. 3.0 Credits.
Similar material as EN.601.315 covered in more depth for advanced undergraduates. Introduction to database management systems and database design, focusing on the relational and object-oriented data models, query languages and query optimization, transaction processing, parallel and distributed databases, recovery and security issues, commercial systems and case studies, heterogeneous and multimedia databases, and data mining. [Systems] (www.cs.jhu.edu/~yarowsky/cs415.html)
Prerequisites: Students may receive credit for only one of EN.600.315, EN.600.415, EN.601.315, EN.601.415.,EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.

EN.601.417. Distributed Systems. 3.0 Credits.
Graduate version of 601.317 Systems. Students may receive credit for 601.317 or 601.417 but not both. Recommended Course Background: EN.601.220, EN.601.226
Instructor(s): Y. Amir
Area: Engineering.

EN.601.418. Operating Systems. 3.0 Credits.
Similar material as EN.601.318, covered in more depth. Intended for advanced undergraduate students. This course covers fundamental topics related to operating systems theory and practice. Topics include processor management, storage management, concurrency control, multi-programming and processing, device drivers, operating system components (e.g., file system, kernel), modeling and performance measurement, protection and security, and recent innovations in operating system structure. Course work includes the implementation of operating systems techniques and routines, and critical parts of a small but functional operating system.
Prerequisites: EN.600.120 AND EN.600.226 AND EN.600.233; Students may receive credit for only one of EN.600.318, EN.600.418, EN.601.318, EN.601.418, EN.601.618.
Instructor(s): P. Huang
Area: Engineering.

EN.601.420. Parallel Programming. 3.0 Credits.
More advanced version of EN.601.320. Students may receive credit for EN.601.320 or EN.601.420, but not both. Prerequisite: EN.601.226 and EN.601.229 Computer System Fundamentals.
Prerequisites: EN.600.226 AND EN.600.233; Students may receive credit for only one of EN.600.320, EN.600.420, EN.601.320, EN.601.420, EN.601.620.
Instructor(s): R. Burns
Area: Engineering.

EN.601.421. Object Oriented Software Engineering. 3.0 Credits.
This course covers object-oriented software construction methodologies and their application. The main component of the course is a large team project on a topic of your choosing. Course topics covered include object-oriented analysis and design, UML, design patterns, refactoring, program testing, code repositories, team programming, and code reviews. [Systems or Applications] (http://pl.cs.jhu.edu/oose/index.shtml)
Prerequisites: EN.600.120 AND EN.600.226; Students may receive credit for only one of EN.600.321, EN.600.421, EN.601.421, EN.601.621.
Instructor(s): S. Smith
Area: Engineering.

EN.601.425. Declarative Methods. 3.0 Credits.
Students can only receive credit for EN.601.325 or EN.601.425, not both. Graduate level version of EN.601.325. Recommended Course Background: EN.601.226, EN.601.231, AS.110.107/AS.110.109
Instructor(s): J. Eisner
Area: Engineering.

EN.601.426. Principles of Programming Languages. 3.0 Credits.
Functional, object-oriented, and other language features are studied independent of a particular programming language. Students become familiar with these features by implementing them. Most of the implementations are in the form of small language interpreters. Some type checkers and a small compiler will also be written. The total amount of code written will not be overly large, as the emphasis is on concepts. The ML programming language is the implementation language used. [Analysis] Prerequisites include EN.601.226. No Freshmen or Sophomores.
Prerequisites: EN.600.226
Instructor(s): S. Smith
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.427. Ontologies and Knowledge Representation. 3.0 Credits.
Knowledge representation (KR) deals with the possible structures by which the content of what is known can be formally represented in such a way that queries can be posed and inferences drawn. Ontology concerns the hierarchy- cal classification of entities from given domains of knowledge together with the relations between various classes or subclasses. We begin with KR, examining the standard variety of frameworks developed or implemented over the last twenty years, including 1st-order logic and automated theorem proving, networks, frames, and description logics. Then we move on to a study of the problems inherent in ontology development and examine the some of the currently prevalent environments, including Universal Modeling Language, OWL and Protege’, RDFS and semantic web applications. [Analysis] Recommended Course Background: EN.601.107
Instructor(s): R. Rynasiewicz
Area: Humanities, Quantitative and Mathematical Sciences.

EN.601.428. Compilers & Interpreters. 3.0 Credits.
Prerequisites: EN.600.120 AND EN.600.226 AND EN.600.233
Instructor(s): P. Froehlich
Area: Engineering.

EN.601.430. Combinatorics & Graph Theory in Computer Science. 3.0 Credits.
This is a graduate level course studying the applications of combinatorics and graph theory in computer science. We will start with some basic combinatorial techniques such as counting and pigeon hole principle, and then move to advanced techniques such as the probabilistic method, spectral graph theory and additive combinatorics. We shall see their applications in various areas in computer science, such as proving lower bounds in computational models, randomized algorithms, coding theory and pseudorandomness. [Analysis] Recommended Course Background: probability theory and linear algebra
Prerequisites: EN.550.171
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.
EN.601.433. Intro Algorithms. 3.0 Credits.
This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis. [Analysis]
Prerequisites: EN.600.226 AND EN.550.171; Students may receive credit for only one of EN.600.363, EN.600.463, EN.601.433, EN.601.633.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.434. Randomized and Big Data Algorithms. 3.0 Credits.
The course emphasizes algorithmic design aspects, and how randomization can be a helpful tool. The topics covered include: tail inequalities, linear programming relaxation & randomized rounding, derandomization, existence proofs, universal hashing, markov chains, metropolis and metropolis-hastings methods, mixing by coupling and by eigenvalues, counting problems, semi-definite programming and rounding, lower bound arguments, and applications of expanders. [Analysis] (www.cs.jhu.edu/~cs464) Recommended Course Background: Probability
Prerequisites: EN.600.363 AND (EN.550.420 OR EN.550.620 OR EN.550.310) or similar; Students may receive credit for only one of EN.600.464, EN.600.664, EN.601.434, EN.601.634.
Instructor(s): V. Braverman
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.435. Approximation Algorithms. 3.0 Credits.
This course provides an introduction to approximation algorithms. Topics include vertex cover, TSP, Steiner trees, cuts, greedy approach, linear and semi-definite programming, primal-dual method, and randomization. Additional topics will be covered as time permits. There will be a final project. Students may receive credit for EN.601.435 or EN.601.635, but not both. [Analysis]
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.436. Algorithmic Game Theory. 3.0 Credits.
This course provides an introduction to algorithmic game theory: the study of games from the perspective of algorithms and theoretical computer science. There will be a particular focus on games that arise naturally from economic interactions involving computer systems (such as economic interactions between large-scale networks, online advertising markets, etc.), but there will also be broad coverage of games and mechanisms of all sorts. Topics covered will include a) complexity of computing equilibria and algorithms for doing so, b) (in)efficiency of equilibria, and c) algorithmic mechanism design. [Analysis]
Prerequisites: EN.600.363 OR EN.600.463 OR EN.601.433 OR EN.601.633
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.440. Web Security. 3.0 Credits.
This course begins with reviewing basic knowledge of the World Wide Web, and then exploring the central defense concepts behind Web security, such as same-origin policy, cross-origin resource sharing, and browser sandboxing. It will cover the most popular Web vulnerabilities, such as cross-site scripting (XSS) and SQL injection, as well as how to attack and penetrate software with such vulnerabilities. Students will learn how to detect, respond, and recover from security incidents. Newly proposed research techniques will also be discussed. [Systems]
Prerequisites: (EN.601.226 OR EN.600.226) AND (EN.601.229 OR EN.600.233)
Instructor(s): Y. Cao
Area: Engineering.

EN.601.441. Blockchains and Cryptocurrencies. 3.0 Credits.
This course will introduce students to cryptocurrencies and the main underlying technology of Blockchains. The course will start with the relevant background in cryptography and then proceed to cover the recent advances in the design and applications of blockchains. This course should primarily appeal to students who want to conduct research in this area or wish to build new applications on top of blockchains. It should also appeal to those who have a casual interest in this topic or are generally interested in cryptography. Students are expected to have mathematical maturity. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.451 OR EN.601.441 OR EN.601.641;EN.601.226 AND (EN.553.211 OR EN.553.310 OR EN.553.311 OR EN.560.348 OR EN.553.420)
Instructor(s): A. Jain
Area: Engineering.

EN.601.442. Modern Cryptography. 3.0 Credits.
Modern Cryptography includes seemingly paradoxical notions such as communicating privately without a shared secret, proving things without leaking knowledge, and computing on encrypted data. In this challenging but rewarding course we will start from the basics of private and public key cryptography and go all the way up to advanced notions such as zero-knowledge proofs, functional encryption and program obfuscation. The class will focus on rigorous proofs and require mathematical maturity. [Analysis]
Prerequisites: EN.600.271 AND (EN.553.420 or EN.553.310); Students may receive credit for only one of EN.600.442, EN.601.442, EN.601.642.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.443. Security & Privacy in Computing. 3.0 Credits.
This course will introduce students to cryptocurrencies and the main underlying technology of Blockchains. The course will start with the relevant background in cryptography and then proceed to cover the recent advances in the design and applications of blockchains. This course should primarily appeal to students who want to conduct research in this area or wish to build new applications on top of blockchains. It should also appeal to those who have a casual interest in this topic or are generally interested in cryptography. Students are expected to have mathematical maturity. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.451 OR EN.601.441 OR EN.601.641;EN.601.226 AND (EN.553.211 OR EN.553.310 OR EN.553.311 OR EN.560.348 OR EN.553.420)
Instructor(s): A. Jain
Area: Engineering.

EN.601.444. Security & Privacy in Computing. 3.0 Credits.
Lecture topics will include computer security, network security, basic cryptography, system design methodology, and privacy. There will be a heavy work load, including written homework, programming assignments, exams and a comprehensive final. The class will also include a semester-long project that will be done in teams and will include a presentation by each group to the class. [Applications] Recommended Course Background: A basic course in operating systems and networking, or permission of instructor.
Prerequisites: (EN.600.318 OR EN.600.418) OR (EN.600.344 OR EN.600.444) AND (EN.600.233 OR EN.601.229); Students may receive credit for only one of EN.600.443, EN.601.443, EN.601.643.
Instructor(s): A. Rubin
Area: Engineering.
EN.601.444. Network Security. 3.0 Credits.
This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems]
Prerequisites: EN.600.120 AND EN.600.226 AND ( EN.600.344 OR EN.600.444 ) or permission;Students may receive credit for only one of EN.600.424, EN.650.424, EN.601.444, EN.601.644.
Instructor(s): S. Nielson
Area: Engineering.

EN.601.445. Practical Cryptographic Systems. 3.0 Credits.
This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems]
Prerequisites: EN.600.226 AND EN.600.233;Students may receive credit for only one of EN.600.454, EN.601.445, EN.601.645.
Instructor(s): M. Green
Area: Engineering.

EN.601.447. Computational Genomics: Sequences. 3.0 Credits.
Your genome is the blueprint for the molecules in your body. It’s also a string of letters (A, C, G and T) about 3 billion letters long. How does this string give rise to you? Your heart, your brain, your health? This, broadly speaking, is what genomics research is about. This course will familiarize you with a breadth of topics from the field of computational genomics. The emphasis is on current research problems, real-world genomics data, and efficient software implementations for analyzing data. Topics will include: string matching, sequence alignment and indexing, assembly, and sequence models. Course will involve significant programming projects. [Applications]
Prerequisites: EN.600.120 AND EN.600.226;Students may receive credit for only one of EN.600.439, EN.600.639, EN.601.447, EN.601.647.
Instructor(s): B. Langmead
Area: Engineering.

EN.601.448. Computational Genomics: Data Analysis. 3.0 Credits.
Genomic data has the potential to reveal causes of disease, novel drug targets, and relationships among genes and pathways in our cells. However, identifying meaningful patterns from high-dimensional genomic data has required development of new computational tools. This course will cover current approaches in computational analysis of genomic data with a focus on statistical methods and machine learning. Topics will include disease association, prediction tasks, clustering and dimensionality reduction, data integration, and network reconstruction. There will be some programming and a project component. [Applications]
Prerequisites: EN.601.226 or other programming experience, probability and statistics, linear algebra or calculus.
Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.]  
Instructor(s): A. Battle
Area: Engineering.

EN.601.452. Computational Biomedical Research. 3.0 Credits.
[Co-listed with AS.020.415] This course for advanced undergraduates includes classroom instruction in interdisciplinary research approaches and lab work on an independent research project in the lab of a Bloomberg Distinguished Professor and other distinguished faculty. Lectures will focus on cross-cutting techniques such as data visualization, statistical inference, and scientific computing. In addition to two 50-minute classes per week, students will commit to working approximately 3 hours per week in the lab of one of the professors. The student and professor will work together to schedule the research project. Students will present their work at a symposium at the end of the semester.
Instructor(s): M. Schatz
Area: Engineering.

EN.601.454. Augmented Reality. 3.0 Credits.
Same as EN.601.654, for undergraduate students. This course introduces students to the field of Augmented Reality. It reviews its basic definitions, principles and applications. It then focuses on Medical Augmented Reality and its particular requirements. The course also discusses the main issues of calibration, tracking, multi-modal registration, advance visualization and display technologies. Homework in this course will relate to the mathematical methods used for calibration, tracking and visualization in medical augmented reality. Students may also be asked to read papers and implement various techniques within group projects. Recommended Course Background: EN.601.220, EN.601.226, and AS.110.201. [Applications]
Prerequisites: EN.600.120 AND EN.600.226 AND (AS.110.201 OR EN.550.291);Students may receive credit for only one of EN.600.484, EN.600.684, EN.601.454, EN.601.654.
Instructor(s): N. Navab
Area: Engineering.

EN.601.455. Computer Integrated Surgery I. 4.0 Credits.
This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Recommended Course Background: EN.601.220, EN.601.457, EN.601.461, image processing.
Prerequisites: EN.600.226 AND (AS.110.201 OR AS.110.212 ) or permission of the instructor;Students may receive credit for only one of EN.600.445, EN.600.645, EN.601.455, EN.601.655.
Instructor(s): R. Taylor
Area: Engineering.
EN.601.456. Computer Integrated Surgery II. 3.0 Credits.
This weekly lecture/seminar course addresses similar material to EN.601.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.601.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. [Applications]
Prerequisites: EN.600.445 or EN.600.645 or permission; Students may receive credit for only one of EN.600.446, EN.600.646, EN.601.456, EN.601.656.
Instructor(s): R. Taylor
Area: Engineering.

EN.601.457. Computer Graphics. 3.0 Credits.
This course introduces computer graphics techniques and applications, including image processing, rendering, modeling and animation. [Applications]
Prerequisites: EN.600.120 AND EN.600.226, and linear algebra or permission of instructor; Students may receive credit for only one of EN.600.357, EN.601.457, EN.601.657.
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.459. Computational Geometry. 3.0 Credits.
This course will provide an introduction to computational geometry. It will cover a number of topics in two- and three-dimensions, including polygon triangulations and partitions, convex hulls, Delaunay and Voronoi diagrams, arrangements, and spatial queries. Time-permitting, we will also look at kD-trees, general BSP-trees, and quadtrees. [Analysis]
Recommended Course Background: EN.601.220 AND EN.601.226 AND (EN.600.363 OR EN.601.433).
Prerequisites: Students may receive credit for EN.600.459 or EN.600.659, but not both.
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.461. Computer Vision. 3.0 Credits.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] Prerequisites: intro programming, linear algebra, and prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.361, EN.600.461, EN.600.661, EN.601.461, EN.601.661.
Instructor(s): H. Ali
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.463. Algorithms for Sensor-Based Robotics. 3.0 Credits.
This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis]
Prerequisites: EN.600.226 OR EN.601.226 and Linear Algebra and Probability; Students may receive credit for only one of EN.600.336, EN.600.436, EN.600.636, EN.601.463, EN.601.663.
Instructor(s): S. Leonard
Area: Engineering.

EN.601.464. Artificial Intelligence. 3.0 Credits.
The class is recommended for all scientists and engineers with a genuine curiosity about the fundamental obstacles to getting machines to perform tasks such as learning, planning and prediction. Materials will be primarily based on the popular textbook, Artificial Intelligence: A Modern Approach. Strong programming skills are expected, as well as basic familiarity with probability. For students intending to also take courses in Machine Learning (e.g., 601.475/675, 601.476/676), they may find it beneficial to take this course first, or concurrently. [Applications]
Prerequisites: EN.600.226; Students may receive credit for only one of EN.600.335, EN.600.435, EN.601.464, EN.601.664.
Instructor(s): B. Van Durme
Area: Engineering.

EN.601.465. Natural Language Processing. 4.0 Credits.
This course is an in-depth overview of techniques for processing human language. How should linguistic structure and meaning be represented? What algorithms can recover them from text? And crucially, how can we build statistical models to choose among the many legal answers? The course covers methods for trees (parsing and semantic interpretation), sequences (finite-state transduction such as morphology), and words (sense and phrase induction), with applications to practical engineering tasks such as information retrieval and extraction, text classification, part-of-speech tagging, speech recognition and machine translation. There are a number of structured but challenging programming assignments. [Applications]
Prerequisites: EN.600.226; Students may receive credit for only one of EN.600.465, EN.601.465, EN.601.665.
Instructor(s): J. Eisner
Area: Engineering.

EN.601.466. Information Retrieval and Web Agents. 3.0 Credits.
An in-depth, hands-on study of current information retrieval techniques and their application to developing intelligent WWW agents. Topics include a comprehensive study of current document retrieval models, mail/news routing and filtering, document clustering, automatic indexing, query expansion, relevance feedback, user modeling, information visualization and usage pattern analysis. In addition, the course explores the range of additional language processing steps useful for template filling and information extraction from retrieved documents, focusing on recent, primarily statistical methods. The course concludes with a study of current issues in information retrieval and data mining on the World Wide Web. Topics include web robots, spiders, agents and search engines, exploring both their practical implementation and the economic and legal issues surrounding their use. Recommended Course Background: EN.601.226
Prerequisites: EN.600.226
Instructor(s): D. Yarowsky
Area: Engineering.
EN.601.468. Machine Translation. 3.0 Credits.
Google translate can instantly translate between any pair of over fifty human languages (for instance, from French to English). How does it do that? Why does it make the errors that it does? And how can you build something better? Modern translation systems learn to translate by reading millions of words of already translated text, and this course will show you how they work. The course covers a diverse set of fundamental building blocks from linguistics, machine learning, algorithms, data structures, and formal language theory, along with their application to a real and difficult problem in artificial intelligence.
Prerequisites: EN.600.226 and prob/stat. Students may receive credit for only one of EN.600.468, EN.601.468, EN.601.668.
Instructor(s): P. Koehn
Area: Engineering.

EN.601.475. Machine Learning. 3.0 Credits.
Machine learning is subfield of computer science and artificial intelligence, whose goal is to develop computational systems, methods, and algorithms that can learn from data to improve their performance. This course introduces the foundational concepts of modern Machine Learning, including core principles, popular algorithms and modeling frameworks. This will include both supervised learning, which includes popular algorithms like SVMs, logistic regression, boosting and deep learning, as well as unsupervised learning frameworks, which include Expectation Maximization and graphical models. Homework assignments include a heavy programming components, requiring students to implement several machine learning algorithms in a common learning framework. Additionally, analytical homework questions will explore various machine learning concepts, building on the pre-requisites that include probability, linear algebra, multi-variate calculus and basic optimization. Students in the course will develop a learning system for a final project. [Applications or Analysis] Required course background: multivariable calculus, probability, linear algebra.
Prerequisites: EN.600.107 OR EN.600.120 OR EN.601.220 OR EN.600.226/EN.601.226 OR EN.580.200 OR EN.500.200 OR AS.250.205 OR EN.601.107 OR EN.500.112 OR AP Computer Science; Students may receive credit for only one of EN.600.475, EN.601.475, EN.601.675.
Instructor(s): M. Dredze
Area: Engineering.

EN.601.476. Machine Learning: Data to Models. 3.0 Credits.
How can robots localize themselves in an environment when navigating? Can we predict which patients are at greatest-risk for complications in the hospital? Which movie should I recommend to this user given his history of likes? Many such big data questions can be answered using the paradigm of probabilistic models in machine learning. These are especially useful when common off-the-shelf algorithms such as support vector machines and k-means fail. You will learn methods for clustering, classification, structured prediction, recommendation and inference. We will use Murphy’s book, Machine Learning: a Probabilistic Perspective, as the text for this course. Assignments are solved in groups of size 1-3 students. The class will have 4 interactive sessions during which we brainstorm how to solve example open-ended real-world problems with the tools learnt in class. Students are also required to do a project of their choice within which they experiment with the ideas learnt in class. [Analysis or Applications] Prerequisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.477. Causal Inference. 3.0 Credits.
"Big data" is not necessarily "high quality data." Systematically missing records, unobserved confounders, and selection effects present in many datasets make it harder than ever to answer scientifically meaningful questions. This course will teach mathematical tools to help you reason about causes, effects, and bias sources in data with confidence. We will use graphical causal models, and potential outcomes to formalize what causal effects mean, describe how to express these effects as functions of observed data, and use regression model techniques to estimate them. We will consider techniques for handling missing values, structure learning algorithms for inferring causal directionality from data, and connections between causal inference and reinforcement learning. [Analysis] Pre-requisites: familiarity with the R programming language, multivariate calculus, basics of linear algebra and probability.
Prerequisites: EN.600.475 OR (EN.550.310 OR EN.550.420) AND AS.110.202 or permission of instructor; Students may receive credit for only one of EN.600.477, EN.600.677, EN.601.477, EN.601.677.
Instructor(s): I. Shpitser
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.479. Representation Learning. 3.0 Credits.
Often the success of a machine learning project depends on the choice of features used. Machine learning has made great progress in training classification, regression and recognition systems when "good" representations, or features, of input data are available. However, much human effort is spent on designing good features which are usually knowledge-based and engineered by domain experts over years of trial and error. A natural question to ask then is "Can we automate the learning of useful features from raw data?" Representation learning algorithms such as principal component analysis aim at discovering better representations of inputs by learning transformations of data that disentangle factors of variation in data while retaining most of the information. The success of such data-driven approaches to feature learning depends not only on how much data we can process but also on how well the features that we learn correlate with the underlying unknown labels (semantic content in the data). This course will focus on scalable machine learning approaches for learning representations from large amounts of unlabeled, multi-modal, and heterogeneous data. We will cover topics including deep learning, multi-view learning, dimensionality reduction, similarity-based learning, and spectral learning. Students may receive credit for 601.479 or 601.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra.
Prerequisites: If you have completed EN.600.679 you may not enroll in EN.601.479.
Instructor(s): R. Arora
Area: Engineering.
EN.601.481. Machine Learning: Optimization. 3.0 Credits.
Optimization is at the heart of machine learning. Most machine learning problems can be posed as optimization problems. However, unlike mathematical optimization where the focus is on efficient algorithms for finding solutions with a high degree of accuracy as measured by optimality conditions, optimization for machine learning focuses on algorithms that are efficient and generalize well. In this course, we will focus on optimization for problems that arise in machine learning, design and analysis of algorithms for solving these problems, and the interplay of optimization and machine learning. The coursework will include homework assignments and a final project focusing on applying optimization algorithms to real world machine learning problems. [Analysis or Applications]
Prerequisites: EN.601.473 OR (EN.553.310 OR (EN.553.420 AND EN.553.430 ) AND AS.110.201 AND AS.110.202 ); Students may receive credit for only one of EN.601.481/681.
Instructor(s): R. Arora
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.482. Machine Learning: Deep Learning. 3.0 Credits.
Deep learning (DL) has emerged as a powerful tool for solving data-intensive learning problems such as supervised learning for classification or regression, dimensionality reduction, and control. As such, it has a broad range of applications including speech and text understanding, computer vision, medical imaging, and perception-based robotics. The goal of this course is to introduce the basic concepts of deep learning (DL). The course will include a brief introduction to the basic theoretical and methodological underpinnings of machine learning, commonly used architectures for DL, DL optimization methods, DL programming systems, and specialized applications to computer vision, speech understanding, and robotics. Students will be expected to solve several DL problems on standardized data sets, and will be given the opportunity to pursue team projects on topics of their choice. [Applications] Students should also consider taking EN.601.382 Deep Learning Lab as a supplement. Students may choose to skip the lab course if they already have a strong programming background and are comfortable learning on their own using online resources and tutorials. Pre-req: (AS.110.201 or AS.110.212 or EN.553.291) and (EN.553.310 or EN.553.311 or EN.553.420; Calc III and numerical optimization recommended.
Prerequisites: (AS.110.201 OR AS.110.212 OR EN.553.291) AND (EN.553.310 OR EN.553.311 OR EN.553.420 OR EN.560.348); Calc III and numerical optimization recommended.
Instructor(s): G. Hager
Area: Engineering.

EN.601.485. Probabilistic Models of the Visual Cortex. 3.0 Credits.
The course gives an introduction to computational models of the mammalian visual cortex. It covers topics in low-, mid-, and high-level vision. It briefly discusses the relevant evidence from anatomy, electrophysiology, imaging (e.g., fMRI), and psychophysics. It concentrates on mathematical modelling of these phenomena taking into account recent progress in probabilistic models of computer vision and developments in machine learning, such as deep networks. [Applications or Analysis] Programming experience (Python preferred).
Prerequisites: AS.110.106 OR AS.110.108
Instructor(s): A. Yuille
Area: Quantitative and Mathematical Sciences.

EN.601.488. Foundations of Computational Biology & Bioinformatics II. 3.0 Credits.
This course will introduce probabilistic modeling and information theory applied to biological sequence analysis, focusing on statistical models of protein families, alignment algorithms, and models of evolution. Topics will include probability theory, score matrices, hidden Markov models, maximum likelihood, expectation maximization and dynamic programming algorithms. Homework assignments will require programming in Python. Foundations of Computational Biology I is not a prereq. [Analysis] Co-listed with EN.580.488. Recommended Course Background: math through linear algebra and differential equations, at least one prob/stat course, EN.580.221 or equivalent, EN.601.226 or equivalent.
Instructor(s): R. Karchin
Area: Engineering, Natural Sciences.

EN.601.490. Introduction to Human-Computer Interaction. 3.0 Credits.
This course is designed to introduce undergraduate and graduate students to design techniques and practices in human-computer interaction (HCI), the study of interactions between humans and computing systems. Students will learn design techniques and evaluation methods, as well as current practices and exploratory approaches, in HCI through lectures, readings, and assignments. Students will practice various design techniques and evaluation methods through hands-on projects focusing on different computing technologies and application domains. This course is intended for undergraduate and graduate students in Computer Science/Cognitive Science/Psychology. Interested students from different disciplines should contact the instructor before enrolling in this course. [Applications] Recommended Background: Basic programming skills.
Prerequisites: Students can receive credit for either EN.601.490 or EN.601.690, but not both.
Instructor(s): C. Huang
Area: Engineering.

EN.601.501. Computer Science Workshop. 1.0 - 3.0 Credits.
An applications-oriented, computer science project done under the supervision and with the sponsorship of a faculty member in the Department of Computer Science. Computer Science Workshop provides a student with an opportunity to apply theory and concepts of computer science to a significant project of mutual interest to the student and a Computer Science faculty member. Permission to enroll in CSW is granted by the faculty sponsor after his/her approval of a project proposal from the student. Interested students are advised to consult with Computer Science faculty members before preparing a Computer Science Workshop project proposal.
Instructor(s): D. Yarowsky; J. Selinski; M. Darvish Darab; S. Smith.

EN.601.503. Independent Study. 1.0 - 3.0 Credits.
Individual guided study for undergraduate students under the direction of a faculty member in the department. The program of study, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.

EN.601.507. Undergraduate Research. 1.0 - 3.0 Credits.
Individual research for undergraduates under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Permission required.
Instructor(s): Staff.
EN.601.509. Computer Science Internship. 1.0 Credit.
Individual work in the field with a learning component, supervised by a faculty member in the department. The program of study and credit assigned must be worked out in advance between the student and the faculty member involved. Students may not receive credit for work that they are paid to do. As a rule of thumb, 40 hours of work is equivalent to one credit. Permission required.
Instructor(s): Staff.

EN.601.517. Group Undergraduate Research. 1.0 - 3.0 Credits.
Independent research for undergraduates under the direction of a faculty member in the department. This course has a weekly research group meeting that students are expected to attend. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.
Instructor(s): Staff.

EN.601.519. Senior Honors Thesis. 3.0 Credits.
The student will undertake a substantial independent research project under the supervision of a faculty member, potentially leading to the notation "Departmental Honors with Thesis" on the final transcript. Students are expected to enroll in both semesters of this course during their senior year. Project proposals must be submitted and accepted in the preceding spring semester (junior year) before registration. Students will present their work publicly before April 1st of senior year. They will also submit a first draft of their project report (thesis document) at that time. Faculty will meet to decide if the thesis will be accepted for honors. Computer science majors only. Students should have a 3.5 GPA in computer science courses at the end of their junior year and permission of faculty sponsor.
Instructor(s): Staff.

EN.601.520. Senior Honors Thesis. 0.0 - 3.0 Credits.
For computer science majors only, a continuation of EN.601.519. Recommended Course Background: EN.601.519
Instructor(s): Staff.

EN.601.556. Senior Thesis In CIS. 3.0 Credits.
Prerequisites: EN.600.445 or permission of instructor.
Instructor(s): R. Taylor.

EN.601.618. Operating Systems. 3.0 Credits.
Topics include processor management, storage management, operating system components (e.g., file system, kernel), modeling and performance measurement, protection and security, and recent innovations in operating system structure. Course work includes the implementation of operating systems techniques and routines, and critical parts of a small but functional operating system. [Systems] Recommended Course Background: EN.601.226
Prerequisites: Students may receive credit for only one of EN.600.315, EN.600.415, EN.601.315, EN.601.415, EN.601.615.
Instructor(s): D. Yarowsky
Area: Engineering.

EN.601.619. Principles of Programming Languages. 3.0 Credits.
Same material as EN.601.419, for graduate students. Introduction to the design and implementation of programming languages, focusing on the use of language features in achieving programming goals. [Analysis] Students may receive credit for only one of EN.601.419, EN.601.619.
Instructor(s): S. Smith
Area: Engineering.
EN.601.433. Randomized and Big Data Algorithms. 3.0 Credits.
Same material as EN.601.434, for graduate students. This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.363, EN.600.463, EN.601.433, EN.601.633.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.441. Blockchain and Cryptocurrencies. 3.0 Credits.
Same as EN.601.441, for graduate students. This course will introduce students to cryptocurrencies and the main underlying technology of Blockchains. The course will start with the relevant background in cryptography and then proceed to cover the recent advances in the design and applications of blockchains. This course should primarily appeal to students who want to conduct research in this area or wish to build new applications on top of blockchains. It should also appeal to those who have a casual interest in this topic or are generally interested in cryptography. Students are expected to have mathematical maturity. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.451 OR EN.601.441 OR EN.601.641; EN.601.226 AND (EN.553.310 OR EN.553.420)
Instructor(s): A. Jain
Area: Engineering.

EN.601.442. Modern Cryptography. 3.0 Credits.
Same material as EN.601.442, for graduate students. Modern Cryptography includes seemingly paradoxical notions such as communicating privately without a shared secret, proving things without leaking knowledge, and computing on encrypted data. In this challenging but rewarding course we will start from the basics of private and public key cryptography and go all the way up to advanced notions such as zero-knowledge proofs, functional encryption and program obfuscation. The class will focus on rigorous proofs and require mathematical maturity. [Analysis] Required course background: EN.601.231 or EN.601.631.
Prerequisites: Students may receive credit for only one of EN.600.442, EN.601.442, EN.601.642.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.
EN.601.644. Network Security. 3.0 Credits.
Same material as 601.444, for graduate students. This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] Recommended. Course Background: EN.601.220, EN.601.226 or equivalent
Prerequisites: Students may receive credit for only one of EN.600.424, EN.650.424, EN.601.444, EN.601.644.
Instructor(s): S. Nielson
Area: Engineering.

EN.601.645. Practical Cryptographic Systems. 3.0 Credits.
Same material as 601.445, for graduate students. This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems]
Prerequisites: Students may receive credit for only one of EN.600.454, EN.650.454, EN.601.445, EN.601.645.
Instructor(s): M. Green
Area: Engineering.

EN.601.646. Computational Genomics: Sequences. 3.0 Credits.
Same material as 601.447, for graduate students. Your genome is the blueprint for the molecules in your body. It's also a string of letters (A, C, G and T) about 3 billion letters long. How does this string give rise to you? Your heart, your brain, your health? This, broadly speaking, is what genomics research is about. This course will familiarize you with a breadth of topics from the field of computational genomics. The emphasis is on current research problems, real-world genomics data, and efficient software implementations for analyzing data. Topics will include: string matching, sequence alignment and indexing, assembly, and sequence models. Course will involve significant programming projects. [Applications] Recommended Course Background: EN.601.220 and EN.601.226
Prerequisites: Students may receive credit for only one of EN.600.439, EN.600.639, EN.601.447, EN.601.647.
Instructor(s): B. Langmead
Area: Engineering.

EN.601.654. Augmented Reality. 3.0 Credits.
This course introduces students to the field of Augmented Reality. It reviews its basic definitions, principles and applications. It then focuses on Medical Augmented Reality and its particular requirements. The course also discusses the main issues of calibration, tracking, multimodal registration, advance visualization and display technologies. Homework in this course will relate to the mathematical methods used for calibration, tracking and visualization in medical augmented reality. Students may also be asked to read papers and implement various techniques within group projects. Recommended Course Background: EN.601.220, EN.601.226, and AS.110.201. [Applications]
Prerequisites: Students may receive credit for only one of EN.600.484, EN.600.684, EN.601.454, EN.601.654.
Instructor(s): N. Navab.

EN.601.655. Computer Integrated Surgery I. 4.0 Credits.
Same material as 601.455, for graduate students. This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. [Applications] Recommended Course Background: intermediate programming in C/C++, EN.601.457, EN.601.461, image processing.
Prerequisites: Students may receive credit for only one of EN.600.445, EN.600.645, EN.601.455, EN.601.655.
Instructor(s): R. Taylor
Area: Engineering.

EN.601.656. Computer Integrated Surgery II. 3.0 Credits.
Same material as EN.601.456, for graduate students. This weekly lecture/seminar course addresses similar material to EN.601.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.601.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. [Applications]
Prerequisites: EN.600.445 OR EN.600.645 OR PERMISSION OF INSTRUCTOR, Students may receive credit for only one of EN.600.446, EN.600.646, EN.601.456, EN.601.656.
Instructor(s): R. Taylor.

EN.601.657. Computer Graphics. 3.0 Credits.
Same material as 601.457, for graduate students. This course introduces computer graphics techniques and applications, including image processing, rendering, modeling and animation. [Applications] Permission of instructor is required for students not satisfying a pre-requisite. Required course background: EN.601.220 (C++), EN.601.226, linear algebra.
Prerequisites: Students may receive credit for only one of EN.600.357, EN.600.457, EN.601.457, EN.601.657.
Instructor(s): M. Kazhdan
Area: Engineering, Quantitative and Mathematical Sciences.
EN.601.658. Introduction to Geometry Processing. 2.0 Credits.
In this course we will look at fundamental techniques in geometry processing, including smoothing / sharpening, parameterization, and (if time allows) vector fields. The course will begin with a review of the discretization of the underlying concepts from differential geometry (e.g., normals, curvature, Laplacian) before proceeding to specific applications. 
Prerequisites: EN.600.357 AND EN.600.457
Instructor(s): F. Prada Nino; M. Kazhdan.

EN.601.661. Computer Vision. 3.0 Credits.
Same material as 601.461, for graduate students. Students may receive credit for at most one of 601.461/661/761. This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] Recommended Course Background: intro programming, linear algebra, prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.361, EN.600.461, EN.600.661, EN.601.461, EN.601.661.
Instructor(s): H. Ali
Area: Engineering.

EN.601.663. Algorithms for Sensor-Based Robotics. 3.0 Credits.
Same material as EN.601.463, for graduate students. This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis] Recommended Course Background: EN.600.226 and Linear Algebra and Probability
Prerequisites: Students may receive credit for only one of EN.600.336, EN.600.436, EN.600.636, EN.601.463, EN.601.663.
Instructor(s): S. Leonard
Area: Engineering.

EN.601.664. Artificial Intelligence. 3.0 Credits.
Same material as EN.601.464, for graduate students. The class is recommended for all scientists and engineers with a genuine curiosity about the fundamental obstacles to getting machines to perform tasks such as learning, planning and prediction. Materials will be primarily based on the popular textbook, Artificial Intelligence: A Modern Approach. Strong programming skills are expected, as well as basic familiarity with probability. For students intending to also take courses in Machine Learning (e.g., EN.601.475/675, EN.601.476/676), they may find it beneficial to take this course first, or concurrently. [Applications] Prereq: EN.600.226; Recommended: linear algebra, prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.335, EN.600.435, EN.601.464, EN.601.664.
Instructor(s): B. Van Durme
Area: Engineering.

EN.601.665. Natural Language Processing. 4.0 Credits.
Same material as 601.465, for graduate students. This course is an in-depth overview of techniques for processing human language. How should linguistic structure and meaning be represented? What algorithms can recover them from text? And crucially, how can we build statistical models to choose among the many legal answers? The course covers methods for trees (parsing and semantic interpretation), sequences (finite-state transduction such as morphology), and words (sense and phrase induction), with applications to practical engineering tasks such as information retrieval and extraction, text classification, part-of-speech tagging, speech recognition and machine translation. There are a number of structured but challenging programming assignments. [Applications] Recommended Course Background: EN.601.226
Prerequisites: Students may receive credit for only one of EN.600.465, EN.601.465, EN.601.665.
Instructor(s): J. Eisner
Area: Engineering.

EN.601.666. Information Retrieval and Web Agents. 3.0 Credits.
Same material as EN.601.466, for graduate students. An in-depth, hands-on study of current information retrieval techniques and their application to developing intelligent WWW agents. Topics include a comprehensive study of current document retrieval models, mail/news routing and filtering, document clustering, automatic indexing, query expansion, relevance feedback, user modeling, information visualization and usage pattern analysis. In addition, the course explores the range of additional language processing steps useful for template filling and information extraction from retrieved documents, focusing on recent, primarily statistical methods. The course concludes with a study of current issues in information retrieval and data mining on the World Wide Web. Topics include web robots, spiders, agents and search engines, exploring both their practical implementation and the economic and legal issues surrounding their use. [Applications] 
Instructor(s): D. Yarowsky
Area: Engineering.

EN.601.668. Machine Translation. 3.0 Credits.
Same material as 601.468, for graduate students. Google translate can instantly translate between any pair of over fifty human languages (for instance, from French to English). How does it do that? Why does it make the errors that it does? And how can you build something better? Modern translation systems learn to translate by reading millions of words of already translated text, and this course will show you how they work. The course covers a diverse set of fundamental building blocks from linguistics, machine learning, algorithms, data structures, and formal language theory, along with their application to a real and difficult problem in artificial intelligence. [Applications] Recommended Course Background: prob/stat, EN.601.226, EN.601.645
Prerequisites: Students may receive credit for only one of EN.600.468, EN.601.468, EN.601.668.
Instructor(s): P. Koehn
Area: Engineering.
EN.601.475. Machine Learning. 3.0 Credits.
Same material as 601.475, for graduate students. Machine learning is a subfield of computer science and artificial intelligence, whose goal is to develop computational systems, methods, and algorithms that can learn from data to improve their performance. This course introduces the foundational concepts of modern Machine Learning, including core principles, popular algorithms and modeling frameworks. This will include both supervised learning, which includes popular algorithms like SVMs, logistic regression, boosting and deep learning, as well as unsupervised learning frameworks, which include Expectation Maximization and graphical models. Homework assignments include a heavy programming component, requiring students to implement several machine learning algorithms in a common learning framework. Additionally, analytical homework questions will explore various machine learning concepts, building on the pre-requisites that include probability, linear algebra, multi-variate calculus and basic optimization. Students in the course will be given the opportunity to pursue scientific meaningful questions. This course will teach mathematical tools to help you reason about causes, effects, and bias sources in data with confidence. We will use graphical causal models, and potential outcomes to formalize what causal effects mean, describe how to express these effects as functions of observed data, and use regression model techniques to estimate them. We will consider techniques for handling missing values, structure learning algorithms for inferring causal directionality from data, and connections between causal inference and reinforcement learning. [Analysis] Pre-requisites: familiarity with the R programming language, multivariate calculus, basics of linear algebra and probability.
Prerequisites: Students may receive credit for only one of EN.600.475, EN.601.475, EN.601.675.
Instructor(s): M. Dredze
Area: Engineering.

EN.601.677. Causal Inference. 3.0 Credits.
"Big data" is not necessarily "high quality data." Systematically missing records, unobserved confounders, and selection effects present in many datasets make it harder than ever to answer scientifically meaningful questions. This course will teach mathematical tools to help you reason about causes, effects, and bias sources in data with confidence. We will use graphical causal models, and potential outcomes to formalize what causal effects mean, describe how to express these effects as functions of observed data, and use regression model techniques to estimate them. We will consider techniques for handling missing values, structure learning algorithms for inferring causal directionality from data, and connections between causal inference and reinforcement learning. [Analysis] Pre-requisites: familiarity with the R programming language, multivariate calculus, basics of linear algebra and probability.
Prerequisites: Students may receive credit for only one of EN.600.477, EN.600.677, EN.601.477, EN.601.677.
Instructor(s): I. Shpitser
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.679. Representation Learning. 3.0 Credits.
Graduate level version of 601.479. Students may receive credit for 601.479 or 601.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra. Co-listed with EN.601.479
Prerequisites: If you have completed EN.600.479 you may not enroll in EN.600.679.
Instructor(s): R. Arora.

EN.601.681. Machine Learning: Optimization. 3.0 Credits.
Same material as EN.601.481, for graduate students. Optimization is at the heart of machine learning. Most machine learning problems can be posed as optimization problems. However, unlike mathematical optimization where the focus is on efficient algorithms for finding solutions with a high degree of accuracy as measured by optimality conditions, optimization for machine learning focuses on algorithms that are efficient and generalize well. In this course, we will focus on optimization for problems that arise in machine learning, design and analysis of algorithms for solving these problems, and the interplay of optimization and machine learning. The coursework will include homework assignments and a final project focusing on applying optimization algorithms to real world machine learning problems. [Analysis or Applications] Recommended Course Background: EN.601.475 OR ( EN.553.310 OR ( EN.553.420 AND EN.553.430 ) AND AS.110.201 AND AS.110.202 )
Prerequisites: Students may receive credit for only one of EN.601.481/681
Instructor(s): R. Arora.

EN.601.682. Machine Learning: Deep Learning. 3.0 Credits.
Deep learning (DL) has emerged as a powerful tool for solving data-intensive learning problems such as supervised learning for classification or regression, dimensionality reduction and control. As such, it has a broad range of applications including speech and text understanding, computer vision, medical imaging, and perception-based robotics. The goal of this course is to introduce the basic concepts of deep learning (DL). The course will include a brief introduction to the basic theoretical and methodological underpinnings of machine learning, commonly used architectures for DL, DL optimization methods, DL programming systems, and specialized applications to computer vision, speech understanding, and robotics. Students will be expected to solve several DL problems on standardized data sets, and will be given the opportunity to pursue team projects on topics of their choice. [Applications] Students should also consider taking EN.601.382 Deep Learning Lab as a supplement. Students may choose to skip the lab course if they already have a strong programming background and are comfortable learning on their own using online resources and tutorials. Recommended Course Background: (AS.110.201 or AS.110.212 or EN.553.291) and (EN.553.310 EN.553.311 or EN.553.420); numerical optimization recommended.
Instructor(s): G. Hager
Area: Engineering.

EN.601.690. Introduction to Human-Computer Interaction. 3.0 Credits.
This course is designed to introduce undergraduate and graduate students to design techniques and practices in human-computer interaction (HCI), the study of interactions between humans and computing systems. Students will learn design techniques and evaluation methods, as well as current practices and exploratory approaches, in HCI through lectures, readings, and assignments. Students will practice various design techniques and evaluation methods through hands-on projects focusing on different computing technologies and application domains. This course is intended for undergraduate and graduate students in Computer Science/Cognitive Science/Psychology. Interested students from different disciplines should contact the instructor before enrolling in this course. [Applications] Recommended Background: Basic programming skills.
Prerequisites: Students can receive credit for either EN.601.490 or EN.601.690, but not both.
Instructor(s): C. Huang
Area: Engineering.
EN.601.691. Human-Robot Interaction. 3.0 Credits.
This course is designed to introduce graduate students to research methods and topics in human-robot interaction (HRI), an emerging research area focusing on the design and evaluation of interactions between humans and robotic technologies. Students will (1) learn design principles for building and research methods of evaluating interactive robot systems through lectures, readings, and assignments, (2) read and discuss relevant literature to gain sufficient knowledge of various research topics in HRI, and (3) work on a substantial project that integrates the principles, methods, and knowledge learned in this course. [Applications] Required course background: EN.601.220 and EN.601.226. Instructor(s): P. Huang.

EN.601.714. Advanced Computer Networks. 3.0 Credits.
This is a graduate-level course on computer networks. It provides a comprehensive overview on advanced topics in network protocols and networked systems. The course will cover both classic papers on Internet protocols and recent research results. It will examine a wide range of topics, e.g., routing, congestion control, network architectures, datacenter networks, network virtualization, software-defined networking, and programmable networks, with an emphasize on core networking concepts and principles. The course will include lectures, paper discussions, programming assignments and a research project. Recommended Course Background: One undergraduate course in computer networks (e.g., EN.601.414/614 Computer Network Fundamentals or the equivalent), or permission of the instructor. The course assignments and projects assume students to be comfortable with programming. Instructor(s): S. Ghorbani Khaledi.

EN.601.717. Advanced Distributed Systems & Networks. 3.0 Credits.
The course explores the state of the art in distributed systems, networks and Internet research and practice, trying to see what it would take to push the envelop a step further. The course is conducted as a discussion group, where the professor and students brainstorm and pick interesting semester-long projects with high potential future impact. Example areas include robust scalable infrastructure (distributed datacenters, cloud networking, scada systems), real-time performance (remote surgery, trading systems), hybrid networks (mesh networks, 3G/4G/Wifi/Bluetooth). Students should feel free to bring their own topics of interest and ideas. Recommended Course Background: a systems course (distributed systems, operating systems, computer networks, parallel programming) or permission of instructor. Instructor(s): Y. Amir.

EN.601.718. Advanced Operating Systems. 3.0 Credits.
Students will study advanced operating systems topics and be exposed to recent developments in operating systems research. This course involves readings on classic and new papers. Topics include virtual memory management, synchronization and communication, file systems, protection and security, operating system structure and extension techniques, fault tolerance, and history and experience of systems programming. [Systems] Prerequisites: EN.600.318 OR EN.600.418 OR EN.601.318 OR EN.601.418 OR EN.601.618
Instructor(s): P. Huang.

EN.601.723. Advanced Topics in Data-Intensive Computing. 3.0 Credits.
The advent of cloud computing has lead to an explosion of storage system and data analysis software, including NoSQL databases, bulk-synchronous processing, graph computing engines, and stream processing. This course will explore scale-out software architectures for data-processing tasks. It will examine the algorithms and data-structures that underlie scalable systems and look at how hardware and networking trends influence the design and deployment of cloud computing. Recommended Course Background: EN.601.320/420 or permission of instructor. [Systems] Prerequisites: EN.600.320 OR EN.600.420 OR EN.601.620
Instructor(s): R. Burns.

EN.601.730. Pseudorandomness and Combinatorial Constructions. 3.0 Credits.
Randomness is very useful in almost all areas of computer science, such as algorithms, distributed computing and cryptography. However, computers generally do not have access to truly random bits. To deal with this, we rely on various pseudorandom objects to reduce either the quantity or the quality of the random bits needed. In this course, we will develop provably good pseudorandom objects for a variety of tasks. We will frequently require explicit combinatorial constructions. That is, we will want to efficiently and deterministically construct such objects. Along the way, we will also explore the close connections of such objects to many other areas in computer science and mathematics, such as graph theory, coding theory, complexity theory and arithmetic combinatorics. [Analysis] Recommended course background: EN.601.231 or EN.601.631, and probability.
Instructor(s): X. Li.

EN.601.743. Advanced Topics in Computer Security. 3.0 Credits.
Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class. There will be homework assignments and a course project.
Instructor(s): A. Rubin.

EN.601.745. Advanced Topics in Applied Cryptography. 3.0 Credits.
This reading and project based course will explore the latest research in the area of applied cryptography and cryptographic engineering. Topics covered will include zero knowledge, efficient multiparty computation, cryptocurrencies, and trusted computing hardware. Readings will be drawn from the latest applied cryptography and security conferences. The course will include both reading, critical analysis, presentations and a course programming project. [Analysis or Applications] Prerequisites: EN.600.454 OR EN.601.445 OR EN.600.442 OR EN.601.442 OR EN.601.642
Instructor(s): M. Green.

EN.601.748. Computational Genomics: Data Analysis. 3.0 Credits.
Graduate level version of EN.601.448. [Applications] Recommended Course Background: EN.601.226 or other programming experience, probability and statistics, linear algebra or calculus. Students may receive credit for EN.601.448 or EN.601.748 but not both. Prerequisites: Students may receive credit for EN.600.438 or EN.600.638, but not both.
Instructor(s): A. Battle
Area: Engineering.
EN.601.749. Computational Genomics: Applied Comparative Genomics. 3.0 Credits.
The goal of this course is to study the leading computational and quantitative approaches for comparing and analyzing genomes starting from raw sequencing data. The course will focus on human genomics and human medical applications, but the techniques will be broadly applicable across the tree of life. The topics will include genome assembly & comparative genomics, variant identification & analysis, gene expression & regulation, personal genome analysis, and cancer genomics. The grading will be based on assignments, a midterm & final exam, class presentations, and a significant class project. [Applications] Expected course background: familiarity with UNIX scripting and/or programming. Instructor(s): M. Schatz.

EN.601.750. Frontiers of Sequencing Data Analysis. 3.0 Credits.
Public archives now contain petabytes of valuable but hard-to-analyze DNA sequencing data. Analyzing even small datasets is complicated by sequencing errors, differences between individuals, and the fragmentary nature of the sequencing reads. In this course, we study recent algorithms and methods that seek to make sense of DNA sequencing datasets from small to very large. Topics covered will vary from year to year, but could include RNA sequencing data analysis, other functional genomics data analysis, metagenomics analysis, data compression, indexing, applications of streaming algorithms and sketch data structures, assembly, etc. There will be homework assignments and a course project. [Applications] Instructor(s): B. Langmead.

EN.601.751. Advanced Topics in Genomic Data Analysis. 3.0 Credits.
New Description: Genomic data is becoming available in large quantities, but understanding how genetics contributes to human disease and other traits remains a major challenge. Machine learning and statistical approaches allow us to automatically analyze and combine genomics data, build predictive models, and identify genetic elements important to disease and cellular processes. This course will cover current uses of statistical methods and machine learning in diverse genomic applications including new genomic technologies. Students will present and discuss current literature. Topics include personal genomics, integrating diverse genomic data types, new technologies such as single cell sequencing and CRISPR, and other topics guided by student interest. The course will include a project component with the opportunity to explore publicly available genomic data. [Applications] Recommended Course Background: coursework in data science or machine learning. Instructor(s): A. Battle.

EN.601.760. FFT in Graphics & Vision. 3.0 Credits.
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariances, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations. Instructor(s): M. Kazhdan.

EN.601.761. Advanced Computer Vision. 3.0 Credits.
Similar material as 601.461/661, covered in more depth. [Applications] Recommended Course Background: intro programming, linear algebra, prob/stat. Prerequisites: Students may receive credit for only one of the following: EN.600.461/EN.601.461, EN.600.661/EN.601.661, or EN.601.761. Instructor(s): A. Reiter Area: Engineering.
EN.601.775. **Statistical Machine Learning. 3.0 Credits.**
This is a second graduate level course in machine learning. It will provide a formal and an in-depth coverage of topics at the interface of statistical theory and computational sciences. We will revisit popular machine learning algorithms and understand their performance in terms of the size of the data (sample complexity), memory needed (space complexity), as well as the overall computational runtime (computation or iteration complexity). We will cover topics including nonparametric methods, kernel methods, online learning and reinforcement learning, as well as introduce students to current topics in large-scale machine-learning and randomized projections. Topics will vary from year-to-year but the general focus would be on combining methodology with theoretical and computational foundations. [Analysis or Applications]
Instructor(s): R. Arora.

EN.601.776. **Machine Learning: Data to Models. 3.0 Credits.**
Students in the class will be asked to do assignments in Matlab. Matlab is typically easy to pick up if one is already familiar with a different programming language. Students are expected to be mathematically mature. One should have taken at least an introductory course in probability theory and linear algebra. Though not required, exposure to optimization or machine learning is recommended. Proficiency in at least one programming language is expected. When in doubt, send the instructor a copy of your transcript to see if the class is appropriate for you. Also, sit through the first few sessions and first homework to get a sense of fit. Requisites include Intro Prob/Stat, Linear Algebra and Intro Machine Learning as well as strong background in s.
Instructor(s): S. Saria.

EN.601.777. **Advanced Topics in Causal Inference. 3.0 Credits.**
This course will cover advanced topics on all areas of causal inference, including learning causal effects, path-specific effects, and optimal policies from data featuring biases induced by missing data, confounders, selection, and measurement error; techniques for generalizing findings to different populations, complex probabilistic models relevant for causal inference applications, learning causal structure from data, and inference under interference and network effects. The course will feature a final project which would involve either an applied data analysis problem (with a causal inference flavor), a literature review, or theoretical work. [Analysis] Pre-requisite: EN.600.477/677 or permission.
Prerequisites: EN.600.477 OR EN.600.677
Instructor(s): I. Shpitser.

EN.601.779. **Machine Learning: Advanced Topics. 3.0 Credits.**
This course will focus on recent advances in machine learning. Topics will vary from year to year. The course will be project focused and involve presenting and discussing recent research papers.
Prerequisites: EN.600.475/EN.601.475 or EN.600.675/EN.601.675 or EN.600.775/EN.601.775 or EN.600.479/EN.601.479 or EN.600.679/EN.601.679 or EN.600.476/EN.601.476 or EN.600.676/EN.601.676 or permission.
Instructor(s): R. Arora.

EN.601.780. **Unsupervised Learning: From Big Data to Low-Dimensional Representations. 3.0 Credits.**
In the era of data deluge, the development of methods for discovering structure in high-dimensional data is becoming increasingly important. This course will cover state-of-the-art methods from algebraic geometry, sparse and low-rank representations, and statistical learning for modeling and clustering high-dimensional data. The first part of the course will cover methods for modeling data with a single low-dimensional subspace, such as PCA, Robust PCA, Kernel PCA, and manifold learning techniques. The second part of the course will cover methods for modeling data with multiple subspaces, such as algebraic, statistical, sparse and low-rank subspace clustering techniques. The third part of the course will cover applications of these methods in image processing, computer vision, and biomedical imaging. Requisites include Linear Algebra, Optimization, and prior exposure to Machine I.
Instructor(s): R. Vidal.

EN.601.782. **Deep Learning for Image Understanding. 3.0 Credits.**
This course discusses advanced topics on the recent progresses using deep learning, specifically deep convolutional neural networks in computer vision and medical image analysis. Topics will be selected from most recent papers from CVPR/ICCV/ArXiv/NIPS/MICCAI, with the core focus on object/scene recognition, object detection, domain transfer learning and computer-aided diagnosis. This course is targeted toward graduate students who are interested in mastering the understanding of the recent massive amount of literature and applying the skills to a course project (with lectures, paper reading, in-class presentation & discussion and a final research project). [Applications]
Prerequisites: Prereq: EN.600.461 OR EN.600.661
Instructor(s): L. Lu.

EN.601.783. **Vision as Bayesian Inference. 3.0 Credits.**
This is an advanced course on computer vision from a probabilistic and machine learning perspective. It covers techniques such as linear and non-linear filtering, geometry, energy function methods, markov random fields, conditional random fields, graphical models, probabilistic grammars, and deep neural networks. These are illustrated on a set of vision problems ranging from image segmentation, semantic segmentation, depth estimation, object recognition, object parsing, scene parsing, action recognition, and text captioning. [Analysis or Applications] Required course background: calculus, linear algebra (AS.110.201 or equiv.), probability and statistics (AS.553.311 or equiv.), and the ability to program in Python and C++. Background in computer vision (EN.601.461/661) and machine learning (EN.601.475) suggested but not required.
Instructor(s): A. Yuille.

EN.601.801. **Computer Science Seminar. 1.0 Credit.**
Required for all full-time CS PhD students. Recommended for MSE students.
Instructor(s): S. Smith.

EN.601.803. **Masters Research. 3.0 - 10.0 Credits.**
Permission required. Independent research for masters or pre-dissertation PhD students.
Instructor(s): Staff.

EN.601.805. **Graduate Independent Study. 1.0 - 3.0 Credits.**
Permission required. Individual study in an area of mutual interest to a graduate student and a faculty member in the department.
Instructor(s): Staff.
EN.601.807. Teaching Practicum. 1.0 Credit.
PhD students will gain valuable teaching experience, working closely with their assigned faculty supervisor. Successful completion of this course fulfills the PhD teaching requirement. (Grad students) Permission req'd.
Instructor(s): J. Selinski; M. Schatz; S. Smith.

EN.601.808. Selected Topics in CS Education.
This course will explore current issues and research in computer science education. Topics will be drawn from literature, news items, and participant experience. Current faculty and students with interests in academic careers are encouraged to attend.
Instructor(s): J. Selinski.

EN.601.809. PhD Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.601.817. Selected Topics in Systems Research. 1.0 Credit.
This course covers latest advances in the research of computer systems including operating systems, distributed system, mobile and cloud computing. Students will read and discuss recent research papers in top systems conferences. Each week, one student will present the paper and lead the discussion for the week. The focus topics covered in the papers vary semester to semester. Example topics include fault-tolerance, reliability, verification, energy efficiency, and virtualization.
Instructor(s): P. Huang.

EN.601.826. Selected Topics in Programming Languages. 1.0 Credit.
This seminar course covers recent developments in the foundations of programming language design and implementation. Topics covered include type theory, process algebra, higher-order program analysis, and constraint systems. Students will be expected to present papers orally.
Instructor(s): S. Smith.

EN.601.831. CS Theory Seminar. 1.0 Credit.
Seminar series in theoretical computer science. Topics include algorithms, complexity theory, and related areas of TCS. Speakers will be a mix of internal and external researchers, mostly presenting recently published research papers.
Instructor(s): M. Dinitz; X. Li.

EN.601.833. Seminar in Algorithms. 1.0 Credit.
This course will explore algorithms and theoretical computer science with a focus on algorithms for massive data. Examples of topics include streaming algorithms, approximation algorithms, online algorithms. Students will be encouraged to select a paper and lead a discussion. External speakers will be invited to present current work as well. This course is a good opportunity for motivated students to learn modern algorithmic methods. Recommended Course Background: EN.601.433 or equivalent.
Instructor(s): V. Braverman
Area: Engineering.

EN.601.845. Selected Topics in Applied Cryptography. 1.0 Credit.
In this course students will read, discuss and present current research papers in applied cryptography. Topic coverage will vary each semester. Instructor approval required.
Instructor(s): M. Green.

EN.601.850. Selected Topics in Computational Genomics. 1.0 Credit.
This course will survey current areas where computer science approaches have been applied to genomics research. Chiefly, the course focuses on DNA sequencing data analysis, including sequence alignment, de novo assembly, error correction, and DNA data compression. Subject matter will be partially guided by student interests. Students will present papers orally.
Instructor(s): B. Langmead.

EN.601.856. Seminar: Medical Image Analysis. 1.0 Credit.
This weekly seminar will focus on research issues in medical image analysis, including image segmentation, registration, statistical modeling, and applications. It will also include selected topics relating to medical image acquisition, especially where they relate to analysis. The purpose of the course is to provide the participants with a thorough background in current research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University. The format of the course is informal. Students will read selected papers. All students will be assumed to have read these papers by the time the paper is scheduled for discussion. But individual students will be assigned on a rotating basis to lead the discussion on particular papers or sections of papers. Co-listed with En.520.746.
Instructor(s): J. Prince; R. Taylor.

EN.601.857. Selected Topics in Computer Graphics. 1.0 Credit.
In this course we will review current research in computer graphics. We will meet for an hour once a week and one of the participants will lead the discussion for the week.
Instructor(s): M. Kazhdan.

EN.601.865. Selected Topics in Natural Language Processing. 1.0 Credit.
A reading group exploring important current research in the field and potentially relevant material from related fields. Enrolled students are expected to present papers and lead discussion.
Prerequisites: EN.600.465 OR EN.601.665 or permission of instructor
Instructor(s): J. Eisner.

EN.601.866. Selected Topics in Computational Semantics. 1.0 Credit.
This weekly reading group will review current research and survey articles on the topics of computational semantics, statistical machine translation, and natural language generation. Enrolled students will present papers and lead discussions.
Instructor(s): B. Van Durme.

EN.601.868. Selected Topics in Machine Translation. 1.0 Credit.
Students in this course will review, present, and discuss current research in machine translation. Permission of instructor.
Instructor(s): P. Koehn.

EN.601.875. Selected Topics in Machine Learning. 1.0 Credit.
This seminar is recommended for all students interested in data intensive computing research areas (e.g., machine learning, computer vision, natural language processing, speech, computational social science). The meeting format is participatory. Papers that discuss best practices and the state-of-the-art across application areas of machine learning and data intensive computing will be read. Student volunteers lead individual meetings. Faculty and external speakers present from time-to-time. Recommended Course Background: machine learning or permission of the instructor.
Instructor(s): R. Arora.

Cross Listed Courses

Cognitive Science

AS.050.375. Probabilistic Models of the Visual Cortex. 3.0 Credits.
The course gives an introduction to computational models of the mammalian visual cortex. It covers topics in low-, mid-, and high-level vision. It briefly discusses the relevant evidence from anatomy, electrophysiology, imaging (e.g., fMRI), and psychophysics. It concentrates on mathematical modeling of these phenomena taking into account recent progress in probabilistic models of computer vision and developments in machine learning, such as deep networks.
Prerequisites: AS.110.106 OR AS.110.108
Instructor(s): A. Yuille
Area: Quantitative and Mathematical Sciences.
The course gives an introduction to computational models of the mammalian visual cortex. It covers topics in low-, mid-, and high-level vision. It briefly discusses the relevant evidence from anatomy, electrophysiology, imaging (e.g., fMRI), and psychophysics. It concentrates on mathematical modelling of these phenomena taking into account recent progress in probabilistic models of computer vision and developments in machine learning, such as deep networks. Also offered as AS.050.375. Co-listed with Computer Science as EN.601.485.
Instructor(s): A. Yuille.

AS.050.814. Research Seminar in Computer Vision.
This course covers advanced topics in computational vision. It discusses and reviews recent progress and technical advances in visual topics such as object recognition, scene understanding, and image parsing.
Instructor(s): A. Yuille.

Physics Astronomy
AS.171.205. Introduction to Practical Data Science: Beautiful Data. 3.0 Credits.
The class will provide an overview of data science, with an introduction to basic statistical principles, databases, fundamentals of algorithms and data structures, followed by practical problems in data analytics. Recommend Course Background: Familiarity with principles of computing.
Instructor(s): S. Szalay
Area: Natural Sciences, Quantitative and Mathematical Sciences.

Psychological Brain Sciences
AS.200.313. Models of Mind and Brain. 3.0 Credits.
This is a seminar surveying computational approaches to understanding mental and neural processes, including sensory and conceptual representation, categorization, learning and memory. The course will also develop familiarity with computational tools such as numerical simulation, linear transformation and data visualization. Enrollment limited to Juniors and Seniors. Recommended Course Background: AS.110.106 / Calculus I OR AS.110.108 Calculus I, AS.050.101 / Cognition OR AS.200.211 / Sensation & Perception OR AS.080.105 / Introduction to Neuroscience OR other introductory coursework in cognitive & neural sciences.
Instructor(s): C. Honey
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

General Engineering
EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.

Electrical Computer Engineering
EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473
Prerequisites: Students may not have taken EN.520.634
Instructor(s): B. Tsui.

EN.520.447. Information Theory. 3.0 Credits.
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g. image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).
Instructor(s): S. Khudanpur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.701. Current Topics in Language and Speech Processing. 1.0 Credit.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U.
Instructor(s): J. Trmal.
EN.520.702. Current Topics in Language and Speech Processing. 1.0 Credit.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Cross-listed with Computer Science. Grading will be S/U.
Instructor(s): J. Trmal
Area: Engineering.

Mechanical Engineering
EN.530.707. Robot System Programming. 4.0 Credits.
This course seeks to introduce students to open-source software tools that are available today for building complex experimental and fieldable robotic systems. The course is grouped into sections, each of which building on the previous in increasing complexity and specificity: tools and frameworks supporting robotics research, robotics-specific software frameworks, integrating complete robotic systems, and culminates with an independent project of the student's own design using small mobile robots or other robots in the lab. Students will need to provide a computer (with at least a few GB of memory and a several tens of GB of disc space) running Ubuntu (https://www.ubuntu.com or one of its variants such as Xubuntu) and ROS (http://ros.org/). Students should have an understanding of intermediate programming in C/C++ (including data structures and object-oriented programming). Familiarity with Linux programming. Familiarity with software version control systems such as Git, and linear algebra. Students should see the course homepage http://dscl.lcsr.jhu.edu/ME530707_2018 for more information and to get started with the course. Required Course Prerequisite/Corequisite: EN.530.646 and EN.600.436. Registration only by permission of the instructor. Please contact Prof. Louis Whitcomb at llw@jhu.edu. Please put '530.707 Robot System Programming' in the subject line of your email.
Instructor(s): L. Whitcomb.

Biomedical Engineering
EN.580.468. The Art of Data Science. 3.0 Credits.
In this course, we will cover the fundamentals of doing data science research, explaining "best practices" for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) positing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Note that this course will largely be project based; each student will be expected to complete each of the above steps on some real data of interest to the student. Lectures will be minimal, giving introductory explanations one day, hopefully only part of the time. The rest of the time, we will work independently or in small groups to complete the weekly portion of the overall project. Please come ready to do science! If you don't have questions that you want answered, you can work in small groups, but each student will need to write the code and reports on their own. Recommended Course Background: No courses are formally required, though students will need to write numerical code (in R, Python, or Julia), and make reports using LaTeX, knitr, or Jupyter notebooks or similar.
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.473. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.520.434 Recommended course background: EN.520.432 or EN.580.472
Prerequisites: Students may not have taken EN.580.773.
Instructor(s): B. Tsui
Area: Engineering, Natural Sciences.

EN.580.668. The Art of Data Science. 3.0 Credits.
In this course, we will cover the fundamentals of doing data science research, explaining "best practices" for each step, that collectively comprise an upward spiral. These steps include: (i) asking an interesting question, (ii) determining the degree to which the answer is known, (iii) assessing there currently exists data to likely obtain a satisfactory answer, (iv) exploring the data set, (v) cleaning up the dataset, (vi) formalizing a statistical inquiry, (vii) positing a statistical model which we hope will yield satisfactory answers, (viii) devising a test to assess the answer, (ix) building an estimator to assess the model, (x) checking the model, (xi) reporting the results, (xii) suggesting the next experiment to perform or question to answer to further enhance the model. Instructor(s): J. Vogelstein
Area: Engineering.
EN.580.689. Computational Personal Genomics. 3.0 Credits.
What can we learn from the genome sequence of an individual? Genomic technology now makes it possible to generate huge amounts of DNA sequence data for a single individual at a relatively low cost. To make sense of this data, we need to employ sophisticated computational methods to identify genetic variations that influence an individual’s health. In this course, we will first review the state of the art in sequencing technology, and discuss how this technology is being applied to study human biology and disease. We will then explore the computational methods used to turn raw sequence data into knowledge. Topics will include genetic variant detection; discovery of chromosomal rearrangements and fusions; methods to measure gene expression from RNA; and measurements of the microbiome living inside our bodies. Recommended Course Background: EN.601.447/639, EN.600.363/463, EN.600.688, EN.580.688 (any one is sufficient), or permission of the instructor. Course is also open to undergraduate students.
Instructor(s): S. Salzberg
Area: Engineering.

EN.580.694. Statistical Connectomics. 3.0 Credits.
This course will cover the basics of an exciting emerging field of statistical connectomics (aka, brain-graphs). It is so new, that we are going to make some of it up in this class! The first week will be introductory lectures that I give. The rest of the semester will be run like a seminar; each week will focus on a different topic. On Tuesdays we will hear about a statistical method that operates on graphs, and on Thursdays we will read about some neuroscience data upon which one could apply these techniques. The final project will consist of implementing a statistical method devised for graphs on a brain-graph problem. Recommended background: coursework in probability, linear algebra, and numerical programming (eg, R, Python, Matlab).
Instructor(s): J. Vogelstein
Area: Engineering.

EN.580.745. Mathematics of Deep Learning. 1.5 Credits.
The past few years have seen a dramatic increase in the performance of recognition systems thanks to the introduction of deep networks for representation learning. However, the mathematical reasons for this success remain elusive. For example, a key issue is that the training problem is nonconvex, hence optimization algorithms are not guaranteed to return a global minima. Another key issue is that while the size of deep networks is very large relative to the number of training examples, deep networks appear to generalize very well to unseen examples and new tasks. This course will overview recent work on the theory of deep learning that aims to understand the interplay between architecture design, regularization, generalization, and optimality properties of deep networks.
Instructor(s): R. Vidal.

Information Security Institute
EN.650.624. Advanced Network Security. 3.0 Credits.
This course focuses on advanced security topics and research in computer networks. It builds on the basic overview of network security covered in previous security courses. Beyond the basics of developing security network communications and applications, this advanced course dives deeper into the theory and practice behind network attack, the growing reality of weaponized zero-day vulnerabilities, and the current state-of-the-art responses. Course work includes reviewing contemporary security research papers, hands-on experiments in defending/attacking networks, and writing analyses.
Prerequisites: EN.650.424 OR EN.600.424 or permission of the instructor.
Instructor(s): S. Nielson
Area: Engineering.

EN.650.724. Advanced Network Security. 3.0 Credits.

Instructor(s): S. Nielson
Area: Engineering.

Doctor of Engineering
https://engineering.jhu.edu/doctor-of-engineering/

Johns Hopkins University’s Doctor of Engineering (D.Eng.) program provides professional engineers with the advanced technical expertise they need to succeed in industry and the public sector by emphasizing creative problem solving and the innovative application of technical knowledge.

• The D.Eng. program is a doctoral-level graduate degree program designed for working engineers and scientists.
• It is a nonresidential, full-time program with semiannual D.Eng. conferences held at the Homewood Campus in Baltimore twice a year (once in January and once in June).
• The program is structured as a research collaboration between a student’s employer and the Whiting School of Engineering.
• Students are actively mentored by a primary advisor in the Whiting School as well as a co-advisor at their place of employment.
• Students customize their program (https://engineering.jhu.edu/doctor-of-engineering/about-the-program/program-structure) to meet their professional goals, and immediately contribute to their current job responsibilities.

Admissions
To be admitted to the Doctor of Engineering program, the application must be approved both by the Doctor of Engineering Oversight Committee as well as the WSE faculty member who will be serving as advisor.

Educational Objectives
There are three overarching educational objectives for D.Eng. students:

• Ability to acquire new, advanced knowledge
Doctor of Engineering

- Ability to formulate a research problem/program
- Execution of the proposed research

These objectives are assessed by three milestone examinations, respectively:

- Preliminary Examination
- Proposal Presentation and Examination
- Project Defense

Curriculum
Year One
Doctor of Engineering students are expected to come to Baltimore twice each year: once in January and once in June for the Semiannual Doctor of Engineering Conferences. D.Eng. students may begin their program at either time.

1. Diagnostic Interview, Syllabus of Study, and Start of Research

D.Eng. students begin their program with an extended, in-person meeting with their advisor. This meeting is called the Diagnostic Interview. The student and advisor discuss the proposed project and identify new material for the student to learn (roughly equivalent to two graduate-level courses). This new material should be relevant to the proposed research, especially to guide the student to fill in background material that the advisor anticipates will be needed. Together, the advisor and student lay out a syllabus of study for the coming months. (The syllabus is then approved by the student’s three-person supervisory committee.

The student works to learn the material on the syllabus. This may be done through online courses (such as those offered by our Engineering for Professionals program) or guided independent reading. The advisor and co-advisor are available to the student to answer questions and, if need be, revise the syllabus. The student works on research.

2. Required Course Enrollment

EN.700.791 Doctor of Engineering Fundamentals. 10 credits

This is an intense, professor-guided, individualized course for D.Eng. students preparing for their Preliminary Examinations. The course instructor is the student’s primary advisor and sets the requirements. Successful students pass their Preliminary Examinations upon completing this course. Students may enroll in this course for multiple semesters if necessary.

3. Preliminary Examination

At the student’s second Doctor of Engineering Conference (in either January or June, roughly six months from the start of their program) they will be examined on the syllabus developed in the Diagnostic Interview. This Preliminary Examination is administered by the student’s supervisory committee. The format of the exam may be either written or oral at the discretion of the supervisory committee.

4. Refining the Written Research Proposal

After successfully completing the Preliminary Exam, the student spends the next six months refining the basic proposal in the application into a robust, more specific written research proposal.

Year Two to Degree Completion

1. Required Course Enrollment

EN.700.792 Doctor of Engineering Proposal. 10 credits

The purpose of this course is to synthesize a coherent research proposal for the Doctor of Engineering major project. The course instructor is the student’s primary advisor, working with the student to create the research proposal to be defended in a public presentation and private examination. Students may enroll in this course for multiple semesters if necessary.

2. Proposal Presentation and Examination

At the start of the 2nd year in the program, the student stands for the Proposal Presentation and Examination. This is an oral exam conducted by the supervisory committee plus two additional JHU faculty members. The first portion of the examination is a presentation of the research proposal. This portion of the exam is a public presentation of the research proposal (and other D.Eng. students are encouraged to attend). This is followed by an examination by the five-member panel to assess the student’s readiness to engage in the proposed research.

3. Continued Research, Project Development, and Defense

Upon successful completion of the Proposal Presentation and Examination, the student earns in earnest to execute the research. Of course, the scope and direction of the research may deviate from the plan originally presented. At this time, the student should register for EN.700.891 Doctor of Engineering Research. 10 - 20 credits

Once the advisor and co-advisor deem the student’s research to be sufficient for the degree, the student presents their research at a public defense conducted by the student’s three-person supervisory committee. PhD students typically report and archive the fruits of their research by writing a dissertation. D.Eng. students may do likewise, but we allow greater latitude in this case. The D.Eng. project must include a written description of the key results, but then maybe evidenced by a portfolio including such items as:

- Prototypes
- Animations or simulations
- Computer code
- Journal paper submissions
- Invention disclosures/patent applications

Taken together, the portfolio is used to evaluate the depth and quality of the student’s work. The design of the portfolio (what is included) is subject to the approval of the student’s advisory committee.

Note that the portfolio, as well as its defense, must be public. That is, neither classified nor otherwise restricted material may be used. However, it is reasonable that the student’s project may support a proprietary application at the student’s home company/agency. Nevertheless, it must be possible for the student to demonstrate their accomplishments in a fully open setting.
### Program Policies

#### Continuous Enrollment Requirement

All D.Eng. students are required to register in every term (Summer, Intersession) and semester (Fall, Spring) they are in the program, and must complete registration at the beginning of each term in accordance with instruction issued by the registrar. Detailed instructions about registration will be provided to all students before the registration period each term.

Students who, for any reason, do not complete their registration until after the prescribed registration period are required to pay a late registration service fee. The late registration fee schedule is posted every semester on the registrar’s website: https://studentaffairs.jhu.edu/registrar/students/graduate-registration/ (see Term Dates & Deadlines). Graduate students must obtain permission from the chair of their department to register after the second week of classes.

#### Non-Curricular Program Requirements

In addition to their academic coursework, exams, and research, D.Eng. students must also satisfy three additional requirements:

- Academic Ethics, EN.500.603 (an online module)
- Responsible Conduct of Research, AS.360.624 (an online module)
- Title IX Training (through JHU’s MyLearning portal)

Please contact Ms. Mia Brooms with any questions.

#### Retakes and Probation

Ideally, students in the Doctor of Engineering program will pass their milestone exams on the first attempt. However, students will have a second chance to pass any of their exams should they fail on their first attempt. Failing any exam twice is grounds for dismissal from the Doctor of Engineering program.

D.Eng. students are expected to be fully engaged and make progress toward their degree. Should a student become disengaged, or have a significant period with no progress, the student may be placed on probation. Please see Assistant Dean Christine Kavanagh (christinekavanagh@jhu.edu) for guidance.

#### Annual Student Review

Doctoral students need to have a clear understanding of their progress and what is expected next in their programs. To this end, D.Eng. students will undergo a formal annual review. This consists of three steps:

- First, the student will be given a self-evaluation in which they should report their accomplishments from the previous year and lay out their expectations for the coming year.
- Second, the Doctor of Engineering Oversight Committee reviews the progress of all students in the program. This requires input from the advisor and co-advisor. This culminates in a letter to the student.
- Third, the student’s advisor presents the Committee’s letter to the student (perhaps via email) and then follows up with a discussion (possibly via video chat).

#### Semiannual Doctor of Engineering Conference

D.Eng. students are nonresidential and therefore have little opportunity to interact with each other. However, they are expected to come to Baltimore for semi-annual Doctor of Engineering Conferences in June and January. As described earlier, the various milestone examinations take place during these conferences. D.Eng. students are strongly encouraged to attend public portions of each other’s oral examinations (proposal and project defenses).

In addition, the conferences provide opportunities for social networking among the students as well as professional development programming.

#### Advisor or Employer Changes

If a D.Eng. student needs to find a new advisor for any reason or will be leaving their sponsoring employer, before completion of the degree, please contact Vice Dean Edward Scheinerman immediately (before finalizing any transition).

#### Funding

The training of a Doctor of Engineering student takes the form of a research contract between the student’s employer and the Whiting School of Engineering. This includes a significant administrative fee plus the cost of the research. D.Eng. students will not be personally liable for these fees, except in the cases of health insurance premiums through the JHU Student Insurance plan facilitated by CHP and any late fees, library fines, etc. There will be no additional funding provided to a D.Eng. student by the Whiting School of Engineering/Johns Hopkins University.

Note that graduate students are subject to these policies and requirements in addition to all university and departmental policies and requirements.

---

[1] (p. ) This exam is analogous to the Graduate Board Oral (GBO) examination for PhD students. As with GBO exams, non-JHU examiners may be used on the exam subject to the approval of the WSE Vice Dean for Graduate Education.

#### Faculty

**Chair**
Edward Scheinerman
Chair, Doctor of Engineering Oversight Committee; Vice Dean, Graduate Education; Professor, Applied Mathematics and Statistics

**Doctor of Engineering Oversight Committee**

- John Boland
  Professor Emeritus, Environmental Health and Engineering
- Amy Foster
  Assistant Professor, Electrical and Computer Engineering
- Howard Katz
  Professor, Materials Science and Engineering
- Benjamin Schafer
  Professor, Civil Engineering
- Russell Taylor
  Professor, Computer Science
- Leslie Tung
  Professor, Biomedical Engineering

**Advisory Committee**

Primary Advisor: Any WSE professor or research professor (including BME faculty appointed in the School of Medicine and EHE faculty appointed in the School of Public Health)
The faculty offers undergraduate courses at both the introductory and intermediate levels in these areas, and graduate courses leading to research topics at the forefront of current knowledge. Guided individual study projects available for undergraduates provide opportunities for student participation in activities in the department and in the research programs of the faculty. In the graduate program, original research in close association with individual faculty members is emphasized.

**Current Research Activities**

**Control, Networks, and Systems**
Current research in control, networks, and systems includes the design and analysis of robust control algorithms; design, analysis, and performance evaluation of distributed control algorithms for networked dynamical systems; real-time optimization of dynamical systems; multi-time scale optimization decomposition of networked systems. Application domains include systems and synthetic biology, particularly the analysis of signaling pathways in biological systems; power systems, including multi-timescale market design and co-optimization, distributed control design for frequency regulation, real-time congestion management, and low inertia power systems control; information networks, including the design of clock synchronization algorithms, and joint congestion control and multi-path routing for data networks.

**Image and Signal Processing**
Image analysis efforts currently concern statistical analysis of restoration and reconstruction algorithms, development of statistical image models for image restoration and segmentation, geometric modeling for object detection and estimation, morphological image analysis, magnetic resonance imaging, ultrasound imaging, and photoacoustic imaging. There is opportunity for joint work in image analysis and signal processing with faculty in the Department of Radiology and various other departments within the School of Medicine.

**Acoustics, Speech and Language Processing**
Research in speech processing involves work in all aspects of language or speech science and technology, with fundamental studies under way in areas such as language modeling, pronunciation modeling, natural language processing, neural auditory processing, acoustic processing, optimality theory, and language acquisition. Research starting at the materials used for transduction of acoustic signals, through signal processing involved in extract relevant information from the acoustic signatures, and leading to the interpretation of the information to extract meaning and/or translating between languages.

**Microsystems and Computer Engineering**
Computer engineering research activities include work on computer structures (with emphasis on microprocessors), parallel and distributed processing, fault-tolerant computing, analysis of algorithms, VLSI analog architectures for machine vision, associative processing, and micropower computing, alternative computation systems and devices, applied neuroscience, hardware-friendly algorithms and MEMS.

**Photonics and Physical Electronics**
Current research activities include work in fiber optic sensors and endoscopic 3-D imaging devices for medical applications, secure optical communications, and semiconductor optoelectronics. Other areas of interest involve the study of the nonlinear interactions of light with matter, laser beam control and steering, and plasmonics. Semiconductor device studies include optical detectors, photovoltaics, silicon photonics,

---

**Electrical and Computer Engineering**

http://www.ece.jhu.edu/

The Department of Electrical and Computer Engineering at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and successful careers, and is dedicated to research that contributes to fundamental knowledge in both analytical and experimental aspects of the field. The mission of our undergraduate programs is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical and computer engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences. At the graduate level, our mission is to prepare advanced training that prepares master's graduates to work at the forefront of knowledge in their chosen specialty, and prepares doctoral students for original research that will advance the frontiers of knowledge in their chosen areas.

The department focuses its teaching and research programs in five major areas:

1. controls, networks and systems;
2. image and signal processing;
3. acoustics, speech and language processing;
4. microsystems and computer engineering, and
5. photonics and physical electronics.

---

Co-Advisor: From the student's home company/agency, and vetted by the Doctor of Engineering Oversight Committee

Third Committee Member: Any JHU professor or research professor

For current course information and registration go to https://sis.jhu.edu/classes/

**Courses**

**EN.700.791. Doctor of Engineering Fundamentals. 10.0 Credits.**
This is an intense, professor-guided, individualized course for D.Eng. students preparing for their Preliminary Examinations. The course instructor is the student's primary advisor and sets the requirements. Successful students pass their Preliminary Examinations upon completing this course. Students may enroll in this course for multiple semesters if necessary.

Instructor(s): Staff.

**EN.700.792. Doctor of Engineering Research Proposal. 10.0 Credits.**
The purpose of this course is to synthesize a coherent research proposal for the Doctor of Engineering major project. The course instructor is the student's primary advisor, working with the student to create the research proposal to be defended in a public presentation and private examination. Students may enroll in this course for multiple semesters if necessary.

Instructor(s): Staff.

**EN.700.891. Doctor of Engineering Research. 10.0 - 20.0 Credits.**
Students enroll in this course upon completion of their Research Proposal Examinations while they are conducting advanced engineering research under the supervision of their advisors. The number of credits awarded will vary based on the amount of time students devote to their research; this is exactly analogous to how we assign credit hours for dissertation research for Ph.D. students. Course is for Doctor of Engineering students only. Course is repeatable for credit.

Instructor(s): Staff.

---

**Electrical and Computer Engineering**

http://www.ece.jhu.edu/
nanophotonics, quantum cascade lasers, high power III-Nitride electronic devices, VLSI circuit design and modeling and microwave devices and circuits. Study of a laser radar and RF photonics is also being pursued. Theoretical and experimental studies involving linear optical properties of various materials and passive remote sensing of the atmosphere are being investigated.

Facilities
The department maintains extensive facilities for teaching and research in Barton Hall, Hackerman Hall, Wyman, and Maryland Hall. The two main teaching labs (Electrical Engineering Lab and Computer Engineering Lab) make extensive use of state-of-the-art design environments such as CADENCE, Xilinx Tools, TI DSP systems, VHDl, and Verilog. In addition, the department includes the computational sensory motor system lab, the cellular signaling control lab, the parallel computing and imaging lab, the photonics and optoelectronics lab, the semiconductor microstructures lab, and the sensory communication and microsystem lab, adaptive and the sensory communication microsystem lab.

Undergraduate Programs
The Department of Electrical and Computer Engineering offers two bachelor's degree programs: one in Electrical Engineering and one in Computer Engineering (with the close collaboration of the Computer Science Department (p. 821)). Each program is described below. Both degree programs are accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Bachelor of Science in Electrical Engineering
Mission
The faculty of the Electrical Engineering Program at Johns Hopkins is committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide a stimulating and flexible curriculum in fundamental and advanced topics in electrical engineering, basic sciences, mathematics, and humanities, in an environment that fosters development of analytical, computational, and experimental skills and that involves students in design projects and research experiences; and to provide our electrical engineering graduates with the tools, skills and competencies necessary to understand and apply today's technologies and become leaders in developing and deploying tomorrow's technologies.

Educational Objectives
The Program Educational Objectives (PEOs) for electrical engineering (EE) at the Johns Hopkins University describe what EE graduates are expected to attain within a few years of graduation. The PEOs are determined in consultation with the Electrical and Computer Engineering External Advisory Committee and approved by the ECE faculty.

The educational objectives of the EE program are:

- Our graduates will become successful practitioners in engineering and other diverse careers.
- Some graduates will pursue advanced degree programs in engineering and other disciplines.

Outcomes
Students graduating with a B.S. in electrical engineering will have demonstrated:

1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
3. an ability to communicate effectively with a range of audiences
4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist are provided in a separate advising manual and illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits, students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student's program will depend on effective faculty advising. Every undergraduate student in the Electrical Engineering Program must follow a program approved by the faculty advisor. The faculty advisor must be a member of the Electrical and Computer Engineering faculty.

Requirements for the Bachelor of Science in Electrical Engineering
The Bachelor of Science degree in electrical engineering requires a minimum of one hundred and twenty-six (126) credits that must include:

Forty-five (45) credits of ECE courses including the following:

<table>

Advanced laboratory, design intensive, or senior design project courses 6

Total Credits 24
Six (6) credits of engineering courses from School of Engineering departments other than ECE or Applied Mathematics and Statistics or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as "other engineering courses"). Students must complete enough of the approved non-ECE advanced design labs so that they have at least twelve (12) credits of combined ECE and non-ECE advanced laboratory, design intensive, or senior design project courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

Mathematics Department or the Applied Mathematics and Statistics Department (20 credits)

Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics:Physical Science Major I AS.171.102 General Physics:Physical Science Major II, AS.173.111 General Physics Laboratory I and AS.173.112 General Physics Laboratory II. Courses in this group may not be taken Satisfactory/Unsatisfactory.

At least five (5), three-credit courses in humanities and social sciences, plus two (2) additional credits in EN.660.400 Practical Ethics for Future Leaders and one (1) credit EN.520.404 Engineering solutions in a global, economic, environmental, and societal context ECE students beginning prior to Fall 2018 will be permitted to fulfill this requirement by six (6), three credit courses, or by the guidelines provided above. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses, but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area or theme, with at least one of them at an advanced level (300 level or higher).

- A programming language requirement must be met by taking EN.500.112 Gateway Computing or EN.601.220 Intermediate Programming.
- Two (2) writing intensive courses (at least 3 credits each) are required. The writing intensive courses may not be taken Satisfactory/Unsatisfactory and require a C- or better grade. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements. The course EN.661.315 Culture of the Engineering Profession, is recommended by the ECE Faculty as a writing intensive course.

Additional details concerning advising and degree requirements are in the Electrical Engineering Advising Manual. The B.S. in Electrical Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, [http://www.abet.org](http://www.abet.org).

The sample program below is very general. Sample programs with an emphasis on Signals, Systems, and Communications or Photonics and Optoelectronics can be found in the advising manual.

Bachelor of Science in Computer Engineering

Mission
The Computer Engineering Program at Johns Hopkins is supported by faculty in the Department of Electrical and Computer Engineering and the Department of Computer Science, who are committed to providing a rigorous educational experience that prepares students for further study and to professionally and ethically practice engineering in a competitive global environment. The mission of the program is to provide students with a broad, integrated education in the fundamentals and advanced topics in computer engineering, basic sciences, mathematics, and humanities in an environment that fosters the development of analytical, computational, and experimental skills, and that involves students in design projects and research experiences; and to provide our computer engineering graduates with the tools, skills and competencies necessary to understand and apply today's technologies and become leaders in developing and deploying tomorrow's technologies.

Educational Objectives
The Program Educational Objectives (PEOs) for computer engineering (CE) at the Johns Hopkins University describe what CE graduates are expected to attain within a few years of graduation. The PEOs are determined in consultation with the Electrical and Computer Engineering External Advisory Committee and approved by the ECE faculty.

The educational objectives of the CE program are:

• Our graduates will become successful practitioners in engineering and other diverse careers.
• Some graduates will pursue advanced degree programs in engineering and other disciplines.

Outcomes
Students graduating with a B.S. in computer engineering will have demonstrated:
1. an ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics
2. an ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors
3. an ability to communicate effectively with a range of audiences
4. an ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts
5. an ability to function effectively on a team whose members together provide leadership, create a collaborative and inclusive environment, establish goals, plan tasks, and meet objectives
6. an ability to develop and conduct appropriate experimentation, analyze and interpret data, and use engineering judgment to draw conclusions
7. an ability to acquire and apply new knowledge as needed, using appropriate learning strategies.

Each student and faculty advisor must consider these objectives in planning a set of courses and projects that will satisfy degree requirements. The sample programs and the program checklist included in this advising manual illustrate course selections that will help students meet the program objectives.

Faculty and others will assess student performance to ensure that our educational objectives are met. Students will have opportunities to assess their own educational progress and achievements in several ways, including exit interviews and alumni surveys. Through regular review processes, including Academic Council departmental reviews, visits by the departmental external advisory board, course evaluations, and ABET visits; students will have opportunities to discuss their educational experiences and expectations. The outcomes of these assessment processes will be used by the faculty to improve the content and delivery of the educational program.

The success of each student’s program will depend on effective faculty advising. Every undergraduate student in the Computer Engineering Program must follow a program approved by a faculty advisor.
Requirements for the Bachelor of Science in Computer Engineering

The Bachelor of Science degree in Computer Engineering requires a minimum of 126 credits, which must include the following:

- **Forty-two (42) credits in Computer Engineering**, which must include:

<table>
<thead>
<tr>
<th>Electrical and Computer Engineering courses (15 credits)</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.520.123 Computational Modeling for Electrical and Computer Engineering</td>
<td>3</td>
</tr>
<tr>
<td>EN.520.142 Digital Systems Fundamentals</td>
<td>3</td>
</tr>
<tr>
<td>EN.520.214 Signals and Systems</td>
<td>4</td>
</tr>
<tr>
<td>EN.520.230 Mastering Electronics</td>
<td>2</td>
</tr>
<tr>
<td>EN.520.231 Mastering Electronics Laboratory</td>
<td>2</td>
</tr>
</tbody>
</table>

  a. **Fifteen (15) credits of Electrical and Computer Engineering courses**, which must include EN.520.123 Computational Modeling for Electrical and Computer Engineering, EN.520.142 Digital Systems Fundamentals, EN.520.214 Signals and Systems, EN.520.230 Mastering Electronics, and EN.520.231 Mastering Electronics Laboratory.

  b. **Fifteen (15) credits of Computer Science courses** which must include either EN.601.220 Intermediate Programming, EN.601.226 Data Structures. Either EN.601.229 Computer System Fundamentals or EN.520.222 Computer Architecture can be taken to fulfill this requirement.

  c. **The program must also contain a substantial advanced laboratory and design experience component, appropriate for the student’s interests.** This requirement can be met by taking twelve (12) credits of advanced laboratory, design intensive, or senior design project courses from those given in the degree planning checklist in Section I.C. At least six (6) of these 12 credits must be from ECE or CS courses. A GPA of at least 2.0 must be maintained in Computer Engineering courses. Courses in this category may not be taken Satisfactory/Unsatisfactory.

  - **Six (6) credits of engineering courses from School of Engineering departments other than Computer Science, ECE, Applied Mathematics and Statistics, or General Engineering (note: Entrepreneurship and Management courses in the Center for Leadership Education CANNOT be counted as “other engineering courses”). Students must complete enough of the approved non-CS/ECE advanced design labs so that they have at least twelve (12) credits of advanced laboratory, design intensive, or senior design project courses. Courses in this group may not be taken Satisfactory/Unsatisfactory.

  - **Twenty-four (24) credits in mathematics courses taken from the Mathematics Department or the Applied Mathematics and Statistics Department. AS.110.109 Calculus II (For Physical Sciences and Engineering), AS.110.202 Calculus III, AS.110.201 Linear Algebra or EN.553.291 Linear Algebra and Differential Equations, EN.553.171 Discrete Mathematics, EN.553.310 Probability & Statistics/EN.553.311 Probability and Statistics for the Biological Sciences and Engineering or EN.553.420 Introduction to Probability must be taken. Elementary or precalculus courses such as AS.110.105 or EN.553.111-EN.553.112 are not acceptable. (Calculus I may be waived through an examination taken during freshman orientation. If not waived, it must be taken as a prerequisite to Calculus II.) Courses in this category may not be taken Satisfactory/Unsatisfactory.

  - **Sixteen (16) credits of basic sciences (physics, chemistry, biology, earth and planetary sciences), which must include AS.171.101 General Physics:Physical Science Major I-AS.171.102 General Physics:Physical Science Major II, AS.173.111 General Physics Laboratory I-AS.173.112 General Physics Laboratory II, and AS.030.101 Introductory Chemistry I. Courses in this category may not be taken Satisfactory/Unsatisfactory.

  - **At least five (5), three-credit courses in humanities and social sciences, plus two (2) additional credits in EN.660.400 Practical Ethics for Future Leaders and one (1) credit EN.520.404 Engineering solutions in a global, economic, environmental, and societal context. ECE students beginning prior to Fall 2018 will be permitted to fulfill this requirement by six (6), three credit courses, or by the guidelines provided above. The humanities and social sciences courses are one of the strengths of the academic programs at Johns Hopkins. They represent opportunities for students to appreciate some of the global and societal impacts of engineering, to understand contemporary issues, and to exchange ideas with scholars in other fields. Some of the courses will help students to communicate more effectively, to understand economic issues, or to analyze problems in an increasingly international world. The selection of courses should not consist solely of introductory courses, but should have both depth and breadth. Typically, this means that students should take at least three (3) courses in a specific area or theme, with at least one of them at an advanced level (300 level or higher).

  - **At least two (2) writing intensive courses are required (at least 3 credits each). These courses may not be taken Satisfactory/Unsatisfactory and require a grade of C- or better. Students may wish to consider a course in Technical Communications to fulfill one of the writing intensive requirements.

  - **At least fifteen (15) credits of Computer Science courses, which must include EN.601.220 Intermediate Programming, EN.601.226 Data Structures, and EN.601.229 Computer System Fundamentals. (NOTE: You can count either EN.601.229 Computer System Fundamentals or EN.520.222 Computer Architecture as a CE required course.) If you take EN.500.112 Gateway Computing it will count as a CS credit even though it has a general engineering number (EN.500.XXX). Please be register for the ECE section of Gateway Computing. If you take a different section, you will be required to take a supplemental summer/intercession course to count this towards CS/ECE requirements.

Additional details concerning advising and degree requirements are in the **Computer Engineering Advising Manual**. The B.S. in Computer Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, [http://www.abet.org](http://www.abet.org).

The sample program shown is very general. Other sample programs with a focus in Microsystems, Computer Integrated Surgery, Software, or Robotics can be found in the advising manual.

## Bachelor of Arts Degree in Electrical Engineering

To meet the requirements for the B.A. degree, the program must include:

- **Eighteen (18) credits of humanities and social sciences courses.**
- **Four writing intensive courses.**
- **Twenty (20) credits of mathematics or mathematical statistics courses.** Typically these include AS.110.108 Calculus I, AS.110.109 Calculus II (For Physical Sciences and Engineering), and AS.110.202 Calculus III or equivalent, and AS.110.201 Linear Algebra. Elementary or pre-calculus courses such as AS.110.105 or EN.553.111-EN.553.112 are not acceptable.
- A **programming language requirement must be met by taking EN.601.107 Introductory Programming in Java** or **EN.601.220 Intermediate Programming** or **EN.500.112 Gateway Computing.** If you take EN.500.112 Gateway Computing it will count as a CS credit even though it has a general engineering number (EN.500.XXX). Please be sure to register for the ECE section of Gateway Computing. If you take a different section, you will be required to take a supplemental summer/intersession course to count this towards ECE requirements. This cannot be taken as a Pass/fail.
- **Thirty (30) credits of ECE courses.** Three credits of computer science courses may be counted toward this 30-credit requirement.
- Additional credits giving a total of at least 120 credits.
- Additional information on academic policies and degree requirements can be found in the Undergraduate Academic Policies section of this catalog.

The student should be aware that the B.A. degree program is **not accredited by the Accreditation Board for Engineering and Technology (ABET).**

### Minor in Robotics
A minor in Robotics is offered by the Laboratory for Computational Sensing and Robotics. Detailed information regarding this program can be found at: [http://lcsr.jhu.edu/robotics-minor/](http://lcsr.jhu.edu/robotics-minor/).

### Minor in Computer-Integrated Surgery
A minor in Computer-Integrated Surgery is offered by the Laboratory for Computational Sensing and Robotics. Detailed information regarding this program can be found at: [http://lcsr.jhu.edu/computer-integrated-surgery-minor/](http://lcsr.jhu.edu/computer-integrated-surgery-minor/).

### Bachelor’s/Master’s Program
At the end of their sophomore year, students who are majors in electrical and computer engineering may apply for admission to the combined bachelor’s/master’s program which combines a B.S. in electrical engineering with a master of science in engineering. If accepted, they must take at least two courses per semester that satisfy the requirements of the M.S.E. program.

### Graduate Programs
Every graduate student in the Department of Electrical and Computer Engineering must follow a program approved by a faculty advisor in the department. The advisor assigned to the student upon admission may be
changed, subject to the approval of the new advisor. Additional details are in the department's Graduate Student Advising Manual.

**Master of Science in Engineering (M.S.E.) Degree**

The department offers a comprehensive and flexible Master of Science in Engineering (M.S.E.) degree program that includes courses from several areas of Electrical and Computer Engineering. In addition, the following specialized M.S.E. tracks are offered: 1) Communications, 2) Control Systems, 3) Language and Speech Processing, 4) Image Processing, 5) Microsystems and Computer Engineering, 6) Photonics and Optoelectronics, and 7) Robotics.

**Requirements for the M.S.E. Degree**

A student who has completed a program of study similar to that required for the B.S. in electrical engineering degree must complete the following requirements for the M.S.E. degree:

- Eight one-semester graduate (400-799) courses approved by the advisor must be satisfactorily completed. At least five of these courses must come from the full-time ECE Department (520.XXX) but cannot include Independent Study, Dissertation Research, ECE Seminar or Special Studies.
- Further depth of understanding must be demonstrated by either satisfactorily completing two additional one-semester graduate (400-799) courses approved by the advisor (one of which must come from the full-time ECE Department (520.XXX), or by writing an M.S.E. thesis acceptable to a member of our faculty, or by completing a special project acceptable to a member of our faculty and writing the corresponding report.
- A course (including independent study) is satisfactorily completed if a grade of A, B, C, or P is obtained. No more than one C grade can be counted toward the requirements and a D or F or second C grade results in probation. A second D or F or a third C grade results in termination from our program.
- Students may transfer in up to two courses from outside JHU. These courses must have been completed after the undergraduate degree was conferred, not applied to a degree elsewhere, and must be approved in advance by the department.
- Every graduate course designated Independent Study, Dissertation Research, or Special Studies counted toward the M.S.E. degree must include a written report. A copy of the report will become part of the student’s permanent file.
- Every student must register for a minimum of two semesters as a full-time resident M.S.E. student in the concurrent B.S./M.S.E. program. Full-time resident M.S.E. students must be enrolled in at least 9 credits to maintain fulltime status (in fall/spring semesters).
- Every student must be registered in the semester that degree requirements are met; this includes students who have no courses remaining in which to enroll but must resolve coursework for which an "Incomplete" grade was assigned and those who must complete other academic requirements, such as a language or computing requirement (these students may apply for Nonresident Status).
- Every student must earn the M.S.E. degree within five consecutive academic years (ten semesters). Only semesters during which a student has a university-approved leave of absence are exempt from the ten semester limit; otherwise, all semesters from the beginning of the student's graduate studies – whether the student is resident or not – count toward the ten semester limit.
- Every student must complete training on academic ethics.
- Every student must complete training on the responsible and ethical conduct of research, if applicable (Please see the WSE Policy on the Responsible Conduct of Research).

**Doctor of Philosophy (Ph.D.) Degree**

The Ph.D. in Electrical and Computer Engineering is oriented with an emphasis on scholarship and research rather than formal coursework. Our Ph.D. program is designed to be easily tailored to the needs and interests of individual students. There are no lists of required courses. The program is directed at independent, highly motivated individuals who desire to work closely with faculty members at the forefront of research in a variety of scientific areas, such as:

- Computational and Biomorphic Systems
- Computational Systems Biology and Bioinformatics
- Computer Engineering
- Control Systems
- Image Processing and Analysis
- Integrated Circuits and Microsystems
- Language and Speech Processing
- Photonics and Optoelectronics
- Signal Processing

**Requirements for the Ph.D. Degree**

University requirements for the Ph.D. degree are listed under Academic Information for Graduate Students (p. 45). In addition, the department requires satisfactory completion of the Ph.D. departmental examination and the university Graduate Board oral examination, preparation of a preliminary research proposal, a departmental seminar presentation, and an oral dissertation defense.

The departmental examination is offered twice yearly. Each faculty member prepares a set of questions, and the student must select and complete the sets of questions of three faculty members. This examination must be passed before the beginning of the fifth semester of full-time graduate study. After passing the examination, the student can be accepted by a faculty member who will oversee the student’s research. This research advisor then guides the remainder of the student’s program leading to the Ph.D. degree.

The university Graduate Board oral examination is administered by a panel consisting of the research advisor, another faculty member in Electrical and Computer Engineering, and three faculty members from other departments. This examination must be taken before the end of the sixth semester.

In the course of research leading to the Ph.D. degree, the student must submit a preliminary research proposal to the department, and present a departmental seminar. Finally, a public dissertation defense will be conducted before a panel of readers consisting of at least three Electrical and Computer Engineering faculty members. Further details concerning M.S.E. and Ph.D. degree requirements are published in a manual for graduate students in Electrical and Computer Engineering.

**Financial Aid**

Financial aid is available for candidates of high promise. Research assistantships are available on sponsored research projects directed by members of the faculty.

Faculty

Chair
Ralph R. Etienne-Cummings
Mixed-signal VLSI, computational sensors, robotics, neuromorphic engineering.

Director of Undergraduate Programs
Trac D. Tran
Filter banks, wavelets, multirate systems and applications.

Director of Graduate Programs
Pablo A. Iglesias
Edward J. Schaefer Professor: systems biology, mathematical modeling of biological systems, control theory.

Professors
Andreas G. Andreou
CMOS devices and integrated circuits, bioelectronics, nanoelectronics, life science microsystems, natural and synthetic sensory systems, neural computation.

John I. Goutsias
Signal and image processing, computational systems biology, bioinformatics, modeling and analysis of complex networked systems.

Hynek Hermansky
Julian S. Smith Professor: emulating and integrating human-like processing strategies into speech engineering systems; neural information processing; human sensory perception; speech and speaker recognition; speech coding and enhancement; and machine learning.

Jin U. Kang
Jacob Suter Jammer Professor: fiber optic devices and lasers, biophotonics, optical imaging and sensing.

Jacob B. Khurgin
Quantum electronics, nonlinear optics.

Jerry L. Prince
William B. Kouwenhoven Professor: image processing and computer vision with application to medical imaging.

T. E. (Ed) Schlesinger
Professor and Benjamin T. Tome Dean: solid state electronic and optical devices, nanotechnology, and information storage systems.

Howard L. Weinert
Fast compact algorithms and software for extracting signals from noise

James West
electroacoustics, physical acoustics, and architectural acoustics.

Associate Professors
Mounya Elhilali
Biological basis of sound and speech perception, neural signal processing, computational neuroscience, cognitive neuromorphic engineering.

Mark A. Foster
Ultrafast and nonlinear optics, all-optical signal processing, ultrafast phenomena and measurement, nonlinear dynamics.

Sanjeev P. Khudanpur
Information theory, statistical language modeling.

Assistant Professors
Muyinatu A. Lediju Bell
Ultrasound imaging, photoacoustic imaging, image quality improvements, advanced beamforming methods, light delivery systems, medical robotics, image-guided surgery, technology development, medical device design, clinical translation.

Najim Dehak
Speech processing and modeling; speaker and language recognition; audio segmentation; emotion recognition and health applications.

Amy C. Foster
Silicon photonics, nonlinear optics, nanophotonics, integrated biophotonics.

Enrique Mallada
Networked dynamics, control, optimization, power networks.

Susanna M. Thon
Renewable energy conversion and storage, photovoltaics, optoelectronics, nanoelectronics and nanophotonics, and scalable fabrication.

Archana Venkataraman
Functional neuroimaging (fMRI, EEG), machine learning & probabilistic inference, network modeling of the brain, integration of imaging, genetics and behavioral data.

Joint, Part-Time, Visiting, and Emeritus Appointments
Emad M. Boctor
Assistant Professor (Radiology): image-guided intervention, ultrasound imaging, elasticity, and thermal imaging.

Paul A. Bottomley
Professor (Radiology): magnetic resonance imaging, metabolic MRI.

Sang (Peter) Chin
Assistant Research Professor: compressive sensing, novel signal processing, game theory, extremal graph theory, differential geometry, and quantum computing and verification.

A. Brinton Cooper III
Associate Research Professor: error control coding, coded wireless, and optical communication.

Noah J. Cowan
Professor (Mechanical Engineering): navigation and control in biological systems; animal biomechanics and multisensory control; robotic systems, dynamics, and control; system identification of rhythmic systems; medical robotics.

Richard V. Cox
Research Professor/Director, Human Language Technology Center of Excellence.

Frederic M. Davidson
Professor Emeritus

Nicholas Durr
Assistant Professor (Biomedical Engineering): endoscopy, medical devices, in-vivo diagnostics, microscopy, surgical guidance, ocular imaging, cytometry, global health, clinical translation, commercial translation.

Eric C. Frey
Professor (Radiology): algorithms for computed tomography, small animal X-ray microcomputed tomography, quantitative PET, SPECT and nuclear medicine imaging, image evaluation, scatter compensation in SPECT, simultaneous dual isotope SPECT and Monte Carlo simulation of radiation transport.

Gene Yevgeny Fridman
Assistant Professor (Otolaryngology): neural prostheses, vestibular and cochlear implants, medical instrumentation.

Israel Gannot
Associate Research Professor.

Dennice F. Gayme
Assistant Professor (Mechanical Engineering): dynamics and control of nonlinear, networked and spatially distributed systems. Applications include: the electric power grid, wall turbulence and wind farms.

Peter Gehlbach
Associate Professor (Ophthalmology): angiogenesis; diabetic retinopathy; microsurgical instrument development; gene therapy; macular degeneration.

Donald J. Geman
Professor (Applied Mathematics and Statistics): computer vision, computational biology, statistical learning.

Robert E. Glaser
Lecturer: advanced digital logic systems.

Moise H. Goldstein Jr.
Professor Emeritus.

Willis Gore
Professor Emeritus.

Gregory D. Hager
Mandell Bellmore Professor (Computer Science): vision, robotics, human-machine systems, computer-integrated medicine.

Richard I. Joseph
Jacob Suter Jammer Professor Emeritus.

Pedro M. Julian
Associate Professor: theory and applications of circuits and systems, nonlinear computational architectures, sensory and neuromorphic processors, low power VLSI systems.

Alexander E. Kaplan
Professor Emeritus

Marin Kobilarov
Assistant Professor (Mechanical Engineering): dynamics and control motion planning reasoning under uncertainty robotics and aerospace.

Xingde Li
Professor (Biomedical Engineering): endomicroscopy technologies, nanobiophotonics and molecular imaging, early detection.

Gerard G.L. Meyer
Professor Emeritus

Michael I. Miller
Professor and Director (Biomedical Engineering): computational anatomy, medical imaging, image understanding.

C. Harvey Palmer Jr.
Professor Emeritus.

Dzung L. Pham
Adjunct Associate Professor (Radiology): homeomorphic brain image segmentation, neuroanatomical atlases in MIPAV, robust tissue classification, statistical characterization of brain tissue in MRI.

Philippe O. Pouliquen
Assistant Research Professor: optoelectronic, mixed signal, low power VLSI, CAD tools for VLSI.

Carey E. Priebe

Arman Rahmim
Associate Professor (Radiology): 3D and spatiotemporal 4D tomographic image reconstruction algorithms; texture and shape analysis as applied to medical imaging (SPECT/PET); diffuse optical tomography (DOT) through the intact brain; cardiac and respiratory motion compensation methods; dynamic whole-body PET/CT parametric imaging; advanced quantitation methods for enhanced prognosis and treatment response assessment in cancer patients; adaptive multi-modality integration of anatomical (e.g. MRI or CT) information into functional (e.g. PET) image reconstruction; Monte Carlo simulation approaches, using high performance computing and mathematical anthropomorphic models; application of numerical observer studies as preliminary substitute for human observers for optimization and validation; modeling and incorporation of resolution degrading effects within image reconstruction tasks.

Charbel G. Rizk
Associate Research Professor: integrated system-on-chip sensors; integrated photonics, controls, autonomous systems, UAV platforms, and sensors; biomimetic devices for medical applications.

Wilson J. Rugh
Edward J. Schaefer Professor Emeritus.

Suchi Saria
Assistant Professor (Computer Science): machine learning; statistical inference; computational health informatics; probabilistic methods; time series models; information extraction in domains with structured and unstructured data (e.g., text, sensing devices, electronic health records, smart rooms); predictive modeling in healthcare.

Sridevi V. Sarma
Associate Professor (Biomedical Engineering) Research Interests: Computational neuroscience, estimation and control theory, applications to disorders of the central nervous system and brain machine interfaces.

J. Webster Stayman
Assistant Professor (Biomedical Engineering) Research Interests: Medical imaging, device design and optimization, adaptive imaging, task-based acquisition, reconstruction, and estimation theory.

Xiaoying Tang
Adjunct Assistant Professor: quantitative medical image analysis; neuroimaging; computational anatomy; computational neuroinformatics.

Nitish V. Thakor
Professor (Biomedical Engineering): medical instrumentation, medical micro and nanotechnologies, neurological instrumentation, signal processing, computer applications.

Benjamin M. W. Tsui
Professor (Radiology): quantitative SPECT, PET and CT imaging techniques, image reconstruction methods, computer simulation tools and methods in imaging, image quality assessment, small animal SPECT, PET and CT imaging techniques.

Rene Vidal
Professor (Biomedical Engineering): computer vision, biomedical imaging, machine learning, signal processing.

Shinji Watanabe
Associate Research Professor (Center for Language & Speech Processing) Research Interests: Speech Recognition, Speech Enhancement, Deep Learning, Spoken Language Processing

C. Roger Westgate
Professor Emeritus.

Raimond Winslow
Raj and Neera Singh Professor (Biomedical Engineering): applied statistical learning, computational cell biology, cardiac electrophysiology, grid-based computing and data sharing for collaborative science.

For current course information and registration go to https://sis.jhu.edu/classes/

**Courses**

**EN.520.123. Computational Modeling for Electrical and Computer Engineering. 3.0 Credits.**
In this course, the students will acquire the skills of solving complex real world Electrical and Computer Engineering problems using computational modeling tools. This course will cover two aspects of solving those ECE problems. The first aspect consists of learning to map ECE tasks to mathematical models. The second aspect consists of introducing the students to the basic of computational algorithms needed to work with the models, and programming such algorithms in MATLAB.

Instructor(s): N. Dehak
Area: Engineering.

**EN.520.137. Introduction To Electrical & Computer Engineering. 3.0 Credits.**
An introductory course covering the principles of electrical engineering including sinusoidal wave forms, electrical measurements, digital circuits, and applications of electrical and computer engineering. Laboratory exercises, the use of computers, and a design project are included in the course.

Instructor(s): T. Tran
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.520.142. Digital Systems Fundamentals. 3.0 Credits.**
Number systems and computer codes, switching functions, minimization of switching functions, Quine - McCluskey method, sequential logic, state tables, memory devices, analysis, and synthesis of synchronous sequential devices.

Instructor(s): P. Julian
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.520.140. Light, Image and Vision. 3.0 Credits.**
This course is designed for beginning undergraduate students and covers the principle of optics and imaging from the human vision perspective. The topics for the course include the basic principles and properties of light, imaging and image formation, optical imaging and display systems, and human vision. The course include bio-weekly labs that allows students to implement and experience the concepts learned during the lectures.

Instructor(s): J. Kang
Area: Engineering.

**EN.520.211. ECE Engineering Team Project. 1.0 Credit.**
This course introduces the student to the basics of engineering team projects. The student will become a member of and participate in the different aspects of an ECE team project over several semesters. (Freshmen and Sophomores)

Instructor(s): C. Rizk; J. Kang; J. West; S. Ramesh
Area: Engineering.

**EN.520.212. ECE Engineering Team Project (Freshmen and Sophomores). 1.0 Credit.**
This course introduces the student to the basics of engineering team projects. The student will participate in an ECE engineering team project as a member. The student is expected to participate in the different aspects of the project over several semesters. (Freshmen and Sophomores) Permission of instructor required.

Instructor(s): C. Rizk; J. Kang; J. West; S. Ramesh
Area: Engineering.

**EN.520.213. Circuits. 4.0 Credits.**
An introductory course on electric circuit analysis. Topics include time domain and frequency domain analysis techniques, transient and steady-state response, and operational amplifiers.

Prerequisites: AS.110.108 and AS.110.109
Instructor(s): B. Mohanty; H. Weinert
Area: Engineering.

**EN.520.214. Signals and Systems. 4.0 Credits.**
An introduction to discrete-time and continuous-time signals and systems covers representation of signals and linear time-invariant systems and Fourier analysis.

Prerequisites: (AS.110.107 OR AS.110.109); AS.110.202 can be taken while taking EN.520.214
Instructor(s): M. Elhilali
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.520.216. Introduction To VLSI. 3.0 Credits.**
This course teaches the basics of switch-level digital CMOS VLSI design. This includes creating digital gates using MOS transistors as switches, laying out a design using CAD tools, and checking the design for conformance to the Scalable CMOS design rules. Recommended: EN.520.213.

Prerequisites: EN.520.142 and recommended: 520.213
Instructor(s): R. Etienne Cummings
Area: Engineering.
EN.520.219. Introduction to Electromagnetics. 4.0 Credits.
Vector analysis, electrostatic fields in vacuum and material media, stationary currents in conducting media, magnetostatic fields in vacuum and material media. Maxwell's equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications.
Prerequisites: Co-req: AS.110.202; Prerequisites: ((AS.171.101 and AS.171.102) or (AS.171.101 and AS.171.108) or (AS.171.107 and AS.171.108)) and AS.110.109 Pre/co-req: AS.110.202
Instructor(s): M. Foster
Area: Engineering, Natural Sciences.

EN.520.220. Electromagnetic Waves. 3.0 Credits.
Magnetostatic fields in vacuum and material media. Maxwell's equations and time-dependent electric and magnetic fields, electromagnetic waves and radiation, transmission lines, wave guides, applications.
Prerequisites: EN.520.219 or equivalent
Instructor(s): M. Foster
Area: Engineering, Natural Sciences.

EN.520.222. Computer Architecture. 3.0 Credits.
A study of the structure and organization of classical von Neumann uniprocessor computers. Topics include a brief history of modern machines starting from the Turing computer model, instruction sets, addressing, RISC versus CISC, traps and interrupt handling, two-complement arithmetic, adders and ALUs, CSA's Booth's algorithm, multiplication and division, control unit design, microprogramming, dynamic versus static linking, memory systems and memory hierarchy, paging segmentation, cache hardware, cache organizations, and replacement policies.
Prerequisites: EN.520.142
Instructor(s): P. Pouliquen
Area: Engineering.

EN.520.225. Advanced Digital Systems. 3.0 Credits.
Students are introduced to Hardware Description Languages (HDL) through the assembly of virtual versions of the digital parts used in the previous semester's Digital Systems Fundamentals. From this point on, new components called modules are created as needed to implement larger digital circuits. Increasingly complex digital systems are then created through stages such as desktop calculators, and culminating in the design of microcontrollers and microprocessors. The hardware used for the digital systems designed is a custom board containing a Field Programmable Gate Array (FPGA). This board is configured using software on the student's computer, but is designed to be standalone. That is, once configured, it no longer needs to be connected to any host computer. The architecture of these complex digital systems starts with Finite State Machines (FSM). Hierarchical FSMs are then covered, followed by traditional two and three bus microprocessor architectures and digital signal processors.
Prerequisites: EN.520.142
Instructor(s): P. Pouliquen.

EN.520.230. Mastering Electronics. 2.0 Credits.
With this course, students will have a solid understanding of basic and fundamental electronic concepts and rules including resistive circuits, loop and node analysis, capacitor/inductor circuits, and transient analysis. Students will be able to build, design, and simulate a wide range of electronic devices; the class will focus on building and designing audio devices. Class lectures cover the fundamental concepts of electronics, followed by laboratory exercises that demonstrate the basic concepts. Students will learn to simulate circuits using SPICE. A final project is required. Prerequisites: Physical Science Majors II (AS.171.102); General Physics Laboratory (AS.173.112).
Prerequisites: (AS.110.108 AND AS.110.109) AND ((AS.171.102 OR AS.171.108) AND AS.173.112)
Corequisites: EN.520.231
Instructor(s): A. Foster; S. Ramesh
Area: Engineering.

EN.520.231. Mastering Electronics Laboratory. 2.0 Credits.
With this course, students will have a solid understanding of basic and fundamental electronic concepts and rules including resistive circuits, loop and node analysis, capacitor/inductor circuits, and transient analysis. Students will be able to build, design, and simulate a wide range of electronic devices; the class will focus on building and designing audio devices. Class lectures cover the fundamental concepts of electronics, followed by laboratory exercises that demonstrate the basic concepts. Students will learn to simulate circuits using SPICE. A final project is required. Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.; (AS.110.108 AND AS.110.109) AND ((AS.171.102 OR AS.171.108) AND AS.173.112)
Corequisites: EN.520.230 Mastering Electronics
Instructor(s): A. Foster
Area: Engineering.

EN.520.250. Leading Innovation Design Team. 1.0 Credit.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu For additional info, see link below: https://engineering.jhu.edu/ece/undergraduate-studies/leading-innovation-design-team/
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.
EN.520.251. Leading Innovation Design Team. 1.0 Credit.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first-hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu
Prerequisites: Students may receive credit for only one of the following courses; EN.520.251, EN.520.463 OR EN.520.663.;Laboratory Safety Introductory Course available in MyLearning prior to registration. The course is accessible from the Education tab through the portal my.jhu.edu
Please note that this requirement is not applicable to new students registering for their first semester at Hopkins.
Instructor(s): C. Rizk
Area: Engineering.

EN.520.302. Internet of Things Project Lab. 3.0 Credits.
In this course the student configures, programs, and tests microprocessor modules with wireless interconnectivity for embedded monitoring and control purposes. Several different platforms are explored and programmed in high level languages (HLL). Upon completion, students can use these devices as elements in other project courses. Recommended Course Background: HLL programming and digital logic familiarity; Advanced Microprocessor Lab is a plus.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.
Instructor(s): R. Glaser
Area: Engineering.

EN.520.313. Signals, Systems & Inference. 3.0 Credits.
This course builds on the fundamentals of signal processing to explore state space models and random processes. Topics include LTI systems, feedback, probabilistic models, signal estimation, random processes, power spectral density and hypothesis testing.
Prerequisites: EN.520.214 AND EN.550.310 AND AS.110.201
Instructor(s): A. Venkataraman
Area: Engineering.

EN.520.315. Intro. to Bio-Inspired Processing of Audio-Visual Signals. 3.0 Credits.
An introductory course to basic concepts of information processing of human communication signals (sounds, images) in living organisms and by machine. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky
Area: Engineering.

EN.520.340. Introduction to Mechatronics. 3.0 Credits.
Introduction to Mechatronics is mostly hands-on, interdisciplinary design class consisting of lectures about key topics in mechatronics, and lab activities aimed at building basic professional competence. After completing the labs, the course will be focused on a final mini-project for the remainder of the semester. This course will encourage and emphasize active collaboration with classmates. Each team will plan, design, manufacture and/or build, test, and demonstrate a robotic system that meets the specified objectives.
Instructor(s): I. Sekyonda
Area: Engineering.

EN.520.345. Electrical & Computer Engineering Laboratory. 3.0 Credits.
This course consists of 11 one-week laboratory experiments intended to provide an introduction to analog and digital circuits commonly used in engineering. Topics include phase and frequency response, transistors, operational amplifiers, filters, and other analog circuits. The experiments are done using computer controlled digital oscilloscopes, function generators, and power supplies.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.;Prerequisites: (AS.171.101 AND AS.171.102) OR (AS.171.107 AND AS.171.108) AND EN.520.213.
Instructor(s): A. Foster; S. Ramesh
Area: Engineering.

EN.520.349. Microprocessor Lab I. 3.0 Credits.
This course introduces the student to the programming of microprocessors at the machine level. 68HC08, 8051, and eZ8 microcontrollers are programmed in assembly language for embedded control purposes. The architecture, instruction set, and simple input/output operations are covered for each family. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.142 or equivalent. The lab is open 24/7 and students can still take the class if they are unable to meet during lab time.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Glaser
Area: Engineering.

EN.520.353. Control Systems. 3.0 Credits.
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).
Prerequisites: Prereqs: EN.530.343 AND EN.520.214
Instructor(s): E. Mallada Garcia
Area: Engineering.

EN.520.370. Introduction to Renewable Energy Engineering. 3.0 Credits.
This course provides an introduction to the science and engineering of renewable energy technologies. The class will begin with an overview of today's energy landscape and proceed with an introduction to thermodynamics and basic heat engines. Specific technologies to be discussed include photovoltaics, fuel cells and hydrogen, biomass, wind power and energy storage. The class should be accessible to those from a variety of science and engineering disciplines. Recommended Course Background: Introductory Physics and Calculus.
Prerequisites: (AS.171.101 OR AS.171.107) AND AS.110.109
Instructor(s): S. Thon
Area: Engineering, Natural Sciences.
EN.520.372. Programmable Device Lab. 3.0 Credits.
The use of programmable memories (ROMs, EPROMs, and EEPROMs) as circuit elements (as opposed to storage of computer instructions) is covered, along with programmable logic devices (PLAs and GALs). These parts permit commanding dozens of standard logic packages (TTL logic) into one or more off-the-shelf components. Students design and build circuits using these devices with the assistance of CAD software. Topics include programming EEPROMs; using PLDs as address decoders; synchronous sequential logic synthesis for PLDs; and PLD-based state machines. Recommended Course Background: EN.520.142 and EN.520.345
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Glaser
Area: Engineering.

EN.520.391. CAD Design of Digital VLSI Systems I (Juniors). 3.0 Credits.
An introductory course in which students, manually and through computer simulations, design digital CMOS integrated circuits and systems. The design flow covers transistor, physical, and behavioral level descriptions, using SPICE, Layout, and VerilogHDL VLSI CAD tools. After design computer verification, students can fabricate and test their semester-long class projects. Juniors Only. Recommended Course Background: EN.520.142, EN.520.216 or equivalent; Corequisite: EN600.333, EN.600.334, EN.520.349 or EN.520.372
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.403. Introduction to Optical Instruments. 3.0 Credits.
This course is intended to serve as an introduction to optics and optical instruments that are used in engineering, physical, and life sciences. The course covers first basics of ray optics with the laws of refraction and reflection and goes on to description of lenses, microscopes, telescopes, and imaging devices. Following that basics of wave optics are covered, including Maxwell equations, diffraction and interference. Operational principles and performance of various spectrometric and interferometric devices are covered including both basics (monochromatic, Fabry-Perot and Michelson interferometers), and advanced techniques of near field imaging, laser spectroscopy, Fourier domain spectroscopy, laser Radars and others.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.404. Engineering solutions in a global, economic, environmental, and societal context. 1.0 Credit.
Students will examine ECE based case studies and will apply decision making theory and leadership theory as it relates to information, communication, healthcare, and energy. The course aims to examine technology as it transitions from old to new, from impossible to possible. It will also evaluate the new hazards that these new technologies may have on the world. The students will have to quantify the good and the bad of each solution and weigh their contribution to Environment, Economy, society and Healthcare. The group will present these case studies to their classmates, justifying the solutions and answers to the ethical dilemmas they faced, and explain the impact of their decisions from an economic, environmental, and global perspective.
Corequisites: EN.660.400
Instructor(s): I. Gannot
Area: Humanities.

EN.520.407. Introduction to the Physics of Electronic Devices. 3.0 Credits.
This course is designed to develop and enhance the understanding of the basic physical processes taking place in the electronic and optical devices and to prepare students for taking classes in semiconductor devices and circuits, optics, lasers, and microwaves devices, as well as graduate courses. Both classical and quantum approaches are used. Specific topics include theory of molecular bonding; basics of solid state theory; mechanical, transport, magnetic, and optical properties of the metals; semiconductors; and dielectrics.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.412. Machine Learning for Signal Processing. 3.0 Credits.
This course will focus on the use of machine learning theory and algorithms to model, classify and retrieve information from different kinds of real world complex signals such as audio, speech, image and video.
Prerequisites: Student may earn credit for EN.520.612 or EN.520.412, but not both; AS.110.201 AND EN.550.310 AND EN.520.435
Instructor(s): N. Dehak
Area: Engineering.

EN.520.414. Image Processing & Analysis. 3.0 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.; Students may earn credit for EN.520.614 or EN.520.414, but not both.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.415. Image Process & Analysis II. 3.0 Credits.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation.
Prerequisites: Students may earn credit for EN.520.615 or EN.520.415, but not both.; EN.520.414
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.417. Computation for Engineers. 3.0 Credits.
Designing algorithms in a finite precision environment that are accurate, fast, and memory efficient is a challenge that many engineers must face. This course will provide students with the tools they need to meet this challenge. Topics include floating point arithmetic, rounding and discretization errors, problem conditioning, algorithm stability, solving systems of linear equations and least-squares problems, exploiting matrix structure, interpolation, finding zeros and minima of functions, computing Fourier transforms, derivatives, and integrals. Matlab is the computing platform. Background in linear algebra, matrices, digital signal processing, Matlab.
Instructor(s): H. Weinert
Area: Engineering.
EN.520.424. FPGA Synthesis Lab. 3.0 Credits.
This advanced laboratory course in the application of FPGA technology to information processing using VHDL synthesis methods for hardware development. The student will use commercial CAD software for VHDL simulation and synthesis, and implement their systems in programmable XILINX 20,000 gate FPGA devices. The lab will consist of a series of digital projects demonstrating VHDL design and synthesis methodology, building up to final projects at least the size of an 8-bit RISC computer. Projects will encompass such things as system clocking, flip-flop registers, state-machine control, and arithmetic. The students will learn VHDL methods as they proceed through the lab projects, and prior experience with VHDL is not a prerequisite.
Prerequisites: EN.520.142 Recommended Courses: EN.600.333 (Computer System Fundamentals) or EN.520.349 (Microprocessor Lab); Students must have completed Lab Safety training prior to registering for this class; Students may take EN.520.624 or EN.520.644, but not both.
Instructor(s): P. Pouliquen
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.427. Product Design Lab. 3.0 Credits.
This project-based course is designed to help students learn how to turn their ideas into commercial products. In the first half of the course, emphasis will be placed on the product development process: student teams will gradually build up a complete “contract book” including a mission statement, competitive analysis, patent review, product specifications, system schematics, economic analysis, development schedule, etc. In the second half of the course, each team will be expected to implement its design and demonstrate a prototype of their product’s core functionality. At the end of the semester, a final written report will be submitted in the form of a utility patent. Students are encouraged to take this course in conjunction with Electronic Design Lab (ECE 520.448) in the Spring semester and leverage the groundwork developed here to enable production of a fully functional and marketable prototype by the end of the academic year.
Instructor(s): I. Gannot; S. Ramesh
Area: Engineering.

EN.520.432. Medical Imaging Systems. 3.0 Credits.
This course provides students with an introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality from a signals and systems perspective, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Students will additionally engage in hands-on activities to reconstruct medical images from raw data.
Prerequisites: Student may earn credit for EN.520.632 or EN.520.432, but not both; EN.580.222 OR EN.520.214
Instructor(s): M. Bell
Area: Engineering.

EN.520.433. Medical Image Analysis. 3.0 Credits.
This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: EN.550.310 OR EN.550.311 OR EN.560.348
Instructor(s): J. Prince
Area: Engineering.

EN.520.434. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipments in clinical and research settings. Co-listed with EN.580.473
Prerequisites: Students may not have taken EN.520.634
Instructor(s): B. Tsui.

EN.520.435. Digital Signal Processing. 3.0 Credits.
Methods for processing discrete-time signals. Topics include signal and system representations, z-transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214, Students may receive credit for EN.520.435 or EN.520.635, but not both.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.445. Audio Signal Processing. 3.0 Credits.
This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, acoustics, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing.
Prerequisites: Students may take EN.520.445 or EN.520.645, but not both.
Instructor(s): M. Elhilali
Area: Engineering.
EN.520.447. Information Theory. 3.0 Credits.
This course will address some basic scientific questions about systems that store or communicate information. Mathematical models will be developed for (1) the process of error-free data compression leading to the notion of entropy, (2) data (e.g., image) compression with slightly degraded reproduction leading to rate-distortion theory and (3) error-free communication of information over noisy channels leading to the notion of channel capacity. It will be shown how these quantitative measures of information have fundamental connections with statistical physics (thermodynamics), computer science (string complexity), economics (optimal portfolios), probability theory (large deviations), and statistics (Fisher information, hypothesis testing).
Instructor(s): S. Khudanpur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.448. Electronics Design Lab. 3.0 Credits.
An advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. Recommended: EN.600.333, EN.600.334, EN.520.214, EN.520.216, EN.520.349, EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: (EN.520.230 OR EN.520.213) AND (AS.110.108 AND AS.110.109 AND AS.171.101) AND EN.520.142
Instructor(s): P. Julian.

EN.520.450. Advanced Micro-Processor Lab. 3.0 Credits.
This course covers the usage of common microcontroller peripherals. Interrupt handling, timer operations, serial communication, digital to analog and analog to digital conversions, and flash ROM programming are done on the 68HC08, 8051, and eZ8 microcontrollers. Upon completion, students can use these flash-based chips as elements in other project courses. Recommended Course Background: EN.520.349
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Glaser.

EN.520.452. Advanced ECE Engineering Team Project. 3.0 Credits.
This course introduces the student to running an ECE engineering team project. The student will participate in the team project as a leading member and is expected to manage both the team members and the different aspects of the project over several semesters. Permission of the instructor is required for new team members. (Junior and Seniors)
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk; J. Kang; J. West; S. Ramesh
Area: Engineering.

EN.520.453. Advanced ECE Engineering Team Project. 3.0 Credits.
The course introduces the student to running an engineering team project. The student will participate in the ECE engineering team project as a leading member. The student is expected to participate in the different aspects of the project over several semesters and manage both team members and the project. (Juniors and Seniors) Permission of instructor is required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk; J. Kang; J. West; S. Ramesh
Area: Engineering.

EN.520.454. Control Systems Design. 3.0 Credits.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Prerequisites: Students may earn credit for EN.520.654 or EN.520.454, but not both.
Instructor(s): P. Iglesias
Area: Engineering.

EN.520.459. Quantum Mechanics for Engineering. 3.0 Credits.
This course will describe some of the basic ideas in and early development of quantum mechanics. This course is intended for students without any previous background in this subject. A description of some of the fundamental ideas in Quantum Mechanics will be offered from a practical point of view and from a perspective that should be useful to engineers who want to understand how these concepts manifest in materials and devices. Topics include the Schrodinger Wave Equation and the concept of a wave function, quantization in atoms and engineered semiconductor heterostructures, the interaction of radiation and atomic systems, and examples of the application of quantum theory in lasers and electronic solid-state devices. Recommended background for this course includes freshman-year physics (including fundamentals of electricity and magnetism) and sophomore-year mathematics (including partial derivatives, basic differential equations, and fundamentals of linear algebra).
Instructor(s): T. Schlesinger
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.460. The Art of Error Control Coding. 3.0 Credits.
Error control coding is the study and practice of detecting and/or correcting errors that occur in the transmission of digital information over a noisy communication channel, the transferal of information to and from memory and mass storage in a computer, or in any other application where random processes corrupt information. The student will study encoders and decoders for the most important codes in current use and will confront realistic problems in the use of coding. The course will comprise lectures, discussions, and projects.
Instructor(s): A. Cooper
Area: Engineering, Quantitative and Mathematical Sciences.
EN.520.462. Leading Innovation Design Team. 3.0 Credits.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first-hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu For additional info, see: https://engineering.jhu.edu/ece/undergraduate-studies/leading-innovation-design-team/
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.

EN.520.463. Leading Innovation Design Team. 3.0 Credits.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first-hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu
Prerequisites: Students may receive credit for only one of the following courses; EN.520.251, EN.520.463 OR EN.520.663.
Laboratory Safety Introductory Course available in MyLearning prior to registration. The course is accessible from the Education tab through the portal my.jh.edu. Please note that this requirement is not applicable to new students registering for their first semester at Hopkins.
Instructor(s): C. Rizk
Area: Engineering.

EN.520.465. Digital Communications I. 3.0 Credits.
This course introduces the basic tools and topics of modern digital communication beginning with the mathematical representation and spectral properties of random signals and a basic introduction to the detection of real and complex signals in the presence of noise. Memoryless modulation and demodulation schemes are thoroughly studied for the Gaussian channel, and measures of performance are developed. Topics in wireless communication will be introduced. Recommended Course Background: EN.520.401, EN.553.310 or EN.553.420
Instructor(s): F. Davidson
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.473. Magnetic Resonance in Medicine. 3.0 Credits.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472).
Co-listed with EN.580.476 and EN.580.673.
Instructor(s): M. Schar; P. Bottomley
Area: Engineering, Natural Sciences.

EN.520.482. Introduction To Lasers. 3.0 Credits.
This course covers the basic principles of laser oscillation. Specific topics include propagation of rays and Gaussian beams in lens-like media, optical resonators, spontaneous and stimulated emission, interaction of optical radiation and atomic systems, conditions for laser oscillation, homogeneous and inhomogeneous broadening, gas lasers, solid state lasers, Q-switching and mode locking of lasers.
Prerequisites: EN.520.219 AND EN.520.220
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.

EN.520.483. Bio-Photonics Laboratory. 3.0 Credits.
This laboratory course involves designing a set of basic optical experiments to characterize and understand the optical properties of biological materials. The course is designed to introduce students to the basic optical techniques used in medicine, biology, chemistry and material sciences.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Kang; S. Ramesh.

EN.520.485. Advanced Semiconductor Devices. 3.0 Credits.
This course is designed to develop and enhance the understanding of the operating principles and performance characteristics of the modern semiconductor devices used in high speed optical communications, optical storage and information display. The emphasis is on device physics and fabrication technology. The devices include heterojunction bipolar transistors, high mobility FET's, semiconductor lasers, laser amplifiers, light-emitting diodes, detectors, solar cells and others.
Instructor(s): J. Khurgin
Area: Engineering, Natural Sciences.

EN.520.486. Physics of Semiconductor Electronic Devices. 3.0 Credits.
The course is designed to develop and enhance the understanding of the physical principles of modern semiconductor electronic and opto-electronic devices. The course starts with the basics of band structure of solid with emphasis on group IV and III-V semiconductors as well as two dimensional semiconductors like graphene. It continues with the statistics of carriers in semiconductors and continues to electronic transport properties, followed by optical properties. The course goes on to investigate the properties of two dimensional electronic gas. The second part of the course describes operational principles of bipolar and unipolar transistors, light emitting diodes, photodetectors, and quantum devices.
Prerequisites: Students may earn credit for EN.520.486 or EN.520.686, but not both.
Instructor(s): J. Khurgin.
EN.520.491. CAD Design of Digital VLSI Systems I (Juniors/Seniors). 3.0 Credits.
Juniors and Seniors Only.
Prerequisites: Student may take EN.520.491 or EN.520.691, but not both.; AS.110.109 AND AS.171.102 AND EN.520.142 AND EN.520.142 AND (EN.520.230 OR (EN.520.213 AND EN.520.345))
Instructor(s): R. Etienne Cummings
Area: Engineering.
EN.520.492. Mixed-Mode VLSI Systems. 3.0 Credits.
Silicon models of information and signal processing functions, with implementation in mixed analog and digital CMOS integrated circuits. Aspects of structured design, scalability, parallelism, low power consumption, and robustness to process variations. Topics include digital-to-analog and analog-to-digital conversion, delta-sigma modulation, bioinstrumentation, and adaptive neural computation. The course includes a VLSI design project. Recommended Course Background: EN.521.491 or equivalent.
Instructor(s): P. Pouliquen
Area: Engineering.
EN.520.495. Microfabrication Laboratory. 4.0 Credits.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photosist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Perm. Req’d. Co-listed as EN.580.495 & EN.530.495
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.
EN.520.498. Senior Design Project. 3.0 Credits.
Capstone design project, in which a team of students engineers a system and evaluates its performance in meeting design criteria and specifications. Example application areas are micro-electronic information processing, image processing, speech recognition, control, communications, and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics, and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering, and computer science majors, is strongly encouraged. Instructor permission required.
Instructor(s): Staff
Area: Engineering.
EN.520.499. Senior Design Project. 3.0 Credits.
Capstone design project, in which a team of students engineer a system and evaluate its performance in meeting design criteria and specifications. Example application areas are microelectronic information processing, image processing, speech recognition, control, communications and biomedical instrumentation. The design needs to demonstrate creative thinking and experimental skills, and needs to draw upon knowledge in basic sciences, mathematics and engineering sciences. Interdisciplinary participation, such as by biomedical engineering, mechanical engineering and computer science majors, is strongly encouraged.
Instructor(s): A. Venkataraman
Area: Engineering.
EN.520.502. Indep Study - Fresh/Soph. 0.0 - 3.0 Credits.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.
Instructor(s): A. Cooper, M. Bell
Area: Engineering.
EN.520.503. Independent Study-Juniors-Seniors. 3.0 Credits.
Individual, guided study under the direction of a faculty member in the department. The program of study or research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors.
Instructor(s): Staff.
EN.520.504. Independent Study - Juniors/Seniors. 0.0 - 3.0 Credits.
Individual study, including participation in research, under the guidance of a faculty member in the department. The program of study or research, time required, and credit assigned must be worked out in advance between the student and the faculty member involved. May be taken either term by juniors or seniors.
Instructor(s): Staff.
EN.520.506. ECE Undergraduate Research. 1.0 - 3.0 Credits.
Independent research under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. Instructor(s): Staff.
EN.520.516. ECE Group Undergraduate Research. 1.0 - 3.0 Credits.
Independent research under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved. This section has a weekly research group meeting that students are expected to attend.
Instructor(s): Staff.
EN.520.545. Research. 1.0 - 3.0 Credits.
Instructor Approval Required. Independent study or research over the summer under the direction of a faculty member in the department. The program of research, including the credit to be assigned, must be worked out in advance between the student and the faculty member involved.
Instructor(s): J. West; P. Iglesias; S. Thon.
EN.520.548. Independent Research. 0.0 - 3.0 Credits.
Instructor(s): J. West; P. Iglesias; S. Thon.
EN.520.550. Electrical Engineering - Internship. 0.0 - 3.0 Credits.
Instructor(s): J. Kang; T. Tran.
EN.520.595. Independent Study. 3.0 Credits.
Instructor(s): Staff.
EN.520.597. Research - Summer. 3.0 Credits.
Instructor(s): Staff.
EN.520.599. Internship - Summer. 1.0 Credit.
Instructor(s): F. Davidson; G. Meyer; J. Kang; M. Miller.
EN.520.600. Electrical & Computer Engineering Seminar. 1.0 Credit.
Seminar for Electrical & Computer Engineering; required of all doctoral students who have not passed the qualifying exam. Repeatable course.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.
EN.520.601. Introduction to Linear Systems Theory. 3.0 Credits.
A beginning graduate course in multi-input multi-output, linear, time-invariant systems. Topics include state-space and input-output representations; solutions and their properties; multivariable poles and zeros; reachability, observability and minimal realizations; stability; system norms and their computation; linearization techniques. Recommended Course Background: Undergraduate courses in control systems and linear algebra.
Instructor(s): P. Iglesias.

EN.520.603. Introduction to Optical Instruments. 3.0 Credits.
This course is intended to serve as an introduction to optics and optical instruments that are used in engineering, physical, and life sciences. The course covers first basics of ray optics with the laws of refraction and reflection and goes on to description of lenses, microscopes, telescopes, and imaging devices. Following that basics of wave optics are covered, including Maxwell equations, diffraction and interference. Operational principles and performance of various spectrometric and interferometric devices are covered including both basics (monochromatic, Fabry-Perot and Michelson interferometers), and advanced techniques of near field imaging, laser spectroscopy, Fourier domain spectroscopy, laser Radars and others.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.612. Machine Learning for Signal Processing. 3.0 Credits.
This course will focus on the use of machine learning theory and algorithms to model, classify and retrieve information from different kinds of real world complex signals such as audio, speech, image and video. Recommended Course Background: AS.110.201, EN.553.310, and EN.520.435.
Prerequisites: Students may earn credit for EN.520.412 or EN.520.612, but not both.
Instructor(s): N. Dehak
Area: Engineering.

EN.520.613. Advanced Topics in Optical Medical Imaging. 3.0 Credits.
The course will review the recent advances in photonics technologies for medical imaging and sensing. The course is designed for graduate students with a back ground in optics and engineering. The main topics for the course are: Light Source and Devices for Biomedical Imaging; Fluorescence, Raman, Rayleigh Scatterings; Optical Endoscopy and Virtual biopsy; Novel imaging contrast dyes, nanoparticles, and optical clearing reagents; Label-free optical technologies in clinical applications; Neurophotonics and Optogenetics.
Instructor(s): J. Kang.

EN.520.614. Image Processing & Analysis. 3.0 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course. Recommended Prerequisite: EN.520.214 or equivalent
Prerequisites: Students may earn credit for EN.520.614 or EN.520.414, but not both.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.615. Image Processing & Analysis II. 3.0 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course. Grad students only.
Prerequisites: Students may earn credit for EN.520.615 or EN.520.415, but not both.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.616. Processing of Audio and Visual Signals. 3.0 Credits.
This course consists of two parts. The lecture component of this course is covered by attending EN.520.315. Concurrently, on the more advanced graduate level, there is an additional requirement of critical analysis of the material covered, and the hands-on homework complementing the lectures. Recommended Course Background: EN.520.214 (or EN.580.222) or consent of the instructor.
Instructor(s): H. Hermansky.

EN.520.617. Computation for Engineers. 3.0 Credits.
Designing algorithms in a finite precision environment that are accurate, fast, and memory efficient is a challenge that many engineers must face. This course will provide students with the tools they need to meet this challenge. Topics include floating point arithmetic, rounding and discretization errors, problem conditioning, algorithm stability, solving systems of linear equations and least-squares problems, exploiting matrix structure, interpolation, finding zeros and minima of functions, computing Fourier transforms, derivatives, and integrals. Matlab is the computing platform.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.618. Hybrid Systems. 2.0 Credits.
This graduate level seminar style class focuses on the emerging field of hybrid systems. Topics covered include mathematical models of hybrid systems, analysis and controller synthesis techniques, and model complexity reduction.
Instructor(s): D. Tarraf
Area: Engineering.

EN.520.620. Selected Topics in Theory of Iterative Algorithms. 3.0 Credits.
This course covers information on the non-deterministic schema and cyclic iterative schemas, Jacobians, Hessians and Mean Value Theorems, spectral norm, convex sets and positive definite majs.
Instructor(s): G. Meyer.

EN.520.621. Introduction To Nonlinear Systems. 3.0 Credits.
Instructor(s): P. Iglesias
Area: Engineering, Natural Sciences.
EN.520.622. Principles of Complex Networked Systems. 3.0 Credits.
By employing fundamental concepts from diverse areas of research, such as statistics, signal processing, biophysics, biochemistry, cell biology, and epidemiology, this course introduces a multidisciplinary and rigorous approach to the modeling and computational analysis of complex interaction networks. Topics to be covered include: overview of complex nonlinear interaction networks and their applications, graph-theoretic representations of network topology and stoichiometry, stochastic modeling of dynamic processes on complex networks and master equations, Langevin, Poisson, Fokker-Plank, and moment closure approximations, exact and approximate Monte Carlo simulation techniques, time-scale separation approaches, deterministic and stochastic sensitivity analysis techniques, network thermodynamics, and reverse engineering approaches for inferring network models from data.
Instructor(s): J. Goutsias.

EN.520.623. Medical Image Analysis. 3.0 Credits.
Graduate version of 520.433. This course covers the principles and algorithms used in the processing and analysis of medical images. Topics include interpolation, registration, enhancement, feature extraction, classification, segmentation, quantification, shape analysis, motion estimation, and visualization. Analysis of both anatomical and functional images will be studied and images from the most common medical imaging modalities will be used. Projects and assignments will provide students experience working with actual medical imaging data.
Prerequisites: Student may earn credit for 520.433 or 520.623, but not both.
Instructor(s): J. Prince.

EN.520.624. Integrated Photonics. 3.0 Credits.
This course gives an introduction to integrated photonics. Topics include: material platforms, fabrication approaches, devices and device operation, numerical modeling, nonlinear processes, and applications. Devices discussed include waveguides, resonators, sensors, modulators, detectors, lasers and amplifiers. Recommended Course Background: EN.520.219-EN.520.220, EN.520.495, or equivalent.
Instructor(s): A. Foster
Area: Engineering, Natural Sciences.

EN.520.627. Photovoltaics and Energy Devices. 3.0 Credits.
This course provides an introduction to the science of photovoltaics and related energy devices. Topics covered include basic concepts in semiconductor device operation and carrier statistics; recombination mechanisms; p-n junctions; silicon, thin film, and third generation photovoltaic technologies; light trapping; and detailed balance limits of efficiency. Additionally, thermophotovoltaics and electrical energy storage technologies are introduced. A background in semiconductor device physics (EN.520.485, or similar) is recommended.
Instructor(s): S. Thon.

EN.520.628. Satellite Communication System. 3.0 Credits.
This course presents the fundamentals of satellite communications link design and an in-depth treatment of practical considerations. Existing commercial, civil, and military systems are described and analyzed. Topics include satellite orbits, link analysis, antenna and payload design, interference and propagation effects, modulation techniques, coding, multiple access, and Earth station design. The impact of new technology on future systems in this dynamic field is discussed. Recommended Course Background: Communication Systems Engineering or equivalent or permission of the instructor.
Instructor(s): N. Mosavi.

EN.520.629. Networked Dynamical Systems. 3.0 Credits.
Networks and dynamics are pervasive in our world today. Power systems, the Internet, social networks, and biological systems are only a few of the numerous scenarios in which objects or individuals can affect -and be affected by- other members of a large group. This course examines modeling, analysis and design of networked dynamical systems - i.e., dynamic entities interconnected by a network- as well as various applications of such systems in science and engineering. Topics covered include (algebraic) graph theory, basic models of networked dynamical systems, continuous-time and discrete-time distributed averaging (consensus), coordination algorithms (rendezvous, formation, flocking, and deployment), and distributed algorithm computation and optimization over networks. Some of the motivating applications that will be analyzed are robotic coordination, coupled oscillators, social networks, web PageRank, sensor networks, power grids, and epidemics. Recommended Course Background: Linear Algebra (AS.110.201), Control Systems (EN.520.353), or equivalents, basic Matlab skills, and sufficient mathematical maturity.
Instructor(s): E. Mallada Garcia.

EN.520.631. Ultrasound and Photoacoustic Beamforming. 3.0 Credits.
This course will discuss basic principles of ultrasound and photoacoustic imaging and provide an in-depth analysis of the beamforming process required to convert received electronic signals into a usable image. We will cover basic beamforming theory and apply it to real clinical and preclinical data. The course will culminate with student projects to design and implement a new beamformer derived from the principles taught in class.
Instructor(s): M. Bell.

EN.520.632. Medical Imaging Systems. 3.0 Credits.
This course provides students with an introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality from a signals and systems perspective, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Students will additionally engage in hands-on activities to reconstruct medical images from raw data.
Instructor(s): M. Bell
Area: Engineering.

EN.520.633. Intro To Robust Control. 3.0 Credits.
The subject of this course is robust analysis and control of multivariable systems. Topics include system analysis (small gain arguments, integral quadratic constraints); parametrization of stabilizing controllers; $H_{\infty}$ optimization based robust control design; and LTI model order reduction (balanced truncation, Hankel reduction). Recommended Course Background: EN.520.601 or EN.530.616 or EN.580.616
Instructor(s): Staff
Area: Engineering.
EN.520.634. Modern Biomedical Imaging Instrumentation and Techniques. 3.0 Credits.
An intermediate biomedical imaging course covering modern biomedical imaging instrumentation and techniques as applied to diagnostic radiology and other biomedical applications. It includes recent advances in various biomedical imaging modalities, multi-modality imaging and molecular imaging. The course is team taught by experts in the respective fields and provides a broad based knowledge of modern biomedical imaging to prepare students for graduate studies and research in biomedical imaging. Also, the course will offer tours and practical experience with modern biomedical imaging equipment in clinical and research settings. Co-listed with EN.580.473/773. Background in EN.520.432 or EN.580.472
Prerequisites: Students may not have taken EN.520.434.
Instructor(s): B. Tsui.
EN.520.635. Digital Signal Processing. 3.0 Credits.
Methods for processing discrete-time signals. Topics include signal and system representations, z-transforms, sampling, discrete Fourier transforms, fast Fourier transforms, digital filters. Audits are not permitted.
Prerequisites: Students may earn credit for EN.520.635 or EN.520.435, but not both.
Instructor(s): H. Weinert
Area: Engineering.
EN.520.636. Feedback Control in Biological Signaling Pathways. 3.0 Credits.
This course considers examples of the use of feedback control in engineering systems and looks for counterparts in biological signaling networks. To do this will require some knowledge of mathematical modeling techniques in biology, so a part of the course will be devoted to this.
Instructor(s): P. Iglesias.
EN.520.644. FPGA Synthesis Lab. 3.0 Credits.
An advanced laboratory course in the application of FPGA technology to information processing, using VHDL synthesis methods for hardware development. The student will use commercial CAD software for VHDL simulation and synthesis, and implement their systems in programmable XILINX 20,000 gate FPGA devices. The lab will consist of a series of digital projects demonstrating VHDL design and synthesis methodology, building up to final projects at least the size of an 8-bit RISC computer. Projects will encompass such things as system clocking, flip-flop registers, state-machine control, and arithmetic. The students will learn VHDL methods as they proceed through the lab projects, and prior experience with VHDL is not a prerequisite.
Prerequisites: Students may take EN.520.424 or EN.520.644, but not both.
Instructor(s): P. Pouliquen
Area: Engineering, Quantitative and Mathematical Sciences.
EN.520.645. Audio Signal Processing. 3.0 Credits.
This course gives a foundation in current audio and speech technologies, and covers techniques for sound processing by processing and pattern recognition, acoustics, auditory perception, speech production and synthesis, speech estimation. The course will explore applications of speech and audio processing in human computer interfaces such as speech recognition, speaker identification, coding schemes (e.g. MP3), music analysis, noise reduction. Students should have knowledge of Fourier analysis and signal processing.
Prerequisites: Students make take EN.520.445 or EN.520.645, but not both.
Instructor(s): M. Elhilali
Area: Engineering.
EN.520.646. Wavelets & Filter Banks. 3.0 Credits.
This course serves as an introduction to wavelets, filter banks, multirate signal processing, and time-frequency analysis. Topics include wavelet signal decompositions, bases and frames, QMF filter banks, design methods, fast implementations, and applications. Recommended Course Background: EN.520.435, AS.110.201, C/C++ and Matlab programming experience.
Instructor(s): T. Tran.
EN.520.648. Compressed Sensing and Sparse Recovery. 3.0 Credits.
Sparsity has become a very important concept in recent years in applied mathematics, especially in mathematical signal and image processing, as in inverse problems. The key idea is that many classes of natural signals can be described by only a small number of significant degrees of freedom. This course offers a complete coverage of the recently emerged field of compressed sensing, which asserts that, if the true signal is sparse to begin with, accurate, robust, and even perfect signal recovery can be achieved from just a few randomized measurements. The focus is on describing the novel ideas that have emerged in sparse recovery with emphasis on theoretical foundations, practical numerical algorithms, and various related signal processing applications. Recommended Course Background: Undergraduate linear algebra and probability.
Instructor(s): T. Tran.
EN.520.649. Introduction to Radar Systems. 3.0 Credits.
This course introduces the fundamental concepts of the modern radar system architecture and design. Topics include the major subsystems and functions of a typical radar, the radar range equation and its different forms, radar cross section, signal to noise ratio, and radar modes. We will also discuss antennas, propagation, pulse compression, detection, tracking and many other general radar topics.
Instructor(s): W. Montlouis.
EN.520.651. Random Signal Analysis. 4.0 Credits.
The content for EN.520.651 has been revised with greater emphasis on graphical models, parameter estimation and posterior inference. Topics include probability theory, random variables/vecors, hypothesis testing, parameter estimation, directed and undirected graphical models, the EM algorithm, deterministic and stochastic approximations for EM, Markov chains and random sequences. Additional material may be covered as appropriate. The class is theoretical in nature; new concepts are presented via formula derivations and example problems. Homework assignments may require familiarity with Matlab (or an equivalent computational software).
Instructor(s): A. Venkataraman.
EN.520.652. Extraction of Signals from Noise. 3.0 Credits.
This course is intended to give students an opportunity to do directed research in algorithm development that culminates in a MATLAB program. Students will learn about extracting signals from noise using statistical and non-statistical models. Topics include Kalman filtering, smoothing, interpolation (upsampling), spline fitting, and the numerical linear algebra issues that impact these problems. Emphasis is on fast, compact, stable algorithms. The grade is based on the term project and occasional homework. There are no examinations. Class attendance is mandatory.
Prerequisites: Some background in linear algebra, matrix theory, random signals, and MATLAB.
Instructor(s): H. Weinert.

EN.520.654. Control Systems Design. 3.0 Credits.
Classical and modern control systems design methods. Topics include formulation of design specifications, classical design of compensators, state variable and observer based feedback. Computers are used extensively for design, and laboratory experiments are included.
Prerequisites: Students may earn credit for EN.520.654 or EN.520.454, but not both.
Instructor(s): P. Iglesias
Area: Engineering.

EN.520.657. Product Design Lab. 3.0 Credits.
This project-based course is designed to help students learn how to turn their ideas into commercial products. In the first half of the course, emphasis will be placed on the product development process: student teams will gradually build up a complete "contract book" including a mission statement, competitive analysis, patent review, product specifications, system schematics, economic analysis, development schedule, etc. In the second half of the course, each team will be expected to implement its design and demonstrate a prototype of their product's core functionality. At the end of the semester, a final written report will be submitted in the form of a utility patent. Students are encouraged to take this course in conjunction with Electronic Design Lab (ECE 520.448) in the Spring semester and leverage the groundwork developed here to enable production of a fully functional and marketable prototype by the end of the academic year.
Instructor(s): I. Gannot; S. Ramesh
Area: Engineering.

EN.520.660. The Art of Error Control Coding. 3.0 Credits.
Error control coding is the study and practice of detecting and/or correcting errors that occur in the transmission of digital information over a noisy communication channel, the transferal of information to and from memory and mass storage in a computer, or in any other application where random processes corrupt information. The student will study encoders and decoders for the most important codes in current use and will confront realistic problems in the use of coding. The course will comprise lectures, discussions, and projects.
Instructor(s): A. Cooper
Area: Engineering, Quantitative and Mathematical Sciences.

EN.520.662. Leading Innovation Design Team. 3.0 Credits.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first-hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu
Instructor(s): C. Rizk.

EN.520.663. Leading Innovation Design Team. 3.0 Credits.
Project design course that Complements and/or Builds on Core Knowledge Relevant to Electrical & Computer Engineering with emphasis on multidisciplinary projects. All Projects will be sponsored, have clearly defined objectives, and must yield a Tangible Result at Completion. Project duration can vary between a minimum of 2 semesters and a maximum of 5 years. This course will afford the students the opportunity to use their creativity to innovative and to master critical skills such as: customer/user discovery and product specifications; concept development; trade study; systems engineering and design optimization; root cause; and effective team work. The students will also experience first-hand the joys and challenges of the professional world. The course will be actively managed and supervised to represent the most effective industry practices with the instruction team, including guest speakers, providing customized lectures, technical support, and guidance. In addition, the students will have frequent interactions with the project sponsor and their technical staff. Specific projects will be listed on ece.jhu.edu
Prerequisites: Students may receive credit for only one of the following courses; EN.520.251, EN.520.463 OR EN.520.663.;Laboratory Safety Introductory Course available in MyLearning prior to registration. The course is accessible from the Education tab through the portal my.jh.edu. Please note that this requirement is not applicable to new students registering for their first semester at Hopkins.
Instructor(s): C. Rizk
Area: Engineering.

EN.520.666. Information Extraction. 3.0 Credits.
Introduction to statistical methods of speech recognition (automatic transcription of speech) and understanding. The course is a natural continuation of EN.601.465 but is independent of it. Topics include elementary probability theory, hidden Markov models, and n-gram models using maximum likelihood, Bayesian and discriminative methods, and deep learning techniques for acoustic and language modeling.
Prerequisites: EN.550.310 AND EN.600.120 or equivalent, expertise in C or C++ or Python programming.
Instructor(s): S. Watanabe.
EN.520.673. Magnetic Resonance in Medicine. 3.0 Credits.
This course provides a wide-ranging introduction to the physics and principles of magnetic resonance imaging (MRI). Topics include the resonance phenomenon, relaxation, signal formation, spatial localization, image contrast, hardware, signal processing, and image reconstruction. MATLAB simulation exercises will demonstrate key aspects of MRI and a laboratory component using the clinical MRI systems at the School of Medicine will reinforce concepts learned in class. Textbook "Principles of Magnetic Resonance Imaging" by D. Nishimura (from www.lulu.com) should be obtained before the start of the course. Recommended Course Background: (EN.520.434 or EN.580.473) or (EN.520.432 or EN.580.472). Co-listed with EN.580.476 and EN.580.673.
Instructor(s): M. Schar; P. Bottomley.

EN.520.678. Biomedical Photonics. 3.0 Credits.
This course will cover the basic optics principles including geometric, beam and wave description of light. The course will also cover the basic generation and detection techniques of light and the principles of optical imaging and spectroscopy. After the basis is established, we will focus on some commonly employed optical techniques and tools for biomedical research including various optical microscopy technologies, fiber optics, Raman spectroscopy, Fluorescence (lifetime), FRAT, FRET and FCS. The recent development in tissue optics, biomedical optical imaging/ spectroscopy techniques (such as OCT; multiphoton fluorescence and harmonics microscopy, Structured Illumination, light scattering, diffuse light imaging and spectroscopy, optical molecular imaging, photo- acoustic imaging) will also be discussed. Representative biomedical applications of translational biomedical photonics technologies will be integrated into the corresponding chapters.
Instructor(s): X. Li
Area: Engineering.

EN.520.680. Speech and Auditory Processing by Humans and Machines. 3.0 Credits.
This graduate level seminar focuses on works that are relevant to building advanced systems for information extraction from auditory signals. It loosely compliments and expands on the lecture material from the graduate course EN.520.515. Participants will take turns in presenting and critically discussing selected topics, with an aim of using this knowledge in their research projects. When available, guest speakers may at times contribute or substitute for the presentation of the participants. Recommended Course Background: Completion or concurrent participation in EN.520.515 or consent of the instructor.
Prerequisites: EN.520.445 OR EN.520.645
Instructor(s): H. Hermansky.

EN.520.682. Introduction to Lasers. 3.0 Credits.
This course covers the basic principles of laser oscillation. Specific topics include propagation of rays and Gaussian beams in lens-like media, optical resonators, spontaneous and stimulated emission, interaction of optical radiation and atomic systems, conditions for laser oscillation, homogeneous and inhomogeneous broadening, gas lasers, solid state lasers, Q-switching and mode locking of lasers. Recommended Course Background: EN.520.219 and EN.520.220.
Instructor(s): J. Khurgin.

EN.520.683. Bio-Photonics Laboratory. 3.0 Credits.
This laboratory course involves designing a set of basic optical experiments to characterize and understand the optical properties of biological materials. The course is designed to introduce students to the basic optical techniques used in medicine, biology, chemistry and material sciences. Graduate version of EN.520.483.
Instructor(s): J. Kang; S. Ramesh.

EN.520.686. Physics of Semiconductor Electronic Devices. 3.0 Credits.
The course is designed to develop and enhance the understanding of the physical principles of modern semiconductor electronic and optoelectronic devices. The course starts with the basics of band structure of solid with emphasis on group IV and III-V semiconductors as well as two dimensional semiconductors like graphene. It continues with the statistics of carriers in semiconductors and continues to electronic transport properties, followed by optical properties. The course goes on to investigate the properties of two dimensional electronic gas. The second part of the course describes operational principles of bipolar and unipolar transistors, light emitting diodes, photodetectors, and quantum devices.
Prerequisites: Students may earn credit for EN.520.486 or EN.520.686, but not both.
Instructor(s): J. Khurgin
Area: Engineering.

EN.520.691. CAD Design of Digital VLSI Systems I (Grad). 3.0 Credits.
Graduate students only.
Prerequisites: Student may take EN.520.491 or EN.520.691, but not both.
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.520.692. Mixed-Mode VLSI Systems. 3.0 Credits.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U.
Instructor(s): J. Trmal.

EN.520.693. Silicon models of information and signal processing functions, with implementation in mixed analog and digital CMOS integrated circuits. Aspects of structured design, scalability, parallelism, low power consumption, and robustness to process variations. Topics include digital-to-analog and analog-to-digital conversion, delta-sigma modulation, bioinstrumentation, and adaptive neural computation. The course includes a VLSI design project. Recommended Course Background: EN.521.491 or equivalent.
Instructor(s): P. Pouliquen.

EN.520.700. Masters Research. 3.0 - 10.0 Credits.
Independent research for masters students.
Instructor(s): D. Povey; J. Prince; S. Khudanpur.

EN.520.701. Current Topics in Language and Speech Processing. 1.0 Credit.
This biweekly seminar will cover a broad range of current research topics in human language technology, including automatic speech recognition, natural language processing and machine translation. The Tuesday seminars will feature distinguished invited speakers, while the Friday seminars will be given by participating students. A minimum of 75% attendance and active participation will be required to earn a passing grade. Grading will be S/U.
Instructor(s): J. Trmal.
Area: Engineering.
EN.520.735. Sensory Information Processing. 3.0 Credits.
Analysis of information processing in biological sensory organs and in engineered microsystems using the mathematical tools of communication theory. Natural or synthetic structures are modeled as microscale communication networks implemented under physical constraints, such as size and available energy resources and are studied at two levels of abstraction. At the information processing level we examine the functional specification, while at the implementation level we examine the physical specification and realization. Both levels are characterized by Shannon's channel capacity, as determined by the channel bandwidth, the signal power, and the noise power. The link between the information processing level and the implementation level of abstraction is established through first principles and phenomenological otherwise, models for transformations on the signal, constraints on the system, and noise that degrades the signals.
Instructor(s): A. Andreou.

EN.520.738. Advanced Electronic Lab Design. 3.0 Credits.
This course is the graduate expansion of the EN.520.448 Electronic Design Lab, which is an advanced laboratory course in which teams of students design, build, test and document application specific information processing microsystems. Semester long projects range from sensors/actuators, mixed signal electronics, embedded microcomputers, algorithms and robotics systems design. Demonstration and documentation of projects are important aspects of the evaluation process. For this graduate expansion, all projects will be based on recently published research from IEEE Transactions. The students will be required to fully research, analyze, implement and demonstrate their chosen topic. The emphasis will be on VLSI microsystems, although other topics will also be considered. Open to graduate students only.
Instructor(s): P. Julian.

EN.520.746. Seminar: Medical Image Analysis. 1.0 Credit.
This weekly seminar will focus on research issues in medical image analysis, including image segmentation, registration, statistical modeling, and applications. It will also include selected topics relating to medical image acquisition, especially where they relate to analysis. The purpose of the course is to provide the participants with a background in research in these areas, as well as to promote greater awareness and interaction between multiple research groups within the University. The format of the course is informal. It will meet weekly for approximately 1.5 hours. Students will read selected papers and will be assigned on a rotating basis to lead the discussion. Co-listed as EN.601.856.
Instructor(s): J. Prince; R. Taylor.

EN.520.771. Advanced Integrated Circuits. 1.0 Credit.
Instructor(s): A. Andreou.

EN.520.773. Advanced Topics In Microsystem Fabrication. 4.0 Credits.
Graduate-level course on topics that relate to microsystem integration of complex functional units across different physical scales from nano to micro and macro. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Topics will include emerging fabrication technologies, micro-electromechanical systems, nanolithography, nanotechnology, soft lithography, self-assembly, and soft materials. Discussion will also include biological systems as models of microsystem integration and functional complexity. Perm. Required.
Instructor(s): J. Wang.

EN.520.788. Biomedical Photonics II. 3.0 Credits.
This course serves as the continuation of 580.678(520.678) (Biomedical Photonics Part I). It will cover the advanced topics on biomedical photonics, including (but not limited to) light scattering (Rayleigh and Mie scattering), photon diffusion, polarization (birefringence), fluorescence, lifetime measurements, confocal microscopy, optical coherence tomography, nonlinear microscopy, and super-resolution microscopy. Representative biomedical applications of some of these technologies will be integrated into the relevant chapters. If the lab space becomes available, we will also offer a hand-on lab section (optional) for students to design and build an imaging instrument. Recommended Background: Biomedical Photonics (580.678/520.678), or equivalent background on optics.
Instructor(s): X. Li.

EN.520.800. Independent Study. 1.0 - 3.0 Credits.
Individual, guided study under the direction of a faculty member in the department. May be taken either term by graduate students.
Instructor(s): Staff.

EN.520.801. Dissertation Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.520.802. Dissertation Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.520.890. Independent Study-Summer. 1.0 - 3.0 Credits.
Instructor(s): Staff.

Cross Listed Courses

General Engineering

EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.
Materials Science Engineering
EN.510.314. Electronic Properties of Materials. 3.0 Credits.
Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent. Prerequisites: EN.510.311
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.
EN.510.418. Electronic and Photonic Processes and Devices. 3.0 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.
EN.510.611. Solid State Physics. 3.0 Credits.
An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering.
Instructor(s): T. Poehler
EN.510.612. Solid State Physics. 3.0 Credits.
Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611
Instructor(s): T. Poehler.
EN.510.618. Electronic and Photonic Processes and Devices. 3.0 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

Mechanical Engineering
EN.530.421. Mechatronics. 3.0 Credits.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or EN.520.240 or permission of instructor;
Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.
EN.530.682. Haptic Applications. 4.0 Credits.
An introduction to the required theoretical and practical background in the design and development of haptic applications. Haptic technology enables users to touch and/or manipulate virtual or remote objects in simulated environments or tele-operation systems. This course aims to cover the basics of haptics through lectures, lab assignments, a term project, and readings on current topics in haptics. Through lab assignments, students learn to create haptic-enabled virtual environments using software development toolkits and a haptic device.
Students will be required to complete a project with approval of the instructor. Recommended course background: ME, CS, and ECE graduate and senior undergraduate students who are being enthusiastic to learn about haptics and knowledgeable in basic C++ programming. Students with experience with other programming languages (Python, Java, etc.) should be able to self-tutor themselves to complete lab assignments.
Instructor(s): M. Zadeh.
Biomedical Engineering
EN.580.472. Medical Imaging Systems. 3.0 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): M. Bell
Area: Engineering.
EN.580.483. Nuclear Medicine Imaging. 3.0 Credits.
This course provides an intermediate-level introduction to the instrumentation, image processing and reconstruction methods used in planar nuclear medicine imaging, single-photon emission computed tomography (SPECT) and positron emission tomography (PET). Topics include radioactive decay, nuclear medicine instrumentation including radiation detectors and associated electronics, analytic and statistical iterative tomographic reconstruction, imaging physics, and image quality in the context of these three modalities. This course will be taught at the School of Medicine Campus. Recommended Course Background: EN.520.432/EN.580.472 and EN.520.434/EN.580.473
Instructor(s): A. Rahmim; B. Tsui; E. Frey; Y. Du
Area: Engineering.
Computer Science

EN.601.479. Representation Learning. 3.0 Credits.

Often the success of a machine learning project depends on the choice of features used. Machine learning has made great progress in training classification, regression and recognition systems when "good" representations, or features, of input data are available. However, much human effort is spent on designing good features which are usually knowledge-based and engineered by domain experts over years of trial and error. A natural question to ask then is "Can we automate the learning of useful features from raw data?" Representation learning algorithms such as principal component analysis aim at discovering better representations of inputs by learning transformations of data that disentangle factors of variation in data while retaining most of the information. The success of such data-driven approaches to feature learning depends not only on how much data we can process but also on how well the features that we learn correlate with the underlying unknown labels (semantic content in the data). This course will focus on scalable machine learning approaches for learning representations from large amounts of unlabeled, multi-modal, and heterogeneous data. We will cover topics including deep learning, multi-view learning, dimensionality reduction, similarity-based learning, and spectral learning. Students may receive credit for 601.479 or 601.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra.

Prerequisites: If you have completed EN.600.679 you may not enroll in EN.600.479.
Instructor(s): R. Arora
Area: Engineering.

EN.601.679. Representation Learning. 3.0 Credits.

Graduate level version of 601.479. Students may receive credit for 601.479 or 601.679 but not both. [Analysis or Applications] Required course background: machine learning or basic probability and linear algebra. Co-listed with EN.601.479

Prerequisites: If you have completed EN.600.479 you may not enroll in EN.600.679.
Instructor(s): R. Arora.

Environmental Health and Engineering

https://ehe.jhu.edu/

Housed in both the Whiting School of Engineering and Bloomberg School of Public Health, the Department of Environmental Health and Engineering is the only program of its kind, bringing environmental engineering and public health faculty into a single, collaborative department. The overarching goal of the program is to prepare students to tackle the environmental challenges of the 21st century by both identifying existing and emerging environmental issues and developing innovative policy and technical solutions to address these threats to our environment and mankind.

EHE offers three programs of study to prepare students for a future in interdisciplinary scientific collaboration:

- an undergraduate program (Bachelor of Science in Engineering),
- a Master's program with varied tracks, concentrations, and research opportunities, and
- a doctoral degree program.

Drawing from a number of cross-disciplinary disciplines and approaches, EHE is concerned with identifying, exploring, and ultimately solving environmental problems including (but certainly not limited to):

- air pollution, assessment, management and health outcomes
- aquatic chemistry
- bioinformatics
- climate and health
- drinking water, water reuse, and wastewater treatment
- environmental and economic policy, law, and management
- environmental nanotechnology
- energy and water systems
- epidemiology and epigenetics
- microbiology and microbial ecology
- toxicology, physiology, and metabolomics
- evaluation of environmental program impacts
- hazardous and solid waste engineering and management
- landscape hydrology and transport
- occupational exposure assessment and health impacts
- particle interaction
- pollutant fate and transport

Interdisciplinary, collaborative practices within our academic programs are necessary in order to most effectively identify and address longstanding, environmental questions and problems. Because of its diversity of interests and association with other departments within the university, EHE is able to offer a broad range of study and research opportunities for both undergraduate and graduate students.

Facilities

Our state of the art labs and facilities are well-equipped for research and study within a vast array of interdisciplinary areas of study. On the Homewood campus, EHE offices and laboratories are located in Ames Hall and at the Stieff Building. In addition to computers for scientific modelling laboratories, EHE has two undergraduate teaching labs and many individual laboratories for environmental engineering and health research. Each lab is equipped with a broad array of state-of-the-art analytical equipment for assessment of biologics and chemicals in water, waste water, and soil.

Extensive computer facilities and high speed computing are available both in the department and the university as a whole for computational and modeling studies.

On the Bloomberg campus, EHE offices and laboratories are located on the 6th and 7th floors of the Public Health building. Laboratories include state-of-the-art equipment and facilities for assessment of hazardous environmental chemicals/toxicants (airborne, waterborne, or foodborne) on human health and the exploration of the physiological, immune, genetic, and/or epigenetic origins of these effects.

Students have access to a broad range of core facilities on both campuses including: Mass Spectrometry and Proteomics, Biostatistics, and Data Management, Computational Biology, Genetics Resource Core, High Throughput Chemical Screening Core, Deep Sequencing and Microarray Cores.
Students graduating with a B.S. in Environmental Engineering will have demonstrated:

- (a) an ability to apply knowledge of mathematics, science, and engineering
- (b) an ability to design and conduct experiments, as well as to analyze and interpret data
- (c) an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability
- (d) an ability to function on multidisciplinary teams
- (e) an ability to identify, formulate, and solve engineering problems
- (f) an understanding of professional and ethical responsibility
- (g) an ability to communicate effectively
- (h) the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context
- a recognition of the need for, and an ability to engage in life-long learning
- (i) a knowledge of contemporary issues
- (k) an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

and, the following specific Environmental Engineering outcomes:

- EE(1a) Understand and apply the principles upon which engineering practice is based: physical, chemical, and biological science
- EE(1b) Understand and apply the principles upon which engineering practice is based: mathematics and scientific computation
- EE(1c) Understand and apply the principles upon which engineering practice is based: economics
- EE(1d) Understand and apply the principles upon which engineering practice is based: engineering science
- EE(2) – Have the knowledge and skills to design, conduct, and evaluate experiments
- EE(3) – Understand the cross-media (air, water, earth) nature of environmental problems and the need for multidisciplinary approaches to their solution.
- EE(4) – Be able to design systems, components, or processes that provide engineering solutions to environmental problems given realistic economic, social, political, ethical, health, safety, and sustainability constraints
- EE(5) – Demonstrate critical thinking skills and ability for independent study needed to engage in life-long learning
- EE(6) – Possess the knowledge and skills to identify, formulate, and implement solutions to engineering problems using modern engineering tools and synthesizing different fields of knowledge
- EE(7) – Can communicate both orally and in writing, and effectively function in multidisciplinary teams
- EE(8) – Understand contemporary issues, the social nature of environmental problems, and the context in which environmental engineering is practiced in modern society
- EE(9) – Have access to specialized training through coursework and research
- EE(10) – Understand professional ethics and the value of service through participation in technical activities and in professional organizations

Working with faculty on both campuses, students conduct research in our local, regional, national, and global laboratories and field sites.

**Undergraduate Programs**

The Department of Environmental Health and Engineering offers:

- an undergraduate Bachelor of Science (B.S.E.) degree in Environmental Engineering
- four focus areas within the environmental engineering major:
  - Environmental Management and Economics
  - Environmental Engineering Science
  - Environmental Transport
  - Environmental Health Engineering
- three minors:
  - a minor in environmental engineering
  - a minor in environmental sciences
  - a minor in engineering for sustainable development
- a five-year combined (B.S./M.S. or B.S./M.S.E.) program.

As part of these minor programs, or as part of other programs of the student's own design, the department offers electives in such areas as ecology, geomorphology, water and wastewater pollution treatment processes, environmental systems analysis, and environmental policy studies.

**Major in Environmental Engineering**

The mission of our undergraduate program is to provide students with a broadly based yet rigorous education in the fundamental subjects central to the field, in a milieu that fosters development of a spirit of intellectual inquiry and the problem-solving skills required to address the open-ended issues characteristic of the real world.

Our B.S. program provides a strong foundation in the physical, chemical, and biological sciences, as well as in mathematics, engineering science, and engineering design. It is broad and flexible enough to accommodate students with a variety of interests in environmental engineering. This training should provide an ideal preparation for future employment in business or industry or for subsequent training at the graduate level, either in environmental engineering or in a field such as environmental law, public health, or medicine.

**Program Objectives**

The B.S. in Environmental Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

**ABET Program Educational Objectives**

The BSEE Program Educational Objectives focus on objectives that our graduates are expected to attain within a few years of graduation. The objectives were reviewed and approved by our external advisory committee in May 2015. The objectives are stated as follows:

The Program in Environmental Engineering educates students to think critically, communicate clearly, and collaborate effectively as they apply the fundamental scientific principles of engineering to environmental problems. We emphasize the importance of intellectual growth, professional ethics, and service to society. Our graduates are prepared to be successful

- engineering professionals in private and governmental organizations, and
- students in the best graduate programs.
Environmental Health and Engineering

Annual Student Enrollment and Graduation Data
Academic Year/ Total Enrolled/ Total Graduated
2015-16/ 61/ 18
2016-17/ 56/ 13
2017-18/ 45/ 9

Continuous Improvement
The Department of Environmental Health and Engineering strives to continuously improve its curriculum by using performance criteria to regularly assess its program educational objectives (what skills it expects its students to demonstrate). The environmental engineering program uses the results of each assessment to continuously improve upon its curriculum and thus ensure that it is meeting the needs of its students.

Our department is noted for our students' exceptionally high pass rate of the "Fundamentals of Engineering" (FE) exam offered by the National Council of Examiners for Engineering and Surveying (NCEES).

Focus Areas within the Environmental Engineering (EE) Major
Students must select among four different focus areas:

- Environmental Management and Economics
- Environmental Engineering Science
- Environmental Transport
- Environmental Health Engineering

With the assistance of a faculty advisor, each student will plan a curriculum suited to his or her ultimate career goals. The program also encourages and supports individual study and research. Program requirements total 125 credits.

Mathematics with a focus on applications (19 credits)

Humanities and Social Sciences (HS) (18 credits)
A minimum of six courses totaling 18 credits in Humanities or Social Sciences. The six courses must include:

1. one advisor-approved course that specifically develops writing skills (e.g., a how to write class),
2. EN.570.334 Engineering Microeconomics, and
3. four additional Humanities and Social Sciences courses with at least two at the 300-level or higher. EN.570.406 Environmental History can be taken as part of these requirements.

Please note that the writing course will fulfill one of the two writing intensive courses required by the university.

Note: most medical schools require a year of English literature and/or composition.

The Design and Synthesis sequence is a five-credit project course (2 credits fall semester, 3 credits spring semester) and involves a comprehensive study of the engineering design process from problem definition to final design. The course involves team projects that include written and oral presentations. Students will form small teams that will work with local companies or government agencies in executing the project. Prerequisite: senior standing in the Environmental Engineering major.

</table>

Technical Electives (TE) (minimum of 12 credits) (selected in consultation with an advisor)

At least three Engineering, Quantitative Studies, or Natural Sciences at or above the 300-level, subject to approval by the department totaling at least 12 credits.

Technical electives must fulfill the following requirements:

1. TEs must total 12 credits of advanced 300-level Engineering, Quantitative Studies, or Natural Sciences courses, and
2. TEs must be approved by the department. (For ABET requirements at least one from: Solid Waste; Hazardous Waste; Air Pollution; Environmental Health Engineering, if not satisfied as part of the Environmental Engineering electives.) Up to six credits of independent study or research may be applied toward engineering requirements (e.g., EN.570.501 Undergraduate Research/EN.570.502 Undergraduate Research, EN.570.505 Undergraduate Independent Study, or Senior Thesis). Note earlier comments for premedical majors.

It is strongly recommended that students take additional advanced classes in computing and numerical methods. EE students are strongly encouraged to take at least one course in organic chemistry (e.g., AS.030.205 Introductory Organic Chemistry I). The organic chemistry course will meet the TE requirement.

Guidance for Technical Electives for the EE Major

Technical electives are intended to provide students with courses with technical content and extend mastery in appropriate subject matter.

- TEs require use of fundamental science or mathematics, have appropriate prerequisites (e.g., university-level calculus, physics, chemistry, or other N or Q courses) and generally at a 300-level or higher.
- TEs must have the appropriate level of rigor which is defined as encompassing both of the following requirements:
  - 5-10 homework assignments; and
  - a culminating project (final project, group project, paper) or final examination. Lecture-only classes (no homework or exams) will not qualify as a TE for the EE major.
- TEs require accumulation and depth of analytical skill or knowledge. In general, this precludes survey courses or courses that have no technical prerequisites that are taught by multiple professors or a series of guest lecturers, or cover a broad spectrum of a topic instead of building mastery in one area.

Exceptions are possible only with the approval of either the Departmental Chair or Director of Undergraduate Studies.
Sample EE Program (Focus Area: Environmental Engineering Science)

Note: This program is based on the assumption that students have not previously completed A.P. courses in calculus, physics, chemistry, etc.

**Minor in Environmental Engineering**

Environmental engineers play particularly pivotal roles as professionals who bridge the gap between understanding complex scientific concepts and helping to formulate public policies that affect the environment. Environmental engineering has become an important aspect of engineering practice in most engineering fields, and the discipline spans the professional spectrum from the private sector through governmental agencies to academia. An undergraduate minor in environmental engineering allows engineering students to pursue an interest in this field and to incorporate aspects of environmental engineering into careers in other engineering disciplines.
Students in any undergraduate major in the Whiting School of Engineering are eligible for admission to the environmental engineering minor program. Students will work with an advisor in the Department of Environmental Health and Engineering to develop a program that meets the requirements for the minor and is consistent with the educational requirements of their major field of engineering study.

Requirements of the EE minor program consist of:

- a set of required core science and mathematics courses, already common to civil and chemical engineering majors;
- four required courses in environmental engineering (total of 12 credits, listed below); and
- two elective courses, one taken at the freshman or sophomore level, and the other taken at the junior or senior level.

**Core Courses (EE Minor)**

Advanced placement credits and/or equivalent courses in other schools or departments are acceptable, subject to advisor approval.

**Elective Courses**

(Total of 6 credits) one course from each of two groups is required. Double counting of these courses with specified required courses in the student’s major is not allowed. Substitution for one required course may be possible under special circumstances, with explicit approval of the environmental engineering minor advisor. Additional course electives are possible but require approval of the environmental engineering minor advisor.

**Group A**

Introductory courses at the freshman and sophomore level. One course required.*

**Minor in Environmental Sciences**

The environmental sciences minor has been developed to encourage and facilitate studies in environmental sciences by students completing degrees in the other science and engineering disciplines. The environmental sciences (ES) minor requires:

- completion of a set of courses in the core sciences,
- two introductory courses dealing with the environment, and
- three or more upper-level environmental sciences courses, as described.

**Core Sciences (ES Minor)**

Because of the interdisciplinary nature of environmental science, it is important that professionals from various areas of expertise acquire a common language and set of core concepts to make discussion and cooperation possible. The following courses represent the minimum set of requirements:

**Mathematics (12 credits)**

<table>
<thead>
<tr>
<th>Course Code</th>

<tr>
<td>AS.110.109</td>
<td>Calculus II (For Physical Sciences and Engineering)</td>
<td>4</td>
</tr>
</tbody>
</table>

At least one of the following courses:

- AS.110.201  Linear Algebra
- AS.110.210 Honors Linear Algebra
- AS.110.202  Calculus III
- AS.110.211 Honors Multivariable Calculus
- AS.110.302  Differential Equations and Applications
One course, such as:
AS.020.151 General Biology I 3

Physics (10 credits)
AS.171.101 General Physics: Physical Science Major I 4
or AS.171.107 General Physics for Physical Science Majors (AL) 4
AS.171.102 General Physics: Physical Science Major II 4
or AS.171.108 General Physics for Physical Science Majors (AL) 4
AS.173.111 General Physics Laboratory I 1
AS.173.112 General Physics Laboratory II 1

Chemistry (13 credits)
AS.030.101 Introductory Chemistry I 3
AS.030.105 Introductory Chemistry Laboratory I 1
AS.030.106 Introductory Chemistry Laboratory II 1

Total Credits 30

Environmental Sciences
Students must take two introductory courses dealing with the environment and three or more of the upper-level environmental science courses on the following lists:

Introductory Courses (6 credits)
EN.570.110 Introduction to Engineering for Sustainable Development
EN.570.205 Ecology
EN.570.239 Emerging Environmental Issues
AS.270.110 Freshman Seminar: Sustainable + Non-Sustainable Resources
AS.270.220 The Dynamic Earth: An Introduction to Geology
AS.270.221 The Dynamic Earth Laboratory

Upper-Level Courses (9 credits)
EN.570.239 Emerging Environmental Issues
EN.570.301 Environmental Engineering Fundamentals I
EN.570.302 Water & Wastewater Treatment
EN.570.328 Geography & Ecology of Plants
EN.570.353 Hydrology
EN.570.411 Engineering Microbiology
EN.570.441 Environmental Inorganic Chemistry
EN.570.442 Environmental Organic Chemistry
EN.570.443 Aquatic and Biofluid Chemistry
EN.570.445 Physical and Chemical Processes I
EN.570.446 Biological Process of Wastewater Treatment
EN.570.491 Hazardous Waste Engineering and Management
AS.270.302 Aqueous Geochemistry
AS.270.311 Geobiology
AS.270.313 Isotope Geochemistry
AS.270.350 Sedimentary Geology
AS.270.369 Geochem Earth/Environmen

Environmental Health and Engineering
Environmental modeling, risk assessment, environmental systems design, pollution control strategies. Illustrative majors: Civil Engineering, Applied Mathematics and Statistics.

Faculty Advising
A faculty advisor is assigned to each student in the environmental sciences minor program to assist in planning his/her academic program and to approve the choice of courses to satisfy the minor. Faculty advisors are available in the following areas:

Minor in Engineering for Sustainable Development
Engineers will be increasingly called upon to help devise solutions to the tremendous problems of poverty, inequality, and social and environmental dislocation that afflict major parts of the globe in the 21st century. Working as an engineer in this context involves negotiating highly complex social, economic, and political realities and dealing with a wide range of institutions and actors, including national and local governments, multilateral lenders such as the World Bank, diverse non-governmental organizations (NGOs), and local communities. It also increasingly involves working in interdisciplinary teams with social scientists, public health and medical workers, humanitarian aid workers, bankers, politicians, and the like. “Sustainable” development implies a development path that is socially equitable, culturally sensitive, and environmentally appropriate over a multi-generational time frame. The minor in Engineering for Sustainable Development exposes engineering students to some of the key issues related to development, methods of information-gathering in diverse and difficult settings, and working effectively with non-engineers on complex problems.

The minor encompasses seven courses. The core course is EN.570.110 Introduction to Engineering for Sustainable Development. Five additional courses will be selected in a program devised in consultation with the minor advisor.

Of the Five Additional Courses
• Three must be grouped around a specific theme, region or within a specific discipline. Themes might include, for example, public health, environment, or economic development. Regions include Africa, Latin America, or Asia. Disciplinary concentrations might be in Anthropology, Economics, Geography, History, Political Science, Public Health, or Sociology.
• Three of the courses must be at the 300-level or above.
• One of the courses must cover methods for gathering and evaluating information in a development context.

Examples include:

**Graduate Programs**

Because of the department's unique cross-divisional affiliation, EHE is able to offer a wide array of masters and doctoral programs at the intersection of public health and engineering. With programs based both on the Bloomberg School of Public Health's East Baltimore campus and on the Whiting School of Engineering's Homewood campus, our graduate students benefit from expertise that is deep and broad in areas that include everything from the science of biological processes and environmental engineering to environmental and health policy and data analytics.

Graduates of the department have found jobs in university departments of civil and environmental engineering, economics, biology, chemistry, geography, and geology; in federal, state, and municipal government; in private industry; and in private research and consulting organizations.

**Ph.D. Degree**

The goals for students in our Ph.D. program are:

• to develop reasoning skills that can be applied to new and unanticipated issues;
• learn how to pose questions and answer them in a logical manner;
• acquire a depth of understanding and technical knowledge in a particular study area, on par with others worldwide; and
• make a significant contribution to our understanding in this particular study area. The emphasis in the Ph.D. degree is upon a sound foundation in the fundamentals required in a given area with considerable flexibility in course selection determined by the interests and background of each graduate student. The doctoral student must take the equivalent of about two full academic years of formal course work. Roughly half of this is done in the principal subject, and the rest is chosen from allied fields. Students may request to move to non-resident status in their final semester, with the approval of the department and Dean's Office once they have completed all exams and a defense date has been scheduled.

All students must pass departmental and Graduate Board oral examinations for the doctorate. Usually these examinations are taken after two years of academic work. Research leading to the dissertation should make an original contribution to the chosen field of specialization, and the result must be worthy of publication. A final dissertation defense that involves an open seminar and a closed oral examination is required of all EHE doctoral students. More information can be found in the departmental advising manual.

**Master of Science (M.S.) Degree**

The M.S. degree is open to students with undergraduate degrees in engineering, mathematics, biology, chemistry, physics, geology, and other scientific disciplines. The M.S. degree program includes the following requirements:

• a minimum of 30 graduate credits including no more than 1 credit of seminar, 1 credit of intersession course work or 1.5 credits from CLE (with advisor approval), and 6 credits of independent research counting toward the 30 credits.
• at least 50% of the required 30 credits must come from courses within the department.
• students are permitted to apply up to two classes with a grade of “C” toward their degree.
• up to two courses from AAP or EP may be taken and counted to receive a master’s degree as long as there is sufficient rigor and prior approval as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

M.S. students have the option to complete an independent research project, submitted as a formal essay. A minimum of two semesters is required to complete the M.S. degree without the research project option. Three to four semesters are typically required to complete the degree with a research project.

M.S. students are strongly recommended to take mathematics-specifically differential equations and computing skills- as prerequisites for the M.S. program. Additionally, M.S. students who choose to follow Contaminant Fate and Transport, Environmental Process Engineering, and Water Resources Engineering concentrations are encouraged to take an introductory fluid mechanics course. Whether introductory fluid mechanics will count towards an M.S. student’s graduation credits is decided on a case-by-case basis by the department. Each individual’s program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

**Concentrations for the M.S. Degree**

**Environmental Science**

This concentration provides a broad yet rigorous background for environmental professionals. Using the department’s areas of interest, study, and research as guides and in consultation with their advisors, M.S. students can construct their own concentration that complements and expands their interests and professional goals. Additionally, M.S. students can choose to follow or pull from the M.S.E. concentration tracks: Contaminant Fate & Transport, Environmental Management and Economics, Environmental Process Engineering, and Water Resources Engineering.

**Environmental Science and Policy**

This concentration is similar to Environmental Science but includes economics and systems courses.

**Master of Science in Engineering (M.S.E.) Degree**

The M.S.E. degree is open to students with an ABET-accredited undergraduate engineering degree or demonstrated equivalent (as determined by the department). The M.S.E. degree program includes the following requirements:

• a minimum of 30 graduate credits including no more than 1 credit of seminar, 1 credit of intersession course work or 1.5 credits from CLE (with advisor approval), and 6 credits of independent research counting toward the 30 credits.
• at least 50% of the required 30 credits must come from courses within the department.
• students are permitted to apply up to two classes with a grade of “C” toward their degree.
• 5-6 required courses and 4-5 recommended elective courses depending on concentration (Note: In order to substitute an alternate course for a recommended elective, students must receive written approval from their advisor).
• prerequisites (required) for the M.S.E. program include mathematics: differential equations and computing skills.
• up to two courses from AAP or EP may be taken and counted to receive a master's degree as long as there is sufficient rigor and prior approval as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

The M.S.E. program is typically a two semester program based on course work alone. However, M.S.E. students have the option to complete an independent research project, submitted as a formal essay or group project report. An M.S.E. degree with significant research components will usually require three to four semesters for completion and is generally intended for those students planning to work in engineering practice. Each individual's program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor. M.S.E. students select from the concentrations below.

Concentrations for the M.S.E. Degree

Contaminant Fate and Transport
This concentration emphasizes understanding of physical, chemical, and biological phenomena that affect the movement and transformation of pollutants in the environment.

Environmental Process Engineering
This concentration involves the analysis and design of processes of water treatment, waste treatment, and environmental remediation, and includes a solid grounding in the chemical, biological, and physical principles underlying treatment and remediation technologies.

Water Resources Engineering
This concentration combines a solid grounding in environmental fluid mechanics and hydrology with electives in modeling, water development planning, policy, and contaminant fate and transport.

Environmental Management and Economics
This concentration focuses on using models of physical and economic systems to analyze and improve the design of public policies and environmental control systems.

M.A. Degree
The M.A. degree is open to students with undergraduate degrees in social sciences or the humanities. It requires:

• a minimum of 30 graduate credits including no more than 1 credit of seminar, 1 credit of intersession course work or 1.5 credits from CLE (with advisor approval), and 6 credits of independent research counting toward the 30 credits.
• at least 50% of the required 30 credits must come from courses within the department.
• students are permitted to apply up to two classes with a grade of “C” toward their degree.
• up to two courses from AAP or EP may be taken and counted to receive a master’s degree as long as there is sufficient rigor and prior approval as deemed by the advisor. Students must have written consent from advisor (an email will suffice) prior to signing up for the course.

M.A. students have the option to complete an independent research project, submitted as a formal essay. Students can focus on one of the department’s areas of interest, study, or research or construct their own program that complements and expands their undergraduate experience; three semesters are typically required to complete the degree. Each program of study is planned by the student in consultation with department faculty and must be approved by the faculty advisor.

For more detailed information about our Graduate programs, including course requirements and research opportunities, visit our website at ehe.jhu.edu

Financial Aid
Financial aid is granted on the basis of merit and availability. Criteria for consideration for these awards include academic excellence, professional or research experience, and career commitment to the field. Ph.D. students receive full financial support. Partial tuition fellowships are offered to qualified master's students.

Furthermore, many students within the department have been awarded graduate research fellowships available to Ph.D. and Masters students through programs administered by the National Science Foundation and the Environmental Protection Agency.

Faculty

Chair
Marsha Wills-Karp
Anna M. Baetjer Professor in Environmental Health and Engineering: allergy, asthma, immunology, pulmonary biology, environmental health, air pollution, genetics of asthma, microbiome

Professors
Jacqueline Agnew
aging workers, occupational health, environmental health, occupational stress, musculoskeletal disorders, ergonomics, neurotoxins

Shyam S. Biswal
electronic cigarettes, cigarette smoke, lung diseases, inflammation, cancer, COPD, emphysema, asthma

Edward J. Bouwer
Abel Wolman Professor of Environmental Engineering: environmental microbiology, waste treatment

Patrick N. Breysse,
industrial hygiene, exposure assessment, pollution, childhood asthma, environmental epidemiology

Grace S. Brush
ecology, paleoecology, plant geography

Srinivasan Chandrasegaran
restriction enzymes, methylases, chimeric nucleases, targeted recombination, zinc finger nucleases, targeted gene correction, targeted gene disruption, homologous recombination

Arthur Dannenberg
tuberculosis, BCG, sulfur mustard, cytokines, adhesion molecules, allergic dermatitis, macrophages and lymphocytes cell mediated immunity, CMI delayed-type hypersensitivity DTH

J. Hugh Ellis
environmental systems

Paul Ferraro
Bloomberg Distinguished Professor of Water and Environmental Economics: evaluation of environmental program impacts, behavioral economics

Robert Fitzgerald, carotid body, chemotransduction, cardiopulmonary control, acetylcholine, catecholamines, gene-based differences in ventilatory response to hypoxia and in morphology/function of the carotid body

Alan Goldberg, toxicology, humane science, in vitro, Center for Alternatives to Animal Testing

John Groopman, chemical carcinogenesis, environmental carcinogenesis, chemoprevention, cancer prevention and control

Steve H. Hanke, applied micro- and macroeconomics and finance

Thomas Hartung

Benjamin F. Hobbs, Theodore K. and Kay W. Schad Professor of Environmental Management: environmental, energy, and water systems, economics

Thomas Inglesby, public health preparedness, global health security, biosecurity and biosafety, emerging infections, pandemic influenza, medicine and vaccine development policy, science diplomacy, preparedness indices, exercises, national policy

Thomas Kensler, chemical carcinogenesis, chemoprevention, hepatocarcinogenesis, reactive oxygen, antioxidants, enzyme induction, aflatoxin, olitipraz, chlorophyllin, sulforaphane, Keap1, Nrf2, triterpenoids

Peter Lees, industrial hygiene, occupational and environmental hygiene, exposure assessment, retrospective exposure assessment, surface contamination, dermal exposure, synthetic vitreous fibers, chromium

Jonathan Links, imaging, dosimetry, radiation, dirty bombs, nuclear medicine, radiological terror, public health preparedness

Wayne Mitzner, the structural basis of physiologic lung function, how this normal structure manifests itself in pathologic situations and environmental exposures

Gurumurthy Ramachandran, exposure assessment, occupational health, exposure models air pollution, Bayesian applications in exposure assessment, nanoparticles, occupational exposures, indoor air pollution, cookstove emissions, exposome

A. Lynn Roberts, environmental chemistry

Erica J. Schoenberger, economic geography, environmental history, environmental politics and policy, history of mining, history of the automobile, interdisciplinary scientific collaboration

Kellogg J. Schwab

Abel Wolman Professor in Water and Public Health: environmental microbiology, microbial fate and transport, water quality, drinking water treatment, disinfection, groundwater, wastewater, sewage, water and wastewater distribution systems, gastroenteritis, diarrhea, enteric pathogens, parasites (cryptosporidium, toxoplasma, giardia), viruses (norovirus, norwalk-like viruses, hepatitis A virus, rotavirus), bacterial indicators of water quality, bacteriophage, antibiotic resistant bacteria, molecular detection of microorganisms (PCR, RT-PCR, microarrays, hybridization), infectious diseases, microbial risk assessment, food borne and waterborne outbreak investigations, urban environmental pollution, airborne microorganisms, concentrated animal feeding operations (CAFO), Chesapeake Bay research

Brian Schwartz, biological markers, cognitive functioning, gene-environment interaction, genetic susceptibility, lead intoxication, molecular epidemiology, neurobehavioral testing, occupational epidemiology, occupational safety and health, retrospective assessment of exposure, solvents, chemicals, global warming, global environmental change, the built environment, unconventional fossil fuels, fracking, environmental epidemiology

Ellen Silbergeld, industrial farming, food safety, molecular devices for pathogen detection, disease modeling, antibiotic-resistant bacteria, heavy metals, environmental and occupational health

Alan T. Stone, environmental and aquatic chemistry

Paul Strickland, environmental and occupational health, molecular biomonitoring, genotoxic agents, carcinogens, genetic polymorphisms, carcinogen metabolites, genetic damage in human populations, molecular epidemiology, exposome

James D. Yager, estrogens, estrogen, estradiol, estrogen metabolism, catechol-O-methyltransferase (COMT), catechols, estrogen receptor, estrogen receptors, carcinogenesis, liver cancer, breast cancer, genetic polymorphisms, environmental disease: molecular mechanisms, pathophysiology molecular, translational toxicology, training program in environmental health sciences

Associate Professors

Steven S. An, exposome and cellular engineering

Daniel Barnett J., public health practice, preparedness, emergency response, training, exercises, evaluation, terrorism preparedness, all-hazards readiness, mental health, organizational change, public health workforce

Joseph P Bressler, neurodevelopmental disorders, epigenetics, biomarkers, environmental toxicology

Gigi Kwik Gronvall, biosecurity, biodefense, biosafety, synthetic biology, emerging biotechnologies, national security, international security, medical countermeasure research and development, science policy

Christopher D. Heaney
environmental epidemiology, occupational and environmental health, infectious diseases Water and health, global climate change, community-based participatory research

Paul A. Locke
environmental law, environmental policy, risk assessment, risk management, radon, radiation, alternatives to animal testing, regulation, uranium mining, space radiation

Norma F. Kanarek
environmental health sciences, public health practice, public health performance, surveillance tracking, community health, community health assessment, applied epidemiology, cancer

Jennifer Nuzzo
public health preparedness, emerging infectious disease, tuberculosis, water security, quarantine, biosurveillance, infectious disease diagnostics, International health regulations, global health security, Affordable Care Act, epidemiology, outbreak detection, outbreak response

Winnie Wan-yeecomeric reprogramming in development and disease, epigenetic epidemiology, DNA methylation, DNA hydroxymethylation, transgenerational inheritance, house dust mite, airborne PAHs, arsenic, endocrine disrupting chemicals, asthma, cardiovascular disease, cancer

Assistant Professors
Jessie Buckley P.
biomarkers, children's environmental health, developmental origins of health and disease, endocrine disruptors, environmental epidemiology, environmental phenols, epidemiologic methods, exposure assessment, exposure mixtures, obesity, occupational epidemiology, perinatal and pediatric epidemiology, phthalates

Meghan Frost Davis
antimicrobial resistance, asthma, environmental epidemiology, environmental microbiology, microbial ecology, microbiome, MRSA, MRSP, one health, staphylococci, veterinary medicine

Ciaran Harman
Russell Croft Faculty Scholar: landscape hydrology and transport

Kirsten Koehler
exposure assessment, aerosols, air quality, spatial statistics

Mark J. Kohr
cardiovascular disease, cardiac physiology, electrophysiology, proteomics, reactive nitrogen species, nitric oxide, s-nitrosylation, reactive oxygen species, nitroso-redox balance, oxidative stress, sex differences

Scot Miller
greenhouse gases, air pollution, atmospheric science

Keeve E. Nachman
arsenic, food systems, risk science, risk assessment, environmental epidemiology, industrial food animal production, animal waste, animal feed, foraging, urban gardens, agriculture, biosolids, veterinary drugs, Chesapeake Bay watershed protection, antimicrobial resistance, exposure assessment, regulatory toxicology, regulatory policy, chemical residues in food

Roni A. Neff
food system, food waste, meat, climate change, agriculture, policy, communication, sustainability, health disparities, Baltimore, history, occupational injury and illness, resilience

Carsten Prasse
environmental chemistry, exposome science, water treatment, environmental health

Sarah Preheim
environmental microbiology, microbial ecology, bioinformatics

Caitlin Rivers
epidemiology, infectious disease modeling, outbreak science, public health preparedness, public health response, open data, biosafety, biodefense, public health policy, national security

Tara Kirk Sell
biosecurity, biodefense, public health preparedness, emerging infectious disease, federal funding, nuclear consequence management, Zika, Ebola, communication, risk, public health policy, emergency response

Fenna Sillé
immunology, immunotoxicology, arsenic, infectious disease, tuberculosis, early-life exposures, metabolomics

Genee S. Smith
climate change, environmental epidemiology, infectious disease, air pollution, extreme weather events

Zhibin Wang
human epigenome, epigenetic code, establishment mechanism of histone codes/patterns, environmental disease, next-generation sequencing, histone acetylation, HATs and HDACs, transcriptional regulation, DNA methylation, asthma, cancer, autoimmune diseases, HIV/AIDS

Crystal Watson
public health and medical preparedness, risk assessment and management, crisis decision making, emergency response, CBRN events, global catastrophic biological risk, terrorism preparedness, emerging infectious diseases, policy and funding analysis

Professor Emeritus
John J. Boland
environmental economics and policy

Research Professor
William P. Ball
environmental engineering, physical and chemical processes, water quality

Associate Teaching Professor
Hedy V. Alavi
Associate Teaching Professor: hazardous and solid waste engineering and management

Senior Research Associate
Katya Tsaioun
mechanisms of toxicity, integration of different streams of Evidence in toxicology and nutrition, determination of risk of bias of toxicological and nutrition studies, grading the evidence, food safety, developing public policy to change consumer behavior

Research Associates
Mary L. Doyle
Courses

EN.570.108. Introduction Environmental Engineering. 3.0 Credits.
Overview of environmental engineering including water/air quality issues, water supply/ wastewater treatment, hazardous/solid waste management, pollution prevention, global environmental issues, public health considerations/environmental laws, regulations and ethics. Cross-listed with Public Health Studies.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.110. Introduction to Engineering for Sustainable Development. 3.0 Credits.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

EN.570.130. Climate, Environment and Society. 3.0 Credits.
Climate change will put major stress on the environment and society. Some predict wars over water and climate-induced mass migration. What can the past teach us about how we cope or fail to cope with climate change? What do we think the future holds and what do we think we can do about it? The class involves reading, discussion, debate and research. Freshman only.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.

EN.570.147. Adam Smith & Karl Marx. 3.0 Credits.
Smith and Marx are iconic figures in the history of political economic thought, often cited, rarely read. They are positioned as polar opposites in highly consequential debates about how society should be ordered. In this class, we will read and discuss their work, closely and carefully. We concentrate on the two iconic texts – The Wealth of Nations and Capital, Vol. 1 – but also explore some of their less well-known writings. Freshmen Only.
Instructor(s): E. Schoenberger, P. Jelavich
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

EN.570.205. Ecology. 3.0 Credits.
Introduction to processes governing the organization of individual organisms into populations, communities, and ecosystems. Interactions between individual organisms, groups of organisms, and the environment, including adaptation, natural selection, competition.
Instructor(s): G. Brush
Area: Natural Sciences.

EN.570.210. Computation/Math Modeling. 3.0 Credits.
An introduction to the use of computers in developing mathematical models. A structured approach to problem definition, solution, and presentation using spreadsheets and mathematical software. Modeling topics include elementary data analysis and model fitting, numerical modeling, dimensional analysis, optimization, simulation, temporal and spatial models. Recommended Course Background: AS.110.108 or equivalent.
Instructor(s): M. Beaudin
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.222. Environment and Society. 3.0 Credits.
Humans make their living in the environment. How we do that changes nature and changes us. This class explores human impacts on the environment, how we have thought about our relationship to nature over the millennia, and contemporary environmental discourses.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences.
EN.570.239. Emerging Environmental Issues. 3.0 Credits.
Scientific principles underpinning environmental issues, with an emphasis on potential impacts of anthropogenic perturbation on human and ecosystem health. Recommended Course Background: two semesters of Chemistry.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.285. Understanding Aid: Anthropological Perspectives for Technology-Based Interventions. 3.0 Credits.
This course combines anthropological perspectives with the discussion and examination of technology-based interventions in the field of development and aid policies, with particular focus on activities related to water resources, sanitation, and hygiene. Readings and discussions analyze some of the theoretical, historically rooted, and practical issues that challenge those who hope to provide effective aid. A key aim of this course is to provide students with better understanding of social, cultural, environmental and economic issues relevant to technical intervention in developing countries.
Instructor(s): E. Cervone; W. Ball
Area: Humanities, Social and Behavioral Sciences.

EN.570.301. Environmental Engineering Fundamentals I. 3.0 Credits.
Fundamentals and applications of physical, chemical and biological processes in the natural environment and engineered systems. This class will cover material balances, chemical equilibrium, chemical kinetics, vapor pressure, dissolution, sorption, acid-base reactions, transport phenomena, reactor design, water quality, and environmental implications of nanotechnology.
Instructor(s): K. Chen
Area: Engineering, Natural Sciences.

EN.570.302. Water & Wastewater Treatment. 3.0 Credits.
Theory and design of water and wastewater treatment processes including coagulation, sedimentation, filtration, adsorption, gas transfer, aerobic and anaerobic biological treatment processes, disinfection, and hydraulic profiles through treatment units.
Prerequisites: EN.570.301 or permission required.
Instructor(s): W. Weiss
Area: Engineering, Natural Sciences.

EN.570.303. Environmental Engineering Principles and Applications. 3.0 Credits.
Fundamentals and applications of physical, chemical, and biological processes in the natural environment and engineered systems. The first part of this class will cover material balances, chemical equilibrium, chemical kinetics, vapor pressure, dissolution, sorption, acid-base reactions, transport phenomena, reactor design, and water quality. The second part of this class focuses on the principles and design of water and wastewater treatment processes, such as coagulation, sedimentation, filtration, biological treatment processes, and disinfection.
Instructor(s): C. Prasse
Area: Engineering, Natural Sciences.

EN.570.304. Environmental Engineering Laboratory. 3.0 Credits.
Introduction to laboratory measurements relevant to water supply and wastewater discharge, including pH and alkalinity, inorganic and organic contaminants in water, reactor analysis, bench testing for water treatment, and measurement and control of disinfection by-products. Recommended Course Background: EN.570.210 or Instructor Permission.
Prerequisite: EN.570.303.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.305. Environmental Health and Engineering Systems Design. 4.0 Credits.
Techniques from systems analysis applied to environmental engineering design and management problems: reservoir siting, nuclear waste management, air pollution control, and transportation planning. Design projects are required.
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.314. Microbial Ecology. 3.0 Credits.
This course will highlight the latest methods in biotechnology revealing ecological principles determining the diversity and dynamics of microbial communities in a variety of ecosystems. We will explore advanced topics in ecology, such as niche theory, cooperation and speciation with examples from human health, engineering and environmental microbiology. Recommended Course Background: Ecology - EN.570.205 or Microbiology - AS.020.329
Instructor(s): S. Preheim
Area: Natural Sciences.

EN.570.328. Geography & Ecology of Plants. 3.0 Credits.
Patterns of aquatic and terrestrial plant species; historical changes in patterns using paleobotanical techniques; emphasis on biological and physical mechanisms controlling the patterns; the role of climate and man on plant distributions; several field trips; project required, which is the basis for the final grade.
Instructor(s): G. Brush
Area: Natural Sciences.

EN.570.334. Engineering Microeconomics. 3.0 Credits.
This course uses a calculus-based approach to introduce principles of engineering economics and microeconomics (demand and production theory) and their uses in engineering decision making. Recommended Course Background: AS.110.202
Instructor(s): B. Hobbs; P. Ferraro
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.351. Introduction to Fluid Mechanics. 3.0 Credits.
Introduction to the use of the principles of continuum, momentum, and energy to fluid motion. Topics include hydrostatics, ideal-fluid flow, laminar flow, turbulent flow. Recommended Course Background: Statics, Dynamics, and AS.110.302
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. Kim
Area: Engineering.

EN.570.353. Hydrology. 3.0 Credits.
The occurrence, distribution, movement, and properties of the waters of the Earth. Topics include precipitation, infiltration, evaporation, transpiration, groundwater, and streamflow. Analyzes include the frequency of floods and droughts, time-series analyzes, flood routing, and hydrologic synthesis and simulation. Recommended Course Background: AS.110.302, EN.570.351
Instructor(s): C. Harman
Area: Engineering.
EN.570.395. Principles of Estuarine Environment: Chesapeake Bay. 3.0 Credits.
Topics include the physical, chemical, and biological components of the Chesapeake Bay ecosystem from the time it started to form some 10,000 to 12,000 years ago, when sea level began to rise as the continental glaciers receded; the geology, geomorphology, and biology of the watershed drained by the estuary; relationships between the watershed and the estuary through the millennia and the effect of climate, geomorphology, and humans on the ecology of the ecosystem and its economic productivity.
Instructor(s): G. Brush
Area: Engineering, Natural Sciences.

EN.570.402. Practicum on Appropriate and Sustainable Technology for Developing Communities. 2.0 Credits.
Suggested: Microeconomics, Introductory Statistics and Optimization.
Instructor(s): W. Ball
Area: Engineering.

EN.570.403. Ecology. 3.0 Credits.
This is a graduate level of EN.570.205; Additional Writing Requirements.
Instructor(s): G. Brush
Area: Natural Sciences
Writing Intensive.

EN.570.406. Environmental History. 3.0 Credits.
Environmental history explores the interactions between social change and environmental transformation, or the ways in which societies modify landscapes and are themselves affected by geological, climatological and changing ecological conditions. Topics include the relationship between climate change and human evolution, the environmental impacts of market-based commodity production and regional economic specialization; the relationship between urbanization and environmental change; how warfare affects and is affected by environmental conditions.
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

EN.570.411. Engineering Microbiology. 4.0 Credits.
Fundamental aspects of microbiology and biochemistry as related to environmental pollution and water quality control processes, biogeochemical cycles, microbiological ecology, energetics and kinetics of microbial growth, and biological fate of pollutants.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.412. Landscape Hydrology and Watershed Analysis. 3.0 Credits.
The purpose of this class is to understand the landscape-scale controls on the fluxes of water and waterborne materials through watersheds. This class differs from the Hydrology and Hydrologic Modeling classes in its focus on data analysis, and its embrace of the complexity of real landscapes. There will be significant quantitative components to the material taught, but emphasis will be on developing a greater sense of the way that landscapes "function", and how this function is related to real-world issues of water resources and pollution. Students will gain an understanding of how climate, geologic and ecosystem setting, and human impacts control the partitioning of water between different fates, the flowpaths through the landscape and the storage and residence time of water. They will also learn conceptual and practical tools for analyzing hydrologic and other landscape data, and integrating this data in a holistic approach to watershed analysis. The class will be of interest for students intending to go into watershed or landscape management, and anyone wishing to pursue research in hydrology, geomorphology or ecology at landscape and watershed scales. The class will include at least one field trip to an instrumented watershed. GIS skills will be an advantage but are not required.
Instructor(s): C. Harman.

EN.570.415. Current Trends in Environmental Microbiology. 3.0 Credits.
This course will highlight recent discoveries and advances in environmental microbiology such as the identification of novel microbes, changing paradigms in nitrogen cycling, single-cell activity methods and novel methods in microbial community analysis. We will explore these topics by reading and discussing the current literature, supported by short lectures and in class activities related to the topics. Background in microbiology or microbial ecology is recommended. This course will meet with EN.570.615.
Instructor(s): S. Preheim
Area: Engineering, Natural Sciences.

EN.570.416. Data Analytics in Environmental Health and Engineering. 3.0 Credits.
Data analytics is a field of study involving computational statistics, data mining and machine learning, to explore data sets, explain phenomena and build predictive models. The course begins with an overview of some traditional analysis approaches including ordinary least squares regression and related topics, notably diagnostic testing, detection of outliers and methods to impute missing data. More recent developments are presented, including ridge regression. Generalized linear models follow, emphasizing logistic regression and including models for polynomous data. Variable subsetting is addressed through stepwise procedures and the LASSO. Supervised machine learning topics include the basic concepts of boosting and bagging and several techniques: Decision Trees, Classification and Regression Trees, Random Forests, Conditional Random Forests, Adaptive Boosting, Support Vector Machines and Neural Networks. Unsupervised machine learning approaches are addressed through applications using k-means Clustering, Partitioning Around Medoids and Association Rule Mining. Methods for assessing model predictive performance are introduced including Confusion Matrices, k-fold Cross-Validation and Receiver Operating Characteristic Curves. Public health and environmental applications are emphasized, with modeling techniques and analysis tools implemented in R.
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.
EN.570.418. Multiobjective Programming and Planning. 3.0 Credits.
Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Undergraduate level of EN.570.618. Recommended Prerequisites: EN.570.495, EN.570.305, EN.553.361.
Prerequisites: EN.570.495 or similar course in operations research/linear programming.
Instructor(s): J. Williams
Area: Engineering.

EN.570.419. Environmental Engineering Design I. 2.0 Credits.
Through general lectures and case study examples, this course will expose students to some of the non-technical professional issues that they will face as professional engineers and in their second-semester senior design project.
Instructor(s): E. Bouwer
Area: Engineering.

EN.570.420. Air Pollution. 3.0 Credits.
The course consists of an introduction to the fundamental concepts of air pollution. Major topics of concern are aspects of atmospheric motion near the earth's surface; basic thermodynamics of the atmosphere; atmospheric stability and turbulence; equations of mean motion in turbulent flow, mean flow in the surface boundary layer; mean flow, turbulence in the friction layer; diffusion in the atmosphere; statistical theory of turbulence; plume rise. Emphasis is placed upon the role and utility of such topics in a systems analysis context, e.g., development of large and mesoscale air pollution abatement strategies. Comparisons of the fundamental concepts common to both air and water pollution are discussed. This course meets with EN.570.657, Air Pollution.
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.421. Environmental Engineering Design II. 3.0 Credits.
Engineering design process from problem definition to final design. Team projects include written/oral presentations. Students will form small teams that work with local companies or government agencies in executing the project. Recommended Course Background: EN.570.302, EN.570.352, and EN.570.419
Instructor(s): E. Bouwer; H. Alavi
Area: Engineering.

EN.570.428. Problems in Applied Economics. 3.0 Credits.
This course focuses on a monetary approach to national income determination and the balance of payments. Money and banking, as well as commodity and financial markets, are dealt with under both central banking, as well as alternative monetary regimes. Particular emphasis is placed on currency board systems. Students learn how to properly conduct substantive economic research, utilizing primary data sources, statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers of publishable quality. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be pre-screened for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a pre-requisite.
Prerequisites: EN.660.203 AND AS.180.101 AND AS.180.102
Instructor(s): S. Hanke
Area: Social and Behavioral Sciences
Writing Intensive.

EN.570.429. Methods in Microbial Community Analysis. 3.0 Credits.
This course will provide a practical knowledge of molecular methods used to identify microorganisms present with a sample and gain insight into their function and dynamics. It will provide theoretical background into how to identify microorganisms and infer functional capabilities from genetic material, practical knowledge of common molecular methods and computational skills needed to analyze the resulting sequence data. No background in molecular biology, computation or microbiology is necessary. Course objectives include (1) understanding key aspects of microbial community composition from literature reports; (2) recognizing major microbial taxonomic groups and understanding phylogenetic relationships; (3) developing molecular biology lab skills required to create gene amplicon libraries from an aquatic samples; (4) working knowledge of statistical methods used to associate taxonomic and functional gene information with specific environmental conditions. Recommended Course Background: Microeconomics, Introductory Statistics, Optimization. Open to undergraduates. Co-listed with EN.570.619
Instructor(s): S. Preheim
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.431. Collaborative Modeling for Resolving Water Resources Disputes. 3.0 Credits.
Overview of collaborative modeling in water resources, Economic issues in water resources disputes, Legal issues in water resources disputes, Biological/Environmental issues in water resources disputes, Water management in the Delaware Basin, Understanding and using the Delaware River Basin Commission's water management tool (an OASIS based model of the Delaware, Multi-objective water management, Understanding management trade-offs, Collaborative processes, Reality based negotiation skills, and Consensus building. Recommended Course Background: A strong interest in utilizing scientific tools to help resolve real-world disputes A background in general science -- with at least two of the following disciplines: Biology, chemistry, physics, earth science, economics.
Instructor(s): D. Sheer
Area: Engineering, Quantitative and Mathematical Sciences.
EN.570.435. Principles of Estuarine Environment: Chesapeake Bay. 3.0 Credits.
Topics include the physical, chemical, and biological components of the Chesapeake Bay ecosystem from the time it started to form some 10,000 to 12,000 years ago, when sea level began to rise as the continental glaciers receded; the geology, geomorphology, and biology of the watershed drained by the estuary; relationships between the watershed and the estuary through the millennia and the effect of climate, geomorphology, and humans on the ecology of the ecosystem and its economic productivity.
Instructor(s): G. Brush
Area: Engineering, Natural Sciences.

EN.570.441. Environmental Inorganic Chemistry. 3.0 Credits.
Advanced undergraduate/graduate course that explores the chemical transformations of elements of the periodic table. Thermodynamic, kinetic, and mechanistic tools needed to address the multiple chemical species and interfaces that are present in natural waters and water-based technological processes are emphasized. Ligand exchange, metal ion exchange, adsorption/desorption, precipitation/dissolution, electron and group transfer reactions, and other concepts from coordination chemistry will be covered. Applications include elemental sources and sinks in ocean waters, reactive transport in porous media, weathering and soil genesis, nutrient and toxic element uptake by organisms, water treatment chemistry, and rational design of synthetic chemicals. Co-listed with EN.570.641
Instructor(s): A. Stone
Area: Natural Sciences.

EN.570.442. Environmental Organic Chemistry. 3.0 Credits.
Advanced undergraduate/graduate course focusing on examination of processes that affect the behavior and fate of anthropogenic organic contaminants in aquatic environments. Students learn to predict chemical properties influencing transfers between hydrophobic organic chemicals, air, water, sediments, and biota, based on a fundamental understanding of intermolecular interactions and thermodynamic principles. Recommended Course Background: AS.030.104 or permission required.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.443. Aquatic and Biofluid Chemistry. 3.0 Credits.
Equilibrium speciation of natural waters, biofluids, and engineered systems. Topics include acids, bases, pH, and buffering; the precipitation and dissolution of solids; complexation and chelation; oxidation and reduction reactions; regulation and design. Intended for students from a variety of backgrounds. Recommended Course Background: One year of both Chemistry and Calculus. Meets with EN.570.643 (Aquatic and Biofluid Chemistry).
Instructor(s): A. Stone
Area: Engineering, Natural Sciences.

EN.570.445. Physical and Chemical Processes I. 3.0 Credits.
The application of basic physical and chemical concepts to the analysis of environmental engineering problems. Principles of chemical equilibrium and reaction, reaction engineering, interphase mass transfer, and adsorption are presented in the context of process design for unit operations in common use for water and wastewater treatment. Topics addressed include mass balances, hydraulic characteristics of reactors, reaction kinetics and reactor design, gas transfer processes (including both fundamentals of mass transfer and design analysis), and adsorption processes (including both fundamentals of adsorption and design analysis).
Prerequisites: EN.570.301 AND EN.570.302 or permission of instructor
Instructor(s): W. Ball
Area: Engineering.

EN.570.446. Biological Process of Wastewater Treatment. 3.0 Credits.
Fundamentals and application of aerobic and anaerobic biological unit processes for the treatment of municipal and industrial wastewater.
Recommended Course Background: EN.570.411
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.448. Physical and Chemical Processes II. 3.0 Credits.
Fundamentals and applications of physical and chemical processes used in water and wastewater treatment. This class will cover particle interactions, coagulation, flocculation, granular media filtration, membrane processes, and emerging water treatment processes.
Recommended Course Background: EN.570.445 or Permission Required.
Instructor(s): H. Arora
Area: Engineering.

EN.570.449. Social Theory for Engineers. 3.0 Credits.
Engineers work in a social context. This course addresses a number of questions about that social context. How should we understand how societies come about, how they evolve, and why the rules of the game are what they are? What is the relationship between the individual and society, what does it mean to be 'modern,' are there different forms of rationality? How might all this impinge on what it means to be an engineer?
Instructor(s): E. Schoenberger
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

EN.570.452. Experimental Methods in Environmental Engineering and Chemistry. 4.0 Credits.
An advanced laboratory covering principles of modern analytical techniques and their applications to problems in environmental sciences. Topics include electrochemistry, spectrometry, gas and liquid chromatography. The course is directed to graduate students and advanced undergraduates in engineering and natural sciences. Co-listed with EN.570.652
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): A. Stone
Area: Engineering, Natural Sciences
Writing Intensive.
EN.570.454. Geostatistics: Understanding Spatial Data. 3.0 Credits.
Spatial and geographic datasets are becoming increasingly common with improvements in data collection technologies. For example, satellites are able to collect more and more types of earth/environmental data, and web technologies (e.g., social media and e-commerce) provide vast new datasets on social, economic, and public health phenomena. However, many common statistical tools are ill-suited to spatial datasets; these datasets often exhibit complex spatial (and temporal) dependencies that require a special set of tools. In this course, students will learn how to quantitatively analyze, model, and predict spatial and spatiotemporal phenomena. Topics will include quantifying the spatial and temporal properties of data, interpolation and prediction, multivariate models, modeling uncertainty, measurement design, and strategies for very large datasets. We will draw examples from a wide variety of academic disciplines, including environmental engineering, earth science, public health, and political science. Pre-requisites: An introductory course in statistics is recommended. Knowledge of a scientific programming language (e.g., Matlab, R, or Python) will also be helpful.
Instructor(s): S. Miller
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.470. Applied Economics & Finance. 3.0 Credits.
This course focuses on company valuations, using a Probabilistic Discounted Cash Flow Model. Students use the model and primary data from financial statements filed with the Securities and Exchange Commission to calculate the value of publically-traded companies. Using Monte Carlo simulations, students also generate forecast scenarios, project likely share-price ranges and assess potential gains/losses. Stress is placed on using these simulations to diagnose the subjective market expectations contained in current objective market prices, and the robustness of these expectations. During the weekly seminar, students company valuations are reviewed and critiqued. A heavy emphasis is placed on research and writing. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be pre-screened for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a pre-requisite.
Prerequisites: EN.660.203 AND (EN.570.428 OR AS.360.528)
Instructor(s): S. Hanke
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences
Writing Intensive.

EN.570.490. Solid Waste Engineering and Management. 3.0 Credits.
This course covers advanced engineering and scientific concepts and principles applied to the management of municipal solid waste (MSW) to protect human health and the environment and the conservation of limited resources through resource recovery and recycling of waste material.
Instructor(s): H. Alavi
Area: Engineering.

EN.570.491. Hazardous Waste Engineering and Management. 3.0 Credits.
This course addresses traditional and innovative technologies, concepts, and principles applied to the management of hazardous waste and site remediation to protect human health and the environment. Co-listed with EN.570.691
Instructor(s): H. Alavi
Area: Engineering.

EN.570.492. Wolman Seminar - Undergraduates. 1.0 Credit.
Undergraduates only with permission of instructor.
Instructor(s): S. Preheim.

EN.570.493. Economic Foundations for Environmental Engineering and Policy Design. 3.0 Credits.
This course includes an exposition of intermediate level price theory, combined with a survey of applications to the analysis of public sector decisions. Theoretical topics include demand, supply, the function and behavior of the market, and introductory welfare economics.
Recommended Course Background: AS.180.101-AS.180.102, AS.110.202 or equivalent.
Instructor(s): J. Boland
Area: Quantitative and Mathematical Sciences, Social and Behavioral Sciences.

EN.570.495. Environmental Health and Engineering Systems Design. 3.0 Credits.
A collection of systems analytic techniques which are frequently used in the study of public decision making is presented. Emphasis is on mathematical programming techniques. Primarily linear programming, integer and mixed-integer programming, and multiobjective programming.
Recommended Course Background: AS.110.106-AS.110.107/AS.110.109
Instructor(s): J. Ellis
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.496. Urban and Environmental Systems. 3.0 Credits.
The mathematical techniques learned in EN.570.305 and EN.570.495 are applied to realistic problems in urban and environmental planning and management. Examples of such problems include the siting of public-sector and emergency facilities; natural areas management, protection and restoration; solid waste collection, disposal, and recycling; public health; the planning and design of energy and transportation systems; and cost allocation in environmental infrastructure development.
Instructor(s): J. Williams
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.497. Risk and Decision Analysis. 3.0 Credits.
This class introduces the decision analysis approach to making decisions under risk and uncertainty. Topics covered include decision trees, Bayes law, value of information analysis, elicitation of subjective probabilities, multiattribute utility, and their applications to environmental and energy problems. Textbook: R.T. Clemen, Making Hard Decisions, 2014. Recommended Course Background: introductory statistics and probability.
Instructor(s): B. Hobbs
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.501. Undergraduate Research. 3.0 Credits.
Instructor(s): Staff.

EN.570.502. Undergraduate Research. 0.0 - 3.0 Credits.
Instructor(s): Staff.

EN.570.504. Financial Market Research. 3.0 Credits.
This course investigates the workings of financial, foreign exchange, and commodity futures markets. Research is focused on price behavior, speculation, and hedging in these markets. Extensive research and writing of publishable quality are required. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. An approved research proposal is a pre-requisite.
Instructor(s): S. Hanke
Writing Intensive.
EN.570.505. Undergraduate Independent Study. 3.0 Credits.
Instructor(s): Staff.

EN.570.506. Maryland Department of the Environment Independent Study. 0.0 - 3.0 Credits.
This independent study within the MDE's Water Management Administration (WMA) will engage the student in scientific/policy literature and data research and management, field investigations, or evaluation of emerging issues and innovative approaches to surface and ground water protection and drinking water management, wastewater management, wetlands and non-point source pollution control. Each individual course will focus on a scientific, regulatory or policy topic designed to further the mission of the administration, which is to protect the public health and the aquatic environment. The student will be assigned to a WMA engineer, scientist or project manager to develop a course of study. Hours can be tailored to accommodate student's schedule.
Instructor(s): E. Bouwer.

EN.570.507. Independent Study: Baltimore City Energy Office. 3.0 Credits.
This Independent Study within Baltimore City's Energy Office will engage students in local energy policies, energy initiatives, data and City operations. Interns will have the chance to apply optimization and modeling skills to one of many projects. These projects can include: • Measurement and verification of performance contracts with energy service contractors • Collection of data from City operated co-generation and solar plants and developing operation models • Analyzing energy usage data from City buildings and making recommendations As part of an independent student project, students will be required to submit a final report and present their findings to the City. Hours can be tailored to accommodate student's schedule but a minimum of 10 hours per week during the semester is required. Permission required.
Instructor(s): E. Bouwer.

EN.570.510. Internship-Geog/Envr Eng. 0.0 - 3.0 Credits.
Instructor(s): E. Bouwer.

EN.570.511. Group Undergraduate Research. 3.0 Credits.
This section has a weekly research group meeting that students are expected to attend.
Instructor(s): C. Harman.

EN.570.590. Internship - Summer. 1.0 Credit.
Instructor(s): E. Bouwer; G. Brush; K. Chen; S. Guikema.

EN.570.597. Undergraduate Research-Summer. 3.0 Credits.
Instructor(s): Staff.

EN.570.599. Independent Study. 0.0 - 3.0 Credits.
Instructor(s): A. Roberts; B. Hobbs; S. Guikema.

EN.570.601. IGERT Water, Climate and Health Colloquium. 3.0 Credits.
Instructor(s): G. Brush.

EN.570.602. IGERT-Water, Climate & Health-Capstone. 3.0 - 20.0 Credits.
Instructor(s): G. Brush.

EN.570.603. Ecology. 3.0 Credits.
Introduction to processes governing the organization of individual organisms into populations, communities, and ecosystems. Interactions between individual organisms, groups of organisms, and the environment, including adaptation, natural selection, competition.
Instructor(s): G. Brush.

EN.570.604. Interdisciplinary Research Practice in Sustainability and Health. 3.0 Credits.
Through the application of interdisciplinary research methods and skills to case studies in environmental sustainability and health, the course will provide hands-on training in the management, coordination, and practice of interdisciplinary research. The goal is to enable doctoral students to work effectively on interdisciplinary research and prepare them for professional success in an increasingly interdisciplinary funding environment. This course will be in the format of a weekly seminar and laboratory and is open to all Johns Hopkins University doctoral students from any School. No prior knowledge of sustainability or public health is required.
Instructor(s): A. Monopolis; B. Hobbs.

EN.570.606. Statistical Computing. 1.0 Credit.
This course assumes a basic familiarity with programming in R. Some knowledge of probability and statistics will be a plus. The course introduces some key methods in implementing data-driven research. The course starts with a very brief review of programming in R and basics of probability and statistics and then spans into topics such as random variable generation, Monte Carlo integration, variance reduction techniques, uncertainty estimation, MCMC, probability density estimation and numerical methods. Recommend Course Background: EN.570.608 or equivalent.
Instructor(s): R. Nateghi.

EN.570.607. Energy Policy and Planning Models. 3.0 Credits.
Methods for optimizing operation and design of energy systems and for analyzing market impacts of energy and environmental policies are reviewed, emphasizing both theory and solution of actual models. Review of linear and nonlinear programming and complementarity methods for market simulation. Recommended Course Background: EN.570.493 and EN.570.495 or equivalent.
Instructor(s): B. Hobbs.

EN.570.610. Engineering Microbiology. 4.0 Credits.
Fundamental aspects of microbiology and biochemistry as related to environmental pollution and water quality control processes, biogeochemical cycles, microbiological ecology, energetics and kinetics of microbial growth, and biological fate of pollutants.
Instructor(s): E. Bouwer
Area: Engineering, Natural Sciences.

EN.570.614. Microbial Ecology. 3.0 Credits.
This course will highlight the latest methods in biotechnology revealing ecological principles determining the diversity and dynamics of microbial communities in a variety of ecosystems. We will explore advanced topics in ecology, such as niche theory, cooperation and speciation with examples from human health, engineering and environmental microbiology. Recommended Course Background: Ecology - EN.570.205 or Microbiology - AS.020.329
Instructor(s): S. Preheim
Area: Natural Sciences.

EN.570.615. Current Trends in Environmental Microbiology. 3.0 Credits.
This course will highlight recent discoveries and advances in environmental microbiology such as the identification of novel microbes, changing paradigms in nitrogen cycling, single-cell activity methods and novel methods in microbial community analysis. We will explore these topics by reading and discussing the current literature, supported by short lectures and in class activities related to the topics. Background in microbiology or microbial ecology is recommended. This course will meet with EN.570.415
Instructor(s): S. Preheim
Area: Engineering, Natural Sciences.
EN.570.616. Data Analytics in Environmental Health and Engineering. 3.0 Credits.
Data analytics is a field of study involving computational statistics, data mining and machine learning, to explore data sets, explain phenomena and build predictive models. The course begins with an overview of some traditional analysis approaches including ordinary least squares regression and related topics, notably diagnostic testing, detection of outliers and methods to impute missing data. More recent developments are presented, including ridge regression. Generalized linear models follow, emphasizing logistic regression and including models for polytomous data. Variable subsetting is addressed through stepwise procedures and the LASSO. Supervised machine learning topics include the basic concepts of boosting and bagging and several techniques: Decision Trees, Classification and Regression Trees, Random Forests, Conditional Random Forests, Adaptive Boosting, Support Vector Machines and Neural Networks. Unsupervised machine learning approaches are addressed through applications using k-means Clustering, Partitioning Around Medoids and Association Rule Mining. Methods for assessing model predictive performance are introduced including Confusion Matrices, k-fold Cross-Validation and Receiver Operating Characteristic Curves. Public health and environmental applications are emphasized, with modeling techniques and analysis tools implemented in R. EN.570.616 meets with EN.570.416. Undergraduate (usually Senior) students should sign up for 416 with permission of instructor only. 
Instructor(s): J. Williams
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.618. Multiobjective Programming and Planning. 3.0 Credits.
Public sector problems are typically characterized by a multiplicity of objectives and decision makers. This course presents a relatively new area of systems analysis which is useful for such problems: multiobjective programming or vector optimization theory. The fundamental concepts are developed and various methods are presented, including multiattribute value and utility theory. Graduate level of EN.570.418. Recommended Prerequisites: EN.570.495, EN.570.305, EN.553.361
Instructor(s): J. Williams
Area: Engineering.

EN.570.619. Methods in Microbial Community Analysis. 3.0 Credits.
This graduate level course will provide a practical knowledge of molecular methods used to identify microorganisms present with a sample and gain insight into their function and dynamics. It will provide theoretical background into how to identify microorganisms and infer functional capabilities from genetic material, practical knowledge of common molecular methods and computational skills needed to analyze the resulting sequence data. No background in molecular biology, computation or microbiology is necessary. Course objectives include (1) understanding key aspects of microbial community composition from literature reports; (2) recognizing major microbial taxonomic groups and understanding phylogenetic relationships; (3) developing molecular biology lab skills required to create gene amplicon libraries from an aquatic samples; (4) working knowledge of statistical methods used to associate taxonomic and functional gene information with specific environmental conditions. Recommended Course Background: Microeconomics, Introductory Statistics, Optimization. Co-listed with EN.570.429
Instructor(s): S. Preheim.

EN.570.631. Collaborative Modeling for Resolving Water Resources Disputes. 3.0 Credits.
Overview of collaborative modeling in water resources, Economic issues in water resources disputes, Legal issues in water resources disputes, Biological/Environmental issues in water resources disputes, Water management in the Delaware Basin, Understanding and using the Delaware River Basin Commission’s water management tool (an OASIS based model of the Delaware, Multi-objective water management, Understanding management trade-offs, Collaborative processes, Reality based negotiation skills, and Consensus building. Recommended Course Background: A strong interest in utilizing scientific tools to help resolve real-world disputes A background in general science – with at least two of the following disciplines: Biology, chemistry, physics, earth science, economics.
Instructor(s): D. Sheer
Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.635. Principles of Estuarine Environment: Chesapeake Bay. 3.0 Credits.
Topics include the physical, chemical, and biological components of the Chesapeake Bay ecosystem from the time it started to form some 10,000 to 12,000 years ago, when sea level began to rise as the continental glaciers receded; the geology, geomorphology, and biology of the watershed drained by the estuary; relationships between the watershed and the estuary through the millennia and the effect of climate, geomorphology, and humans on the ecology of the ecosystem and its economic productivity. 
Instructor(s): G. Brush
Area: Engineering, Natural Sciences.

EN.570.641. Environmental Inorganic Chemistry. 3.0 Credits.
Advanced undergraduate/graduate course that explores the chemical transformations of elements of the periodic table. Thermodynamic, kinetic, and mechanistic tools needed to address the multiple chemical species and interfaces that are present in natural waters and water-based technological processes are emphasized. Ligand exchange, metal ion exchange, adsorption/desorption, precipitation/dissolution, electron and group transfer reactions, and other concepts from coordination chemistry will be covered. Applications include elemental sources and sinks in ocean waters, reactive transport in porous media, weathering and soil genesis, nutrient and toxic element uptake by organisms, water treatment chemistry, and rational design of synthetic chemicals. Co-listed with EN.570.441
Instructor(s): A. Stone
Area: Natural Sciences.

EN.570.642. Environmental Organic Chemistry. 3.0 Credits.
Advanced undergraduate/graduate course focusing on examination of processes that affect the behavior and fate of anthropogenic organic contaminants in aquatic environments. Students learn to predict chemical properties influencing transfers between hydrophobic organic chemicals, air, water, sediments, and biota, based on a fundamental understanding of intermolecular interactions and thermodynamic principles. Recommended Course Background: AS.030.104 or permission required.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.
EN.570.643. Aquatic and Biofluid Chemistry. 3.0 Credits.
Equilibrium speciation of natural waters, biofluids, and engineered systems. Topics include acids, bases, pH, and buffering; the precipitation and dissolution of solids; complexation and chelation; oxidation and reduction reactions; regulation and design. Intended for students from a variety of backgrounds. Recommended Course Background: One year of both Chemistry and Calculus. Meets with EN.570.443 (Aquatic and Biofluid Chemistry)
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.644. Physical and Chemical Processes. 3.0 Credits.
The application of basic physical and chemical concepts to the analysis of environmental engineering problems. Principles of chemical equilibrium and reaction, reaction engineering, interphase mass transfer, and adsorption are presented in the context of process design for unit operations in common use for water and wastewater treatment. Topics addressed include mass balances, hydraulic characteristics of reactors, reaction kinetics and reactor design, gas transfer processes (including both fundamentals of mass transfer and design analysis), and adsorption processes (including both fundamentals of adsorption and design analysis).
Instructor(s): W. Ball
Area: Engineering.

EN.570.645. Reaction Mechanisms in Environmental Organic Chemistry. 3.0 Credits.
Detailed investigation of mechanisms of abiotic and biochemical transformations of organic pollutants in natural and engineered environments. Recommended Course Background: EN.570.442.
Instructor(s): A. Roberts
Area: Engineering, Natural Sciences.

EN.570.646. Water Quality and Treatment: Global Issues and Solutions. 3.0 Credits.
This course involves extensive student participation and is intended for motivated graduate students from both engineering and non-engineering disciplines who are interested in understanding technological aspects of water quality in the contexts of drinking water treatment, wastewater disposal, and sanitation for public health. The course involves extensive outside reading, in-class reflections on those readings, and a combination of instructor- and student-led in-class presentations. After this course, students should have improved understanding of: (1) Fundamental concepts of water quality and treatment as related to the application of engineering principles to the design and operation of unit operations for the removal of traditional and "emerging" contaminants; (2) Challenges to providing water of appropriate quality for drinking, sanitation, and environmental sustainability in the face of population growth and climate change; and (3) Alternative approaches for meeting those challenges, particularly as related to the design and application of technological interventions.
Instructor(s): W. Ball.

EN.570.647. Hydrologic Transport in the Environment. 3.0 Credits.
This course considers the transport of solutes and sediments by water through terrestrial landscapes, with an emphasis on the movement of nutrients and contaminants from the landscape into receiving water bodies like rivers, lakes and estuaries. The course will cover the theoretical approaches (advection-diffusion/dispersion, transit time distributions), the use of active and passive tracers to infer transport processes, analysis of water quality time series, runoff generation and flow pathways in watersheds, and the effect of climate variability on transport. Assessment is based on a semester project and in-class presentations. Seniors interested in joining the class must have Hydrology 570.353 and should contact the instructor.
Instructor(s): C. Harman
Area: Engineering, Natural Sciences.

EN.570.648. Chemical Processes II. 3.0 Credits.
The occurrence, distribution, movement, and properties of the waters of the Earth. Topics include precipitation, infiltration, evaporation, transpiration, groundwater, and streamflow. Analyzes include the frequency of floods and droughts, time-series analyzes, flood routing, and hydrologic synthesis and simulation. Recommended Course Background: AS.110.302, EN.570.351
Instructor(s): C. Harman
Area: Engineering.

EN.570.652. Experimental Methods in Environmental Engineering and Chemistry. 4.0 Credits.
An advanced laboratory covering principles of modern analytical techniques and their applications to problems in environmental sciences. Topics include electrochemistry, spectrometry, gas and liquid chromatography. The course is directed to graduate students and advanced undergraduates in engineering and natural sciences. Co-listed with EN.570.452
Prerequisites: EN.570.443 OR EN.570.643 OR Permission of Instructor
Instructor(s): A. Stone
Area: Engineering, Natural Sciences
Writing Intensive.

EN.570.653. Hydrology. 3.0 Credits.
The occurrence, distribution, movement, and properties of the waters of the Earth. Topics include precipitation, infiltration, evaporation, transpiration, groundwater, and streamflow. Analyzes include the frequency of floods and droughts, time-series analyzes, flood routing, and hydrologic synthesis and simulation. Recommended Course Background: AS.110.302, EN.570.351
Instructor(s): C. Harman
Area: Engineering.
EN.570.654. Geostatistics: Understanding Spatial Data. 3.0 Credits. Spatial and geographic datasets are becoming increasingly common with improvements in data collection technologies. For example, satellites are able to collect more and more types of earth/environmental data, and web technologies (e.g., social media and e-commerce) provide vast new datasets on social, economic, and public health phenomena. However, many common statistical tools are ill-suited to spatial datasets; these datasets often exhibit complex spatial (and temporal) dependencies that require a special set of tools. In this course, students will learn how to quantitatively analyze, model, and predict spatial and spatiotemporal phenomena. Topics will include quantifying the spatial and temporal properties of data, interpolation and prediction, multivariate models, modeling uncertainty, measurement design, and strategies for very large datasets. We will draw examples from a wide variety of academic disciplines, including environmental engineering, earth science, public health, and political science. Pre-requisites: An introductory course in statistics is recommended. Knowledge of a scientific programming language (e.g., Matlab, R, or Python) will also be helpful. Instructor(s): S. Miller Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.657. Air Pollution. 3.0 Credits. The course consists of an introduction to the fundamental concepts of air pollution. Major topics of concern are aspects of atmospheric motion near the earth’s surface; basic thermodynamics of the atmosphere; atmospheric stability and turbulence; equations of mean motion in turbulent flow, mean flow in the surface boundary layer; mean flow, turbulence in the friction layer; diffusion in the atmosphere; statistical theory of turbulence; plume rise. Emphasis is placed upon the role and utility of such topics in a systems analysis context, e.g., development of large and mesoscale air pollution abatement strategies. Comparisons of the fundamental concepts common to both air and water pollution are discussed. Instructor(s): J. Ellis Area: Engineering, Quantitative and Mathematical Sciences.

EN.570.656. Stochastic Programming. 3.0 Credits. The course deals with computationally tractable methodologies for incorporating risk/uncertainty into mathematical programming (optimization) models. Focal topics include chance-constrained programming, stochastic linear programming, two-stage programming under uncertainty and stochastic dynamic programming. Some of these techniques may result in the creation of nonlinear models thus nonlinear/nonseparable optimization techniques are presented as well. Numerous applications are presented involving, for the most part, environmental (i.e., water and air resources) problems. Prerequisites: linear programming or equivalent, and introductory probability and statistics. Instructor(s): J. Ellis.

EN.570.659. Solid Waste Engineering and Management. 3.0 Credits. This course covers advanced engineering and scientific concepts and principles applied to the management of municipal solid waste (MSW) to protect human health and the environment and the conservation of limited resources through resource recovery and recycling of waste material. Instructor(s): H. Alavi Area: Engineering.

EN.570.691. Hazardous Waste Engineering and Management. 3.0 Credits. This course addresses traditional and innovative technologies, concepts, and principles applied to the management of hazardous waste and site remediation to protect human health and the environment. Instructor(s): H. Alavi Area: Engineering.

EN.570.693. Economic Foundations for Environmental Engineering and Policy Design. 3.0 Credits. This course includes an exposition of intermediate level price theory, combined with a survey of applications to the analysis of public sector decisions. Theoretical topics include demand, supply, the function and behavior of the market, and introductory welfare economics. Recommended Course Background: AS.180.101-AS.180.102, AS.110.202 or equivalent. This course runs concurrently with EN.570.493 (Undergrads may register by special request for EN.570.493 in order to take this course.) Instructor(s): J. Boland Area: Engineering, Quantitative and Mathematical Sciences, Social and Behavioral Sciences.
Cross Listed Courses

**Earth Planetary Sciences**

AS.270.205. Introduction to Geographic Information Systems and Geospatial Analysis. 3.0 Credits.
The course provides a broad introduction to the principles and practice of Geographic Information Systems (GIS) and related tools of Geospatial Analysis. Topics will include history of GIS, GIS data structures, data acquisition and merging, database management, spatial analysis, and GIS applications. In addition, students will get hands-on experience working with GIS software.
Instructor(s): X. Chen
Area: Engineering, Natural Sciences.

**Public Health Studies**

AS.280.335. The Environment and Your Health. 3.0 Credits.
This course surveys the basic concepts underlying environmental health sciences (toxicology, exposure assessment, risk assessment), current public health issues (hazardous waste, water- and food-borne diseases), and emerging global health threats (global warming, built environment, ozone depletion, sustainability). Public Health Studies, Global Environmental Change and Stability, and Earth and Planetary Science majors have 1st priority for enrollment. Your enrollment may be withdrawn at the discretion of the instructor if you are not a GECS, PHS, or EPS major.
Instructor(s): J. Bressler, J. Yager; M. Latshaw
Area: Natural Sciences.

**Interdepartmental**

AS.360.147. Freshmen Seminar: Adam Smith and Karl Marx. 3.0 Credits.
This course will compare the ideas of Adam Smith, the most famous proponent of free trade and free enterprise, with those of Karl Marx, the greatest critic of capitalism. For freshmen only.
Instructor(s): E. Schoenberger, P. Jelavich
Area: Humanities, Social and Behavioral Sciences
Writing Intensive.

AS.360.528. Problems in Applied Economics. 2.0 Credits.
This course focuses on a monetary approach to national income determination and the balance of payments. Money and banking, as well as commodity and financial markets, are dealt with under both central banking, as well as alternative monetary regimes. Particular emphasis is placed on currency board systems. Students learn how to properly conduct substantive economic research, utilizing primary data sources, statistical techniques and lessons from economic history. Findings are presented in the form of either memoranda or working papers of publishable quality. Exceptional work may be suitable for publication through the Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. Advanced excel programming skills are required and students are expected to be prepared for research at the Library of Congress in Washington, D.C.. Bloomberg certification is a requisite.
Prerequisites: EN.660.203
Instructor(s): S. Hanke
Writing Intensive.

General Engineering

EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

**General Engineering**

The General Engineering program offers both a B.A. with a major in general engineering and a number of non-departmental courses.

**Bachelor of Arts in General Engineering**

The Bachelor of Arts in General Engineering is a liberal arts degree that is designed to provide students with both a focus in some area of humanities or social sciences and the fundamental engineering principles needed to understand modern technology, innovations, and engineering practices. It is intended for undergraduate students who desire a background in engineering and technology yet have neither the desire nor the intention to become professional engineers. These students may, for example, plan to pursue graduate or professional study in architecture, business, law (e.g., intellectual property, patent law), or medicine. They may wish to work in areas which relate to engineering and technology or to thrive in the global industrial economy. The Bachelor of Arts in General Engineering is a true liberal arts degree with an emphasis in engineering.

This degree is not an engineering degree, and is not suitable for employment as a professional engineer. This program is not accredited by ABET. Students desiring careers as professional engineers should complete a B.S. degree in one of the engineering disciplines offered by the Whiting School.

The distinctive features of the Bachelor of Arts in General Engineering include:

- **Breadth.** Course requirements for the Bachelor of Arts in General Engineering encourage breadth, including mathematics, natural sciences, humanities and/or social sciences, international studies (language or other courses and experience in a foreign country), and in engineering. The curriculum also allows for many free electives.
- **Flexibility.** This program is designed to allow students, in consultation with their advisor, the flexibility to choose a program of study that matches their interests. The engineering focus area and the humanities and social science requirements may be departmentally based or may follow a theme designed by the student and his/her advisor. Students are encouraged to minor in any area of their choosing.
- **Interdisciplinary Study.** The distribution requirements are ideal for students who seek to understand areas at the interface between technical fields (such as robotics, nanotechnology, and biomaterials) or the connections between a technical area and a discipline in the
humanities or social sciences (for example environment issues and international trade or ethics and biotechnology).

• International Dimensions of Engineering. Students are required to develop knowledge of the international dimensions of engineering. They may do this by studying abroad or by taking a combination of language and other classes that develop an understanding of the culture, technology, or society in a foreign country.

Requirements for the B.A. Degree
All undergraduate students majoring in the Bachelor of Arts in General Engineering must follow a program approved by their advisor. Candidates must fulfill the overall requirements for the bachelor’s degree described in this catalog. These include the university writing requirement, distribution requirement and 120 credit minimum. Sample curricula and details on concentrations can be found in the Advising Manual for general engineering (www.engineering.jhu.edu/academics).

Mathematics (20 credits)
Mathematics is at the core of modern science and technology and a solid foundation is required to understand how contemporary engineering problems are solved. Students are required to take five courses including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.110.108 Calculus I</td>
<td>4</td>
</tr>
<tr>
<td>or AS.110.106</td>
<td></td>
</tr>
<tr>
<td>AS.110.109 Calculus II</td>
<td>4</td>
</tr>
<tr>
<td>or AS.110.107</td>
<td></td>
</tr>
<tr>
<td>or AS.110.113</td>
<td></td>
</tr>
</tbody>
</table>

One course in statistics 4
One course at the 200-level or above in either statistics or mathematics 4
One mathematics or statistics elective 4
Total Credits 20

Natural Sciences (15 credits)
Students are required to take four courses and two laboratory courses including:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.171.101 General Physics:</td>
<td>3-4</td>
</tr>
<tr>
<td>Physical Science Major I</td>
<td></td>
</tr>
<tr>
<td>or AS.171.103 General Physics I for Biological Science Majors</td>
<td></td>
</tr>
<tr>
<td>or AS.171.105 Classical Mechanics I</td>
<td></td>
</tr>
<tr>
<td>or AS.171.107 General Physics for Physical Sciences Majors (AL)</td>
<td></td>
</tr>
<tr>
<td>or EN.530.123 Introduction to Mechanics I</td>
<td></td>
</tr>
</tbody>
</table>

At least one course chosen from the following: 3

<table>
<thead>
<tr>
<th>Course</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>AS.030.101 Introductory Chemistry I</td>
<td></td>
</tr>
<tr>
<td>AS.030.107 Chemical Principles w/lab: An Integrated Studio Course</td>
<td></td>
</tr>
</tbody>
</table>

Two terms of laboratory course (Integrated lab from AS.030.107 may count as 1 lab) 2

Two elective courses (area code N) 6
Total Credits 14-15

* EN.530.123, Introduction to Mechanics I, may be used to satisfy the Natural Sciences requirement if taken in conjunction with EN.530.124, Introduction to Mechanics II. EN.530.124 is a new course offering that will be taught in Spring 2018.

Humanities and Social Sciences (24 credits)

Writing Requirement. Students must complete at least four (minimum of 12 credits) writing intensive courses (catalog code W) and one of these courses must specifically develop writing skills, such as EN.661.110 Professional Writing and Communication or AS.060.113 Expository Writing.

Humanities or Social Science Focus. A minimum of four courses (12 credits) must be taken as a coherent group in either the humanities or social sciences, of which two are at the advanced (300+) level.

Humanities or Social Science Elective. Three additional courses (9 credits) in either the humanities or social sciences. These electives are typically used to take courses in economics and the history of science and technology, depending on the courses chosen to fulfill the concentration requirements detailed above.

International Dimensions of Engineering
Because of the importance of the globalization of technology, all students completing the B.A. in General Engineering are required to demonstrate competence in being able to address technical issues within the context of another society. This can be done in one of three different ways.

First, students are encouraged to study abroad for a minimum of one fall or one spring semester in any foreign country (except Canada). In that country, they must take the equivalent of a minimum of 12 credits which are transferred to their Hopkins transcript. In this case, these credits can satisfy any degree requirements (Humanities or Social Sciences, Engineering Concentration, Mathematics, Free Electives, etc.).

Second, students may complete the equivalent of two semesters of the same foreign language (students may not use language courses in their native language to satisfy this requirement) and one additional course which relates to the culture, economy, social structure, or politics of a country which uses this foreign language (9 credits).

Third, students may demonstrate proficiency in a foreign language by taking an intermediate course in a foreign language (this can include their native tongue) and two additional courses which relate to the culture, economy, social structure, or politics of a country which uses this foreign language (9 credits).

Engineering Core (15 credits)
One course (3 credits) that is an introduction to an engineering discipline. Examples include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.500.101</td>
<td>3</td>
</tr>
<tr>
<td>EN.520.137</td>
<td></td>
</tr>
<tr>
<td>EN.530.111</td>
<td></td>
</tr>
<tr>
<td>EN.560.141</td>
<td></td>
</tr>
<tr>
<td>EN.570.108</td>
<td></td>
</tr>
<tr>
<td>EN.500.112</td>
<td></td>
</tr>
</tbody>
</table>

One course (at least 3 credits) in a computer language. Examples include:

<table>
<thead>
<tr>
<th>Course</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.500.112</td>
<td></td>
</tr>
</tbody>
</table>
Three courses in the fundamentals of engineering science (at least one course from three of the following four areas):

**Area 1: Circuits**
EN.520.230 Mastering Electronics 2

**Area 2: Statics**
EN.530.201 Statics and Mechanics of Materials 4
or EN.560.201 Statics & Mechanics of Materials

**Area 3: Materials Science**
EN.510.201 Introductory Materials Science for Engineers 3
or EN.510.311 Structure Of Materials

**Area 4: Thermodynamics**
EN.530.231 Mechanical Engineering Thermodynamics 3
or EN.540.203 Engineering Thermodynamics

**Engineering Focus Area (20 credits)**
The engineering focus area must consist of at least six courses (minimum of 20 credits) that are related thematically or departmentally; at least three (3) of which must be at the advanced level (300 or above). While examples of focus areas are provided in the Advising Manual, students are encouraged to develop their own focus areas in consultation with their faculty advisor.

**Free Electives**
Between five and nine full courses (at least 3 credits each) to ensure a minimum of 120 credits in total. The number of courses required will depend on how the International Dimensions requirement is satisfied and on the courses chosen in other areas. Students must select these courses in consultation with their advisor. These free electives are designed to allow students to develop a curriculum of study uniquely suited to their interests.

Students are required to have a minimum cumulative GPA of 2.0 to graduate. Further, a maximum of 12 “D” credits may be counted toward degree requirements. There is a maximum limit of six “D” credits in any combination of courses used to satisfy the Humanities or Social Sciences focus, the Engineering Core and the Engineering Focus Area (47 total credits).

For current course information and registration go to https://sis.jhu.edu/classes/

**Courses**

**EN.500.101. What Is Engineering?. 3.0 Credits.**
This is a course of lectures, laboratories, and special projects. Its objective is to introduce students not only to different fields of engineering but also to the analytic tools and techniques that the profession uses. Assignments include hands-on and virtual experiments, oral presentations of product design, and design/construction/testing of structures. Freshmen only or Permission Required.
Instructor(s): D. Ayhan
Area: Engineering.

**EN.500.103. Hopkins Engineering Sampler Seminar. 1.0 Credit.**
This course provides students with an overview of the undergraduate programs in the Whiting School of Engineering. Faculty from various departments will introduce students to their discipline including aspects of their personal research. Freshmen only.
Instructor(s): M. Falk
Area: Engineering.

**EN.500.111. Hopkins Engineering Applications & Research Tutorials. 1.0 Credit.**
Instructor(s): Staff
Area: Engineering.

Professor (Applied Mathematics and Statistics).
Erica Schoenberger
Professor (Environmental Health and Engineering).
Scott Smith
Professor (Computer Science)
Howard Weinert
Professor (Electrical and Computer Engineering).

**Senior Lecturer**
Lise Dahuron
Senior Lecturer (Chemical and Biomolecular Engineering)

**Lecturer**
Rachel Sangree
Lecturer (Civil Engineering).

For current faculty and contact information go to http://engineering.jhu.edu/academics/general-engineering/people/

**Faculty**

**Chair**
Michael Falk
Professor (Materials Science & Engineering, Mechanical Engineering, Physics) and Vice Dean for Undergraduate Education. Primary Advisor to the General Engineering Program and Chair of the General Engineering Faculty.

**Professors**
Andrew Douglas
Professor (Mechanical Engineering) and Vice Dean for Faculty, Whiting School of Engineering.

Kalina Hristova
Professor (Materials Science and Engineering).

Daniel Naiman
EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

EN.500.125. Spatial Reasoning and Visualization for Engineers. 1.0 Credit.
This course will enhance students ability to imagine and mentally manipulate objects in three-dimensional space—a talent that is important in engineering. Through guided practice and fun hands-on activities, students will hone their spatial skills. This course is only for engineering freshmen. Registration is by invitation only, based on the results of the summer spatial reasoning diagnostic assessment. S/U only.
Instructor(s): A. Stephens
Area: Engineering.

EN.500.200. Computing for Engineers and Scientists. 4.0 Credits.
This course introduces a variety of techniques for solving problems in engineering and science on a computer using MATLAB. Topics include structure and operation of a computer, the programming language MATLAB, computational mathematics, and elementary numerical analysis. Co-listed with EN.550.200.
Prerequisites: Prereqs: AS.110.107 OR AS.110.109
Instructor(s): J. Yoder; K. Hedrick; T. Lebair
Area: Engineering, Quantitative and Mathematical Sciences.

EN.500.401. Research Laboratory Safety. 1.0 Credit.
An introduction to laboratory safety including chemical, biological, radiation, and physical hazards. Includes information on hazard assessment techniques, laboratory emergencies, and general lab standards for Whiting School of Engineering. The class will feature hands-on exercises with real-life experiments. Intended for students who have not yet begun working in a research laboratory.
Instructor(s): D. Kuespert.

EN.500.402. Interdisciplinary Engineering Design I. 4.0 Credits.
This is the first semester of a two-semester long course intended to engage students in the art of engineering design while working on interdisciplinary teams. Student teams must apply for and be accepted into this course prior to registering as a team. Teams must include students from more than one major. Students working in teams of three to six will select a small-scale, industry-suggested design problem in a designated area. A solution to the problem is devised and constructed by the team within limited time and cost boundaries. Oral reports related to the design work will be presented at regular intervals. A substantial prototype with preliminary test results is expected at the end of the first semester. A final device, product, system or method, with evidence of evaluation against project requirements, is expected at the end of the second semester.
Area: Engineering, Natural Sciences.

EN.500.403. Interdisciplinary Engineering Design II. 4.0 Credits.
This is the second semester of a two-semester long course intended to engage students in the art of engineering design while working on interdisciplinary teams. Student teams must apply for and be accepted into this course prior to registering as a team. Teams must include students from more than one major. Students working in teams of three to six will select a small-scale, industry-suggested design problem in a designated area. A solution to the problem is devised and constructed by the team within limited time and cost boundaries. Oral reports related to the design work will be presented at regular intervals. A substantial prototype with preliminary test results is expected at the end of the first semester. A final device, product, system or method, with evidence of evaluation against project requirements, is expected at the end of the second semester.
Area: Engineering, Natural Sciences.
EN.500.497. Practical Ethics for Future Leaders. 2.0 Credits.
This is a new interdisciplinary course on leadership, decision making, and the application of ethics to real world problems. JHU students are future leaders of innovation across many fields, including but not limited to engineering, business, law, journalism, government, science and medicine. The goal of this new course is to give students a deep and practical grounding in how leaders make decisions, and in particular difficult decisions where there is no clearly right answer. In the first part of the course, we will cover important concepts in the practical application of ethics; in decision making; and leadership. In the second part of the course, we will take a deep look at major ethical issues resulting from the newfound capabilities made possible by emerging technologies. This term, the main question will be, should humans eliminate disease-carrying mosquitoes using gene editing technology? In future terms, the question will be different. The awesome power of emerging technologies to modify our world - our food supply, our health, even people - will only increase and become more pressing in coming years. Questions include: Is modifying wild animals ethical, on its face? Who gets to decide this, and how do they decide? Animals interact with humans and cross borders - can one jurisdiction (county, state or country) make changes to wild populations that would impact others? Both EN.500.496 and EN.500.497 are primarily a combination of online lectures, readings and substantial discussion components during the first 2/3rds of the semester. EN.500.496.01 also incorporates several small group meetings in the final weeks of the semesters.
Prerequisites: If you have already taken EN.500.496, you cannot take EN.500.497.
Instructor(s): F. Macgabhann; I. Gannot
Area: Humanities, Social and Behavioral Sciences.

EN.500.501. SAB/JHU General Engineering Research (Abroad). 3.0 Credits.
General Engineering Research Project Abroad for undergraduate participating on summer projects with NUS, EPFL, SJTU, and DTU. Permission required.
Instructor(s): Staff.

Instructor(s): Staff.

EN.500.601. Research Laboratory Safety. 1.0 Credit.
This course provides practical exercises in laboratory safety, employing information on chemical, physical, radiation, and biological hazards. Exercises include topics such as ethics, inherently safer design, and application of safety knowledge and analysis to analyze real and/ or constructed experiments. The course is suitable for experienced researchers and for graduate students who have not yet begun working in a research laboratory in Homewood Schools. The course is given on six consecutive weeks in the latter half of the semester to allow time for students to study preliminary materials and take online exams on Blackboard. The preliminary material must be completed before the first class in order to progress in the course unless permission is obtained from the instructor. Offered Spring and Fall semesters.
Instructor(s): D. Kuespert.

EN.500.602. Seminar: Environmental and Applied Fluid Mechanics. 1.0 Credit.
Instructor(s): J. Katz.

EN.500.603. Academic Ethics.
Instructor(s): C. Kavanagh.

EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.

EN.500.781. Preparation for University Teaching. 1.5 Credits.
This course will prepare graduate students to teach at the university level. Topics covered include large and small class teaching, characteristics of student learning, syllabus construction, grading students, and developing a teaching portfolio. Full-time EN Graduate Students only. Co-listed with AS.360.781.
Instructor(s): R. Shingles.

EN.500.851. Engineering Research Practicum. 1.0 - 9.0 Credits.
Instructor(s): Staff.

Cross Listed Courses

Civil Engineering
EN.560.141. Perspectives on the Evolution of Structures. 3.0 Credits.
Why do buildings and bridges look the way they do today? Students will be provided the tools to answer this question for themselves through a study of the history of the design of buildings and bridges throughout the world from both engineering and architectural/aesthetic perspectives. Only simple mathematics is required (no calculus). Students will participate in individual and group critique of structures from engineering, architectural, and social points of view.
Instructor(s): B. Schafer; R. Sangree
Area: Engineering, Quantitative and Mathematical Sciences
Writing Intensive.

Institute for NanoBio Technology
EN.670.495. Animation in Nanotechnology & Medicine. 3.0 Credits.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

EN.670.616. Introduction to NanoBio Tutorials II. 1.0 Credit.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): P. Searson.

EN.670.695. Animation in Nanotechnology & Medicine. 3.0 Credits.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

Information Security Institute
http://isi.jhu.edu/

The Johns Hopkins University Information Security Institute (JHU-ISI) is the University's focal point for research and education in information security, assurance and privacy. Securing cyberspace and our national information infrastructure is more critical now than ever before, and it can be achieved only when the core technology, legal and policy issues
are adequately addressed. JHUISI is committed to a comprehensive approach that includes input from academia, industry and government. The University, through JHUISI's leadership, has thus been designated as a Center of Academic Excellence in Information Assurance Education and Research by the National Security Agency and the Department of Homeland Security, and leading experts in the field. Through our broad range of educational opportunities including a ground-breaking graduate program and leading edge research in foundational science and applied technologies, JHUISI is having a significant impact in the region and nationwide.

Our research in cryptography, networking, wireless, systems evaluation, medical privacy and electronic voting, among other areas is widely circulated among academics and policymakers. Moreover, JHUISI is instrumental in homeland security efforts across Hopkins, including emergency health preparedness, bio-terrorism and national defense.

The Johns Hopkins University Information Security Institute based in the Whiting School of Engineering provides a broad and holistic perspective to the information security and assurance field relative to both research and education. In addition to a comprehensive collection of programs related to information technology, a range of management, governance, and policy issues are integrated into the Information Security Institute agenda. The breadth of focus provided represents a strength and distinction of the Johns Hopkins University Information Security Institute. Through the involvement of the faculty and resources from the Whiting School of Engineering, the Krieger School of Arts and Sciences, the Bloomberg School of Public Health, the Carey Business School, and the Applied Physics Lab, a variety of innovative as well as international research and educational initiatives in information security and assurance are supported within the Information Security Institute.

Facilities
The computing facilities include a laboratory of shared servers and PC workstations, several customizable machines for student projects, and multiple high-speed laser printers. Various focused research laboratories have additional resources that provide greater specialization than the general lab. The facilities are connected to a secure high-speed network which allows access to specialized hardware in other departments and institutions. The Information Security Institute and Department of Computer Science cooperate in the use of some of these facilities.

M.S.S.I. Graduate Program
The flagship educational experience offered by Johns Hopkins University in the area of information security and assurance is represented by the Master of Science in Security Informatics (M.S.S.I.) degree. A wide range of courses is available in support of this unique and innovative graduate program.

The M.S.S.I. is a full-time day program offered on the Homewood Campus in North Baltimore. Most students complete the program in three full-time semesters though some graduate students may finish their degree part-time after completing the required two consecutive semesters of residency as a full-time student.

Application Requirements for the M.S.S.I. Degree
- Application to the M.S.S.I. degree is open to outstanding candidates who hold a bachelor's degree with sufficient technical exposure to computer science that serves as preparation for the core technology courses, including intermediate programming, data structure, discrete mathematics, and computer system fundamentals.
- All applicants are obligated to take and submit the results of the Aptitude Test of the Graduate Record Examination as one of the requirements for admission.
- International students are obligated to take either the TOEFL test or the IELTS test.

The preferred scores are as follows:

**GRE General Test**
- Verbal: 153 (62%)
- Quantitative: 160 (84%)
- Analytical: 3.5

**TOEFL Internet based**
- 100

**IELTS**
- 7.0

- The institution code for both the GRE and TOEFL is 5332.
- The department code for the GRE is 0404. The department code for TOEFL is 78.
- These scores in the above serve as general guidelines for admission. The Admissions Committee in making its final decisions will consider the combination of professional knowledge, academic excellence, letters of recommendation, and the statement of purpose, as well as GRE, TOEFL, and IELTS scores of the applicants.
- A student is required to apply online at [https://app.applyyourself.com/?id=jhu-grad](https://app.applyyourself.com/?id=jhu-grad).

Course Requirements for the M.S.S.I.
Upon admission to the Master of Science in Security Informatics, a student is assigned a graduate advisor from the Information Security Institute who must approve the courses to be applied to the M.S.S.I. degree.

The Master of Science in Security Informatics program has a course requirement of a minimum of 10 courses, plus a team-based capstone project including a report and presentation. Students must choose one of two tracks – Technology & Research Track or Policy & Management Track.

All courses supporting the M.S.S.I. are categorized as one of four areas of Technology, Policy, Health, and Management. Each course is further classified into Core, Elective or Foundational category.

The Technology & Research Track program of study must satisfy the following course distribution requirements:
- Five Technology courses: at least four Core Technology courses including at least one Core Technology course in Cryptography.
- Three Core Policy/Management/Health courses: at least one Core Policy course and one Core Management course.
- Two additional courses from Core or Elective Technology categories; or when deemed appropriate relative to a student's background, interests, and goals AND with the prior approval of the faculty advisor and the institute, from other course areas.

The Policy & Management Track program of study must satisfy the following course distribution requirements:
- Three Technology courses: at least two Core Technology courses including at least one Core Technology course in Cryptography.
- Five Core/Foundational Policy/Health/Management courses: at least one course from each of Core Policy/Management/Health categories and at least one Foundational Management course.
• Two additional courses from Core/Elective Technology or Core/Foundational Policy/Management/Health categories; or when deemed appropriate relative to a student’s background, interests, and goals AND with the prior approval of the faculty advisor and the institute, from other course areas.

**Project Requirement**
The M.S.S.I. Capstone Project will include both technology and non-technology components, and will be conducted within a team-structured environment comprised of students and faculty mentors (plus external mentors if appropriate). These projects will generally be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and contracts. They should relate to real-world problems and exhibit both theoretical and practical significance. The project must be documented by a report and presentation, as well as other applicable deliverables including but not limited to system prototypes, utility libraries, experimental demonstrations, conference or journal submissions, and so on. It should follow the best practice of software engineering.

Students should actively initiate the project while communicating with the potential faculty mentor for technical issues and the faculty advisor for project management. They are expected to develop a project plan at the end of the second semester. The project is expected to have a proposal approved at the start of the third semester and be finished by the end of the third semester. A presentation will be scheduled when the project concludes. The faculty mentor should approve each milestone of the project with the faculty advisor being informed. When the project is completed with all the deliverables, the faculty advisor assigns a score upon the recommendation of the faculty mentor.

**Additional Course Requirements**
• All courses toward the degree requirement must be 400-level or above. Other courses can be used with the approval of the Institute.
• Courses not found on the area-specific lists (http://engineering.jhu.edu/jhuisi/mssi-course-distribution) can be used to meet area requirements with prior approval from the student’s advisor and the Institute.
• At most two independent study courses can be counted toward the course requirements.
• No courses with grades of P may be counted with the exception of independent study courses.
• At most two courses may be transferred from other institutions. The student’s faculty advisor and the Director of Information Security Institute must approve such transfer courses.
• The overall grade point average of the courses counted towards the coursework requirements must be 3.00 or higher.
• At most two courses with grade less than B may be counted towards the course work requirements. No courses with grade less than C may be counted.
• A grade of D or F results in probation. A second D or F is cause for being dropped from the program.
• Completion of Academic Ethics (EN.500.603) and Responsible Conduct of Research training.

All courses supporting the M.S.S.I. are categorized as one of four areas of Technology, Policy, Health, and Management. Each course is further classified into Core, Elective or Foundational category.

• For seven-week course modules, e.g., several courses offered through the Whiting School of Engineering Center for Leadership Education (CLE) (https://engineering.jhu.edu/cle), two of them count as one course of 3 credit hours.
• For quarter-based courses, e.g., several courses of course numbers starting with ME from the School of Medicine Division of Health Sciences Informatics (http://dhsi.med.jhmi.edu), two of them are equivalent of one WSE course of 3 credit hours.

Elective Technology Courses
EN.601.631 Theory of Computation 3
EN.601.633 Intro Algorithms 3
EN.601.641 Blockchains and Cryptocurrencies 3
EN.650.621 Critical Infrastructure Protection 3
EN.650.840 Information Security Independent Study 3

Core Policy Courses
EN.650.614 Rights In Digital Age 3
EN.650.640 Moral & Legal Foundations of Privacy 3
EN.650.681 Global Cybersecurity Trends and Practices 3
EN.660.311 Law and the Internet 3

Core Health Courses
School of Medicine courses ME.600.900, ME.600.901, ME.600.903, and ME.600.906 may be taken to fulfill core health course requirements.

Core Management Courses
EN.650.653 Financial Issues in Managing a Secure Operation 3
EN.650.655 Implementing Effective Information Security Projects 3

Foundational Management Courses
EN.663.644 Writing Articles and Technical Reports 1.5
EN.663.645 Improving Presentation Skills for Scientists and Engineers 1.5
EN.663.660 Managing People and Resolving Conflicts 1.5
EN.663.670 Project Management 1.5
EN.663.671 Leading Change 1.5
EN.663.673 Leading Teams in Virtual, International and Local Settings 1.5
EN.663.674 Fundamentals of Management 1.5

Elective Policy/Health/Management Courses
The following are sample courses offered by the Bloomberg School of Public Health, the Carey Business School, and the Krieger School of Arts and Sciences.*
PH.300.651 Introduction to U.S. Healthcare System Policy
AS.406.665 Art and Practice of Intelligence

* For other elective options that fulfill this requirement refer to http://isi.jhu.edu/mssi/course_distribution

Combined Bachelor’s/Master’s Degree Program in Conjunction with the M.S.S.I.
A combined bachelor’s/master’s degree program including the M.S.S.I. is also available to Johns Hopkins University students. In this program, by the conclusion of the undergraduate sophomore/junior academic year, a student can apply for combined admission into the M.S.S.I. program. If accepted, the student during each subsequent semester partitions her/his course load into courses that will count for the undergraduate degree and courses that will count for the M.S.S.I. degree. Usually with one additional year of study, the student can simultaneously satisfy both sets of degree requirements. For more information on the combined bachelor’s/master’s status, please visit https://engineering.jhu.edu/academics/combined-bachelors-masters/.

Dual Master’s Program with the Department of Computer Science
Students interested in pursuing the above Dual Master’s Program (DMP) will have initially entered either the M.S.S.I. program or the M.S.E. program in Computer Science, and then apply for the DMP at a later point. A maximum of two courses (approved by the advisors) can be double counted toward each set of course requirements, thereby facilitating the feasibility of completing the DMP in two academic years plus the in-between summer. In such cases, the designation of the double counted courses would be done in conjunction with one advisor from each department and the Academic Program Administrator.

Dual Master’s Program with the Department of Applied Math and Statistics in the WSE
A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the master’s program in the Department of Applied Math and Statistics in the WSE. The details of this DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant requirement/curricular differences. Each program should be contacted if a student is interested, and students will need to comply with any application processes for consideration.

Dual Master’s Program with the School of Public Health
A similar DMP has been initiated regarding the JHUISI M.S.S.I. and the Master of Health Sciences (M.H.S.) program in the Bloomberg School of Public Health (BSPH). The details of this M.S.S.I./M.H.S. DMP are similar in principle to those for the M.S.S.I./M.S.E. in Computer Science, but there are some significant differences. Each program should be contacted if a student is interested.

For current faculty and contact information go to http://isi.jhu.edu/institute/people

Faculty
Executive Director
Anton Dahbura
Information Security Institute

Program Director
Xiangyang Li
Master of Science in Security Informatics

Professor
Aviel Rubin
Computer Science: Technical Director of Information Security Institute: network and systems security, applied cryptography, cryptographic key distribution, anonymity and computer privacy, electronic commerce, fire-walls and network perimeter defenses, security issues in e-voting, applying security to applications such as medical information systems, intellectual property protection.

Associate Research Professor
Susan Hohenberger
Computer Science: theory, cryptography, computer security, algorithms, complexity theory, balancing privacy and accountability in information systems.

Assistant Professors
Matthew Green
Computer Science: applied cryptography, cryptographic protocol design, analysis of practical security systems, privacy-preserving storage and identification technologies.

Abhishek Jain
Computer Science: cryptography & security, theoretical computer science.

**Lecturers**

Joel Coffman, Ph.D.
Senior Cyber Engineer, Applied Physics Laboratory: cloud computing, databases, software engineering, computer architecture.

Vincent Galluzzo, J.D.
Intellectual Property Protection, Privacy.

Michael Jacobs, J.D.
Computer ethics, digital rights management, intellectual property protection.

Reuben A. Johnston
Senior Cyber Security Research Engineer, Applied Physics Laboratory: Systems engineering, operations research, software security and reverse engineering.

Michael Kociemba
Information security, management, and infrastructure protection.

Timothy R. Leschke, Ph.D.
Computer forensics, Information Visualization.

Song Luo, Ph.D
Computer security and security analytics.

Seth Nielson, Ph.D.
Network security.

Williams Sauers, J.D.
Digital rights management, intellectual property protection.

Terry L. Thompson, PhD
Global cyber trends, cyber policy and governance.

Lanier Watkins, Ph.D.

For current course information and registration go to https://sis.jhu.edu/classes/

**Courses**

**EN.650.401. Introduction to Information Security. 3.0 Credits.**
This course exposes students to the cross-disciplinary and broad information security field. It surveys a range of fundamental topics of information security principles, architecture, policy and standard, risk management, cryptography, physical, operation, system and network security mechanisms, and law and ethics, among others. This course includes lectures, case studies, and homework. Students will also complete independent study class projects. Recommended Course Background: Basic knowledge of computer system and information technology.
Instructor(s): X. Li.

**EN.650.457. Computer Forensics. 3.0 Credits.**
This course introduces students to the field of computer forensics and it will focus on the various contemporary policy issues and applied technologies. Topics to be covered include: legal and regulatory issues, investigation techniques, data analysis approaches, and incident response procedures for Windows and UNIX systems. Homework in this course will relate to laboratory assignments and research exercises. Students should also expect that a group project will be integrated into this course.
Instructor(s): T. Leschke
Area: Engineering.

**EN.650.458. Introduction to Cryptography. 3.0 Credits.**
Cryptography has a rich history as one of the foundations of information security. This course serves as the introduction to the working primitives, development and various techniques in this field. It emphasizes reasoning about the constraint and construction of cryptographic protocols that use shared secret key or public key. Students will also be exposed to some current open problems. Permission of instructor only.
Instructor(s): X. Li
Area: Engineering.

**EN.650.471. Cryptography & Coding. 4.0 Credits.**
A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication. How can we ensure the privacy of messages? Coding theory studies how to make communication reliable. How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow. Students should have computing experience. Recommended Course Background: AS.110.201
Prerequisites: EN.550.171 or permission
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

**EN.650.601. Introduction to Information Security. 3.0 Credits.**
This course exposes students to the cross-disciplinary and broad information security field. It surveys a range of fundamental topics of information security principles, architecture, policy and standard, risk management, cryptography, physical, operation, system and network security mechanisms, and law and ethics, among others. This course includes lectures, case studies, and homework. Students will also complete independent study class projects. Recommended Course Background: Basic knowledge of computer system and information technology.
Instructor(s): X. Li.
EN.650.614. Rights In Digital Age. 3.0 Credits.
This course will examine various legal and policy issues presented by the tremendous growth in computer technology, especially the internet. The rights that various parties have with respect to creating, modifying, using, distributing, storing, and copying digital data will be explored. The concurrent responsibilities, and potential liabilities, of those parties will also be addressed. The course will focus on intellectual property issues, especially copyright law, and other legal and economic considerations related to the use and management of digital data. Copyright law and its role within the framework of intellectual property law will be presented in a historical context with an emphasis on its applicability to emerging-technology issues. Specifically, the treatment of various works, such as music, film, and photography that were traditionally, analog in nature will be analyzed with respect to their treatment in the digital domain; works that are by their nature digital, such as computer software, will also be analyzed. The current state of U.S. copyright law will be presented, as will relevant international treaties and foreign laws. The goal of the course is to provide those involved or interested in digital rights management with a general awareness of the rights and obligations associated with maintaining and distributing digital data. (This course will be taught in Washington, DC and video-cast on Homewood Campus.)
Instructor(s): M. Jacobs
Area: Social and Behavioral Sciences.

EN.650.621. Critical Infrastructure Protection. 3.0 Credits.
This course focuses on understanding the history, the vulnerability, and the need to protect our Critical Infrastructure and Key Resources (CIKR). We will start by briefly surveying the policies which define the issues surrounding CIKR and the strategies that have been identified to protect them. Most importantly, we will take a comprehensive approach to evaluating the technical vulnerabilities of the 18 identified sectors, and we will discuss the tactics that are necessary to mitigate the risks associated with each sector. These vulnerabilities will be discussed from the perspective of ACM, IEEE or other technical journals/articles which detail recent and relevant network-level CIKR exploits. We will cover well known vulnerable systems such the Internet, SCADA or PLC and lesser known systems such as E911 and industrial robot. Also, a class project is required. Recommended Course Background: EN.650.424 or equivalent or permission by instructor.
Instructor(s): L. Watkins
Area: Engineering, Natural Sciences.

EN.650.624. Advanced Network Security. 3.0 Credits.
This course focuses on advanced security topics and research in computer networks. It builds on the basic overview of network security covered in previous security courses. Beyond the basics of developing security network communications and applications, this advanced course dives deeper into the theory and practice behind network attack, the growing reality of weaponized zero-day vulnerabilities, and the current state-of-the-art responses. Course work includes reviewing contemporary security research papers, hands-on experiments in defending/attacking networks, and writing analyses.
Prerequisites: EN.650.424 OR EN.600.424 or permission of the instructor.
Instructor(s): S. Nielson
Area: Engineering.

EN.650.631. Ethical Hacking. 3.0 Credits.
Cyber security affects every facet of industry and our government, and thus is now a threat to National Security. This course is designed to introduce students to the skills needed to defend computer network infrastructure by exposing them to the hands-on identification and exploitation of vulnerabilities in servers (i.e., Windows and Linux), wireless networks, websites, and cryptologic systems. These skills will be tested by having teams of students develop and participate in instructor lead capture-the-flag competitions. Also included are advanced topics such as shell coding, IDA Pro analysis, fuzzing, and writing or exploiting network-based applications or techniques such as web servers, spoofing, and denial of service.
Instructor(s): L. Watkins
Area: Engineering.

EN.650.640. Moral & Legal Foundations of Privacy. 3.0 Credits.
This course explores the ethical and legal underpinnings of the concept of privacy. It examines the nature and scope of the right to privacy by addressing fundamental questions such as: What is privacy? Why is privacy morally important? How is the right to privacy been articulated in constitutional law?
Instructor(s): V. Galluzzo; W. Sauers.

EN.650.653. Financial Issues in Managing a Secure Operation. 3.0 Credits.
This course addresses the risks (financial, reputation, business, and third party), costs, ROI, and other business issues concerned in planning and managing a secure operation. Topics include disaster recovery, outsourcing issues; service level agreements; evaluating external security service providers; assessing security total cost of ownership; audit procedures; financial integrity; cost/benefit analyses; back-up and recovery provisions; insurance protection; contingency and business continuity plans; qualitative and quantitative risk analysis; monitoring the security of the enterprise; information economics; performance reporting; automated metrics reporting; responses to threats; effects of security policies and practices on business and customers; preparing a business case for information security investments; and developing cost-effective solutions given constraints in money, assets, and personnel. Case studies and exercises will be used to illustrate financial planning and evaluation of security operations.
Instructor(s): M. Kociemba.

EN.650.654. Computer Intrusion Detection. 3.0 Credits.
Intrusion detection supports the on-line monitoring of computer system activities and the detection of attempts to compromise normal services. This course starts with an overview of intrusion detection tasks and activities. Detailed discussion introduces a traditional classification of intrusion detection models, applications in host-centered and distributed environments, and various intrusion detection techniques ranging from statistical analysis to biological computing. This course serves as a comprehensive introduction of recent research efforts in intrusion detection and the challenges facing modern intrusion detection systems. Students will also be able to pursue in-depth study of special topics of interest in course projects.
Instructor(s): X. Li
Area: Engineering, Natural Sciences.
EN.650.655. Implementing Effective Information Security Projects. 3.0 Credits.
This course focuses on the personnel, legal, regulatory and privacy issues that comprise the basic security management areas that must be considered when developing and implementing an effective information security program. Specific topics include security-related legislation, government and industry security frameworks, the identification and management of risk, security controls, defense in depth, critical infrastructure protection, development and implementation of an enterprise wide security strategy, and organizational roles and responsibilities.
Instructor(s): M. Kociamba.

EN.650.656. Computer Forensics. 3.0 Credits.
This course introduces students to the field of computer forensics and it will focus on the various contemporary policy issues and applied technologies. Topics to be covered include: legal and regulatory issues, investigation techniques, data analysis approaches, and incident response procedures for Windows and UNIX systems. Homework in this course will relate to laboratory assignments and research exercises. Students should also expect that a group project will be integrated into this course.
Instructor(s): T. Leschke
Area: Engineering.

EN.650.658. Introduction to Cryptography. 3.0 Credits.
Cryptography has a rich history as one of the foundations of information security. This course serves as the introduction to the working primitives, development and various techniques in this field. It emphasizes reasoning about the constraint and construction of cryptographic protocols that use shared secret key or public key. Students will also be exposed to some current open problems. Permission of instructor only.
Instructor(s): X. Li
Area: Engineering.

EN.650.660. Software Vulnerability Analysis. 3.0 Credits.
Competent execution of security assessments on modern software systems requires extensive knowledge in numerous technical domains and comprehensive understanding of security risks. This course provides necessary background knowledge and examines relevant theories for software vulnerabilities and exploits in detail. Key topics include historical vulnerabilities, their corresponding exploits, and associated risk mitigations. Fundamental tools and techniques for performing security assessments (e.g., software reverse engineering, static analysis, and dynamic analysis) are covered extensively. The format of this course includes lectures and assignments where students learn how to develop exploits to well-known historical vulnerabilities in a controlled environment. Students will complete and demonstrate a project as part of the course.
Instructor(s): R. Johnston
Area: Engineering.

EN.650.661. Human Factors in Information Security. 3.0 Credits.
The human factor is critical to any successful computer security solution since users are very often the weakest link in such systems. This course will examine a variety of human behaviors ranging from micro to macro cybernetic levels that are relevant to making the best case for information security. It is delivered through lectures on relevant findings in different disciplines of human computer interaction, human factors engineering, cognitive science, and product design; studies of useful user and security modeling frameworks and tools; and term research projects to explore security oriented topics in human machine systems. Its goal is to improve security informatics through informed decisions by the knowledge of the good and bad human characters in computer and cyber security.
Instructor(s): X. Li
Area: Engineering.

EN.650.663. Cloud Computing Security. 3.0 Credits.
Cloud computing promises significant cost savings via economies of scale that typically are not achievable by a single organization. This course examines cloud computing in detail and introduces the security concerns associated with cloud computing. Key topics include service models for cloud computing, virtualization, storage, management, and data processing. Fundamental security principles are introduced and applied to cloud computing environments. The format of this course includes lectures and hands-on assignments. Students will complete a project and present it as part of the course.
Instructor(s): J. Coffman
Area: Engineering, Natural Sciences.

EN.650.671. Cryptography & Coding. 4.0 Credits.
A first course in the mathematical theory of secure and reliable electronic communication. Cryptology is the study of secure communication: How can we ensure the privacy of messages? Coding theory studies how to make communication reliable: How can messages be sent over noisy lines? Topics include finite field arithmetic, error-detecting and error-correcting codes, data compressions, ciphers, one-time pads, the Enigma machine, one-way functions, discrete logarithm, primality testing, secret key exchange, public key cryptosystems, digital signatures, and key escrow. Students should have computing experience. Recommended Course Background: AS.110.201
Prerequisites: EN.550.171 or permission of the instructor.
Instructor(s): D. Fishkind
Area: Engineering, Quantitative and Mathematical Sciences.

EN.650.672. Security Analytics. 3.0 Credits.
Security analytics refers to information technology solutions that gather and analyze security events to bring situational awareness and enable IT staff to understand and analyze events that pose the greatest risk. Increasingly, detecting and preventing cyber attacks require sophisticated use of data analytics and machine learning tools. This course will cover fundamental theories and methods in data science, modern security analytical tools, and practical use cases of security analytics. Students of this course learn concepts, tasks, and methods of data science; and how to apply data science to cyber security problems. Students also learn how to use modern software in security analytics. Recommend Course Background: Basic knowledge of statistics; Either python or R programming skill (do not require both).
Instructor(s): S. Luo.
EN.650.681. Global Cybersecurity Trends and Practices. 3.0 Credits.
This course provides an overview of cybersecurity capabilities and practices in the global community. International organizations engaged in cybersecurity policy and governance and the national strategies of many countries are examined in detail. Students will gain insights into the political, economic, military, and technological components of cybersecurity as practiced in the U.S., UK, China, Russia, and other countries. The course is designed around four general themes: global cyber threats, strategies and policies in response to cyber threats, comparative cybersecurity capabilities of nation-states; and cybersecurity in international politics. Students will also gain an appreciation of key cybersecurity issues like critical infrastructure protection and information sharing in the international context. The course will provide students a broad perspective on the global context of cybersecurity, complementing knowledge gained in other courses in the graduate program. There will be assignments to study key literature and current events, as well as quizzes and a mid-term exam. Students will also conduct research projects that focus on the interaction of technology, policy, strategy, and governance, and present results to the class. EN.650.401/EN.650.601 recommended
Instructor(s): T. Thompson
Area: Engineering.

EN.650.724. Advanced Network Security. 3.0 Credits.
This course focuses on advanced security topics and research in computer networks. It builds on the basic overview of network security covered in previous security courses. Beyond the basics of developing security network communications and applications, this advanced course dives deeper into the theory and practice behind network attack, the growing reality of weaponized zero-day vulnerabilities, and the current state-of-the-art responses. Course work includes reviewing contemporary security research papers, hands-on experiments in defending/attacking networks, and writing analyses.
Prerequisites: EN.601.644 or permission of the instructor.
Instructor(s): S. Nielson
Area: Engineering.

EN.650.739. Special Network Security Projects. 1.0 - 4.0 Credits.
Instructor(s): Staff.

EN.650.757. Advanced Computer Forensics. 3.0 Credits.
This course will analyze advanced topics and state of the art issues in the field of digital forensics. The course will be run in a research seminar format and students will be given both basic and applied research projects in such areas as: intrusion analysis, network forensics, memory forensics, mobile devices, and other emerging issues.
Instructor(s): T. Leschke.

EN.650.836. Information Security Projects. 1.0 Credit.
All MSSI programs must include a project involving a research and development oriented investigation focused on an approved topic addressing the field of information security and assurance from the perspective of relevant applications and/or theory. There must be project supervision and approval involving a JHUISI affiliated faculty member. A project can be conducted individually or within a team-structured environment comprised of MSSI students and an advisor. A successful project must result in an associated report suitable for on-line distribution. When appropriate, a project can also lead to the development of a so-called "deliverable" such as software or a prototype system. Projects can be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and Contracts. Required course for any full-time MSSI student. Open to MSSI students. Permission required for non-MSSI students.
Instructor(s): A. Dahbura; X. Li.

EN.650.837. Information Security Projects. 1.0 Credit.
Open to MSSI students. Permission Required for non-MSSI students.
All MSSI programs must include a project involving a research and development oriented investigation focused on an approved topic addressing the field of information security and assurance from the perspective of relevant applications and/or theory. There must be project supervision and approval involving a JHUISI affiliated faculty member. A project can be conducted individually or within a team-structured environment comprised of MSSI students and an advisor. A successful project must result in an associated report suitable for on-line distribution. When appropriate, a project can also lead to the development of a so-called "deliverable" such as software or a prototype system. Projects can be sponsored by government/industry partners and affiliates of the Information Security Institute, and can also be related to faculty research programs supported by grants and Contracts. Required for MSSI students on full-time status.
Instructor(s): A. Dahbura; X. Li.

EN.650.840. Information Security Independent Study. 3.0 Credits.
Individual study in an area of mutual interest to a graduate student and a faculty member in the Institute.
Instructor(s): X. Li.

EN.650.890. Information Security Research. 1.0 - 4.0 Credits.
Instructor(s): G. Masson.

Cross Listed Courses

Computer Science
EN.601.631. Theory of Computation. 3.0 Credits.
This is a graduate-level course studying the theoretical foundations of computer science. Topics covered will be models of computation from automata to Turing machines, computability, complexity theory, randomized algorithms, inapproximability, interactive proof systems and probabilistically checkable proofs. Students may not take both EN.601.231 and EN.601.631, unless one is for an undergrad degree and the other for grad. [Analysis]Recommended Course Background: EN.553.171 or instructor permission.
Instructor(s): X. Li
Area: Engineering, Quantitative and Mathematical Sciences.
EN.601.443. Operating Systems and Networking. 3.0 Credits.
Same material as EN.601.443, for graduate students. This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.443, EN.601.463, EN.601.433, EN.601.633.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.444. Network Security. 3.0 Credits.
Same material as 601.444, for graduate students. This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] Recommended. Course Background: EN.601.220, EN.601.226 or equivalent
Prerequisites: Students may receive credit for only one of EN.600.424, EN.650.424, EN.601.444, EN.601.644.
Instructor(s): S. Nielson
Area: Engineering.

EN.601.445. Modern Cryptography. 3.0 Credits.
Same material as 601.445, for graduate students. This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems]
Prerequisites: Students may receive credit for only one of EN.600.454, EN.650.454, EN.601.445, EN.601.645.
Instructor(s): M. Green
Area: Engineering.

EN.601.633. Intro Algorithms. 3.0 Credits.
Same material as 601.433, for graduate students. This course concentrates on the design of algorithms and the rigorous analysis of their efficiency. Topics include the basic definitions of algorithmic complexity (worst case, average case); basic tools such as dynamic programming, sorting, searching, and selection; advanced data structures and their applications (such as union-find); graph algorithms and searching techniques such as minimum spanning trees, depth-first search, shortest paths, design of online algorithms and competitive analysis. [Analysis]
Prerequisites: Students may receive credit for only one of EN.600.363, EN.600.463, EN.601.433, EN.601.633.
Instructor(s): M. Dinitz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.642. Modern Cryptography. 3.0 Credits.
Same material as 601.442, for graduate students. Modern Cryptography includes seemingly paradoxical notions such as communicating privately without a shared secret, proving things without leaking knowledge, and computing on encrypted data. In this challenging but rewarding course we will start from the basics of private and public key cryptography and go all the way up to advanced notions such as zero-knowledge proofs, functional encryption and program obfuscation. The class will focus on rigorous proofs and require mathematical maturity. [Analysis] Required course background: EN.601.231 or EN.601.631.
Prerequisites: Students may receive credit for only one of EN.600.442, EN.601.442, EN.601.642.
Instructor(s): A. Jain
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.644. Network Security. 3.0 Credits.
Same material as 601.444, for graduate students. This course focuses on communication security in computer systems and networks. The course is intended to provide students with an introduction to the field of network security. The course covers network security services such as authentication and access control, integrity and confidentiality of data, firewalls and related technologies, Web security and privacy. Course work involves implementing various security techniques. A course project is required. [Systems] Recommended. Course Background: EN.601.220, EN.601.226 or equivalent
Prerequisites: Students may receive credit for only one of EN.600.424, EN.650.424, EN.601.444, EN.601.644.
Instructor(s): S. Nielson
Area: Engineering.

EN.601.645. Practical Cryptographic Systems. 3.0 Credits.
Same material as 601.445, for graduate students. This semester-long course will teach systems and cryptographic design principles by example: by studying and identifying flaws in widely-deployed cryptographic products and protocols. Our focus will be on the techniques used in practical security systems, the mistakes that lead to failure, and the approaches that might have avoided the problem. We will place a particular emphasis on the techniques of provable security and the feasibility of reverse-engineering undocumented cryptographic systems. [Systems]
Prerequisites: Students may receive credit for only one of EN.600.454, EN.650.454, EN.601.445, EN.601.645.
Instructor(s): M. Green
Area: Engineering.

EN.601.743. Advanced Topics in Computer Security. 3.0 Credits.
Topics will vary from year to year, but will focus mainly on network perimeter protection, host-level protection, authentication technologies, intellectual property protection, formal analysis techniques, intrusion detection and similarly advanced subjects. Emphasis in this course is on understanding how security issues impact real systems, while maintaining an appreciation for grounding the work in fundamental science. Students will study and present various advanced research papers to the class. There will be homework assignments and a course project.
Instructor(s): A. Rubin.

EN.601.745. Advanced Topics in Applied Cryptography. 3.0 Credits.
This reading and project based course will explore the latest research in the area of applied cryptography and cryptographic engineering. Topics covered will include zero knowledge, efficient multiparty computation, cryptocurrencies, and trusted computing hardware. Readings will be drawn from the latest applied cryptography and security conferences. The course will include both reading, critical analysis, presentations and a course programming project. [Analysis or Applications] Required course background: EN.600.363.
Prerequisites: EN.600.454 OR EN.601.445 OR EN.601.645 OR EN.600.442 OR EN.601.442 OR EN.601.642
Instructor(s): M. Green.

Materials Science and Engineering

http://materials.jhu.edu/

Materials are essential to the construction of any engineering structure, from the smallest integrated circuit to the largest bridge. In almost every technology, the performance, reliability, or cost is determined by the materials used. As a result, the drive to develop new materials and processes (or to improve existing ones) makes materials science
and engineering one of the most important and dynamic engineering disciplines.

The central theme of materials science and engineering is that the relationships among the structures, properties, processing, and performance of materials are crucial to their function in engineering structures. Materials scientists seek to understand these fundamental relationships and use this understanding to synthesize new materials or develop new processes for producing existing ones. Materials engineers design or select materials for particular applications and develop improved processing techniques. Since materials scientists and engineers must understand the properties of materials as well as their applications, the field is inherently interdisciplinary and draws on aspects of almost every other engineering discipline as well as physics, chemistry, and, most recently, biology. Because the field encompasses so many different areas, it is often categorized according to types of materials (metals, ceramics, polymers, and semiconductors) or to their applications (biomaterials, electronic materials, magnetic materials, or structural materials).

The department prepares students for successful careers in materials science and engineering, for advanced study in science or engineering, and for professional education in other fields. The goal of the undergraduate program is to provide a rigorous and comprehensive curriculum in materials science and engineering as well as in mathematics, basic sciences, humanities, and social sciences. Our low student-to-faculty ratio allows students close contact with faculty in both classroom and research environments, as well as with other students and researchers in the department. The student is encouraged to proceed at his or her own rate and to participate in interdisciplinary, interdepartmental, and interschool programs. In the tradition of Johns Hopkins, all of our undergraduate students participate in research, often beginning in their sophomore year, working closely with faculty and graduate students.

In recognition that biomaterials and nanotechnology represent two of the most rapidly developing areas of materials science and engineering, the Department of Materials Science and Engineering offers challenging specializations in biomaterials or nanotechnology within its undergraduate program.

The field of biomaterials is concerned with the science and engineering of materials in biology and medicine. Engineering materials are increasingly used in applications such as drug delivery and gene therapy, scaffolds for tissue engineering, replacement body parts, and biomedical and surgical devices. Biomaterials is an inherently interdisciplinary field that requires deep understanding of the properties of materials in general, and the interactions of materials with the biological environment. The Biomaterials concentration is designed to provide a firm grounding in the physics, chemistry, and biology of materials, as well as breadth in general engineering, mathematics, humanities, and social science. In addition, students are encouraged to gain hands-on experience in biomaterials research laboratories. The program seeks to educate students to reach the forefront of leadership in the field of biomaterials engineering. While the fundamental principles of materials science still apply, a complete understanding of biomaterials and their interactions with biological environments requires a greater degree of specialization than the standard undergraduate curriculum provides. In recognition of completion of the Biomaterials concentration, a student may elect to have his or her academic transcript annotated to indicate a specialty in biomaterials.

Nanotechnology advances the utilization of materials and devices with extremely small dimensions. Nanotechnology is a visionary field, as micro and nanostructured devices impact all fields of engineering, from microelectronics (smaller, faster computer chips) to mechanical engineering (micromotors and actuators) to civil engineering (“smart,” self-healing nanocomposite materials for buildings and bridges) to biomedical engineering (biosensors and tissue engineering). Materials science is central to nanotechnology because the properties of materials can change dramatically when things are made extremely small. This observation is not simply that we need to measure such properties or develop new processing tools to fabricate nanodevices. Rather, our vision is that the wide (and sometimes unexpected) variety of phenomena associated with nanostructured materials allow us to envision radically new devices and applications that can only be made with nanostructured materials. The Nanotechnology concentration encompasses a curriculum designed to train students in the fundamental interdisciplinary principles of materials science including physics and chemistry, and also to expose students to the forefront of nanomaterials research through elective classes as well as research laboratories. Students in the Nanotechnology concentration will be well-prepared for successful careers in materials engineering across a wide range of disciplines. In recognition of completion of the Nanotechnology concentration, a student may elect to have his or her academic transcript annotated to indicate a specialty in nanotechnology.

The graduate curriculum provides students with a broad yet thorough grounding in the fundamentals of materials science and engineering. After completing the core curriculum, students pursuing master and Ph.D. degrees take advanced courses that will allow them to work at the forefront of knowledge in their chosen specialty. Those desiring to conduct original research and advance the frontiers of knowledge pursue a master’s essay and/or Ph.D. thesis. To this end, the department has an outstanding and wide-ranging research program, with particular emphasis on nanomaterials, thin films, metastable materials, biomaterials, computational materials science, and materials characterization.

Facilities
The teaching and research facilities of the Department of Materials Science and Engineering are located in Maryland and Krieger halls on the Homewood campus. Our central facilities include the Surface Analytical Laboratory, with advanced tools for the chemical characterization of solid surfaces; the Scanning Electron Microscopy Laboratory; the X-Ray Diffraction Laboratory; the Laboratory for Thin Film Deposition; and facilities for sample preparation, optical microscopy, and mechanical testing. Individual research groups have established laboratories with advanced facilities for materials processing, nanotechnology, and materials characterization. Through collaboration with other departments and national laboratories, students and faculty also have access to a variety of other facilities necessary for world-class research.

Undergraduate Programs
Materials play a central role in the performance and reliability of virtually every technology and living organism. The central theme of materials science and engineering is that the relationships between the structure, properties, processing, and performance of materials are crucial to their function. Materials scientists seek to understand these fundamental relationships, synthesize new materials, develop improved processes for making materials, and understand the role of materials in the functioning of biological organisms. The wide range of problems addressed makes
materials science one of the most highly interdisciplinary and dynamic engineering disciplines.

The Materials Science & Engineering faculty strives to maintain the Johns Hopkins University tradition of training a small number of students of the highest quality. We measure our success by the impact our graduates have on the scientific and engineering communities. Our program is designed to provide a solid foundation for future career development for students with diverse career aspirations.

Accreditation

Our BS program in Materials Science and Engineering is accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org.

Program Educational Objectives:
The program has as its objectives that within 3 to 5 years, our graduates will:

1. be engaged in advanced education, research, and development in materials science and engineering, including materials discovery and/or processing, or in professional disciplines that benefit from an understanding of MSE such as business, medicine or law.

2. employ elements of the materials research process in their careers including the use of:
   - critical reasoning to identify fundamental issues and establish directions for investigation
   - creative processes to define specific plans for problem solution
   - analytical thought to interpret results and place them within a broader context.

3. demonstrate ethical responsibility and an appreciation for the societal and global impact of their endeavors while maintaining their intellectual curiosity through lifelong learning.

Program Educational Outcomes:
Students graduating with a B.S. in Materials Science and Engineering will have demonstrated:

a) an ability to apply knowledge of mathematics, science, and engineering

b) an ability to design and conduct experiments, as well as to analyze and interpret data

c) an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability

d) an ability to function on multidisciplinary teams

e) an ability to identify, formulate, and solve engineering problems

f) an understanding of professional and ethical responsibility

g) an ability to communicate effectively

h) the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context

i) a recognition of the need for, and an ability to engage in life-long learning

j) a knowledge of contemporary issues

k) an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Requirements for the B.S. Degree

The Department of Materials Science and Engineering offers a program leading to the Bachelor of Science Degree. The B.S. for the Materials Science and Engineering degree program is accredited by the Engineering Accreditation Commission of ABET, www.abet.org (http://www.abet.org). The student must meet the general university requirements for the chosen degree as well as the departmental requirements, and must complete the program approved by the student's advisor.

An anticipated individual program of study designed to meet the university and department requirements for the B.S. degree, as well as to reflect the student's interest, should be filed as early as possible during the student's residence. The faculty advisor's signature is required on all course registration and course change forms. As changes are made in the program, it shall be the student's responsibility to see that a revised program is filed with the advisor. Each student must have an approved program on file no later than the semester before he/she expects to graduate.

General university requirements include (see also General Requirements for Departmental Majors for more information):

- Complete program of study outlined by track or concentration (standard track, biomaterials concentration, or nanotechnology concentration).
- Fulfill the university writing requirement; two writing intensive courses, at least 3 credits each
- Fulfill the distribution requirement: 18 credits of courses coded (H) or (S), comprised of 6 courses at least 3 credits each. See the Distribution tab in the Requirements for a Bachelor's Degree (http://e-catalog.jhu.edu/undergrad-students/academic-policies/requirements-for-a-bachelors-degree) section for two exceptions to the rule that each H/S distribution course be at least 3 credits.
- Take a minimum of 126 credits.

To meet the course requirements for the B.S. degree in Materials Science and Engineering, the student must complete a minimum of 126 credits, distributed as follows:

| Materials Science Core Classes | 30 |
| Upper Level Materials Science Classes | 12 |
| Basic Sciences & Engineering | 28 |
| Mathematics | 20 |
| Humanities (H) or (S) | 18 |
In addition to the degree program in Materials Science and Engineering, students may elect to complete specialized concentrations in biomaterials or nanotechnology. Whether a student chooses to pursue studies following the standard track, the Biomaterials concentration or the Nanotechnology concentration, the course work specified for the degree will provide a firm grounding in the principles of materials science and engineering.

Three B.S. Degree Options are Offered by the Department of Materials Science and Engineering

**Standard Track**
The Standard Track is intended for those students with general materials science interests. It permits the student to tailor the degree program to specific interests by allowing a broad range of choices for upper-level science and engineering electives.

**Biomaterials Concentration**
Biomaterials is an exciting and rapidly developing field. Engineered materials are increasingly used in medical applications (such as drug delivery, gene therapy, scaffolds for tissue engineering, replacement body parts, and biomedical and surgical devices) while an understanding of structure-property relationships in natural biomaterials may lead to improved interventions for a wide variety of diseases and injuries. Because it is highly interdisciplinary (involving elements of materials science, engineering, biology, chemistry and medicine), biomaterials as a discipline requires a deep understanding of the properties of materials in general, and the interactions of materials with the biological environment in particular.

The biomaterials concentration is designed to provide a broad basis in the fundamentals of materials science and engineering, as well as a particular emphasis on the principles and applications of biomaterials. While the fundamental principles of materials science still apply, a complete understanding of biomaterials and their interactions with biological environments requires a greater degree of specialization than the standard undergraduate curriculum provides. The biomaterials curriculum includes topics such as biomimetic materials, natural biomaterials, host responses to biomaterials, biocompatibility, and applications of biomaterials, particularly in tissue engineering, drug delivery, and medical devices and implants. Our goal is to train students who can apply these principles to the development of novel materials that benefit human health.

To receive commendation for completion of the Biomaterials concentration, the student must complete three electives, whose subject matter is some aspect of Biomaterials, Molecules and Cells as a Science & Engineering elective, a biomaterials laboratory course, and complete a biomaterials-related senior design project. **Approval of electives must be made by a student’s academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.**

**Nanotechnology Concentration**
Nanotechnology advances the utilization of materials and devices with extremely small dimensions. Nanotechnology is a visionary field, as micro- and nano-structured devices impact all fields of engineering, including microelectronics (smaller, faster computer chips), mechanical engineering (micromotors and actuators), civil engineering (“smart”, self-healing nanocomposite materials for buildings and bridges), and biomedical engineering (biosensors and tissue engineering).

Materials science is central to nanotechnology because the properties of materials can change dramatically when things are made extremely small. This observation is not simply that we need to measure such properties or develop new processing tools to fabricate nanodevices. Rather, our vision is that the wide (and sometimes unexpected) variety of phenomena associated with nanostructured materials allow us to envision radically new devices and applications that can only be made with nanostructured materials. The nanotechnology concentration encompasses a curriculum designed to train students in the fundamental interdisciplinary principles of materials science, including physics and chemistry, and also to expose students to the forefront of nanomaterials research through elective classes and research laboratories. In recognition of completion of the Nanotechnology concentration, a student may elect to have his or her academic transcript annotated to indicate a concentration in nanotechnology.

To receive commendation for completion of the Nanotechnology concentration, the student must complete three electives, whose subject matter is some aspect of Nanotechnology, a nanomaterials laboratory course, and complete a nanotechnology-related senior design project. **Approval of electives must be made by a student’s academic advisor prior to taking the courses, and approval of the senior design project must be pre-approved by the senior design instructor.**

Upper Level materials science electives each 300 level or higher. 12

Basic Sciences and Engineering (28 credits)
Must be passed with a letter grade of C- or higher. Both 030.101 and 030.102 may substitute for 510.101. Students are required to take both semesters of Intro. Chem Lab.

AS.171.101 General Physics: Physical Science Major I 4
AS.171.102 General Physics: Physical Science Major II 4
AS.173.111 General Physics Laboratory I 1
AS.173.112 General Physics Laboratory II 1
EN.510.101 Introduction to Materials Chemistry 3
AS.030.105 Introductory Chemistry Laboratory I 1
AS.030.106 Introductory Chemistry Laboratory II 1
AS.030.205 Introductory Organic Chemistry I 4
AS.030.225 Introductory Organic Chemistry Laboratory 3
EN.660.363 Leadership & Management in Materials Science and Engineering 3
EN.500.112 Gateway Computing 3

Mathematics (20 credits)
Must be passed with a letter grade of C- or higher
AS.110.108 Calculus I 4
AS.110.109 Calculus II (For Physical Sciences and Engineering) 4
AS.173.111 General Physics Laboratory I 1
AS.110.201 Linear Algebra 4
AS.110.302 Differential Equations and Applications 4

Humanities (H or S) (18 credits)
Must be passed with a letter grade of C- or higher (or S if the grade system is S/U). Introductory language courses, even if not with H or S designator, can substitute for H designated courses.

Science and Engineering Electives (9 credits)
Three courses of 200-level or above in engineering, natural sciences, or mathematics. At least one of the three electives must be from another department in the Whiting School of Engineering to ensure exposure to another engineering field. Must be passed with a letter grade of D or higher. For the Biomaterials concentration, one of the three electives must be 580.221: Molecules and Cells (4 credits) (students can substitute Cell Biology and Biochemistry for Molecules and Cells). For other students, a possible choice is 530.201: Statics and Mechanics (4 credits).

Unrestricted Electives (9 credits)
Must be passed with a letter grade of D or higher. A student who has taken both 030.101 and 030.102 may count one of them toward one unrestricted elective.

Total Credits Required for Graduation: 126
Biomaterials Concentration: 127 Credits

* Courses in other departments with an emphasis on the structure, properties, or processing of materials may be counted as materials science electives. A list of approved electives appears in the department’s Undergraduate Advising Manual (available from a student’s academic advisor). All 400-level or higher classes required in the Biomaterials and Nanotechnology concentrations will be counted toward satisfying the upper-level materials science electives requirement.

** Students are encouraged to also take the 1-credit introductory 510.109 Materials Science & Engineering for the 21st Century.

*** For the Biomaterials concentration, EN.580.221 Molecules and Cells must be passed with a grade of C or higher.

**** A student who has taken both 030.101 and 030.102 may count one of them toward one unrestricted elective.

Total Credits: 127

* Students are encouraged to take this course and count it as an unrestricted elective.

Financial Aid
Information about scholarships and other sources of financial assistance for undergraduates is available from Student Financial Services (http://pages.jh.edu/~finaid). In addition, the faculty employs a number of undergraduates as laboratory assistants to help with various aspects of their individual research programs.

Graduate Programs
The Department of Materials Science and Engineering (DMSE) offers three graduate degrees: the Ph.D. (Doctor of Philosophy), the M.S.E. (Master of Science in Engineering), and the M.M.S.E. (Master of Materials Science and Engineering). The Ph.D. and the M.S.E. can be completed on either a full-time or part-time basis (with advanced approval from the program). Financial aid is available only for students admitted to the full-time Ph.D. program. The M.S.E. degree may be completed either with or without an essay, as described below.

Hopkins undergraduate students are encouraged to consider completing both the B.S. degree and the M.S.E. degree in a total of five years. This five-year, dual degree option offers additional preparation for the pursuit of Ph.D. programs and careers in materials science and engineering. Students are encouraged to consult their undergraduate advisors to gain information on M.S.E. programs at Hopkins, as well as third- and fourth-year course selections best suited to the pursuit of the M.S.E. degree.

The M.M.S.E. is a terminal master's degree offered through Johns Hopkins Engineering for Professionals (EP) of the Whiting School of Engineering. The degree program consists of 10 courses offered primarily in the evening. Students interested in this program should apply through the EP Office, 410.516.2300 or www.ep.jhu.edu.

Admission
To be admitted to graduate study in the Department of Materials Science and Engineering, students must submit credentials sufficient to convince the faculty that they have the potential to successfully complete the program requirements. Under the new GRE test, applicants should take the General Test package containing the Mathematical Reasoning test.

Hopkins undergraduate students who plan to pursue a M.S.E. degree in their fifth year are encouraged to submit an application early in their fourth year of study.

A graduate student pursuing a Ph.D. degree with the Department of Materials Science and Engineering who is funded by the department as
a teaching assistant or research assistant may not enroll simultaneously in a master’s program in another department, unless he or she receives written approval from his or her advisor, the DMSE Graduate Program Committee, and the department chairman.

Advising and Review of Student Performance

Each graduate student will normally have one or more faculty advisors. Students who are entering the M.S.E. program and plan to pursue a degree without an essay will be assigned an academic advisor. Students who are entering the M.S.E. program and plan to pursue a degree with an essay will be advised by their research advisor. Students who are entering the Ph.D. program will be advised by their research advisor. Students with a research advisor in another department will be assigned an internal academic advisor from among the full-time faculty in the department.

Student progress will be assessed regularly by the faculty advisor(s) and the Graduate Program Committee. Students are expected to remain in regular communication with their faculty advisor(s).

Each student’s progress will be reviewed annually by the Graduate Program Committee, in consultation with the student’s advisor(s). To assist in this evaluation, students are required to submit a form (available from the academic program coordinator) detailing progress toward completion of the degree requirements. This form must be signed by the student’s advisor(s) and filed with the Graduate Program Committee each year. The department must be convinced that all academic requirements have been satisfied by the candidate before a recommendation to confer a graduate degree is passed on to the University Graduate Board.

Grade requirements for graduate course work differ according to the degree program, as described below. All graduate students are required to maintain an overall grade point average of 3.0 or higher; failure to do so will ordinarily be cause for dismissal from the program. Independent research courses will not be counted toward completion of course requirements.

The department believes that teaching experience is important to professional growth; therefore, a student may be required to serve as a teaching assistant during his or her academic career.

Fulltime credit enrollment requirement for WSE graduate students:

• All WSE Graduate Students must be enrolled in at least 9 credits to maintain fulltime status (in fall/spring semesters).
• Typically, fulltime WSE PhD students will be enrolled in a combination of WSE classes and/or research for a total of 20 WSE credits per semester (fall/spring).
• Typically, fulltime WSE Masters students will be enrolled in a combination of classes and/or research for a total of 9-10 credits a semester (fall/spring).

Requirements for the M.S.E. Degree with Essay

(8 courses)

The degree of Master of Science in Engineering (M.S.E.) with Essay is awarded subject to the recommendation of the student’s advisor and departmental approval, based on satisfactory completion of the following requirements:

** Academic Ethics (EN.500.603) and:

Three core courses in Materials Science and Engineering
EN.510.601 Structure Of Materials 3
EN.510.602 Thermodynamics Of Materials 3
EN.510.603 Phase Transformations of Materials 3

• Two 600-level or higher and three 400-level or higher electives in materials science and engineering or related fields subject to the following rules:
  • Each elective must be worth at least three credits. Multiple courses that add up to three credits may be used in place of one three-credit course with approval from the Master’s Degree Committee.
  • Up to two of the elective courses may be taken from within the Engineering for Professionals (EP) part-time program.
  • Up to two of the electives may be business courses.
  • Any elective taken from outside the department (including all EP courses) requires prior approval of the Master’s Degree Committee. The Master’s Degree Committee will determine the appropriate number of credits for any elective taken outside the Whiting School of Engineering.
  • With approval of the Master’s Degree Committee, the student can transfer up to two graduate courses from another institution. Students desiring such credit must make the request in writing to the Master’s Degree Committee by the end of the first semester after matriculation. This request must include a description of the course, a course syllabus, and documentation of the grade received. Please note that transfer coursework grades do not count towards calculation of the GPA.
  • Responsible Conduct of Research training (AS.360.624 or AS.360.625) in accordance with the Whiting School of Engineering policy. Details about this requirement, including the criteria for determining whether the online or in-person course must be taken, are provided in the description of the policy.
  • Training on academic ethics in accordance with the Whiting School of Engineering policy. This requirement can be satisfied by passing EN.500.603 (Academic Ethics).
  • A grade of C or better must be achieved in each course to obtain credit.
  • A overall grade point average of 3.0 must be maintained, and a grade point average of a 3.0 is required to earn the degree at the end of the program.
  • Attendance is required at the weekly Department of Materials Science and Engineering Seminar.

** A master’s essay or journal publication is required. A Master’s essay must be approved by one faculty reader and confirm to the requirements of the Graduate Board. For a journal publication a student must submit to the Master’s Degree Committee an article describing his or her original research that has been published (or accepted for publication) in an archival, peer-reviewed technical journal. The student must be the primary author of the article.

Research for the master’s essay or journal publication may be conducted with a corporate sponsor through the INBT Co-Op Program.

Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 21 months. The student’s transcript will reflect a “Master of Science in Engineering with Essay.”

Requirements for the M.S.E. Degree without Essay

(10 courses)

The degree of Master of Science in Engineering (M.S.E.) is awarded subject to the recommendation of the student’s advisor and departmental approval, based on satisfactory completion of the following requirements:

Academic Ethics (EN.500.603) and:

Three core courses in Materials Science and Engineering
EN.510.601 Structure Of Materials 3
EN.510.602 Thermodynamics Of Materials 3
EN.510.603 Phase Transformations of Materials 3
Admission to the M.S.E. program is through the standard graduate admissions process. The typical duration of the program is 12 months. The student’s transcript will reflect a “Master of Science in Engineering.”

Requirements for the Ph.D. degree
To receive the Ph.D. degree, the candidate must fulfill the requirements below. The department must be satisfied that all academic requirements have been satisfied by the candidate before a recommendation will be made to the University Graduate Board to confer the Ph.D. degree.

1. Successful completion of four required courses in materials science and engineering.

EN.510.601 Structure Of Materials 3
EN.510.602 Thermodynamics Of Materials 3
EN.510.603 Phase Transformations of Materials 3
EN.510.615 Physical Properties of Materials 3

Each of the four required courses must be passed with a letter grade of B- or higher. If a student receives a grade of C+ or lower in a required course, the student may re-take the course once to achieve a grade of B- or higher. Receipt of grades of C+ or lower in two or more required courses will ordinarily be cause for dismissal from the program without the opportunity to re-take those courses.

In addition, the student must maintain an overall GPA of 3.0 or better in the four required courses. If the student’s GPA falls below 3.0, the student must re-take one or more of the required courses and earn higher grade(s). Upon doing so the prior grade(s) in those course(s) are replaced and not counted toward the GPA.

The four required courses must be successfully completed (meeting the grade and GPA requirements above) no later than the start of the student’s third year after matriculation; failure to do so will result in dismissal from the program. Exception: A student who fails to meet the requirements above due to a low grade in a single required course, and who has not had an opportunity to re-take that course during the first two years, will be permitted to re-take that one course in the third year.

Students who have completed prior graduate-level coursework similar to EN.510.601 Structure Of Materials, EN.510.602 Thermodynamics Of Materials or EN.510.603 Phase Transformations of Materials may petition the Graduate Program Committee to waive one of these required courses. Alternatively, students with undergraduate degrees in Materials Science may petition the Graduate Program Committee to waive the Physical Properties course. However, only one of the four required courses can be waived. If approved, the course that has been waived will not be counted toward calculation of the GPA as described above. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation. Please note that transfer credits do not count towards calculation of the GPA.

2. Successful completion of three advanced (600-level or higher) elective courses in materials science and engineering or a related field.

Elective courses must be completed with a grade of C or higher, but there is no cumulative GPA requirement. A list of approved electives is available from the Academic Program Coordinator. Students wishing to use a course not on this list must submit a request to the Graduate Program Committee. The Master’s Degree Committee must approve the course before it can be taken. Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses.

Graduate research (EN.510.807-EN.510.808), part-time graduate courses (from Engineering for Professionals in WSE or Advanced Academic Programs in KSAS), and seminars (courses with less than three contact hours per week) will not be counted toward completion of PhD course requirements. Undergraduate courses (400-level or lower) will not be counted unless they are cross-listed as graduate level, 600 or higher. Independent study courses may be used with prior approval of the Graduate Program Committee.

Students who have completed prior graduate-level coursework may petition the Graduate Program Committee to waive one of the required elective courses. Written requests for such waivers must be submitted to the Graduate Program Committee no later than the end of the first semester after matriculation.

In some cases an advisor may require a student to complete additional coursework, beyond the four required courses and three electives described above.

3. Teaching Assistant Requirement: Students in their second year in the department will be required to act as teaching assistant for two courses.

4. Completion of Academic Ethics (EN.500.603)

5. Successful completion of a comprehensive oral examination covering fundamentals of materials science and engineering. The comprehensive examination tests knowledge in each of the subjects listed below.

---Structure of materials
– Thermodynamics of materials
– Phase transformations in materials

In each of the three subject areas, students may be asked questions related to the properties of materials. The depth of required knowledge regarding properties of materials will match the level of knowledge presented in the Physical Properties of Materials class.

Successful completion of the comprehensive exam requires satisfactory performance on all areas tested; there are no partial or conditional passes.

The comprehensive exam is offered semiannually, usually immediately prior to the fall and spring semesters. A student who fails the exam on the first try may make a second attempt, but the exam must be successfully completed no later than the start of the third year following matriculation. Failure to do so will result in dismissal from the program.

6. An oral presentation of a proposal for a research project to form the basis of the candidate’s dissertation.

The dissertation proposal must be presented at a department seminar no later than the end of the third year following matriculation. A written version of the dissertation proposal must be submitted to a faculty committee consisting of the student’s faculty advisor and two other faculty members (to be selected in consultation with the advisor) no later than two weeks prior to the oral presentation. A brief closed session between the student and the committee shall follow the presentation, at which the committee members will ask questions about and provide comments on the proposed plan of research. Additional private discussions may be required by one or more committee members. The thesis proposal is also an examination, with the committee testing the candidate’s depth of knowledge in his or her area of specialization (and not simply on the specific proposed research).

7. Completion of an original research project, documented in a dissertation that is defended by the candidate in a public presentation.

Candidates must write a dissertation conforming to university requirements that describes their work and results in detail. A public defense of the dissertation is required, and will be followed by a closed examination session. The committee for the closed examination shall consist of five faculty members, approved by the Graduate Program Committee, with at least two members being from outside the department. The outcome of the closed examination will be decided by majority vote of the committee. Because the closed examination session fulfills the university Graduate Board Oral (GBO) examination requirement, all procedures pertaining to GBOs as established by the University Graduate Board must be followed.

The committee may impose certain conditions (e.g. changes to the dissertation) for the candidate to meet prior to final certification that he or she has passed the exam. For this reason, the thesis defense must be scheduled for a date at least two months prior to any personal or university deadline for graduation. A complete draft of the dissertation must be submitted to all committee members no later than two weeks prior to the defense.

The dissertation in its final form must be read and approved in writing by two members of the committee (the advisor and one other member to be chosen by the committee as a whole).

Financial Aid
Fellowships of various forms are available for full-time graduate students (typically for PhD as opposed to MSE students), including tuition remission fellowships, teaching fellowships, and additional stipend fellowships.

Research assistantships are available to support full-time graduate students who work with individual professors on their research contracts and grants.

Faculty
Chair
Jonah Erlebacher
Professor: Nanostructured materials, self-organization and pattern formation, computational materials science, kinetics of shape change, ultra-high vacuum processing, nanoporous metals, fuel cells and energy.

Professors
Mingwei Chen
Professor: Research is primarily focused on the relationship between the structure and properties of advanced materials, particularly non-equilibrium and nanostructured materials.

Michael Falk
Professor: Theoretical and computational research investigating materials processes far from equilibrium: deformation, failure and fracture in non-crystalline materials such as metallic glasses; reactive materials, interactions of stress and diffusion in energy storage materials; mixing processes that accompany frictional sliding and wear.

Kalina Hristova
Professor: Biomolecular materials, structure and function of cellular membranes, membrane proteins, self-assembly of biological amphiphiles, protein-lipid interactions, protein synthesis, X-ray diffraction, fluorescence.

Todd C. Hufnagel
Professor: Structure and properties of amorphous alloys; mechanical behavior of metals, polymers, and biomaterials; use of synchrotron radiation for in situ studies of deformation and phase transformations in materials; electron microscopy.

Howard E. Katz
Professor: Organic, hybrid, nanostructured, and interfacial materials in electronic and photonic devices; organic materials synthesis, thin film fabrication and patterning; novel architectures for devices, sensors, and circuits; host-guest chemistry, material responses to high electric fields; organic nonlinear optics; nanoparticles in biosystems; materials for physical science education.

Hai-Quan Mao
Professor: Nanomaterials, electrospinning, nanofibers, biomimetic matrix, stem cell expansion and differentiation, nerve regeneration, micellar nanoparticle, therapeutic delivery, biodegradable polymers.

Peter C. Searson
Professor: Biomaterials, nanomedicine.

James B. Spicer
Professor: Ultrafast phenomena, laser interactions with materials, nanostructured composite materials, sensor physics, laser-based
materials processing, elastic and anelastic materials properties,
intelligent materials processing, near-field optical and microwave
techniques.

Timothy P. Weihs
Professor: The study of exothermic reactions in layered materials
and their applications, processing and characterization of thin films,
mechanical testing of metals and biological materials, nanoindentation
studies.

Assistant Professors
Anthony Shoji Hall
Investigation of chemical reactions catalyzed by solid surfaces to
address problems in renewable energy storage and utilization.

Tim Mueller
Computational materials discovery and design.

Associate Research Professor
Patricia M. McGuiggan
Adhesion, tribology, tribocharging, atomic force microscopy, interfacial
phenomena, wetting, interferometry, polymer and ceramic materials.

Senior Lecturer
Orla Wilson
Senior Lecturer

Research Faculty
Kenneth Levi
Director of Materials Characterization & Processing Facility

Joint, Part-Time, and Visiting Appointments
Kit Bowen
E. Emmet Reid Professor (Chemistry): experimental chemical physics-
photoelectron spectroscopy of negative ions, structure and dynamics of
gas phase, weakly bound molecular clusters.

Collin Broholm
Gerhard H. Dieke Professor (Director, Institute for Quantum Matter)
Physics & Astronomy: experimental condensed matter physics

Chia-Ling Chien
Jacob L. Hain Professor of Physics (Physics & Astronomy): Fabrication
of experimental studies of structural, electronic, magnetic, and super-
conducting properties of nanostructured solids; magneto-electronics,
manipulation of small entities in low Reynolds number regime,
biosensing.

Michael Edidin
Professor (Biology): membrane organization and dynamics, immunology
studied with nanoparticles and advanced microscopy.

Jaafar El-Awady
Assistant Professor: Multiscale materials modeling, damage and fracture
mechanisms of materials in mechanical design, material degradation in
extreme environments, nano-materials and structures, impact dynamics
and wave propagation.

Jennifer H. Elisseff
Professor (Biomedical Engineering): tissue engineering, biomaterials,
cartilage regeneration.

D. Howard Fairbrother
Professor (Chemistry): surface chemistry, electron induced deposition
of nanostructured materials, environmental health and safety of
nanomaterials.

Sharon Gerecht
Associate Professor (Chemical and Biomolecular Engineering):
biomaterials, stem cells, biomimetic hydrogels, vascular differentiation,
angiogenesis, regenerative medicine, hypoxia, microfluidics.

Somnath Ghosh
Professor (Civil Engineering): computational mechanics with focus on
materials analysis, characterization and processing, including simulation
and design.

David Gracias
Professor (Chemical & Biomolecular Engineering): micro and
nanotechnology, surface science, metamaterials, complex systems,
nanoelectrics, nanomedicine, regenerative medicine, drug delivery and
microfluidics.

Warren Grayson
Assistant Professor (Biomedical Engineering): Tissue engineering, stem
cells, bioreactors, biomaterials, orthopaedics

Jordan Green
Assistant Professor (Biomedical Engineering): cellular engineering,
nanobiotechnology, biomaterials, controlled drug delivery and gene
delivery.

Kevin J. Hemker
Professor (Mechanical Engineering): mechanical behavior of materials,
transmission on electron microscopy, high temperature alloys, thermal
barrier coatings, nanocrystalline materials and materials for MEMS.

Robert Ivkov
Visiting Assistant Professor, Radiation Oncology (JHU School of
Medicine): development, characterization, and use of nanomaterials to
target cancer and to enhance the effectiveness of other therapies such as
radiation. A specific area of research includes the study and development
of selective heating with magnetic nanoparticles.

Lynne Jones
Associate Professor (Orthopaedic Surgery, School of Medicine):
biomaterials, osteonecrosis pathogenesis and treatment, total joint
arthroplasty, bone graft materials.

Rangaramanujam Kannan
Professor: Ophthalmology, JHU School of Medicine

Felizh MacGabhann
Assistant Professor: computational modeling of growth factor-receptor
networks, personalized medicine; individualized medicine; experimental
studies of interindividual variation, therapeutic cardiovascular
remodeling, novel methods for data visualization and automated image
analysis, computational models of virus-host interactions.

Tyrel McQueen
Assistant Professor (Chemistry): Solid State and Inorganic Chemistry/
Condensed Matter Physics

Thao (Vicky) Nguyen
Assistant Professor (Mechanical Engineering): Biomechanics:
mechanical behavior, growth and remodeling of fibrous soft tissues.
Constitutive Modeling: thermomechanics, viscoelasticity, viscoplasticity

K.T. Ramesh
Alonzo G. Decker Jr. Professor of Science and Engineering (Mechanical Engineering): Nanomaterials, planetary impact, dynamic failure mechanisms, shock, impact, and wave propagation, high-strain-rate behavior of materials, injury biomechanics, constitutive and failure modeling.

John D. Tovar
Professor (Chemistry): materials-oriented synthetic organic chemistry, electrochemistry, pi-conjugated and conducting polymers, supramolecular chemistry, organic electronics, biomimetic electronic materials.

Tza-Huei (Jeff) Wang
Professor (Mechanical Engineering): cell adhesion and migration, cell mechanics, cysto-skeleton physics, receptor-ligand interactions, cancer bioengineering, progeria, particle tracking methods.

For current course information and registration go to https://sis.jhu.edu/classes/

Courses

**EN.510.101. Introduction to Materials Chemistry. 3.0 Credits.**
Basic principles of chemistry and how they apply to the behavior of materials in the solid state. The relationship between electronic structure, chemical bonding, and crystal structure is developed. Attention is given to characterization of atomic and molecular arrangements in crystalline and amorphous solids: metals, ceramics, semiconductors, and polymers (including proteins). Examples are drawn from industrial practice (including the environmental impact of chemical processes), from energy generation and storage (such as batteries and fuel cells), and from emerging technologies (such as biomaterials). Students may receive credit for AS.030.103 or EN.510.101, but not both.
Prerequisites: Students may receive credit for AS.030.103 or EN.510.101, but not both.
Instructor(s): P. Mcguiggan
Area: Natural Sciences.

**EN.510.105. Chocolate: An Introduction to Materials Science. 1.0 Credit.**
This course will introduce students to some basic concepts in materials science including phase diagrams, crystallization, and various characterization techniques, all through the close examination of chocolate. Students will have the opportunity to try some of their own experiments to see these processes in action. This course is directed toward freshman or sophomore engineering and natural science students with no previous background in these topics.
Instructor(s): J. Dailey
Area: Engineering, Natural Sciences.

**EN.510.106. Foundations of Materials Science & Engineering. 3.0 Credits.**
Basic principles of materials science and engineering and how they apply to the behavior of materials in the solid state. The relationship between electronic structure, chemical bonding, and crystal structure is developed. Attention is given to characterization of atomic and molecular arrangements in crystalline and amorphous solids: metals, ceramics, semiconductors and polymers (including proteins). The processing and synthesis of these different categories of materials. Basics about the phase diagrams of alloys and mass transport in phase transformations. Introduction to materials behavior including their mechanical, chemical, electronic, magnetic, optical and biological properties.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

**EN.510.107. Modern Alchemy. 3.0 Credits.**
Can you really turn lead into gold? Converting common substances into useful materials that play important roles in today's technologies is the goal of many modern scientists and engineers. In this course, we will survey selected topics related to modern materials, the processes that are used to make them as well as the inspiration that led to their development. Topics will include the saga of electronic paper, the sticky stuff of gecko feet and the stretchy truth of metal rubber.
Instructor(s): J. Spicer
Area: Engineering, Natural Sciences.

**EN.510.109. Materials Science & Engineering for the 21st Century. 1.0 Credit.**
Through this course, students are introduced to the basic tenants of the field of materials science and engineering and important aspects of career development. Discussions will cover the range of career options in the field, the opportunities to engage with cutting edge research and technology at JHU, the skills that practitioners require and the ethical conundrums that engineering professionals navigate. Only available to Materials Science & Engineering freshmen and engineering undecided freshmen.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.

**EN.510.135. MSE Design Team I. 3.0 Credits.**
This course is the first half of a two-semester course sequence for freshmen majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems.
Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.
EN.510.136. MSE Design Team I. 3.0 Credits.
This course is the second half of a two-semester course sequence for freshmen majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
Instructor(s): H. Mao; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.201. Introductory Materials Science for Engineers. 3.0 Credits.
An introduction to the structure, properties, and processing of materials used in engineering applications. After beginning with the structure of materials on the atomic and microscopic scales, this course explores defects and their role in determining materials properties, the thermodynamics and kinetics of phase transformations, and ways in which structure and properties can be controlled through processing. Previously: Introduction to Engineering Materials.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

EN.510.202. Computation and Programming for Materials Scientists and Engineers. 3.0 Credits.
This course will introduce students to the basics of programming in the MATLAB environment. Students will build skills in algorithmic problem solving by programming assignments regarding a range of biological and non-biological materials systems. Students will learn to write function definitions and deploy basic operations of selection and iteration as well as MATLAB specific vectorization methods and the construction of graphical user interfaces. Applications may include materials structure, phase equilibrium, propagating reactions, and other relevant scientific and engineering applications.
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.235. MSE Design Team I. 3.0 Credits.
This course is the first half of a two-semester course sequence for sophomores majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Sophomores Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
Instructor(s): O. Wilson.

EN.510.236. MSE Design Team I. 3.0 Credits.
This course is the second half of a two-semester course sequence for sophomores majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Sophomores Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
Instructor(s): H. Mao; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.311. Structure Of Materials. 3.0 Credits.
First of the Introduction to Materials Science series, this course seeks to develop an understanding of the structure of materials starting at the atomic scale and building up to macroscopic structures. Topics include bonding, crystal structures, crystalline defects, symmetry and crystallography, microstructure, liquids and amorphous solids, diffraction, molecular solids and polymers, liquid crystals, amphiphilic materials, and colloids. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Prerequisites: ((AS.110.106 AND AS.110.107) OR (AS.110.108 AND AS.110.109) OR (AS.110.107 AND AS.110.108) OR (AS.110.106 OR AS.110.109)) AND (AS.030.103 OR (AS.030.101 AND AS.030.102)) AND (((AS.171.101 OR AS.171.103 OR AS.171.107) AND (AS.171.102 OR AS.171.104 OR AS.171.108))
Instructor(s): A. Hall
Area: Engineering, Natural Sciences.

EN.510.312. Thermodynamics/Materials. 3.0 Credits.
Second of the Introduction to Materials Science series, this course examines the principles of thermodynamics as they apply to materials. Topics include fundamental principles of thermodynamics, equilibrium in homogeneous and heterogeneous systems, thermodynamics of multicomponent systems, phase diagrams, thermodynamics of defects, and elementary statistical thermodynamics. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Instructor(s): E. Ma
Area: Engineering, Natural Sciences.

EN.510.313. Mechanical Properties of Materials. 3.0 Credits.
Third of the Introduction to Materials Science series, this course is devoted to a study of the mechanical properties of materials. Lecture topics include elasticity, anelasticity, plasticity, and fracture. The concept of dislocations and their interaction with other lattice defects is introduced. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Prerequisites: EN.510.311
Instructor(s): T. Hufnagel
Area: Engineering, Natural Sciences.
EN.510.314. Electronic Properties of Materials. 3.0 Credits.
Fourth of the Introduction to Materials Science series, this course is devoted to a study of the electronic, optical and magnetic properties of materials. Lecture topics include electrical and thermal conductivity, thermoelectricity, transport phenomena, dielectric effects, piezoelectricity, and magnetic phenomena. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Prerequisites: EN.510.311
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.315. Physical Chemistry of Materials II. 3.0 Credits.
Fifth of the Introduction to Materials Science series, this course covers diffusion and phase transformations in materials. Topics include Fick’s laws of diffusion, atomic theory of diffusion, diffusion in multi-component systems, solidification, diffusional and diffusionless transformations, and interfacial phenomena. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Prerequisites: EN.510.311 AND EN.510.312
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.316. Biomaterials I. 3.0 Credits.
Sixth of the Introduction to Materials Science series, this course offers an overview of principles and properties of biomedical materials. Topics include properties of materials used in medicine, synthesis and properties of polymeric materials, polymeric biomaterials, natural and recombinant biomaterials, biodegradable materials, hydrogels, stimuli-sensitive materials, and characterizations of biomaterials. This course contains computational modules; some prior knowledge of computer programming is needed. Recommended Course Background: EN.510.202 (Computation and Programming for Materials Scientists and Engineers) or equivalent.
Instructor(s): H. Mao
Area: Engineering, Natural Sciences.

EN.510.335. MSE Design Team I. 3.0 Credits.
This course is the first half of a two-semester course sequence for freshmen, sophomores, and juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE freshmen, sophomores, and juniors, working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. *The team will meet 150 minutes per week at a time to be designated by the instructor. Recommended Course Background: EN.510.101, EN.510.109, or equivalent courses.
Instructor(s): H. Mao; O. Wilson
Area: Engineering, Natural Sciences.

EN.510.336. MSE Design Team II. 3.0 Credits.
This course is the second half of a two-semester course sequence for juniors majoring or double majoring in materials science and engineering (MSE). This course provides a broad exposure to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE juniors working with a team leader and seniors on the team, apply their general knowledge in MSE to develop the solution to open-ended problems. Materials Science & Engineering Freshman Only. Recommended Course Background: EN.510.106, EN.510.109, or equivalent courses. *The team will meet 150 minutes per week at a time to be designated by the instructor.
Prerequisites: EN.510.335
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences.

EN.510.400. Introduction to Ceramics. 3.0 Credits.
This course will examine the fundamental structure and property relationships in ceramic materials. Areas to be studied include the chemistry and structure of ceramics and glasses, microstructure and property relationships, ceramic phase relationships, and ceramic properties. Particular emphasis will be placed on the physical chemistry of particulate systems, characterization, and the surface of colloid chemistry of ceramics. Recommended Course Background: EN.510.311, EN.510.312, or permission of instructor.
Instructor(s): P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.401. Macromolecular Drug Carriers. 3.0 Credits.
This course will describe the various types of environmental chemical attack (corrosion) resulting in degradation of materials, as well as the loss of mechanical stability caused by cyclic fatigue, other mechanical loading, and thermal cycling. In addition, we will discuss advanced nondestructive evaluation techniques for detecting fatigue, corrosion, and thermal damage in structures in service.
Instructor(s): M. Herrera-Alonso
Area: Engineering, Natural Sciences.

EN.510.402. Soft Materials. 3.0 Credits.
The structure and properties of soft materials will be studied with the focus on understanding ways to control and measure the dynamics. Soft materials to be studied include colloids, emulsions, dispersions, drops, polymers and gels. We will use experimental tools to study these materials including optical microscopy, rheometers, and atomic force microscopy. Recommended Course Background: EN.510.311 or permission of instructor.
Instructor(s): P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.403. Materials Characterization. 3.0 Credits.
This course will describe a variety of techniques used to characterize the structure and composition of engineering materials, including metals, ceramics, polymers, composites and semiconductors. The emphasis will be on microstructural characterization techniques, including optical and electron microscopy, X-ray diffraction, and thermal analysis and surface analytical techniques, including Auger electron spectroscopy, secondary ion mass spectroscopy, X-ray photoelectron spectroscopy, and atomic force microscopy. Working with the JHU museums, we will use the techniques learned in class to characterize historic artifacts.
Instructor(s): P. Mcguiggan
Area: Natural Sciences.
EN.510.405. Materials Science of Energy Technologies. 3.0 Credits.
This course examines the science and engineering of contemporary and cutting-edge energy technologies. Materials Science and Mechanical Engineering fundamentals in this area will be complemented by case studies that include fuel cells, solar cells, lighting, thermoelectrics, wind turbines, engines, nuclear power, biofuels, and catalysis. Students will consider various alternative energy systems, and also to research and engineering of traditional energy technologies aimed at increased efficiency, conservation, and sustainability. Recommended Course Background: undergraduate course in thermodynamics.
Instructor(s): J. Erlebacher
Area: Engineering, Natural Sciences.

EN.510.407. Biomaterials II: Host response and biomaterials applications. 3.0 Credits.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Also listed as EN.510.607.
Prerequisites: EN.510.316 or permission of instructor.
Instructor(s): L. Gu
Area: Engineering, Natural Sciences.

EN.510.409. Melting, Smelting, Refining and Casting. 3.0 Credits.
This is a laboratory class on metal formation, an area that underlies almost all other technologies. We will examine extraction of metals from ore, refining of metals. The kinetics of melting and solidification will be explored in the context of casting and forming.
Prerequisites: EN.510.311 AND EN.510.312 AND EN.510.313 AND EN.510.315
Instructor(s): T. Hufnagel
Area: Engineering, Natural Sciences.

EN.510.412. Introduction to and Applications of Scanning Probe Microscopy. 3.0 Credits.
Scanning Probe Microscopy has emerged as one of the premier techniques to characterize surfaces. This course will give an overview of the family of SPM techniques including scanning tunneling microscopy (STM), atomic force microscopy (AFM), scanning near field optical microscopy (SNOM) and Kelvin probe microscopy. In each of these applications, the theory of operation, measurement and imaging techniques, and experimental limitations will be discussed. Also listed as 510.632.
Instructor(s): P. Mcquiggin
Area: Engineering, Natural Sciences.

EN.510.415. The Chemistry of Materials Synthesis. 3.0 Credits.
Many of the latest breakthroughs in materials science and engineering have been driven by new approaches to their synthesis, which has allowed the preparation of materials with fanciful structures and fascinating properties. This advanced course will explore synthetic approaches to multifunctional and nanostructured materials, ranging from opals to complex polymers to nanowires and quantum dots. Applications include electronics, energetics, and drug delivery. Participants will gain sufficient familiarity with synthesis options to be able to design research programs that rely on them. Emphasis will be placed on broad strategies that lead to material functionality, rather than detailed step-by-step sequences. Some topics will be selected “on the fly” from the most exciting current literature.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.416. Physical Behavior of Metamaterials. 3.0 Credits.
The field of metamaterials is a rapidly evolving area within the physical and engineering sciences that relates to diverse applications such as transformation optics for advanced imaging, acoustic noise reduction for architectural spaces and electromagnetic shielding for electronic devices. The goal of metamaterials design is to guide energy transport through specified regions of a material avoiding others that might contain delicate or otherwise susceptible structures that must be shielded. Energy transport can occur via electromagnetic waves, acoustic waves, electrical currents or thermal fluxes. Through rational design of the material micro/meso/macrostructure, any one of these can be effectively directed in the material. The challenge is to engineer materials that respond in a way that approximates the desired design. In this course, the methods for metamaterials design will be investigated along with those aspects of materials science and engineering that allow for the fabrication of these materials. Also listed as EN.510.616
Prerequisites: EN.510.31 AND EN.510.314 or their equivalents
Instructor(s): J. Spicer.

EN.510.418. Electronic and Photonic Processes and Devices. 3.0 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.420. Stealth Science & Engineering. 3.0 Credits.
The goal of stealth engineering is the creation of objects that are not easily detected using remote sensing techniques. To achieve this end, engineered systems of materials are arrayed to alter the signature of objects by reducing energy returned to remote observers. This course will provide an introduction to the general principles behind signature reduction by examining the mathematics and science behind basic electromagnetic and acoustic transport processes. Specific topics will include energy absorbing materials, anti-reflection coatings, wave guiding and scattering, metamaterials and adaptive screens. Co-listed with EN.510.640
Instructor(s): J. Spicer
Area: Engineering, Natural Sciences.

EN.510.421. Nanoparticles. 3.0 Credits.
Nanoparticles - one-dimensional materials with diameters of nearly atomic dimension - are one of the most important classes of nanostructured materials because their unusual properties that often differ significantly from bulk materials. This course will explore the synthesis, structure and properties of nanoparticles. Applications of nanoparticles in medicine, optics, sensing, and catalysis will be discussed, with an emphasis will be on metal nanoparticles and semiconductor quantum dots.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences.
EN.510.422. Micro and Nano Structured Materials & Devices. 3.0 Credits.
Almost every material's property changes with scale. We will examine ways to make micro- and nano-structured materials and discuss their mechanical, electrical, and chemical properties. Topics include the physics and chemistry of physical vapor deposition, thin film patterning, and microstructural characterization. Particular attention will be paid to current technologies including computer chips and memory, thin film sensors, diffusion barriers, protective coatings, and microelectromechanical (MEMS) devices.
Instructor(s): A. Hall, E. Ma
Area: Engineering, Natural Sciences.

EN.510.424. Physical Science of Paper. 3.0 Credits.
An exploration of paper's past, present, and possible future from the physical science and engineering perspectives. Includes an in-depth analysis of the defining physical, chemical, and electronic properties of paper since its origins in China as early as 202 BCE and the periodic technological innovations that improved quality, lowered price, and expanded use. Applications include paper as a medium for historic heritage artifacts and their conservation. Recommended: AS.030.205 Organic Chemistry I
Prerequisites: EN.510.101 OR (AS.030.101 AND AS.030.102)
Instructor(s): J. Baty
Area: Engineering, Natural Sciences.

EN.510.426. Biomolecular Materials I - Soluble Proteins and Amphiphiles. 3.0 Credits.
This course will examine the fundamental structure, interactions, and function relationship for biological macromolecules. The course will emphasize experimental methods and experimental design, and the physics behind human disease. Topics will include micellization, protein folding and misfolding, and macromolecular interactions. Recommended Course Background: EN.580.221 Co-listed with EN.510.621
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.

EN.510.427. Chemistry of Nanomaterials. 3.0 Credits.
This course introduces the fundamental principles necessary to understand the behavior of materials at length scales larger than atoms or molecules with applications in chemistry and materials science. This course will explore topics such as nanoparticle synthesis and self assembly, ordered porous materials, catalysis, nanostructured thin films, and solar energy conversion. Size dependent properties of nanomaterials will be discussed. Co-listed with EN.510.661.
Instructor(s): A. Hall
Area: Engineering, Natural Sciences.

EN.510.428. Material Science Laboratory I. 3.0 Credits.
This course focuses on characterizing the microstructure and mechanical properties of structural materials that are commonly used in modern technology. A group of A1 alloys, Ti alloys, carbon and alloy steels, and composite materials that are found, for example, in actual bicycles will be selected for examination. Their microstructures will be studied using optical metallography, scanning electron microscopy, X-ray diffraction, and transmission electron microscopy. The mechanical properties of these same materials will be characterized using tension, compression, impact, and hardness tests. The critical ability to vary microstructure and therefore properties through mechanical and heat treatments will also be demonstrated and investigated in the above materials. Restricted to Materials Science & Engineering juniors only
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Corequisites: EN.510.313
Writing Intensive.
Area: Engineering, Natural Sciences

EN.510.429. Materials Science Laboratory II. 3.0 Credits.
This laboratory concentrates on the experimental investigation of electronic properties of materials using basic measurement techniques. Topics include thermal conductivity of metal alloys, electrical conductivity of metals/metal alloys and semiconductors, electronic behavior at infrared wavelengths, magnetic behavior of materials, carrier mobility in semiconductors and the Hall effect in metals and semiconductors. Lab Assignment is by Professor. Recommended Course Background: EN.510.311 or Permission Required.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.430. Biomaterials Lab. 3.0 Credits.
This laboratory course concentrates on synthesis, processing and characterization of materials for biomedical applications, and characterization of cell-materials interaction. Topics include synthesis of biodegradable polymers and degradation, electrospinning of polymer nanofibers, preparation of polymeric microspheres and drug release, preparation of plasmid DNA, polymer-mediated gene delivery, recombinant protein synthesis and purification, self-assembly of collagen fibril, surface functionalization of biomaterials, cell culture techniques, polymer substrates for cell culture, and mechanical properties of biological materials. Recommended Course Background: EN.510.407
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences
Writing Intensive.
EN.510.433. Senior Design Research. 3.0 Credits.
This course is the first half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of the weekly departmental research seminar. Co-listed with EN.510.438 and EN.510.440
Prerequisites: Prereq: EN.510.311 and 510.312 and EN.510.428 and 510.429
Instructor(s): O. Wilson
Area: Engineering
Writing Intensive.

EN.510.434. Senior Design/Research II. 3.0 Credits.
This course is the second half of a two-semester sequence required for seniors majoring or double majoring in materials science and engineering. It is intended to provide a broad exposure to many aspects of planning and conducting independent research. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 Meets with EN.510.439, EN.510.441, EN.510.446, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.435. Mechanical Properties of Biomaterials. 3.0 Credits.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic systems will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.635.
Instructor(s): T. Weihs
Area: Engineering, Natural Sciences.

EN.510.438. Biomaterials Senior Design I. 3.0 Credits.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.440 and EN.510.433
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.439. Biomaterials Senior Design II. 3.0 Credits.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Biomaterials Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on biomaterials. During this semester, verbal reporting of project activities and status is emphasized, culminating in student talks presented to a special session of students and faculty. Students also prepare a poster and a written final report summarizing their design and research results. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 or 510.438 or 510.440 Meets with EN.510.434, EN.510.441, EN.510.446, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.440. Nanomaterials Senior Design I. 3.0 Credits.
This course is the first half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. During this semester, students join ongoing graduate research projects for a typical 10-12 hours per week of hands-on experiences in design and research. Classroom activities include discussions, followed by writing of research pre-proposals (white papers), proposals, status reports and lecture critiques of departmental research seminars. Co-listed with EN.510.433 and EN.510.438
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.

EN.510.441. Nanomaterials Senior Design II. 3.0 Credits.
This course is the second half of a two-semester sequence required for seniors majoring in materials science and engineering with the Nanotechnology Concentration. It is intended to provide a broad exposure to many aspects of planning and conducting independent research with a focus on nanotechnology and nanomaterials. Students also prepare a poster and a written final report summarizing their design and research results. Recommended Course Background: EN.510.311-EN.510.312, EN.510.428-EN.510.429, and EN.510.433 or 510.438 or 510.440 Meets with EN.510.434, EN.510.439, EN.510.444, and EN.510.448
Instructor(s): O. Wilson
Area: Engineering, Natural Sciences
Writing Intensive.
EN.510.442. Nanomaterials Lab. 3.0 Credits.
The objective of the laboratory course will be to give students hands on experience in nanotechnology based device fabrication through synthesis, patterning, and characterization of nanoscale materials. The students will use the knowledge gained from the specific synthesis, characterization and patterning labs to design and fabricate a working nanoscale/nanostructured device. The course will be augmented with comparisons to microscale materials and technologies. These comparisons will be key in understanding the unique phenomena that enable novel applications at the nanoscale. DMSE Seniors or permission of the instructor.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): O. Wilson; P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.443. Chemistry and Physics of Polymers. 3.0 Credits.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.643. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.444. MSE Bone Marrow Design Team. 3.0 Credits.
This course is the first half of a two-semester course sequence for senior students majoring or double majoring in MSE. This course provides current seniors with the opportunity to continue working on a design team project they were involved in as juniors while taking independent senior design (510.433 or equivalent). In this course, MSE seniors, working with a team leader and a group of freshmen, sophomores, and seniors, continue to apply their knowledge in their track area to generate the solution to open-ended problems encountered in MSE. Recommended Course Background: EN.510.101, EN.510.311, EN.510.312, EN.510.428, EN.510.429. Meets with EN.510.434, EN.510.439, EN.510.441 and EN.510.448.
Prerequisites: EN.510.445
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences Writing Intensive.

EN.510.446. MSE Design Team II. 3.0 Credits.
This course is the second half of a two-semester course sequence for senior students majoring or double majoring in MSE. This course provides a broad experience to various aspects of planning and conducting independent research in a team setting (3 to 6 students on each team). In this course, MSE seniors, working with a team leader and a group of freshmen, sophomores, and seniors, apply their knowledge in their track area to generate the solution to open-ended problems encountered in MSE. Materials Science & Engineering Seniors Only. Recommended Course Background: EN 510.101, EN 510.311, EN 510.312, EN 510.428, EN 510.429. Meets with EN.510.434, EN.510.439, EN.510.441, and EN.510.446
Prerequisites: EN.510.447
Instructor(s): H. Mao; O. Wilson
Area: Engineering, Natural Sciences Writing Intensive.

EN.510.447. MSE Design Team Leader. 4.0 Credits.
This course is the first half of a two-semester course sequence for students majoring or double majoring in MSE. This course provides a leadership experience to various aspects of planning and conducting independent research in a team setting. In this course, MSE seniors assemble and lead a student team consisting of 3 to 6 students, apply their knowledge in their track area, and develop leadership skills to generate the solution to open-ended problems encountered in MSE. Recommended Course Background: EN.510.101, EN.510.311, EN.510.312, EN.510.428, EN.510.429.
Instructor(s): H. Mao; O. Wilson
Area: Engineering, Natural Sciences Writing Intensive.

EN.510.448. MSE Design Team Leader. 4.0 Credits.
This course is the second half of a two-semester course sequence for students majoring or double majoring in MSE. This course provides a leadership experience to various aspects of planning and conducting independent research in a team setting. In this course, MSE seniors assemble and lead a student team consisting of 3 to 6 students, apply their knowledge in their track area, and develop leadership skills to generate the solution to open-ended problems encountered in MSE. Materials Science & Engineering Seniors Only. Recommended Course Background: EN 510.101, EN 510.311, EN 510.312,EN. 510.428, EN.510.429. Meets with EN.510.434, EN.510.439, EN.510.441, and EN.510.446
Prerequisites: EN.510.447
Instructor(s): H. Mao; J. Spicer; O. Wilson; P. Searson
Area: Engineering, Natural Sciences Writing Intensive.

EN.510.449. MSE Bone Marrow Design Team II. 3.0 Credits.
This course is the second half of a two-semester course sequence for senior students majoring or double majoring in MSE. This course provides current seniors with the opportunity to continue working on a design team project they were involved in as juniors while taking independent senior design (510.433 or equivalent). In this course, MSE seniors, working with a team leader and a group of freshmen, sophomores, and seniors, continue to apply their knowledge in their track area to generate the solution to open-ended problems encountered in MSE. Recommended Course Background: EN.510.101, EN.510.311, EN.510.312, EN.510.428, EN.510.429.
Instructor(s): H. Mao; O. Wilson
Area: Engineering, Natural Sciences Writing Intensive.
EN.510.457. Materials Science of Thin Films. 3.0 Credits.
The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Co-listed with EN.510.657
Instructor(s): T. Weihs
Area: Engineering, Natural Sciences.

EN.510.501. Undergraduate Research/Material Science. 3.0 Credits.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): Staff.

EN.510.502. Research in Materials Science. 0.0 - 3.0 Credits.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Instructor(s): Staff.

EN.510.503. Independent Study/Materials Science. 3.0 Credits.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): R. Cammarata.

EN.510.504. Independent Study. 0.0 - 3.0 Credits.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): A. Hall, P. Searson; T. Hufnagel.

EN.510.511. Group Undergraduate Research/Material Science. 3.0 Credits.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group. This section has a weekly research group meeting that students are expected to attend.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): Staff.

EN.510.597. Research - Summer. 3.0 Credits.
Instructor(s): Staff.

EN.510.601. Structure Of Materials. 3.0 Credits.
An introduction to the structure of inorganic and polymeric materials. Topics include the atomic scale structure of metals, alloys, ceramics, and semiconductors; structure of polymers; crystal defects; elementary crystallography; tensor properties of crystals; and an introduction to the uses of diffraction techniques (including X-ray diffraction and electron microscopy) in studying the structure of materials. Recommended Course Background: undergraduate chemistry, physics, and calculus or permission of instructor.
Instructor(s): M. Chen.

EN.510.602. Thermodynamics Of Materials. 3.0 Credits.
An introduction to the classical and statistical thermodynamics of materials. Topics include the zeroth law of thermodynamics; the first law (work, internal energy, heat, enthalpy, heat capacity); the second law (heat engines, Carnot cycle, Clausius inequality, entropy, absolute temperature); equilibrium of single component systems (free energy, thermodynamic potentials, virtual variations, chemical potential, phase changes); equilibrium of multicomponent systems and chemical thermodynamics; basics of statistical physics (single and multiple particle partition functions, configurational entropy, third law; statistical thermodynamics of solid solutions); and equilibrium composition-temperature phase diagrams. Recommended Course Background: undergraduate calculus, chemistry, and physics or permission of instructor.
Instructor(s): P. Searson.

EN.510.603. Phase Transformations of Materials. 3.0 Credits.
This course presents a unified treatment of the thermodynamics and kinetics of phase transformations from phenomenological and atomistic viewpoints. Phase transformations in condensed metal and nonmetal systems are discussed. Recommended Course Background: EN.510.601 and EN.510.602
Instructor(s): E. Ma.

EN.510.604. Mechanical Properties of Materials. 3.0 Credits.
An introduction to the properties and mechanisms that control the mechanical performance of materials. Topics include mechanical testing, tensor description of stress and strain, isotropic and anisotropic elasticity, plastic behavior of crystals, dislocation theory, mechanisms of microscopic plasticity, creep, fracture, and deformation and fracture of polymers. Recommended Course Background: EN.510.601
Instructor(s): T. Hufnagel.

EN.510.605. Electrical, Optical and Magnetic Properties of Materials. 3.0 Credits.
An overview of electrical, optical and magnetic properties arising from the fundamental electronic and atomic structure of materials. Continuum materials properties are developed through examination of microscopic processes. Emphasis will be placed on both fundamental principles and applications in contemporary materials technologies. Recommended Course Background: EN.510.601
Instructor(s): J. Spicer.

EN.510.606. Polymer Chemistry & Biology. 3.0 Credits.
An introduction to the chemical and biological properties of organic and inorganic materials. Topics include an introduction to polymer science, polymer synthesis, chemical synthesis, and modification of inorganic materials, biomineralization, biosynthesis, and properties of natural materials (proteins, DNA, and polysaccharides), structure-property relationships in polymeric materials (synthetic polymers and structural proteins), and materials for biomedical applications. Recommended Course Background: undergraduate chemistry and biology or permission of instructor.
Instructor(s): M. Herrera-Alonso.
EN.510.607. Biomaterials II: Host response and biomaterials applications. 3.0 Credits.
This course focuses on the interaction of biomaterials with the biological system and applications of biomaterials. Topics include host reactions to biomaterials and their evaluation, cell-biomaterials interaction, biomaterials for tissue engineering applications, biomaterials for controlled drug and gene delivery, biomaterials for cardiovascular applications, biomaterials for orthopedic applications, and biomaterials for artificial organs. Recommended Course Background: EN.510.606. Also listed as EN.510.407
Instructor(s): L. Gu.

EN.510.608. Electrochemistry. 3.0 Credits.
Thermodynamics of electrochemical interfaces, including electrochemical potential, the Nernst equation, ion-solvent interactions, and double layer theory. Charge transfer kinetics for activation and diffusion controlled processes. Analysis of kinetics at various electrodes, including redox reactions, metal-ion electrodes, and semiconductor electrodes. Electroanalytical techniques are discussed, including those related to bioelectrochemistry and semiconductor electrochemistry. Selected reactions of technological importance are evaluated, including the hydrogen evolution reaction, oxygen reduction, electrodeposition, and energy generation and storage. Recommended Course Background: introductory chemistry or permission of instructor.
Instructor(s): P. Searson.

EN.510.611. Solid State Physics. 3.0 Credits.
An introduction to solid state physics for advanced undergraduates and graduate students in physical science and engineering. Topics include crystal structure of solids; band theory; thermal, optical, and electronic properties; transport and magnetic properties of metals, semiconductors, and insulators. The concepts of solid state principles in modern electronic, optical, and structural materials are discussed. Cross-listed with Electrical and Computer Engineering.
Instructor(s): T. Poehler.

EN.510.612. Solid State Physics. 3.0 Credits.
Basic solid state physics principles applied to modern electronic, optical, and structural materials. Topics discussed will include magnetism, superconductivity, polymers, nano-structured materials, electronic effects, and surface physics. For advanced undergraduates and graduate students in physical science and engineering. Recommended Course Background: EN.510.611
Instructor(s): T. Poehler.

EN.510.614. Macromolecular Drug Carriers. 3.0 Credits.
In this course we will discuss recent literature findings regarding the design, synthesis, fabrication and characterization of macromolecular materials used as drug carriers. Topics include polymer synthesis, post-polymerization modification, structure-property relationships of nano- and micro-particles and hydrogels. Recommended Course Background: General Chemistry. Also listed as 510.401.
Instructor(s): M. Herrera-Alonso
Area: Engineering, Natural Sciences.

EN.510.615. Physical Properties of Materials. 3.0 Credits.
A detailed survey of the relationship between materials properties and underlying microstructure. Structure/property/processing relationships will be examined across a wide spectrum of materials including metals, ceramics, polymers and biomaterials, and properties including electrical, magnetic, optical, thermal, mechanical, chemical and biocompatibility.
Instructor(s): P. Mcguigan
Area: Engineering, Natural Sciences.

EN.510.616. Physical Behavior of Metamaterials. 3.0 Credits.
The field of metamaterials is a rapidly evolving area within the physical and engineering sciences that relates to diverse applications such as transformation optics for advanced imaging, acoustic noise reduction for architectural spaces and electromagnetic shielding for electronic devices. The goal of metamaterials design is to guide energy transport through specified regions of a material avoiding others that might contain delicate or otherwise susceptible structures that must be shielded. Energy transport can occur via electromagnetic waves, acoustic waves, electrical currents or thermal fluxes. Through rational design of the material micro/meso/macrostructure, any one of these can be effectively directed in the material. The challenge is to engineer materials that respond in a way that approximates the desired design. In this course, the methods for metamaterials design will be investigated along with those aspects of materials science and engineering that allow for the fabrication of these materials. Also listed as EN.510.416
Instructor(s): J. Spicer.

EN.510.618. Electronic and Photonic Processes and Devices. 3.0 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of electronic and optical materials and devices. Subject matter will include a detailed and comprehensive discussion of the physical processes underlying modern electronic and optical devices. Detailed descriptions of modern semiconductor devices such as lasers and detectors used in optical communications and information storage and processing will be presented. Also listed as EN.510.618/EN.510.418.
Instructor(s): T. Poehler.

EN.510.621. Biomolecular Materials I - Soluble Proteins and Amphiphiles. 3.0 Credits.
Instructor(s): K. Hristova
Area: Engineering, Natural Sciences.
EN.510.630. Molecular Simulation of Materials. 3.0 Credits.
Learn the fundamentals necessary to design and implement computer simulations on the molecular level. This course focuses on two widely used techniques: molecular-dynamics and Monte Carlo simulation. Both are introduced in the context of a review of the basic theoretical background. This class will cover the specifics of handling molecular interactions using empirical potentials, applying proper boundary conditions and simulating various equilibrium ensembles and non-equilibrium systems. Lectures will address how to extract transport coefficients, atomic scale correlations and local stresses and strains from simulation data, and computational issues such as algorithmic complexity and efficiency. The final weeks of the course will focus on new and cutting-edge advances in these methods.
Instructor(s): M. Falk
Area: Engineering, Natural Sciences.

EN.510.632. Introduction to and Applications of Scanning Probe Microscopy. 3.0 Credits.
Scanning Probe Microscopy has emerged as one of the premier techniques to characterize surfaces. This course will give an overview of the family of SPM techniques including scanning tunneling microscopy (STM), atomic force microscopy (AFM), scanning near field optical microscopy (SNOM) and Kelvin probe microscopy. In each of these applications, the theory of operation, measurement and imaging techniques, and experimental limitations will be discussed. Also listed as EN.510.412
Instructor(s): P. Mcguiggan
Area: Engineering, Natural Sciences.

EN.510.633. Computational Materials Design. 3.0 Credits.
This course will cover the use of computational methods to discover and design materials for new technologies. Topics addressed will include structure prediction, materials informatics, and the calculation of material properties from first principles using methods such as density functional theory. Participants will gain hands-on experience with modern computational techniques.
Instructor(s): T. Mueller
Area: Engineering, Natural Sciences.

EN.510.634. Simulation of Biomolecules and Membranes. 3.0 Credits.
This class will provide an overview of methods for molecular simulation of biomolecules and membranes. We will study methods for atomic detail molecular dynamics and Monte Carlo simulations. After discussing basic algorithms such as integrators, thermostat, and barostats, we will study how biomolecules are chemically parameterized to accurately capture their conformational equilibria. This knowledge will then be used to build, simulate, and analyse a molecular model of a membrane protein embedded in a lipid bilayer. The simulation will be used to understand how these methods can be used to obtain insights into the molecular mechanisms of protein function.
Instructor(s): M. Ulmschneider
Area: Engineering, Natural Sciences.

EN.510.635. Mechanical Properties of Biomaterials. 3.0 Credits.
This course will focus on the mechanical properties of biomaterials and the dependence of these properties on the microstructure of the materials. Organic and inorganic systems will be considered through a combination of lectures and readings and the material systems will range from cells to bones to artificial implants. Same course as 510.435
Instructor(s): T. Weihrs
Area: Engineering, Natural Sciences.

EN.510.640. Stealth Engineering. 3.0 Credits.
The goal of stealth engineering is the creation of objects that are not easily detected using remote sensing techniques. To achieve this end, engineered systems of materials are arrayed to alter the signature of objects by reducing energy returned to remote observers. This course will provide an introduction to the general principles behind signature reduction by examining the mathematics and science behind basic electromagnetic and acoustic transport processes. Specific topics will include energy absorbing materials, anti-reflection coatings, wave guiding and scattering, metamaterials and adaptive screens. Co-listed with EN.510.420.
Instructor(s): J. Spicer
Area: Engineering, Natural Sciences.

EN.510.643. Chemistry and Physics of Polymers. 3.0 Credits.
The course will describe and evaluate the synthetic routes, including condensation and addition polymerization, to macromolecules with varied constituents and properties. Factors that affect the efficiencies of the syntheses will be discussed. Properties of polymers that lead to technological applications will be covered, and the physical basis for these properties will be derived. Connections to mechanical, electronic, photonic, and biological applications will be made. Also listed as EN.510.443. Recommended Course Background: Organic Chemistry I and one semester of thermodynamics.
Instructor(s): H. Katz
Area: Engineering, Natural Sciences.

EN.510.657. Materials Science of Thin Films. 3.0 Credits.
The processing, structure, and properties of thin films are discussed emphasizing current areas of scientific and technological interest. Topics include elements of vacuum science and technology; chemical and physical vapor deposition processes; film growth and microstructure; chemical and microstructural characterization methods; epitaxy; mechanical properties such as internal stresses, adhesion, and strength; and technological applications such as superlattices, diffusion barriers, and protective coatings. Co-listed with EN.510.457
Instructor(s): T. Weihs
Area: Engineering, Natural Sciences.

EN.510.659. Physics & Properties of Low-Dimensional Nanomaterials. 3.0 Credits.
This course is intended for advanced undergraduates and graduate students and will cover the fundamentals and properties of low dimensional nanomaterials. Subject matter will include a detailed and comprehensive discussion of the physics and physical properties of solids confined in either one, two or three directions. Features examined for these low dimensional materials will include electronic structure, electrical transport, vibrational and thermal transport in low dimensional systems such as graphene, carbon nanotubes, quantum wires, semiconductor and metal nanoparticles. Co-listed with EN.510.459.
Instructor(s): T. Poehler
Area: Engineering, Natural Sciences.

EN.510.661. Chemistry of Nanomaterials. 3.0 Credits.
This course introduces the fundamental principles necessary to understand the behavior of materials at length scales larger than atoms or molecules with applications in chemistry and materials science. This course will explore topics such as nanoparticle synthesis and self assembly, ordered porous materials, catalysis, nanostructured thin films, and solar energy conversion. Size dependent properties of nanomaterials will be discussed. Co-listed with EN.510.427
Instructor(s): A. Hall
Area: Engineering.
EN.510.701. Three-Dimensional Microstructural Characterization of Materials. 3.0 Credits.
A graduate-level introduction to experimental techniques and data analysis for characterizing the microstructure of materials in three dimensions. Topics to be covered include serial sectioning, principles of optical and scanning-electron microscopy and electron back-scatter diffraction (EBSD), high-energy x-ray diffraction microscopy, and techniques for 3D data reduction, representation, and analysis.
Prerequisites: EN.510.601 or Permission of instructor.
Instructor(s): T. Hufnagel
Area: Engineering, Natural Sciences.

EN.510.801. Materials Research Seminar. 1.0 Credit.
The Graduate Research Seminar in the Department of Materials Science and Engineering provides a forum for students to present their latest research results in a formal seminar setting. The course encourages discussion between students in varying disciplines in order to establish new collaborations and develop the shared vocabulary required for interdisciplinary materials science research. Permission Required.
Instructor(s): J. Erlebacher.

EN.510.802. Materials Research Seminar. 1.0 Credit.
Instructor(s): J. Erlebacher.

EN.510.803. Materials Science Seminar. 1.0 Credit.
The Materials Science Seminar exposes students to a wide array of internationally recognized speakers who discuss topics of cutting-edge Materials Science research. Speakers are selected both to overlap research interests within the department and to expose students to broader trends in contemporary Materials Science.
Instructor(s): J. Erlebacher.

EN.510.804. Materials Science Seminar. 1.0 Credit.
Meets with EN.510.434, EN.510.439, EN.510.441, EN.510.446, and EN.510.448.
Instructor(s): J. Erlebacher.

EN.510.807. Graduate Research In Materials Science. 3.0 - 20.0 Credits.
Individual programs of study are worked out between students and the professor supervising their independent study project. Topics selected are those not formally listed as regular courses and include a considerable design component.
Instructor(s): J. Erlebacher.

EN.510.808. Graduate Research. 3.0 - 20.0 Credits.
Instructor(s): J. Erlebacher.

Cross Listed Courses

Physics Astronomy
AS.171.321. Introduction to Space, Science, and Technology. 3.0 Credits.
Topics include space astronomy, remote observing of the earth, space physics, planetary exploration, human space flight, space environment, orbits, propulsion, spacecraft design, attitude control and communication. Crosslisted by Departments of Earth and Planetary Sciences, Materials Science and Engineering and Mechanical Engineering. Recommended Course Background: AS.171.101-AS.171.102 or similar; AS.110.108-AS.110.109.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): J. MacKenty; S. McCandless
Area: Engineering, Natural Sciences.

General Engineering
EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and techniques, and is intended for all who plan to develop computational artifacts or intelligently deploy computational tools in their studies and careers. Topics covered include the design and implementation of algorithms using variables, control structures, arrays, functions, files, testing, debugging, and structured program design. Elements of object-oriented programming, algorithmic efficiency and data visualization are also introduced. Students deploy programming to develop working solutions that address problems in engineering, science and other areas of contemporary interest that vary from section to section. Course homework involves significant programming. Attendance and participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

Electrical Computer Engineering
EN.520.627. Photovoltaics and Energy Devices. 3.0 Credits.
This course provides an introduction to the science of photovoltaics and related energy devices. Topics covered include basic concepts in semiconductor device operation and carrier statistics; recombination mechanisms; p-n junctions; silicon, thin film, and third generation photovoltaic technologies; light trapping; and detailed balance limits of efficiency. Additionally, thermophotovoltaics and electrical energy storage technologies are introduced. A background in semiconductor device physics (EN.520.485, or similar) is recommended.
Instructor(s): S. Thon.

Institute for NanoBio Technology
EN.670.619. Fundamental Physics and Chemistry of Nanomaterials. 3.0 Credits.
This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-micro rheology. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.

Mechanical Engineering

http://me.jhu.edu

The Department of Mechanical Engineering offers undergraduate and graduate programs of instruction and research. Undergraduate programs are offered in Mechanical Engineering and in Engineering Mechanics. The B.S. in the Mechanical Engineering and Engineering Mechanics degree programs are accredited by the Engineering Accreditation Commission of ABET, http://www.abet.org. The department offers undergraduate tracks in biomechanical engineering and aerospace engineering. Graduate programs are offered leading to the M.S.E. and the Ph.D. degrees. A five-year accelerated B.S./M.S.E. program is also available.

Mechanical Engineering is of great importance in most contemporary technologies. Examples include aerospace, power generation and conversion, fluid machinery, design and construction of mechanical systems, transportation, manufacturing, production, and biomechanics. This wide range of applications is reflected in the four main stems of the
undergraduate curriculum: thermal and fluid systems, mechanics and materials, robotics and control systems, and biomechanics.

Engineering Mechanics is a more flexible program that enables students to pursue particular interests while centering on a smaller core of courses. Students may use this flexibility to follow specific interests in physics, mathematics, economics, biology, and other disciplines while receiving an engineering degree.

Design is a major component of both undergraduate programs. In the two-semester Engineering Design Project course taken by undergraduates during their senior year, students work in small teams to design, construct, and test a mechanical device or system for an industrial sponsor.

A major effort of the department is directed toward the creation of a stimulating intellectual environment in which both undergraduate and graduate students can develop to their maximum potential. Faculty members encourage undergraduate students to participate in both fundamental and applied research along with the graduate students. In most junior and senior undergraduate classes, and in graduate classes, small enrollments permit close contact with faculty members. Students have excellent opportunities to participate actively in the classroom and laboratories and to follow special interests within a subject area.

Facilities
The Mechanical Engineering department office is located in 223 Latrobe Hall. The teaching and research facilities of the department are located in Latrobe, Clark, Krieger, Wyman, Maryland, Malone, and Hackerman Halls.

The thermal-fluids teaching laboratory in Krieger Hall supports courses in Thermodynamics, Fluid Mechanics, and Heat Transfer. The undergraduate laboratories at the Wyman Park Building support courses in Design and CAD, Electronics and Instrumentation, Mechanics-Based Design, Robot Sensors and Actuators, Mechatronics, and Dynamical Systems. The Senior Design laboratories are used by seniors to construct and test their prototypes in the yearlong design project course.

The many research laboratories within Mechanical Engineering support a variety of focus areas including: turbulence, oceanographic fluid dynamics, turbomachinery, microfluidics, locomotion (sea, land, and air), mechanisms of deformation and damage, impact dynamics, additive manufacturing, polymer mechanics, mechanics of soft tissues, biophotonics, cellular mechanics, bioMEMS, robot and protein kinematics, haptics, medical robots, underwater robots, and autonomous vehicles.

Financial Aid
Scholarships and other forms of financial assistance for undergraduates are described under Admissions and Finances (p. 6). In addition, selected undergraduates may be employed as laboratory assistants on research projects. Assistance in various forms is available for graduate students, including tuition fellowships, fellowships with stipend, research assistantships, and competitively-awarded hourly teaching assistant positions. Applications for graduate study must be received by October 15 for the Spring semester and December 15 for the Fall semester for consideration.

Research assistantships support graduate students who work with professors on their research contracts and grants.

Undergraduate Programs
The Department of Mechanical Engineering offers two undergraduate programs: the Bachelor of Science in Mechanical Engineering and the Bachelor of Science in Engineering Mechanics. Both programs are accredited by the Engineering Accreditation Commission of ABET. The department offers tracks in biomechanical engineering and aerospace engineering. For additional information regarding both the mechanical engineering and engineering mechanics academic programs, please consult the undergraduate advising manuals which are available on the departmental website (http://me.jhu.edu/undergraduate-studies/academic-advising-undergraduate).

For details and an explanation of ABET requirements, visit www.abet.org.

Requirements for the Bachelor’s Degree
See also General Requirements for Departmental Majors (p. 7) and the department's undergraduate advising manuals (http://me.jhu.edu/undergraduate-studies/academic-advising-undergraduate).

The Mechanical Engineering Program
The mission of the B.S. in mechanical engineering degree program is to provide a rigorous educational experience that prepares a select group of students for leadership positions in the profession and a lifetime of learning. The faculty is committed to maintaining a modern and flexible curriculum which, building on a foundation of basic sciences and mathematics, develops a solid education in the mechanical engineering sciences. The aim of the Mechanical Engineering program is to build competence in the design and development of thermal, fluid, and mechanical systems, to promote a broad knowledge of the contemporary social and economic context, and to develop the communication skills necessary to excel.

The program provides a basic background in thermal and mechanical systems. Laboratory instruction, as well as the senior design project, gives the student hands-on experience. Each student's program of study is planned in consultation with his or her faculty advisor. Students are encouraged to develop depth in one or two areas of focus within mechanical engineering chosen from fluid mechanics, mechanics of solids and design, heat transfer and energy, robotics, and biomechanics. The choice of focus is decided in the junior year after consultation with the student's faculty advisor.

Our primary objective is to educate an exceptional group of engineers who, after graduation, will be:

- ...successful and on track to become leaders among their peers in industry, government laboratories and other organizations, and
- ...advanced students in the best graduate programs.

Students graduating with a B.S. in Mechanical Engineering will have demonstrated:

(a) ...an ability to apply knowledge of mathematics, science and engineering

(b) ...an ability to design and conduct experiments, as well as to analyze and interpret data

(c) ...an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability and sustainability
The Mechanical Engineering Curriculum is Structured as Follows

### Mathematics (19 credits)

### Mechanical Engineering Electives (9 credits)

(Grades below C- are not accepted)

Three courses (300-level or higher) in mechanical engineering

### Technical Electives (9 credits)

(Grades below C- are not accepted)

Three engineering, quantitative studies, or natural sciences courses at or above the 300-level, chosen from any combination of courses in engineering, basic sciences, or mathematics selected in consultation with the student’s advisor.

**To obtain coherence and depth in these humanities and social science electives, at least six credits must be at the 300-level or higher. While a course grade of C- or higher is preferred, up to 10 credits with a D or D+ grade will be accepted. For examples of areas of concentration and more details, see the undergraduate academic advising manual at http://www.me.jhu.edu/advising.html.

** These courses are intended to complement the mechanical engineering electives. One of the three technical electives may be a computer language course taken at any level.

A program of not less than 125 credits must be completed to be eligible for the bachelor’s degree. All undergraduate students must follow a program approved by a faculty member in the department who is selected as the student’s advisor.

### Aerospace Track

A student may specialize in aerospace engineering once a solid background in the fundamentals of mechanical engineering has been developed through the basic Mechanical Engineering courses. This track requires knowledge and background in several fields including advanced dynamics, flight mechanics, propulsion, aerospace materials and structures, signal processing, control systems, astrophysics and space systems. Students pursuing the Aerospace Engineering Track...
are required to take at least five of the following courses (which can
be counted toward the Mechanical Engineering elective and Technical
Elective requirements in the general Mechanical Engineering program):

Any five of the courses listed below are required. A sixth course from
this list, though not required is highly recommended.

EN.530.328 Fluid Mechanics II 3
EN.530.418 Aerospace Structures & Materials 3
or EN.530.619 Aerospace Structures and Materials
EN.530.424 Dynamics of Robots and Spacecraft 3
or EN.530.624 Dynamics of Robots and Spacecraft (Graduate)
EN.530.425 Mechanics of Flight 3
EN.530.427 Intermediate Fluid Mechanics 3
EN.530.432 Jet & Rocket Propulsion 3
EN.530.435 Guidance and Control of Flight Vehicles 3
EN.530.470 Space Vehicle Dynamics & Control 3
AS.171.321 Introduction to Space, Science, and Technology 3
AS.270.318 Remote Sensing of the Environment 3
Other courses relevant to the track which don’t count toward the
requirements include:

AS.171.118 Stars and the Universe: Cosmic Evolution 3

**Biomechanics Track**

A student may specialize in biomechanics once a solid background in the
fundamentals of mechanical engineering has been developed through
the core Mechanical Engineering or Engineering Mechanics courses.
The essence of mechanics is the interplay between forces and motion.
In biology, mechanics is important at the macroscopic, cellular, and
subcellular levels.

At the macroscopic length scale biomechanics of both soft and hard
tissues plays an important role in computer-integrated surgical systems
and technologies, e.g., medical robotics. At the cellular level, issues
such as cell motility and chemotaxis can be modeled as mechanical
phenomena. At the subcellular level, conformational transitions in
biological macromolecules can be modeled using molecular dynamics
simulation, which is nothing more than computational Newtonian
mechanics; statistical mechanics, or using coarse-grained techniques
that rely on principles from the mechanics of materials.

In addition, much of structural biology can be viewed from the
perspective of Kinematics, e.g., finding spatial relationships in data from
the Protein Data Bank.

Each student who pursues the Biomechanics track will, in consultation
with his or her academic advisor, choose the set of technical and
mechanical engineering course electives that best matches the student’s
interests. Upon completion of the track, notification of this achievement
is placed on the student’s academic record and transcript.

A student may specialize in biomechanics once a solid background in the
fundamentals of mechanical engineering has been developed through
the basic courses. Students pursuing the biomechanics concentration within
mechanical engineering are required to take at least four of the following
courses. Two among the four should be chosen from the biomechanics-
oriented courses, indicated by an asterisk (*).

EN.510.435 Mechanical Properties of Biomaterials 3
EN.530.410 Biomechanics of the Cell * 3
EN.530.426 Biofluid Mechanics * 3
EN.530.436 Bioinspired Science and Technology 3
EN.530.441 Introduction to Biophotonics 3
EN.530.445 Introduction to Biomechanics * 3
EN.530.446 Experimental Methods in Biomechanics * 3
EN.530.448 Biosolid Mechanics * 3
EN.530.473 Molecular Spectroscopy and Imaging 3
EN.530.485 Physics and Feedback in Living Systems 3
EN.530.486 Mechanics of Locomotion 3
EN.530.495 Microfabrication Laboratory 4
EN.530.672 Biosensing & BioMEMS * 3
EN.540.405/605 The Design of Biomolecular Systems 3
EN.540.440 Micro/Nanotechnology: The Science and
Engineering of Small Structures 3
EN.580.221 Molecules and Cells x 4
EN.580.421 Systems Bioengineering I xx 4
EN.580.422 Systems Bioengineering II xx 4
EN.580.423 Systems Bioengineering Lab I xx 2
EN.580.424 Systems Bioengineering Lab xx 2
EN.580.451 Cell and Tissue Engineering Lab 3
EN.580.452 Cell and Tissue Engineering Lab 3
EN.580.456 Introduction to Rehabilitation Engineering 3

x  Prerequisite: AS.030.101 Introductory Chemistry I
xx  Prerequisite: EN.580.221 Molecules and Cells, EN.580.222 Systems
     and Controls, and AS.110.302 Differential Equations and Applications

Students may not use the satisfactory/unsatisfactory option for required
courses, including Humanities and Social Studies. Exceptions can
be considered and approved by their faculty advisors. Further, the
Department of Mechanical Engineering requires that grades of C- or
better be obtained in all required engineering, mathematics, and science
courses (i.e. grades of D, D+ or F will not be accepted). The department
will accept D or D+ grades only up to a maximum of 10 credits for
Humanities and Social Sciences courses.

### The Engineering Mechanics Program

The mission of the B.S. in engineering mechanics degree program is to provide a rigorous educational experience that prepares a select group of students for leadership positions in the profession and a lifetime of learning. The faculty is committed to maintaining a modern and flexible curriculum which, building on a foundation of basic sciences and mathematics, develops a solid education in the mechanical engineering sciences. The aim of the Engineering Mechanics program is to build competence in the analysis, design, and modeling of fluid and solid systems, to promote a broad knowledge of the contemporary social and economic context, and to develop the communication skills necessary to excel.

The educational objectives for the B.S. in engineering mechanics degree are designed to educate a select group of science-oriented engineers who, after graduation, will be successful and on track to become leaders among their peers:

- ...in the best graduate programs in engineering, science, medical schools, or law schools, and
- ...in industry, government laboratories, and other organizations.

Students graduating with a B.S. in Mechanical Engineering will have demonstrated:

(a) ...an ability to apply knowledge of mathematics, science and engineering
(b) ...an ability to design and conduct experiments, as well as to analyze and interpret data
(c) ...an ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability and sustainability
(d) ...an ability to function on multidisciplinary teams
(e) ...an ability to identify, formulate, and solve engineering problems
(f) ...an understanding of professional and ethical responsibility
(g) ...an ability to communicate effectively
(h) ...the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental and societal context
(i) ...a recognition of the need for and an ability to engage in life-long learning
(j) ...a knowledge of contemporary issues
(k) ...an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

The curriculum is intended to enable graduates to explore fundamental questions in many fields of engineering. Emphasis is placed on the basic
This program provides a strong foundation for graduate work in a wide range of disciplines. All mathematics elective and technical elective courses must be at the 300-level or higher, unless approved by their faculty advisor.

**Engineering Science Electives (12 credits)**

(Grades below C- are not accepted)

One course in the mechanics of solids (see below)

One course in the mechanics of fluids (see below)

One additional course in the mechanics of either solids or fluids (see below)

One course in either materials or dynamics (see below)

**Engineering Mechanics Electives (3 credits)**

(Grades below C- are not accepted)

One additional elective course in the same area of engineering mechanics (solid mechanics, fluid mechanics, or dynamics, see below).

**Technical Electives (minimum of 18 credits)**

(Grades below C- are not accepted)

Engineering, Quantitative Studies, or Natural Science courses at or above the 300-level, chosen in consultation with the student's advisor from any combination of courses in engineering, basic sciences, or mathematics.

* One must specifically teach writing (either AS.060.100 Introduction to Expository Writing, or AS.060.113 Expository Writing or AS.060.114 Expository Writing, or AS.220.105 Fiction/Poetry Writing I). To obtain coherence and depth in these humanities and social science electives, at least six credits must be at the 300-level or higher.

**Required Engineering Courses (minimum of 26 credits; grades below C- are not accepted)**

**++** Appropriate choices from the social sciences and philosophy may be also used to fulfill this requirement. Because of the importance of computer languages in modern technical society, students may take computer language courses at any level.
**Biomechanics Track**

Engineering Mechanics (EM) is a highly flexible program offered by the Department of Mechanical Engineering, which is ideal for students who want to specialize in any area of mechanics, including biomechanics. The essence of mechanics is the interplay between forces and motion.

In biology, mechanics is important at the macroscopic, cellular, and subcellular levels. At the macroscopic length scale biomechanics of both soft and hard tissues plays an important role in computer-integrated surgical systems and technologies (e.g., medical robotics). At the cellular level, issues such as cell motility and chemotaxis can be modeled as mechanical phenomena. At the subcellular level, conformational transitions in biological macromolecules can be modeled using molecular dynamics simulation (which is nothing more than computational Newtonian mechanics), statistical mechanics, or using coarse-grained techniques that rely on principles from the mechanics of materials. In addition, much of structural biology can be viewed from the perspective of Kinematics (e.g., finding spatial relationships in data from the Protein Data Bank).

Each student who pursues the biomechanics track within the EM major will, in consultation with his or her EM advisor, choose the set of technical and EM electives that best matches the student's interests. Many electives from other departments are acceptable. The electives for the EM major are structured as follows:

### Engineering Science Electives (12 credits)
One course in solid mechanics
One course in fluid mechanics
One additional course in mechanics of either solids or fluids
One course in either materials or dynamics

### Engineering Mechanics Electives (6 credits)
Two additional courses in the same area of mechanics (i.e., fluids, solids, or dynamics)

### Technical Electives (18 credits)
Chosen from 300-level courses in engineering and the sciences in consultation with the student’s faculty advisor. One course can be either EN.601.107 Intro to Java, EN.601.220 Intermediate Programming or EN.601.226 Data Structures

Examples of bio-oriented courses which can be applied to the above three categories include (but are not limited to):

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>

<td>3</td>
</tr>
</tbody>
</table>

Students may not use the satisfactory/unsatisfactory option for required courses, including Humanities and Social Sciences, unless approved by their faculty advisor. The department will accept D or D+ grades only up to a maximum of 10 Humanities and Social Science credits. All undergraduate students must follow a program approved by a faculty member in the department who is selected as the student’s advisor.

**The Combined Five-Year Bachelor’s / Master’s Program**

The Mechanical Engineering Department offers a concurrent five-year bachelor’s/master’s program for mechanical engineering and engineering mechanics majors. Applications to the B.S./M.S.E. program should be submitted by January 6 for consideration of spring admission and June 16 for possible fall admission, during applicant’s junior (third) year.

To apply for admission, students must submit an application, plus a statement of purpose, college transcript, and three letters of recommendation, two of which should be from Mechanical Engineering faculty.

Upon acceptance into the program, students will be asked to develop an outline of their proposed academic program with their advisor.

**Graduate Programs**

**Admissions and Advising**

To be admitted to graduate study in the Department of Mechanical Engineering, applicants must submit credentials sufficient to convince the faculty that they will thrive in a program of advanced course work and/or research. Graduate Record Examination scores must be submitted.

Upon arrival, each graduate student is assigned to a faculty advisor to help map a tentative program for the first year and enter the intellectual life of the department. The student will remain in regular communication with the advisor. The advisor may use a variety of methods to assess the student’s progress, sometimes including special oral or written examinations. It is not necessary that a student have the same advisor in successive years. After serious research for a dissertation has begun, the research supervisor will automatically function as advisor. All Ph.D. students are required, and master’s students are encouraged, to attend the weekly Mechanical Engineering Graduate Seminars.

**Requirements for the M.S.E. Degree**

*Essay Option: For the Master of Science in Engineering degree at least eight one-semester courses are required. At least half of them must be*
selected among those listed as graduate courses in this catalog. The remaining courses can be chosen from 400-level courses in this catalog, with the advisor's approval. 50% of all substantive courses must be offered by Mechanical Engineering (EN.530.xxx), including at least two courses at the .600-level or .700-level. A completed piece of original research conducted under the guidance of a full-time faculty member of the department and reported as a master's thesis is required. All students must follow a course of study approved by their individual advisor.

Non-Essay Option: The student must successfully complete a coordinated sequence of ten courses, which requires one year of full-time resident graduate study. At least six of the ten courses must be selected among the graduate courses of this catalog. 50% of all substantive courses must be offered by Mechanical Engineering (EN.530.xxx), including at least two courses at the .600-level or .700-level. The intent of this program is to provide the student with an intensive exposure to fundamental and advanced topics within mechanical engineering and engineering mechanics. Students must follow a course of study approved by their individual advisor.

Details on grade requirements and other departmental academic policy for the M.S.E. degree can be found on the Mechanical Engineering Graduate Advising page at http://me.jhu.edu/graduate-studies/ academic-advising-graduate/.

Requirements for the Ph.D. Degree

As soon as the student is prepared to do so, he/she should fulfill the requirements for candidacy. In addition to general university requirements, the student must pass two exams. The first is an oral Departmental Qualifying Exam based on core courses. This exam is usually taken after the third semester. The second is a preliminary Graduate Board Oral Examination satisfying the Graduate Board requirements. This is a comprehensive examination in which students must demonstrate proficiency at the graduate level in their field of specialization.

Although there are no formal course requirements, students are presumed to be prepared by studies equal to six 600-level courses in their field of specialization and six courses in related fields. All candidates for the doctorate must complete two semesters as a teaching assistant as part of their training. All students are required to follow a course of study approved by their individual advisor.

The final and principal requirement for the doctorate is a piece of original research worthy of publication. Candidates must write a dissertation describing their work in detail and successfully defend it in a final oral presentation and examination.

Additional details on Ph.D. requirements and departmental academic policy for the Ph.D. degree can be found on the Mechanical Engineering Graduate Advising page at http://me.jhu.edu/graduate-studies/ academic-advising-graduate/.

For current faculty and contact information go to http://www.me.jhu.edu/ faculty.html

Faculty

Department Head

Gretar Tryggvason

Chair: multiphase and free surface flows, phase changes including boiling and solidification, vortex flows and combustion, numerical methods

Full Time Professors

Ishan Barman

Assistant Professor: elucidation of morphological and chemical information of different patho-physiological states through an interdisciplinary approach featuring novel optical, spectroscopic and microfluidic measurements, mechanistic modeling and advanced numerical methods for analysis and interpretation of the acquired data.

Jeremy Brown

Assistant Professor: haptic feedback, upper-limb prosthetics, surgical robotics, rehabilitation robotics, human-machine interaction.

Yun Chen

Assistant Professor: cell mechanics, biophysical properties of cancer microenvironment, mechanosignaling pathways, drug delivery, bioenergetics in mitochondria.

Gregory S. Chirikjian

Professor: computational structural biology (in particular, computational mechanics of large proteins), conformational statistics of biological macromolecules, developed theory for 'hyper-redundant' (snakelike) robot motion planning, designs and builds hyper-redundant robotic manipulator arms, applied mathematics (applications of group theory in engineering), self-replicating robotic systems.

Noah J. Cowan

Professor: robot dynamics, animal biomechanics, and sensorimotor control; theory and application of control systems and system identification techniques for closed-loop systems (especially biological systems); biological motor control and systems neuromechanics; medical robotics.

Andrew S. Douglas

Professor (Vice Dean for Academic Affairs, Whiting School of Engineering): nonlinear mechanics of solids, mechanical response of compliant biological tissues, finite deformation elasticity, Static and dynamic fracture of ductile materials.

Jaafar El-Awady

Assistant Professor: multiscale materials modeling, damage and fracture mechanisms of materials in mechanical design, material degradation in extreme environments, nano-materials and structures, impact dynamics and wave propagation.

Dennice Gayme

Assistant Professor: Dynamics and control of nonlinear, networked and spatially distributed systems such as the electric power grid, and wind farms. Modeling of turbulence and transition to turbulence in wall bounded shear flows and wind farms. Grid integration of renewable energy sources.

Kevin J. Hemker

Professor, Alonzo G. Decker, Jr. Chair in Mechanical Engineering: Professor Hemker and his students seek to identify the underlying atomic-scale processes that govern the mechanical behavior of advanced material systems. They are making key observations and discoveries that define the way the mechanics and materials community thinks about and understands the properties of nanocrystalline materials, MEMS and micro-lattice materials, thermal barrier coatings, armor ceramics, and high temperature structural materials.

Soojung Claire Hur

ICME faculty: high temperature structural materials, micro-lattice materials, thermal barrier coatings, armor ceramics, and high temperature structural materials.
Assistant Professor: inertial microfluidics, nonlinear fluid dynamics, multiphase flow, cellular biophysics, cell mechanics, single cell manipulations, personalized medicine, regenerative medicine.

Ryan Hurley
Assistant Professor: mechanics of structurally complex materials, granular and geologic materials, multiscale materials modeling, 3D materials characterization, impact and wave propagation.

Sung Hoon Kang
Assistant Professor: Complex behaviors of material systems and structures with novel properties based on inspiration from nature; rational design followed by rapid prototyping using a 3D printer; designing experimental model systems and/or using computational models to identify key design parameters of systems to make desired structures and properties by tailoring behaviors of systems.

Joseph M. Katz
Professor, Whiting School Mechanical Engineering Chaired Professor, Gilman Scholar: cavitation phenomena, attached partial cavitation, cavitation in turbulent shear flows, jets and wakes. Multiphase flows: interaction between bubbles and flow structure, mixing mechanisms and droplet formation in water-fuel stratified shear flows, transport of microscopic particles and droplets in turbulent flows. Development of optical flow diagnostics techniques, including Particle Image Velocimetry (PIV) and Holographic Particle Image Velocimetry (HPIV). Applications of PIV and HPIV for measuring the characteristics of turbulence and addressing turbulence modeling issues. Complex flow structure and turbulence within turbo-machines: Wake-wake and blade-wake interactions in multistage axial turbomachines, flow and rotating stall in centrifugal pumps, development of optical diagnostics techniques for measurements in turbomachines. Oceanography: flow structure and turbulence in the bottom boundary layer of the coastal ocean; measurement of spatial distributions of plankton, particles and bubbles in the ocean; development of optical instrumen-tation, including submersible holo-graphy and PIV systems. Prevention of nozzle wear in abrasive water suspension jets (AWSJ) using porous lubricated nozzles. Flow-induced vibrations and noise, mechanisms of noise generation in turbulent separated flows and in turbomachines.

Marin Kobilarov
Assistant Professor: developing intelligent robotic vehicles that can perceive, navigate, and accomplish challenging tasks in uncertain, dynamic, and highly constrained environments. Performing research in analytical and computational methods for mechanics, control, motion planning, and reasoning under uncertainty, and in the design and integration of novel mechanisms and embedded systems. Application areas include mobile robots, aerial vehicles, and nanosatellites.

Chen Li
Assistant Professor: Terradynamics, locomotion, biomechanics, bio-inspired robotics, physics of living systems

Charles Meneveau
Professor, Louis M. Sardella Chair in Mechanical Engineering, Director of the Center for Environmental and Applied Fluid Mechanics: theoretical, experimental, and numerical studies in turbulence, large-eddy-simulation, turbulence modeling, fractals and scaling in complex systems, small-scale structure of turbulence and velocity gradient dynamics, applications of LES to environmental flows, wind energy, development of data-intensive science tools to study turbulence.

Rajat Mittal
Professor: computational fluid dynamics, low Reynolds number aerodynamics, biomedical flows, active flow control, LES/DNS, immersed boundary methods, fluid dynamics of locomotion (swimming and flying), biomimetics and bioinspired engineering, turbomachinery flows.

K. T. Ramesh
Professor, Alonzo G. Decker, Jr. Professor of Science and Engineering, Director of the Center for Advanced Metallic and Ceramic Systems (CAMCS) and the Hopkins Extreme Materials Institute (HEMI): Nanomaterials, planetary impact, dynamic failure mechanisms, shock, impact, and wave propagation, high-strain-rate behavior of materials, injury biomechanics, constitutive and failure modeling.

Sean Sun
Vice Chair, Professor: mechanobiology of the cell, molecular biomechanics and biophysics, molecular motors and muscle, statistical mechanics and nonlinear phenomena.

Jeff Tza-Huei Wang
Professor: bioMEMS and microfluidics, single molecule manipulation and detection, nano/micro scale fabrication, conformational dynamics of biomolecules.

Louis Whitcomb
Professor: Control Systems: adaptive and model-based control of linear and nonlinear systems, observers, nonlinear systems analysis, with focus on problems arising in mechanical systems, robots, and robotic vehicles. Underwater Robotics: dynamics, control, instrumentation, and navigation of underwater vehicles and inhabited submersibles—with focus on deep submergence oceanographic vehicles. Industrial and Medical Robotics: dynamics, control, instrumentation, and operation of precision robotics for novel medical and industrial applications.

Tamer Zaki
Associate Professor: Transitional and turbulent shear flows: receptivity, linear and non-linear instability waves, secondary instability, breakdown to turbulence, direct numerical simulations, transition modelling. Two-fluid shear flows: linear and non-linear instability methods, interface tracking, the interaction of vortical disturbances with interfaces, direct numerical simulations, laminar-to-turbulence transition. Turbulence: boundary layer turbulence, separation, stratification, drag reduction, turbulence structures, direct numerical simulations, large-scale high-performance computing.

Secondary Faculty Appointments
Stephen Belkoff
Joint, Part-Time, and Research Appointments: Associate Professor (Orthopedic Surgery): biomechanics, orthopaedic implants, fracture fixation in osteoporotic bone, mechanism of injury, vertebralplasty.

Gregory L. Eyink

Lori Graham-Brady
Professor, Civil Engineering: stochastic finite element methods, probabilistic mechanics, stochastic simulation of material properties, micromechanics.

Daniel Naiman
Joint, Part-Time, and Research Appointments: Professor (Applied
Mathematics and Statistics): statistics, computational probability,
bioinformatics.

Mark Robbins
Joint, Part-Time, and Research Appointments: Professor (Physics and
Astronomy): Connecting and contrasting atomistic and macroscopic
descriptions of non-equilibrium processes including friction, adhesion,
large-strain mechanical deformation, fracture, heat flow, fluid flow,
and boundary conditions at interfaces between different materials.
Techniques include molecular simulations, continuum calculations and
multiscale modeling approaches that bridge the two.

Dan Stoianovici
Joint, Part-Time, and Research Appointments: Professor (Brady
Urological Institute): urology, medical robotics.

Russell H. Taylor
Joint, Part-Time, and Research Appointments: Professor (Computer
Science): medical robotics, computer-assisted surgery.

Nitish V. Thakor
Joint, Part-Time, and Research Appointments: Professor (Biomedical
Engineering): medical instrumentation and medical micro and
nanotechnologies, neurological instrumentation, signal processing,
computer applications.

Rene Vidal
Joint, Part-Time, and Research Appointments: Associate Professor
(Biomedical Engineering): biomedical image analysis, computer vision,
machine learning, dynamical systems, signal processing.

Timothy Wehns
Joint, Part-Time, and Research Appointments: Professor (Materials
Science and Engineering), Director of the Center for Leadership
Education: self-propagating exothermic reaction and joining with reactive
multilayer foils, processing and characterization of thin films, layered
materials, and thin film reactions, mechanical testing of metals and
biological materials.

Associate Teaching Professor
David Kraemer
Associate Teaching Professor: Fluid-structure interaction; dynamic
systems; ocean wave energy conversion, engineering pedagogy.

Steven Marra
Associate Teaching Professor: Soft and hard tissue biomechanics,
nonlinear mechanics of solids, mechanics of tissue damage.

Nathan Scott
Associate Teaching Professor: Principles and practice of engineering
design education.

Professor Emeritus
Cila Herman
Professor Emeritus: experimental heat transfer and fluid mechanics,
optical measurement techniques, image processing. Thermoooustic
refrigeration, influence of electric fields on boiling in terrestrial conditions
and microgravity, heat exchangers, heat transfer in boiling, optical
tomography, holographic interferometry, cooling of electronic equipment,
digital image processing, heat transfer augmentation.

William N. Sharpe Jr.

Professor Emeritus: experimental solid mechanics, microelectro-
mechanical systems (MEMS), microsample testing.

Research Scientist
Alan Brandt
Research Scientist, (Applied Physics Laboratory): ocean physics
including internal waves, turbulence, mixing, and bio-physical
interactions. Coastal, estuarine, and environmental fluid dynamics.

Research Professor
Ilene Busch-Vishniac
Research Professor (University of Saskatchewan).

Shiyi Chen
Research Professor (Peking University).

Allison Okamura
Research Professor (Stanford University).

Alexander Spector
Research Professor, Biomedical Engineering: biosolid mechanics,
cell mechanics and biophysics, molecular motors, mathematical and
computational modeling.

Pazhayannur Swaminthan
Research Professor (Applied Physics Laboratory).

Assistant Teaching Professor
Mehran Armand
Assistant Teaching Professor (Applied Physics Laboratory).

Juan I. Arvelo Jr.
Assistant Research Professor (Applied Physics Laboratory).

Iulian Iordachita
Assistant Research Professor: robotics, medical robotics and
instrumentation, mechanisms and mechanical transmissions for robots,
advance electro-mechanical design, biologically-inspired mechanisms.

Jung-Hee Seo
Assistant Research Professor

Lester Su
Assistant Research Professor: (Stanford University).

Liming Voo
Assistant Research Professor (Applied Physics Laboratory).

Associate Research Professor
Nitin Daphalapurkar
Assistant Research Professor.

John Thomas
Assistant Research Professor (Applied Physics Laboratory).

Adjunct Research Professor
Thomas Wright
Adjunct Research Professor: theoretical solid mechanics, wave
propagation, dynamic failure, adiabatic shear localization, instabilities.
Adjunct Professor
William Blake
Adjunct Professor

Adjunct Associate Professors
Luciano Castillo
Adjunct Associate Professor (Texas Tech University)

Thomas Dragone
Adjunct Associate Professor: aerospace structures and materials, airframe structure design and development, materials science.

Ryan Eustice
Adjunct Assistant Professor (Department of Naval Architecture and Marine Engineering, University of Michigan).

Adjunct Assistant Professor
Jian Sheng
Adjunct Assistant Professor (Texas Tech University)

Associate Research Scientist
Tihomir Hristov
Associate Research Scientist.

Assistant Research Scientist
Kourosh Shoelle
Assistant Research Scientist

Adam Sierakowski
Assistant Research Scientist MARCC

Gidong Sim
Assistant Research Scientist

Kelvin Xie
Assistant Research Scientist

Adjunct Research Scientist
David Smallwood
Adjunct Research Scientist

John Smith
Adjunct Principal Research Scientist

Adjunct Associate Research Scientist
Edwin Malkiel
Adjunct Associate Research Scientist.

Lecturers
Soraya Bailey
Lecturer, Senior Design

Yury Ronzhes
Joint, Part-Time, and Research Appointments: Lecturer.

Homewood Professor of Engineering
Andrea Prosperetti
Homewood Professor of Engineering: Multiphase flow; theoretical and computational fluid mechanics and acoustics; gas and vapor bubbles.

For current course information and registration go to https://sis.jhu.edu/classes/

Courses
EN.530.107. MechE Undergraduate Seminar I.
A series of weekly seminars to inform students about careers in mechanical engineering and to discuss technological, social, ethical, legal, and economic issues relevant to the profession. Part 1 of a year-long sequence.
Instructor(s): S. Marra
Area: Engineering.

EN.530.108. MechE Undergraduate Seminar II.
A series of weekly seminars to inform students about careers in mechanical engineering and to discuss technological, social, ethical, legal, and economic issues relevant to the profession. Part 2 of a year-long sequence.
Instructor(s): S. Marra
Area: Engineering.

EN.530.111. Intro to MechE Design and CAD. 2.0 Credits.
This course introduces students to the basic engineering design process and to fundamental concepts and knowledge used in the design of mechanical devices and systems. Students will explore the range of tools utilized in design practice, beginning with the skills of hand-drawing, exploring ways to articulate visual ideas, and concluding with the standards of presentation and CAD tools typical in professional practice.
Corequisites: EN.530.115
Instructor(s): S. Marra
Area: Engineering.

EN.530.112. Intro to MechE Computing. 2.0 Credits.
This course will introduce students to the basics of programming, using the MATLAB environment and applications in mechanical engineering. Topics covered include variables, arithmetic operators, control structures, arrays, functions, recursion, dynamic memory allocation, files, class usage and class writing. Program design and testing are also covered.
Instructor(s): D. Kraemer
Area: Engineering.

EN.530.115. MechE Freshman Lab I. 1.0 Credit.
Hands-on laboratory complementing EN.530.111, including experiments, mechanical dissections, sketching and CAD, and a cornerstone design project. Experiments and mechanical dissections connect physical principles to practical engineering applications. Sketching and CAD work build the students’ design and communication skills. The design project allows students to synthesize a working system by combining knowledge of mechanics and design with practical engineering skills.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): S. Marra
Area: Engineering.

EN.530.116. MechE Freshman Lab II. 1.0 Credit.
Hands-on laboratory in which students continue to develop their engineering design skills. Laboratory topics include engines and motors, microcontrollers, sensors, and applications of MATLAB to mechanical engineering. An interdisciplinary design project allows students to apply their learning and skills while working with fellow students from outside of Mechanical Engineering. Restricted to Mechanical Engineering, Engineering Mechanics, and Undecided Engineering Majors.
Instructor(s): S. Marra
Area: Engineering.
EN.530.123. Introduction to Mechanics I. 3.0 Credits.
This course offers an in-depth study of the fundamental elements of classical mechanics, including particle and rigid body kinematics and kinetics, and work-energy and momentum principles. Part 1 of a year-long sequence.
Instructor(s): J. Thomas
Area: Engineering, Natural Sciences.

EN.530.124. Intro to Mechanics II. 2.0 Credits.
This course offers an in-depth study of the fundamental elements of classical mechanics, statics, mechanics of materials, fluid mechanics, and thermodynamics. Part 2 of a year-long sequence. Restricted to Mechanical Engineering, Engineering Mechanics, Civil Engineering, Undecided Engineering Majors, or permission of instructor.
Instructor(s): S. Belkoff
Area: Engineering, Natural Sciences.

EN.530.150. Engineering Design Graphics, Visualization, and Fundamentals of CAD. 3.0 Credits.
This course will serve as an introduction to the foundational representational techniques for design, and help students to develop design literacy and three-dimensional visualization skills. Students will explore the range of tools utilized in design practice, beginning with the skills of hand-drawing, exploring ways to articulate visual ideas, and concluding with the standards of presentation and CAD tools typical in professional practice. This class will enable students to better develop, express and communicate their ideas as engineers.
Instructor(s): C. Phinney, S. Marra
Area: Engineering.

EN.530.201. Statics and Mechanics of Materials. 4.0 Credits.
Equilibrium of rigid bodies, free-body diagrams, design of trusses. One-dimensional stress and strain, Hooke’s law. Properties of areas. Stress, strain, and deflection of components subjected to uniaxial tension, simple torsion, and bending. Corequisite: EN.560.201. Recommended Course Background: AS.171.101 or EN.530.103 and EN.530.104 or Permission Only.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): R. Sangree
Area: Engineering.

EN.530.202. Mechanical Engineering Dynamics. 4.0 Credits.
Basic principles of classical mechanics applied to the motion of particles, system of particles and rigid bodies. Kinematics, analytical description of motion; rectilinear and curvilinear motions of particles; rigid body motion. Kinetics: force, mass, and acceleration; energy and momentum principles. Introduction to vibration. Includes laboratory experience.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. (EN.530.201 OR EN.560.201) AND (AS.171.101 OR AS.171.107 OR AS.171.105 OR (EN.530.103 OR EN.530.123) AND (EN.530.104 OR EN.530.124)) AND AS.110.109; grade of C- or higher required for EN.530.201 OR EN.560.201
Instructor(s): D. Kraemer; I. Uyanik; S. Bailey; S. Marra
Area: Engineering.

EN.530.212. MechE Dynamics Laboratory. 1.0 Credit.
This is the laboratory component to EN.530.202 MechE Dynamics.
Corequisites: EN.530.202
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.215. Mechanics-Based Design. 3.0 Credits.
Prerequisites: EN.530.201 OR EN.560.201
Instructor(s): A. Douglas; R. Mittal; T. Nguyen
Area: Engineering.

EN.530.216. Mechanics Based Design Laboratory. 1.0 Credit.
This is the laboratory that supports EN.530.215 Mechanics Based Design.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Corequisites: EN.530.215
Instructor(s): S. Marra
Area: Engineering.

EN.530.231. Mechanical Engineering Thermodynamics. 3.0 Credits.
Prerequisites: (AS.171.102 OR AS.171.108); AS.110.109
Corequisites: EN.530.232
Instructor(s): J. Katz
Area: Engineering.

EN.530.232. Mechanical Engineering Thermodynamics Laboratory. 1.0 Credit.
This course is the complementary laboratory course and a required corequisite for EN.530.231. Corequisite: EN.530.231 There will be four lab sessions, days and times TBA.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): S. Marra
Area: Engineering, Natural Sciences.

EN.530.241. Electronics & Instrumentation. 4.0 Credits.
Introduction to basic analog electronics and instrumentation with emphasis on basic electronic devices and techniques relevant to mechanical engineering. Topics include basic circuit analysis, laboratory instruments, discrete components, transistors, filters, op-amps, amplifiers, differential amplifiers, power amplification, power regulators, AC and DC power conversion, system design considerations (noise, precision, accuracy, power, efficiency), and applications to engineering instrumentation.
Prerequisites: AS.171.102 or AS.171.108 or AS.171.106; Students must have completed Lab Safety training prior to registering for this class.; Co or Pre-requisites: EN.550.291 OR (AS.110.201 AND AS.110.302) OR (AS.110.212 AND AS.110.302)
Instructor(s): D. Kraemer
Area: Engineering.
**EN.530.254. Manufacturing Engineering. 3.0 Credits.**
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Special Notes: Labs and field trips will be scheduled with class separately. Mechanical Engineering and Engineering Mechanics Sophomores and Juniors only.

**Prerequisites:** Students must have completed Lab Safety training prior to registering for this class.

Instructor(s): Y. Ronzhes
Area: Engineering.

**EN.530.310. Reverse Engineering and Diagnostics. 3.0 Credits.**
We will disassemble, inspect, diagnose, reverse engineer, repair (if needed) and test the subsystems of the first modern tractor, the iconic Ford N series (9N, 2N or 8N). The systems include power, cooling, electrical, ignition, hydraulic, transmission, steering, fuel, control (governor) and braking. The course is not about tractor repair, but upon successful completion, you will know the tractor's design and function, inside and out and you will be empowered with the confidence to understand and diagnose mechanical systems. Lessons learned will be applicable to other areas of mechanical engineering and will be particularly helpful for Senior Design. We will analyze (reverse engineer) the tractor. For example, given the engine delivers 28 HP at the PTO, how big does the PTO shaft need to be? How big is it? Over/under designed? How was it manufactured? How else could it have been manufactured. What size engine delivers 28 HP? What fuel consumption is needed? What cooling capacity is needed? Answering such questions will prepare students to ask appropriate questions in senior design. How big/strong do we need to make it? We will also have a functioning N-series tractor that will be 'sabotaged' each week for students to test their logic skills at diagnosing the cause of the malfunction. Course goals include developing diagnostic skills, learning to read electrical and hydraulic schematics and assembly drawings, developing engineering intuition and applying theoretical knowledge to practical problems. No mechanical experience is needed. Students with the least 'hands on' background will have the most to benefit, but even BAJA members have much to gain.

**Prerequisites:** Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.

Instructor(s): S. Belkoff
Area: Engineering.

**EN.530.327. Introduction to Fluid Mechanics Laboratory. 1.0 Credit.**
This is the laboratory that supports EN.530.327 Heat Transfer.

Instructor(s): C. Meneveau
Area: Engineering.

**EN.530.328. Fluid Mechanics II. 3.0 Credits.**

Instructor(s): C. Meneveau
Area: Engineering.

**EN.530.329. Introduction to Fluid Mechanics Laboratory. 1.0 Credit.**
This course is the complementary laboratory course and a required co-requisite for EN.530.327. Corequisite: EN.530.327 There will be four lab sessions, days and times TBA.

**Prerequisites:** Students must have completed Lab Safety training prior to registering for this class.

Instructor(s): S. Marra
Area: Engineering.

**EN.530.334. Heat Transfer. 3.0 Credits.**

**Prerequisites:** EN.530.231 AND EN.530.327
Instructor(s): A. Proserpetti; C. Meneveau; R. Mittal
Area: Engineering.

**EN.530.335. Heat Transfer Laboratory. 1.0 Credit.**
This is the laboratory that supports EN.530.334 Heat Transfer.

**Prerequisites:** Students must have completed Lab Safety training prior to registering for this class.

Corequisites: EN.530.334
Instructor(s): S. Marra
Area: Engineering.

**EN.530.343. Design and Analysis of Dynamical Systems. 3.0 Credits.**
Modeling and analysis of damped and undamped, forced and free vibrations in single and multiple degree-of-freedom linear dynamical systems. Introduction to stability and control of linear dynamical systems.

**Prerequisites:** Prereq: (110.108 and 110.109 and (110.202 or 110.211) and ((550.291) or (110.201 and 110.302) or (110.201 and 110.306)), and C- or better or concurrent enrollment in 530.202 or 560.202. MechE Majors must also have taken 530.241.

Students must have completed Lab Safety training prior to registering for this class.

Instructor(s): L. Whitcomb; S. Marra
Area: Engineering.

**EN.530.344. Design and Analysis of Dynamical Systems Laboratory. 1.0 Credit.**
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.

Corequisites: EN.530.343
Instructor(s): S. Marra
Area: Engineering.

**EN.530.352. Materials Selection. 4.0 Credits.**
An introduction to the properties and applications of a wide variety of materials: metals, polymers, ceramics, and composites. Considerations include availability and cost, formability, rigidity, strength, and toughness. This course is designed to facilitate sensible materials choices so as to avoid catastrophic failures leading to the loss of life and property.

**Prerequisites:** Prereq: EN.530.215 or permission of instructor
Instructor(s): S. Kang
Area: Engineering.
EN.530.354. Manufacturing Engineering. 3.0 Credits.
An introduction to the various manufacturing processes used to produce metal and nonmetal components. Topics include casting, forming and shaping, and the various processes for material removal including computer-controlled machining. Simple joining processes and surface preparation are discussed. Economic and production aspects are considered throughout. Special Notes: Labs and field trips will be scheduled with class separately. Mechanical Engineering and Engineering Mechanics Sophomores and Juniors only.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): Y. Ronzhes
Area: Engineering.

EN.530.366. Spacecraft Instrumentation Project. 3.0 Credits.
Investigation into the content relevant to an ongoing spacecraft instrumentation project. An interdisciplinary team will enhance the skills and knowledge of science and engineering students. Topics include mission background, planetary science, sensor design, spacecraft systems, and mission planning, and sensor fabrication, calibration, integration, and testing, data analysis and interpretation, scientific/technical writing and publication.
Instructor(s): D. Kraemer; S. Horst
Area: Engineering, Natural Sciences.

EN.530.371. Quantitative Applications in Mechanical Engineering. 3.0 Credits.
Solution of practical mechanical engineering problems with differential equations and linear algebra using numerical tools. Applications include topics like ballistics with viscous drag, fluid flow, solid mechanics, and kinematics. Numerical exercises with Matlab and other tools are used to reinforce concepts. Laboratory sessions will be scheduled in place of lectures a few times during the semester.
Prerequisites: EN.550.291 OR (AS.110.201 AND AS.110.302)
Instructor(s): D. Kraemer
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.381. Engineering Design Process. 3.0 Credits.
This course is to get you into the world of Senior Design, which means into our spaces, into the machine shop and into the mind set of doing design-build-test work. You will be assigned to be an assistant to one of our Senior Design teams. In industrial design practice this is absolutely typical and project teams grow or shrink as the need demands. It is also a good way for younger engineers to learn the ropes. You will have your own portfolio of design work to do, but it will be in the context of a large project where there has already been a lot of progress. You will have to fit in with that larger context – as usual for engineers – while also making your own contributions. There will be a lecture series which will introduce some key ideas and tools of the engineering designer. Rapid sketching of design ideas; more careful hand drawings that are like fast technical drawings; how to generate ideas and then develop the ideas into workable, feasible, affordable, desirable solutions; how to identify prototypes that will show the way forward, and then actually make them; how to work with a team and negotiate about time, deliverables and design detail; how to find parts from commercial suppliers, size them, order them and get them delivered; how to document design work in a fast and effective way. Some of the lectures will be in the form of case studies of excellent design work, and will be student-driven i.e. you will prepare a case study to present to the class which we then discuss.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): N. Scott
Area: Engineering.

EN.530.403. MechE Senior Design Project I. 4.0 Credits.
This senior year “capstone design” course is intended to give some practice and experience in the art of engineering design. Students working in teams of two to four will select a small-scale, industry-suggested design problem in the area of small production equipment, light machinery products, or manufacturing systems and methods. A solution to the problem is devised and constructed by the student group within limited time and cost boundaries. Preliminary oral reports of the proposed solution are presented at the end of the first semester. A final device, product, system, or method is presented orally and in writing at the end of the second semester. Facilities of the Engineering Design Laboratory (including machine shop time) and a specified amount of money are allocated to each student design team for purchases of parts, supplies, and machine shop time where needed. Recommended Course Background: ME Majors: EN.530.215, EN.530.327; EM & BME Majors: EN.530.215 or EN.530.405, and EN.530.327.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): N. Scott; S. Bailey
Area: Engineering.

EN.530.404. MechE Senior Design Project II. 4.0 Credits.
The Senior Design Project, a unique two-semester course, is the capstone of Johns Hopkins’s Mechanical Engineering Program. In the class, students working in small teams tackle specific design challenges presented by industry, government, and nonprofit organizations. The sponsors provide each team with a budget, access to world-class resources, and technical contacts. Ultimately, each team conceptualizes a novel solution to the sponsor’s problem and then designs, constructs, and tests a real-world prototype before presenting the finished product and specifications to the sponsor. The course requires students to draw upon the four years of knowledge and experience they’ve gained in their engineering studies and put it to practical use. Throughout the year, they produce progress reports as they design, build, and test the device they are developing. Combining engineering theory, budget and time management, and interactions with real clients, the senior design project is critical to students’ preparation for the transition from school to the workplace.
Prerequisites: EN.530.403
Instructor(s): N. Scott; S. Bailey
Area: Engineering Writing Intensive.

EN.530.405. Mechanics of Advanced Engineering Structures. 3.0 Credits.
This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and structures. We will begin with the mathematical preliminaries used in continuum mechanics: vector and tensor calculus, then introduce kinematics and strain measures, descriptions of stress in a body, frame indifference, conservation laws: mass, momentum, energy balance, and entropy. These concepts will be applied to develop the constitutive equations for solids and fluids, methods for solving boundary values problems that occur in engineering structures, energy methods and foundations of the finite element method.
Instructor(s): J. El-Awady
Area: Engineering, Natural Sciences.
EN.530.410. Biomechanics of the Cell. 3.0 Credits.
Mechanical aspects of the cell are introduced using the concepts in continuum mechanics. Discussion of the role of proteins, membranes and cytoskeleton in cellular function and how to describe them using simple mathematical models.
Instructor(s): S. Sun
Area: Engineering, Natural Sciences.

EN.530.414. Computer-Aided Design. 3.0 Credits.
The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the "Pro/E" package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stoianovici
Area: Engineering.

EN.530.417. Fabricatology - Advanced Materials Processing. 3.0 Credits.
The "Fabricatology" is a course that students can learn how to make desired shapes, structures, and surfaces across various length scales. It will introduce rich scientific and engineering knowledge related to fabrication at multiple length scales and the generated materials and mechanical systems can be utilized for studying diverse topics including energy harvesting, metamaterials, wetting, and information storage. From this course, students can learn principles and technologies to control shapes at various length scales and processes to control internal structures or surface properties for desired properties/functions. They will be also introduced to exciting recent development in the field so that they can have a comprehensive knowledge about the subject.
Recommended Course Background: coursework in introduction to materials chemistry or engineering materials.
Instructor(s): S. Kang
Area: Engineering.

EN.530.418. Aerospace Structures & Materials. 3.0 Credits.
An introduction to the design of aircraft and spacecraft structures and components. This course will build on skills learned in EN.530.215 and EN.530.352. Recommended Course Background: EN.530.352 or instructor permission.
Instructor(s): T. Dragone
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4.0 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module; ((AS.171.101 AND AS.171.102) OR (AS.171.107 AND AS.171.108) OR (EN.530.103 AND EN.530.104) OR (EN.530.123 AND EN.530.124)) AND (AS.110.106 OR AS.110.108) AND AS.110.109 AND (AS.110.202 OR AS.110.211) AND (EN.550.291 OR AS.110.302) AND (EN.530.241 OR EN.520.230 OR (EN.520.132 AND EN.520.345))
Instructor(s): D. Kraemer; N. Cowan
Area: Engineering.

EN.530.421. Mechatronics. 3.0 Credits.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or EN.520.240 or permission of instructor; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.

EN.530.424. Dynamics of Robots and Spacecraft. 3.0 Credits.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinetics, efficient formulation of equations of motion, stability theory, and Hamilton's principle.
Instructor(s): G. Chirikjian; J. Kim
Area: Engineering.

EN.530.425. Mechanics of Flight. 3.0 Credits.
Instructor(s): K. Phillips
Area: Engineering.

EN.530.426. Biofluid Mechanics. 3.0 Credits.
Course will cover selected topics from physiological fluid dynamics, including respiratory flow patterns, blood flow and pulse propagation, aerodynamics of phonation and speech, rheology of blood flow in the microcirculation, aquatic animal propulsion, and animal flight.
Instructor(s): R. Mittal
Area: Engineering.

EN.530.427. Intermediate Fluid Mechanics. 3.0 Credits.
Instructor(s): G. Tryggvason
Area: Engineering.
EN.530.430. Applied Finite Element Analysis. 3.0 Credits.
This course will introduce finite element methods for analysis of solids, structures and heat transfer problems. Following topics will be considered. Procedure to defining a mechanics problem: governing equations, constitutive equations, boundary and initial value problems. Theory and implementation of the finite element methods for static analysis using linear elasticity. Finite element analysis (FEA) using ABAQUS software. Verification and validation, understanding uncertainty. Introduction to other FEA topics: structural elements, dynamic analysis, heat transfer and thermodynamics using ABAQUS. The course will include assignments and a term project. The term project is mandatory for graduate students and will involve applying FEA to an engineering problem or a research problem, interpretation of results and documenting a term paper.
Prerequisites: Prerequisite: EN.550.291 OR AS.110.302, and matrix analysis / algebra and programming recommended.
Instructor(s): L. Voo
Area: Engineering.

EN.530.432. Jet & Rocket Propulsion. 3.0 Credits.
The course covers associated aircraft and spacecraft and power generation. The first part reviews the relevant thermodynamics and fluid mechanics, including isentropic compressible flow, Rayleigh and Fanno lines, shock and expansion waves. Subsequently, the performance of various forms of aviation gas turbines, including turbo-jet, turbo-fan, turbo-prop and ram-jet engines are discussed, followed by component analyses, including inlet nozzles, compressors, combustion chambers, turbines and afterburners. Axial and centrifugal turbomachines are discussed in detail, including applications in aviation, power generation and liquid transport. The section on foundations of combustion covers fuels, thermodynamics of combustion, and energy balance. The last part focuses on rockets, including classification, required power for space flight, chemical rocket components, and combustion involving liquid and solid fuels.
Instructor(s): J. Katz
Area: Engineering.

EN.530.435. Guidance and Control of Flight Vehicles. 3.0 Credits.
This course introduces the fundamental concepts of guidance and control of rockets and will highlight methodologies often employed in industry. The topics covered include: aerodynamic control, review of flight control principles (transfer functions, block diagram reduction, root locus, frequency domain methods), nonlinear representation of an airframe, linearization of an airframe, flight control design of a rocket, three-loop autopilot design, and fundamentals of tactical guidance (proportional navigation guidance theory, zero effort miss). Co-listed with EN.530.635
Prerequisites: EN.530.343
Instructor(s): K. Phillips
Area: Engineering.

EN.530.439. Comparative Biomechanics. 3.0 Credits.
Instructor(s): C. Li
Area: Engineering.

EN.530.441. Introduction to Biophotonics. 3.0 Credits.
The primary aim for this course is to explore the unique and diverse properties of light that makes it suited for diagnosis, imaging, manipulation and control of biological structure and function from the nanoscale to the tissue level. The course will focus on different optical spectroscopic and microscopic modalities that provide biochemical and morphological information, while introducing new ideas on analysis and interpretation of the acquired data. We will also discuss manipulation methods, including optical tweezers and laser scissors, and low-level light therapy. In all of these areas, the idea is to develop a basic understanding of the subject and to use it for finding solutions to real-world problems in healthcare. Discussions and open exchanges of ideas will be strongly emphasized.
Instructor(s): I. Barman
Area: Engineering.

EN.530.443. Fundamentals of Microscale Phenomena. 3.0 Credits.
This course will introduce fundamental physical and chemical principles involved in unique microscale phenomena. Topics to be covered include issues associated with being in micrometers in science and engineering, fluid mechanics in micro systems, diffusion, surface tension, surfactants, and interfacial forces, Interfacial hydrodynamics, Mechanical properties of materials in microscale. Students will learn about applications, enabled by the discussed principles. Recommended Pre-Requisites: EN.530.334
Prerequisites: EN.530.327 AND EN.530.231
Instructor(s): S. Hur
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.445. Introduction to Biomechanics. 3.0 Credits.
An introduction to the mechanics of biological materials and systems. Both soft tissue such as muscle and hard tissue such as bone will be studied as will the way they interact in physiological functions. Special emphasis will be given to orthopedic biomechanics. Recommended Course Background: EN.530.215/EN.530.216 and Lab or equivalent. If you have not taken this course or an equivalent, please contact the instructor before registering to ensure you have the appropriate background knowledge to succeed in this course.
Instructor(s): S. Belkoff
Area: Engineering.

EN.530.446. Experimental Methods in Biomechanics. 3.0 Credits.
An introduction to experimental methods used in biomedical research. Standard experimental techniques will be applied to biological tissues, where applicable and novel techniques will be introduced. Topics include strain gauges, extensometers, load transducers, optical kinematic tracking, digital image correlation, proper experimental design, calibration and error analysis. Of particular emphasis will be maintaining native tissue temperature and hydration. Laboratory will include "hands-on" testing.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.
Instructor(s): S. Belkoff
Area: Engineering, Natural Sciences.
EN.530.448. Biosolid Mechanics. 3.0 Credits.
This class will introduce fundamental concepts of statics and solid mechanics and apply them to study the mechanical behavior of bones, blood vessels, and connective tissues such as tendon and skin. Topics to be covered include concepts of small and large deformation, stress, constitutive relationships that relate the two, including elasticity, anisotropy, and viscoelasticity, and experimental methods. Recommended Course Background: AS.110.201 and AS.110.302, as well as a class in statics and mechanics
Instructor(s): T. Nguyen
Area: Engineering.

EN.530.455. Additive Manufacturing. 3.0 Credits.
The emergence of additive manufacturing (AM) as a viable technology for depositing materials with intricate shapes and architectures enables personal fabrication and threatens to transform global supply chains. This course will give a comprehensive introduction to AM of polymers, metals and ceramics, including: processing fundamentals, processing-structure-property relations and applications. Implications for the design, qualification and introduction of AM products will be addressed, and a variety of applications will be reviewed and used as case studies. Recommended knowledge of Materials Science equivalent to 530.352 Materials Selection. Concurrent enrollment in 530.352 Materials Selection is welcome.
Instructor(s): K. Hemker
Area: Engineering.

EN.530.464. Energy Systems Analysis. 3.0 Credits.
This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required. Co-listed with EN530.664
Instructor(s): D. Gayme
Area: Engineering.

EN.530.470. Space Vehicle Dynamics & Control. 3.0 Credits.
In this course we study applied spacecraft orbital and attitude dynamics and their impact on other subsystems. In the orbital dynamics part of the course, we discuss some the issues associated with orbital insertion, control and station keeping. Focus is on the two-body problem regime where conic solutions are valid. Orbit perturbations are also considered. For attitude dynamics, different attitude representations such as of direction cosines, quaternions, and angles are introduced. Then we look at the forces and moments acting on space vehicles. Attitude stability and control considerations are introduced.
Instructor(s): M. Ozimek; T. McGee
Area: Engineering.

EN.530.473. Molecular Spectroscopy and Imaging. 3.0 Credits.
The overarching objective of this course is to understand, employ and innovate molecular spectroscopy and optical imaging tools. The emphasis will be to bridge the domain between molecular spectroscopy, which provides exquisite chemical information, and the imaging capabilities of microscopy to seamlessly traverse between structural and biochemical spaces. The course will build on the foundational principles of light-matter interactions and an understanding of light sources, geometrical and wave optics, and detectors. Using vibrational and fluorescence spectroscopy as the tools of choice, we will discuss the design and fabrication of molecular reporters that offer unprecedented sensitivity, specificity and multiplexing capabilities in imaging of live biological specimen. Finally, we will learn about spectral and image-processing algorithms that have fundamentally changed the nature and quantity of useful information and have directly lead to breakthroughs in super-resolution imaging and multi-modal image fusion. All through the course, the focus will be on the underlying concepts and physical insights as we navigate through a diverse array of biophotonics applications.
Instructor(s): I. Barman
Area: Engineering.

EN.530.474. Effective and Economic Design for Biomedical Instrumentation. 4.0 Credits.
This course is to introduce students to the design, practice, and devices used in biomedical research. The class will be divided into two parts: lecture and lab. In the lectures, students will learn the physics behind the device, the specific requirements of biomedical instruments, and the engineering principles to construct the devices. Lab sessions will focus on designing and building a prototype device. This course aims to forge collaboration between biomedical researchers and mechanical engineers. The goal is to make the devices accessible to the biomedical research community as well as the general public. Economical availability will be one of the critical elements in the device design. Students will be encouraged to build the devices within a healthy budget. PREREQUISITES: Introductory Physics, Programming, and CAD
Instructor(s): Y. Chen
Area: Engineering.

EN.530.475. Locomotion I: Mechanics. 3.0 Credits.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). Locomotion emerges from effective physical interaction of an animal or a machine with the surrounding environment; therefore, the ability to generate appropriate forces (besides appropriate sensing and control) is essential to successful locomotion. From a mechanics point of view, we will discuss why animals move amazingly well in almost any environment, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex and how they may be improved by better understanding the mechanics of locomotion. Primary focus will be on terrestrial locomotion, but aerial and aquatic locomotion will be also discussed, all with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. A strong understanding of Newtonian mechanics is required. Visit http://li.me.jhu.edu/teaching for more information. Recommended Course Background: B+ or higher in EN.530.202 Dynamics or EN.560.202
Instructor(s): C. Li
Area: Engineering.
EN.530.476. Locomotion in Mechanical and Biological Systems. 3.0 Credits.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information.
Instructor(s): C. Li
Area: Engineering.

EN.530.486. Mechanics of Locomotion. 3.0 Credits.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information. Co-listed with EN.530.686
Prerequisites: EN.530.202 OR EN.560.202 with grade of B+ or higher.
Instructor(s): C. Li
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.480. Image Processing and Data Visualization. 3.0 Credits.
The course will be divided into two parts. In the first part, students will learn the basics of image filtering, including handling noisy background, creating 2D/3D filters, Fourier domain operations, and building processing pipelines. In the second part, students will learn the importance of data visualization, as well as the skills to use the aids such as virtual reality goggles and haptic devices to help scientists gain insights for data interpretation. Recommended experience programming in Matlab.
Instructor(s): Y. Chen
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.483. Applied Computational Modeling in Aerodynamics and Heat Transfer. 3.0 Credits.
Introduction to fundamental principles and applications of the computational modeling in fluid dynamics and heat transfer. Emphasis is on basics of finite-difference methods and hands-on experience in code development as well as the use of a commercial software package (ANSYS CFX) for modeling and simulation. Students will also learn about meshing strategies, post-processing, and critical analysis of simulation results. The concept of numerical errors and the validation and verification will also be emphasized. Recommended Background: (1) Undergraduate or introductory level course in fluid dynamics or heat transfer or transport phenomena or classical mechanics. (2) Basic expertise in writing computer codes (MATLAB or C++ or Fortran or Python).
Instructor(s): J. Seo
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.485. Physics and Feedback in Living Systems. 3.0 Credits.
The complex mechanisms of living systems cannot be reduced to a set of base pairs: genes are only one part of mystery of life. Rather, organisms must develop, move, interact, and function in their natural environment, and thus are constrained by the laws of physics. For example, during locomotion an animal must accelerate according to Newton’s laws by applying forces between itself and the environment. Beyond physical principles alone, biological systems extensively use feedback to enhance stability and facilitate adaptation in the presence of a changing world. This course examines the critical roles that physical principles and feedback mechanisms play in life, with special emphasis on animal locomotion and its control. Juniors and Seniors only.
Instructor(s): N. Cowan
Area: Engineering.
EN.530.527. Independent Study. 1.0 - 3.0 Credits. Students pursue research problems individually or in pairs. Although the research is under the direct supervision of a faculty member, students are encouraged to pursue the research as independently as possible. Instructor(s): Staff.

EN.530.597. Research - Summer. 1.0 - 3.0 Credits. Instructor(s): Staff.

EN.530.599. Independent Study. 1.0 - 4.0 Credits. Instructor(s): Staff.

EN.530.600. MSE Graduate Research. 3.0 - 10.0 Credits. Instructor(s): Staff.

EN.530.602. Master's Essay Research and Writing. 3.0 - 10.0 Credits. This course will be taken by Mechanical Engineering students when doing research and/or writing for the Master's Essay. Note that "essay" is the official term for a thesis at Johns Hopkins University. Instructor(s): Staff.

EN.530.603. Applied Optimal Control. 3.0 Credits. The course focuses on the optimal control of dynamical systems subject to constraints and uncertainty by studying analytical and computational methods leading to practical algorithms. Topics include calculus of variations, nonlinear local optimization, global stochastic search, dynamic programming, linear quadratic (gaussian) control, numerical trajectory optimization, model-predictive control. Advanced topics include approximate dynamic programming and optimal control on manifolds. The methods and algorithms will be illustrated through implementation of various simulated examples. Recommended Course Background: Linear Algebra and Differential Equations; experience with control systems; programming in MATLAB and/or Python. Instructor(s): M. Kobilarov.

EN.530.605. Mechanics of Solids and Materials. 3.0 Credits. This course provides an introduction to the mathematical and theoretical foundations of the mechanics of solids and materials. We will begin with the mathematical preliminaries of continuum mechanics: vectors and tensors calculus, then introduce the kinematics of deformation and descriptions of stress in a continuum: Eulerian and Lagrangian descriptions, followed by conservation laws: mass, momentum, and energy balance, and entropy. These concepts will be applied to develop the concepts of constitutive relations: frame invariance, material symmetry, and dissipation. The second half of the class will be devoted to elasticity, both classical and finite elasticity, and solution methods for boundary value problems. Instructor(s): T. Nguyen.

EN.530.606. Mechanics of Solids and Materials II. 3.0 Credits. An overview of the area of the mechanics of solids and materials, with the intent of providing the foundation for graduate students interested in research that involves these disciplines. The course is based on the principles of continuum mechanics, and covers the fundamental concepts of elasticity, plasticity, and fracture as applied to materials. One objective is to get graduate students to the point that they can understand significant fractions of research seminars and papers in this area. This mathematically rigorous course emphasizes the setup and solution of boundary value problems in mechanics, and attempts to integrate the primary behaviors with deformation and failure mechanisms in materials. Special topics covered may include (depending on the interests of the student body) wave propagation, viscoelasticity, geomechanics or biomechanics. Instructor(s): R. Hurley Area: Engineering.

EN.530.610. Statistical Mechanics in Biological Systems. 3.0 Credits. Application of equilibrium and nonequilibrium concepts in statistical mechanics to biology is presented in some detail. Topics include many-body dynamics and equilibrium ensembles, thermodynamics and phase transitions, free energy functionals, computer simulations of biological systems, nonequilibrium model such as the Langevin equation and the Fokker-Planck equation, kinetic models of biochemical networks, Markov models of stochastic systems and pattern formation in nonequilibrium systems. Emphasis will be on quantitative understanding of biological problems. Instructor(s): S. Sun.

EN.530.612. Computational Solid Mechanics. 3.0 Credits. This course teaches in-depth and hands-on understanding of numerical methods for solid mechanics problems. The course begins with a review of the fundamental concepts of the finite element method for linear boundary value problems (BVP) and initial boundary value problems (IBVP) in solid mechanics. Then more advance methods for nonlinear BVPs are presented and applied to problems of material inelasticity and finite elasticity. Topics covered include the strong and weak statements of the BVP, weighted residual methods, time integration, Newton-type methods for nonlinear problems, and error estimation and convergence. Instructor(s): T. Nguyen.

EN.530.613. MechE Master's Design Project I. 4.0 Credits. This course is intended to give graduate students some practice and experience in the art of engineering design in conjunction with undergraduate students taking MechE Senior Design Project I. Students working in teams of two to four will select a small-scale, industry-suggested design problem in the area of small production equipment, light machinery products, or manufacturing systems and methods. A solution to the problem is devised and constructed by the student group within limited time and cost boundaries. Preliminary oral reports of the proposed solution are presented at the end of the first semester. A final device, product, system, or method is presented orally and in writing at the end of the second semester. Facilities of the Engineering Design Laboratory (including machine shop time) and a specified amount of money are allocated to each student design team for purchases of parts, supplies, and machine shop time where needed. Recommended Course Background: C- or higher in both 530.403 and 530.404 MechE Senior Design Project I/II. Students from other universities may ask to be considered if they have taken a course like MechE Senior Design Project i.e. two semesters, design-build-test, ideally with industry connection. Instructor(s): N. Scott; S. Bailey Area: Engineering.

EN.530.618. Fabricatology - Advanced Materials Processing. 3.0 Credits. The “Fabricatology” is a course that students can learn how to make desired shapes, structures, and surfaces across various length scales. It will introduce rich scientific and engineering knowledge related to fabrication at multiple length scales and the generated materials and mechanical systems can be utilized for studying diverse topics including energy harvesting, metamaterials, wetting, and information storage. From this course, students can learn principles and technologies to control shapes at various length scales and processes to control internal structures or surface properties for desired properties/functions. They will be also introduced to exciting recent development in the field so that they can have a comprehensive knowledge about the subject. Recommended Course Background: coursework in introduction to materials chemistry or engineering materials. Instructor(s): S. Kang.
EN.530.619. Aerospace Structures and Materials. 3.0 Credits.
A graduate-level introduction to the design of aircraft and spacecraft structures and components. This course will build on skills learned in EN.530.215 Mechanics Based Design and EN.530.352 Materials Selection. Recommended Course Background: EN.530.352 (or knowledge of materials selection) or instructor permission.
Instructor(s): K. Phillips.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Instructor(s): D. Kraemer.

EN.530.629. Simulation and Analysis of Ocean Wave Energy Systems. 3.0 Credits.
Various aspects of a simulation of a dynamic system are covered in this project-based course. Open-source software packages are used to simulate the hydrodynamics and rigid-body dynamics of an ocean wave-energy conversion project. Topics include: wave-energy converter types (buoyancy, hydrostatic pressure, potential energy, etc), multi-body coupled dynamics, hydrodynamics, and energy conversion. Prerequisites: undergraduate-level dynamics, fluid mechanics, computer programming (any language).
Instructor(s): D. Kraemer.
EN.530.636. Bioinspired Science and Technology. 3.0 Credits.
Nature has been a source of inspiration for scientists and engineers and it receives particular attention recently to address many challenges the human society encounters. The course will study novel natural materials/structures with unique properties, the underlying principles, and the recent development of the bio-inspired materials and systems. From this course, students can learn about ingenious and sustainable strategies of organisms, open eyes about various phenomena in nature, and get inspiration for opening new directions of science and technology.
Instructor(s): N. Cowan; S. Kang.

EN.530.637. Energy and the Environment. 3.0 Credits.
This course focuses on advanced topics related to energy and thermodynamics. The objective of this course is to provide a thorough understanding of the environmental impacts related to energy conversion systems. The use of the second law of thermodynamics is introduced to quantify the performance of energy conversion systems. Topics such as global warming, alternative energy sources (solar, wind power, geothermal, tides, etc.) and new technology (fuel cells and hydrogen economy) and resources and sustainable development are addressed. A section of the course is devoted to current trends in nuclear energy generation and environmental issues associated with it.
Instructor(s): C. Herman.

EN.530.639. Comparative Biomechanics. 3.0 Credits.
Instructor(s): C. Li.

EN.530.642. Plasticity. 3.0 Credits.
Instructor(s): S. Papanikolaou.

EN.530.643. Fundamentals of Microscale Phenomena. 3.0 Credits.
This course will introduce fundamental physical and chemical principles involved in unique microscale phenomena. Topics to be covered include issues associated with being in micrometers in science and engineering, fluid mechanics in micro systems, diffusion, surface tension, surfactants, and interfacial forces, Interfacial hydrodynamics, Mechanical properties of materials in microscale. Students will learn about applications, enabled by the discussed principles. Required Pre-Requisites: Knowledge of fluid mechanics and thermodynamics. Recommended Pre-Requisites: heat transfer. Suggested: advanced knowledge of fluid mechanics plus knowledge of cell and tissue engineering.
Instructor(s): S. Hur.

EN.530.645. Kinematics. 3.0 Credits.
A theoretical treatment of the kinematics of mechanisms, machines, and robotic manipulators intended for (though not restricted to) graduate students. Topics include parameterizations of spherical motion - Euler angles, Rodrigues parameters, unit quaternions, the matrix exponential; analysis of planar and spatial linkages; robot kinematics - forward and inverse kinematics, singularities, elementary topological issues; theory of wrenches and twists; research issues in robot kinematics - redundancy resolution, grasping and rolling contact, steering of nonholonomic systems. Other advanced topics will be covered as time permits.
Recommended Course Background: Undergraduate linear algebra and multivariable calculus.
Instructor(s): G. Chirikjian.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control. 4.0 Credits.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations. Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.
Instructor(s): J. Kim.

EN.530.647. Adaptive Systems. 4.0 Credits.
Graduate-level introduction to adaptive identification and control. Emphasis on applications to mechanical systems possessing unknown parameters (e.g., mass, inertia, friction). Topics include stability of linear and non-linear dynamical systems, Lyapunov stability, input-output stability, adaptive identification, and direct and indirect adaptive control. Required Prerequisites: Calculus I, II, and III; Physics I and II; Linear Algebra; Differential Equations; Graduate linear systems theory such as EN.520.601 Introduction to Linear Systems Theory is required prerequisite. Please see the course home page here for additional information: https://dscl.lcsr.jhu.edu/courses/530-647-adaptive-systems-fall-2017. Audit registration not permitted.
Instructor(s): L. Whitcomb.

EN.530.649. System Identification. 3.0 Credits.
This course will cover several fundamental approaches system identification, including spectral, prediction error, subspace, and "online" (adaptive) identification methods. The emphasis will be on LTI systems, but some time will be devoted to system identification for classes of nonlinear dynamical systems, such as those that are linear in parameters.
Instructor(s): N. Cowan.

EN.530.653. Advanced Systems Modeling. 3.0 Credits.
This course covers the following topics at an advanced level: Newton's laws and kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion: structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Langrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research.
Instructor(s): G. Chirikjian.
EN.530.654. Advanced Systems Modeling II. 3.0 Credits.
A continuation of EN.530.653, this course covers the following topics at an advanced level: Newton's laws of kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion; structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Lagrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics:Luh-Walker-Paul, Hollerbach, O(n) dynamics simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which relates the topics of this course to his or her research.
Instructor(s): G. Chirikjian.

EN.530.655. Additive Manufacturing (Graduate). 3.0 Credits.
The emergence of additive manufacturing (AM) as a viable technology for depositing materials with intricate shapes and architectures enables personal fabrication and threatens to transform global supply chains. This course will give a comprehensive introduction to AM of polymers, metals and ceramics, including: processing fundamentals, processing-structure-property relations and applications. Implications for the design, qualification and introduction of AM products will be addressed, and a variety of applications will be reviewed and used as case studies. Recommended knowledge in Materials Science equivalent to 530.352 Materials Selection.
Instructor(s): K. Hemker.

EN.530.656. Deformation Mechanisms. 3.0 Credits.
An advanced course on the microscopic mechanisms that control the mechanical behavior of materials. Methods and techniques for measuring, understanding, and modeling: plasticity, creep, shear banding, and fracture will be addressed. Subjects to be covered include dislocation theory and strengthening mechanisms, high temperature diffusion and grain boundary sliding, shear localization, void formation, ductile rupture, and brittle fracture.
Instructor(s): K. Hemker.

EN.530.661. Applied Mathematics for Engineering. 3.0 Credits.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. Hilpert.

EN.530.664. Energy Systems Analysis (graduate). 3.0 Credits.
This course discusses the grid integration of renewable energy systems. The main emphasis is on grid level effects of renewable energy, particularly wind power systems. It begins with an introduction to basic power system concepts along with power flow analysis (and optimization). Then, important concepts for wind power systems are discussed. Following that, integration issues for wind power at the transmission level and solar cell integration at the distribution level are introduced. The last part of the course will focus on current research in these areas. Students will choose a system to research and present a project or literature review at the end of the term. Prior knowledge of optimization is helpful, but not required. Co-listed with EN.530.464.
Instructor(s): D. Gayme.

EN.530.672. Biosensing & BioMEMS. 3.0 Credits.
The course discusses the principles of biosensing and introduces micro- and nano-scale devices for fluidic control and molecular/cellular manipulation, measurements of biological phenomena, and clinical applications.
Instructor(s): J. Wang.

EN.530.674. Effective and Economic Design for Biomedical Instrumentation. 4.0 Credits.
This course is to introduce students to the design, practice, and devices used in biomedical research. The class will be divided into two parts: lecture and lab. In the lectures, students will learn the physics behind the device, the specific requirements of biomedical instruments, and the engineering principles to construct the devices. Lab sessions will focus on designing and building a prototype device. This course aims to forge collaboration between biomedical researchers and mechanical engineers. The goal is to make the devices accessible to the biomedical research community as well as the general public. Economical availability will be one of the critical elements in the device design. Students will be encouraged to build the devices within a healthy budget. PREREQUISITES: Introductory Physics, Programming, and CAD
Instructor(s): Y. Chen
Area: Engineering.

EN.530.675. Locomotion I: Mechanics. 3.0 Credits.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). Locomotion emerges from effective physical interaction of an animal or a machine with the surrounding environment; therefore, the ability to generate appropriate forces (besides appropriate sensing and control) is essential to successful locomotion. From a mechanics point of view, we will discuss why animals move amazingly well in almost any environment, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex and how they may be improved by better understanding the mechanics of locomotion. Primary focus will be on terrestrial locomotion, but aerial and aquatic locomotion will be also discussed, all with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. A strong understanding of Newtonian mechanics is required. Visit http://il.me.jhu.edu/teaching for more information. Recommended Course Background: B+ or higher in EN.530.202 Dynamics or EN.560.202 Dynamics
Instructor(s): C. Li
Area: Engineering.

EN.530.676. Locomotion II: Dynamics. 3.0 Credits.
Graduate course on mechanics and control in locomotion. Topics include modeling (e.g. Lagrangian mechanics), dynamical systems theory (nonholonomic systems, limit-cycle behavior, Poincaré analysis, and Floquet theory), design (control synthesis, mechanical design), and data-driven modeling from animal locomotor control experiments. Prerequisites: A graduate course in linear systems theory (e.g. EN.520.601). Suggested background (not required): 530.475/675.
Instructor(s): N. Cowan.
EN.530.678. Nonlinear Control and Planning in Robotics. 3.0 Credits.
The course starts with a brief introduction to nonlinear systems and covers selected topics related to model-based trajectory planning and feedback control. Focus is on applications to autonomous robotic vehicles modeled as underactuated mechanical systems subject to constraints such as obstacles in the environment. Topics include: nonlinear stability, stabilization and tracking, systems with symmetries, differential flatness, backstepping, probabilistic roadmaps, stochastic optimization. Recommended Course Background: multi-variable/differential calculus, AS.110.302, AS.110.201, undergraduate linear control, basic probability theory.
Instructor(s): M. Zadeh.

EN.530.681. TEM: Practice and Applications. 3.0 Credits.
A lab and lecture course covering the practical aspects of transmission electron microscopy. Electron diffraction, image formation, and analytical techniques are explained, and students are given an opportunity to gain hands-on microscopy experience.
Instructor(s): K. Hemker.

EN.530.682. Haptic Applications. 4.0 Credits.
An introduction to the required theoretical and practical background in the design and development of haptic applications. Haptic technology enables users to touch and/or manipulate virtual or remote objects in simulated environments or tele-operation systems. This course aims to cover the basics of haptics through lectures, lab assignments, a term project, and readings on current topics in haptics. Through lab assignments, students learn to create haptic-enabled virtual environments using software development toolkits and a haptic device. Students will be required to complete a project with approval of the instructor. Recommended course background: ME, CS, and ECE graduate and senior undergraduate students who are being enthusiastic to learn about haptics and knowledgeable in basic C++ programming. Students with experience with other programming languages (Python, Java, etc.) should be able to self-tutor themselves to complete lab assignments.
Instructor(s): M. Zadeh.

EN.530.683. Applied Computational Modeling in Aerodynamics and Heat Transfer. 3.0 Credits.
Introduction to fundamental principles and applications of the computational modeling in fluid dynamics and heat transfer. Emphasis is on basics of finite-difference methods and hands-on experience in code development as well as the use of a commercial software package (ANSYS CFX) for modeling and simulation. Students will also learn about meshing strategies, post-processing, and critical analysis of simulation results. The concept of numerical errors and the validation and verification will also be emphasized. Recommended Background: (1) Undergraduate or introductory level course in fluid dynamics or heat transfer or transport phenomena or classical mechanics. (2) Basic expertise in writing computer codes (MATLAB or C++ or Fortran or Python).
Instructor(s): J. Seo
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.684. Orientation Mapping of Crystalline Materials. 3.0 Credits.
Recent advances in instrumental capabilities are fast making it routine to acquire large 2D and 3D datasets and maps of crystalline materials. SEM-based orientation imaging microscopy (OIM) and transmission Kikuchi diffraction (TKD) and TEM-based precession-assisted crystal orientation mapping (PACOM) provide the means to characterize intra- and inter-granular details such as grain: orientation, size, shape, neighborhoods and GND distributions. This course will cover the science that underpins these technologies and provide practical experience in gathering, filtering, quantifying and displaying such information. It is motivated by the fact that emergent advances based on the practice of Integrated Materials Science and Engineering (ICMSE) and the Materials Genome Initiative (MGI) are predicated on the availability of physics-based, multi-scale models that are based on such detailed quantitative experimental observations of polycrystalline materials.
Instructor(s): K. Hemker.

EN.530.686. Mechanics of Locomotion. 3.0 Credits.
This is a course on the mechanics of locomotion in animals and machines (particularly bio-inspired and biomimetic robots). It will introduce you to the breadth of diverse topics within the field of animal and robot locomotion. We will discuss why animals move amazingly well in all kinds of environments, how they have inspired some highly successful machines, and yet why the majority of robots still struggle in environments that are only modestly complex. Terrestrial, aerial, and aquatic locomotion will be discussed, with numerous examples. General principles and integration of knowledge from engineering, biology, and physics will be emphasized. Students from ME and other departments are welcome. Please visit http://li.me.jhu.edu/teaching for updated information. Co-listed with EN.530.486
Instructor(s): C. Li.

EN.530.691. Haptic Interface Design for Human-Robot Interaction. 3.0 Credits.
This course provides an introduction to haptic interface design and analysis for human-robot interaction involving virtual environments, augmented reality, and teleoperation. Topics include human touch perception, haptic-focused mechatronic design, system modeling and analysis (kinematic and dynamic), human-in-the-loop feedback control, and haptic feedback evaluation. Recommended: coursework or knowledge of Dynamics and knowledge of feedback control, mechatronics, and Matlab.
Instructor(s): J. Brown.
EN.530.707. Robot System Programming. 4.0 Credits.
This course seeks to introduce students to open-source software tools that are available today for building complex experimental and fieldable robotic systems. The course is grouped into sections, each of which building on the previous in increasing complexity and specificity. tools and frameworks supporting robotics research, robotics-specific software frameworks, integrating complete robotic systems, and culminates with an independent project of the student’s own design using small mobile robots or other robots in the lab. Students will need to provide a computer (with at least a few GB of memory and a several tens of GB of disc space) running Ubuntu (https://www.ubuntu.com or one of its variants such as Xubuntu) and ROS (http://ros.org/). Students should have an understanding of intermediate programming in C/C++ (including data structures and object-oriented programming). Familiarity with Linux programming. Familiarity with software version control systems such as Git, and linear algebra. Students should see the course homepage http://dscl.lcsr.jhu.edu/ME530707_2018 for more information and to get started with the course. Required Course Prerequisite/Corequisite: EN.530.646 and EN.600.436. Registration only by permission of the instructor. Please contact Prof. Louis Whitcomb at llw@jhu.edu. Please put ‘530.707 Robot System Programming’ in the subject line of your email.
Instructor(s): L. Whitcomb.

EN.530.710. Optical Measurement Techniques. 3.0 Credits.
Optic-based techniques are being utilized as measurement and data transmission tools in a growing number of applications. The objective of this course is to introduce graduate students with limited background in optics (but with background in graduate-level mathematics) to the fundamentals of optics and their implementation. Topics covered include reflection, refraction, fluorescence, phosphorescence and diffraction of light; review of geometric optics, lenses, lens systems (microscope, telescope), mirrors, prisms; aberrations, astigmatism, coma, and methods to correct them; light as an electromagnetic wave; Fourier optics; spectral analysis of optical systems; coherent and incoherent imaging, holography, interferometry, diffraction grating; lasers, polarization, light detectors; elements of non-linear optics, birefringence; optical fibers, data transmission, and networking.
Instructor(s): J. Katz.

EN.530.726. Hydrodynamic Stability. 3.0 Credits.
Hydrodynamic linear stability theory is developed and applied to a variety of flow problems using analytical techniques and numerical methods. Necessary and sufficient conditions for flow stability are derived. Canonical examples are used to introduce various concepts including, e.g. temporal and spatial analyses, asymptotic and transient flow response, convective and absolute instability, global methods, and direct stability analysis.
Instructor(s): T. Zaki.

EN.530.730. Finite Element Methods. 3.0 Credits.
Variational methods and mathematical foundations, Direct and Iterative solvers, 1-D Problems formulation and boundary conditions, Trusses, 2-D/ 3D Problems, Triangular elements, QUAD4 elements, Higher Order Elements, Element Pathology, Improving Element Convergence, Dynamic Problems.
Instructor(s): J. Cheng.

EN.530.732. Fracture Of Materials. 3.0 Credits.
An advanced examination of fracture mechanisms in ductile and brittle materials. Both the mechanics and the materials aspects are covered with importance placed on the synthesis of the two approaches. Topics include linear elastic fracture mechanics, ductile fracture, the J-integral, atomistic aspects of fracture in polycrystalline materials, fracture in ceramics and polymers, influence of the material microstructure on fracture toughness and ductility in FCC and BCC materials.
Instructor(s): K. Ramesh.

EN.530.748. Stress Waves, Impacts and Shockwaves. 3.0 Credits.
Instructor(s): K. Ramesh.

EN.530.761. Mathematical Methods of Engineering I. 3.0 Credits.
This course is a fast-paced overview of some fundamental topics in applied mathematics including: linear algebra and matrix theory, ordinary differential equations, Laplace and Fourier transforms, as well as an introduction to partial differential equations.
Instructor(s): D. Gayme.

EN.530.766. Numerical Methods. 3.0 Credits.
Comprehensive introduction to the finite-difference method and associated numerical techniques for solving partial differential equations (PDEs) encountered in Engineering and Physics. Homework assignments and Project require substantial computer programming.
Instructor(s): T. Zaki.

EN.530.767. Computational Fluid Dynamics. 3.0 Credits.
Advanced introduction to finite-difference and finite-volume approaches to modeling incompressible flows. Computer project requiring programming.
Instructor(s): J. Seo.

EN.530.772. Non-Linear Finite Elements. 3.0 Credits.
This course will discuss state of the art theoretical developments and modeling techniques in nonlinear computational mechanics, for problems with geometric and material nonlinearities. Large deformation of elastic-plastic and visco-plastic materials, contact-friction and other heterogeneous materials like composites and porous materials will be considered. A wide variety of applications in different disciplines, e.g. metal forming, composite materials, polycrystalline materials will be considered. Co-listed with EN.560.772.
Instructor(s): S. Ghosh.

EN.530.777. Multiphase Flow. 3.0 Credits.
An introduction to basic contemporary ideas concerning gas, liquid, and solid-fluid two-phase flows.
Instructor(s): G. Tryggvason.

EN.530.790. Advanced Finite Element Methods and Multi-Scale Methods. 3.0 Credits.
Instructor(s): S. Ghosh.
EN.530.800. Independent Study. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.530.801. PhD Graduate Research. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.530.802. PhD Graduate Research. 3.0 - 20.0 Credits.
Department approval required to enroll in 01.
Instructor(s): Staff.

EN.530.803. Mechanical Engineering Seminar. 1.0 Credit.
Instructor(s): R. Mittal.

EN.530.804. Mechanical Engineering Seminar. 1.0 Credit.
Instructor(s): R. Mittal.

EN.530.807. Graduate Research Seminar in Fluid Mechanics. 1.0 Credit.
Instructor(s): J. Katz.

EN.530.808. Graduate Seminar in Fluid Mechanics. 1.0 Credit.
Instructor(s): J. Katz.

EN.530.810. Mechanics and Materials Graduate Seminar. 1.0 Credit.
Instructor(s): S. Kang.

EN.530.897. Research-Summer. 3.0 - 20.0 Credits.
Instructor(s): Staff.

EN.530.899. Independent Study-Summer. 1.0 - 3.0 Credits.
Instructor(s): Staff.

Cross Listed Courses

General Engineering
EN.500.112. Gateway Computing. 3.0 Credits.
This course introduces fundamental programming concepts and
techniques, and is intended for all who plan to develop computational
artifacts or intelligently deploy computational tools in their studies
and careers. Topics covered include the design and implementation of
algorithms using variables, control structures, arrays, functions, files,
testing, debugging, and structured program design. Elements of object-
oriented programming, algorithmic efficiency and data visualization
are also introduced. Students deploy programming to develop working
solutions that address problems in engineering, science and other
areas of contemporary interest that vary from section to section.
Course homework involves significant programming. Attendance and
participation in class sessions are expected.
Instructor(s): I. Sekyonda; J. Selinski; M. Darvish Darab
Area: Engineering, Natural Sciences.

EN.500.602. Seminar: Environmental and Applied Fluid Mechanics. 1.0
Credit.
Instructor(s): J. Katz.

EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Instructor(s): J. Katz.
Seminar series in robotics. Topics include: Medical robotics, including
computer-integrated surgical systems and image-guided intervention.
Sensor based robotics, including computer vision and biomedical image
Autonomous robotics for monitoring, exploration and manipulation with
applications in home, environmental (land, sea, space), and defense
areas. Biorobotics and neuromechanics, including devices, algorithms
and approaches to robotics inspired by principles in biomechanics and
neuroscience. Human-machine systems, including haptic and visual
feedback, human perception, cognition and decision making, and human-
machine collaborative systems. Cross-listed Mechanical Engineering,
Computer Science, Electrical and Computer Engineering, and Biomedical
Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.

Electrical Computer Engineering

EN.520.340. Introduction to Mechatronics. 3.0 Credits.
Introduction to Mechatronics is mostly hands-on, interdisciplinary
design class consisting of lectures about key topics in mechatronics,
and lab activities aimed at building basic professional competence.
After completing the labs, the course will be focused on a final mini-
project for the remainder of the semester. This course will encourage and
emphasize active collaboration with classmates. Each team will plan,
design, manufacture and/or build, test, and demonstrate a robotic system
that meets the specified objectives.
Instructor(s): I. Sekyonda
Area: Engineering.

EN.520.353. Control Systems. 3.0 Credits.
Modeling, analysis, and an introduction to design for feedback
control systems. Topics include state equation and transfer function
representations, stability, performance measures, root locus methods,
and frequency response methods (Nyquist, Bode).
Prerequisites: Prereqs: EN.530.343 AND EN.520.214
Instructor(s): E. Mallada Garcia
Area: Engineering.

EN.520.495. Microfabrication Laboratory. 4.0 Credits.
This laboratory course is an introduction to the principles of
microfabrication for microelectronics, sensors, MEMS, and other
synthetic microsystems that have applications in medicine and biology.
Course comprises of laboratory work and accompanying lectures that
cover silicon oxidation, aluminum evaporation, photoresist deposition,
photolithography, plating, etching, packaging, design and analysis CAD
tools, and foundry services. Seniors only or Perm. Req’d. Co-listed as
EN.580.495 & EN.530.495
Prerequisites: Students must have completed Lab Safety training prior to
registering for this class.
Instructor(s): A. Andreou; J. Wang
Area: Engineering, Natural Sciences.
EN.520.773. Advanced Topics In Microsystem Fabrication. 4.0 Credits.
Graduate-level course on topics that relate to microsystem integration of complex functional units across different physical scales from nano to micro and macro. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photosist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Topics will include emerging fabrication technologies, micro-electromechanical systems, nanolithography, nanotechnology, soft lithography, self-assembly, and soft materials. Discussion will also include biological systems as models of microsystem integration and functional complexity. Perm. Required.
Instructor(s): J. Wang.

Civil Engineering
EN.560.201. Statics & Mechanics of Materials. 4.0 Credits.
Basic principles of classical mechanics applied to the equilibrium of particles and rigid bodies at rest, under the influence of various force systems. In addition, the following topics are studied: free body concept, analysis of simple structures, friction, centroids and centers of gravity, and moments of inertia. Includes laboratory experience.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class; AS.171.101 OR AS.171.107 OR (EN.530.123 AND EN.530.124) or instructor permission.
Instructor(s): R. Sangree
Area: Engineering.

Biomedical Engineering
EN.580.451. Cell and Tissue Engineering Lab. 3.0 Credits.
Cell and tissue engineering is a field that relies heavily on experimental techniques. This laboratory course will consist of three six experiments that will provide students with valuable hands-on experience in cell and tissue engineering. Students will learn basic cell culture procedures and specialized techniques related to faculty expertise in cell engineering, microfluidics, gene therapy, microfabrication and cell encapsulation. Experiments include the basics of cell culture techniques, gene transfection and metabolic engineering, basics of cell-substrate interactions I, cell-substrate interactions II, and cell encapsulation and gel contraction. Co-listed with EN.530.451. Senior and Graduate students only; others, instructor permission required. Fall semester only. Lab Fee: $100
Instructor(s): E. Haase
Area: Engineering, Natural Sciences.

Center for Leadership Education
EN.660.361. Engineering Business and Management. 3.0 Credits.
When engineers become working professionals, especially if they become managers, they must juggle knowledge of and tasks associated with operations, finance, ethics, strategy, team citizenship leadership and projects. While engineers’ success may depend on their direct input to the sweat of their own brow – managers’ success depends on their ability to enlist the active involvement of others: direct reports, other managers, other team members, other department employees, and those above them on the organizational chart. You will learn these concepts and skills in this course. In this course, you will learn about teamwork and people management, and gain an introduction to strategy, finance, and project management. You will practice writing concise persuasive analyses and action plans and verbally defending your ideas. Cross-listed with Mechanical Engineering.
Instructor(s): Staff
Area: Engineering.

Entrepreneurship and Management
EN.660.461. Engineering Business and Management. 3.0 Credits.
An introduction to the business and management aspects of the engineering profession, project management, prioritization of resource allocation, intellectual property protection, management of technical projects, and product/production management. Preference will be given to Mechanical Engineering students. No audits. Recommended Course Background: EN.660.105
Instructor(s): Staff
Area: Engineering.

NanoBioTechnology
http://inbt.jhu.edu

The Institute for NanoBioTechnology (INBT) at Johns Hopkins University is an exceptionally diverse, multidisciplinary team of faculty, researchers, and students uncovering new knowledge and creating innovative technologies at the interface of nanoscience, engineering, and medicine. Launched in 2006, INBT aims to revolutionize research by fostering a collaborative environment among engineers, scientist, and clinicians to pioneer new ways to solve some of the complex challenges in healthcare and the environment. The Institute brings together experts from the Bloomberg School of Public Health, School of Medicine, Whiting School of Engineering, Applied Physics Lab, and Krieger School of Arts and Sciences to fulfill their research, education, outreach, and translation initiatives. INBT collaborates with major industry partners through its Corporate Partnership Program, to help move emerging technologies from laboratory to marketplace, as well as provide a vehicle for open exchange between Hopkins researchers and students with their counterparts in industry. Their headquarters are located in 100 Croft Hall on the Homewood campus, with laboratory facilities and research teams located at several Johns Hopkins locations. Examples of INBT research include the development of new tools and techniques to probe biological systems at the molecular, cellular, and tissue levels, to provide new insight into the mechanisms of disease, and the development of new diagnostic and therapeutic platforms for improved diagnosis, prevention, and treatment of disease. These are achieved through their three research focused platforms: Engineering for Cancer Therapies, Diagnostic Tools Engineered for Early Detection, and Stem Cells and Regenerative Engineering.

INBT education programs foster the next wave of nanobiotechnology innovations. Goals include training scientists and engineers who work between the physical sciences/engineering fields and life sciences/medical fields, as well as creating an entrepreneurial environment. INBT offers a Certificate of Advanced Study in Nanobiotechnology for students who complete 13 lecture/tutorial/laboratory courses along with at least eight semesters of research from their home department. The Nanotechnology for Cancer Research program trains students to study and model cancer motility and the biophysical forces involved in metastasis. Additionally, research opportunities exist through INBT’s summer Research Experience for Undergraduates (REU) and International Research Experience for Students (IRES), both funded by NSF.

Certificate of Advance Study
The Nano-Bio Certificate of Advanced Study is recognized by the National Institutes of Health and the National Science Foundation as an innovative new approach to multidisciplinary training, integrating research and education. It combines traditional disciplinary coursework and laboratory
training with peer-to-peer teaching, co-advising and professional development.

Certificate students have the opportunity to:

- earn an accredited Certificate of Advanced Study (CAS) in Nanobiotechnology (for students who complete 13 lecture/tutorial/labatory courses along with at least eight semesters of research from their home department)
- work towards earning a PhD from participating departments such as Biomedical Engineering, Materials Science and Engineering, and Physics (application and acceptance to one of these PhD programs is required separately and in advance of an application for the CAS above). All Science and Engineering students are encouraged to apply.
- be co-advised by faculty experts from outside as well as inside your specialty
- work in a variety of lab setting and build collaborative skills

Program Requirements

Nano-Bio certificate students take two core courses and one lab course. They learn alongside other INBT students in cross-disciplinary journal clubs. To enhance their graduate experience, they attend professional development seminars and present research at the annual Nano-Bio Symposium. Students are given the opportunity to participate in research collaborations with industry partners.

- Students must complete the Nanobiotechnology certificate program course requirements. (http://inbt.jhu.edu/education/graduate/nanobi-certificate-program/courses)
- Students are expected to present their research at the annual INBT research symposium.
- Students must also complete all PhD requirements in their home departments.

Eligibility / How to Apply

Prospective students must apply to and be accepted by a participating department before pursuing this certificate program. For additional information, contact Camille Mathis at cmathis@jhu.edu.

For current course information and registration go to https://sis.jhu.edu/courses/

Courses

EN.670.495. Animation in Nanotechnology & Medicine. 3.0 Credits.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

EN.670.497. Animation in Nanotechnology & Medicine. 3.0 Credits.
This course involves the use of animation to visualize scientific processes in nanotechnology and medicine. Animation is becoming an increasingly important tool in both research and education, especially in fields such as nanobiotechnology that involve complex processes and occur at multiple length scales. Understanding of the subject matter is gained through interaction with faculty and graduate students in research groups in the Institute for NanoBioTechnology at Hopkins. The course follows the basic animation pipeline from concept to post production.
Instructor(s): M. Rietveld.

EN.670.502. INBT Undergraduate Research. 1.0 - 3.0 Credits.
Student participation in ongoing research activities. Research is conducted under the supervision of a faculty member and often in conjunction with other members of the research group.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): Staff.

EN.670.609. Communication for Scientists and Engineers. 1.0 Credit.
Developing communications skills is a vital part of the training process to prepare scientists and engineers for successful careers. The course’s goal is to provide participants with fundamental training in science communication, focusing on how to present science to a non-expert audience. Students will reach this objective through reading, writing, and classroom activities. Conciseness and clarity are valued in scientific fields, so an emphasis will be on quality rather than quantity of writing. Topics covered generally include: communicating with your target audience, communicating on the web and social media, the editing process, communication resources, and more.
Instructor(s): G. Wadas
Writing Intensive.

EN.670.612. INBT Research Practicum. 1.0 Credit.
Research practicum for INBT Co-Op MSE students.
Instructor(s): H. Mao; S. Gerecht
Area: Engineering, Natural Sciences.

EN.670.615. Introduction to NanoBio Tutorial. 1.0 Credit.
Students in the INBT training grant programs study and present topics in nanotechnology applied to biology from the scientific literature.
Instructor(s): P. Searson.

EN.670.616. Introduction to NanoBio Tutorials II. 1.0 Credit.
Ph.D. students and postdoctoral fellows in the HHMI/IGERT/PSOC/CCNE/CNTC training programs study and present topics in nanotechnology for biology and medicine.
Instructor(s): P. Searson.

EN.670.618. Nanobio Tutorials. 1.0 Credit.
As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.670.616
Instructor(s): P. Searson.

EN.670.619. Fundamental Physics and Chemistry of Nanomaterials. 3.0 Credits.
This course will cover the physics and chemistry relevant to the design, synthesis, and characterization of nanoparticles. Topics include nanoparticle synthesis, functionalization, surface engineering, and applications in diagnostics and therapeutics. The properties of semiconductor quantum dots and magnetic nanoparticles will be reviewed along with techniques for nanoparticle manipulation, particle tracking, and bio-microscopy. Patterning tools including soft lithography, optical lithography, e-beam lithography, and template lithography will be discussed. Electron and scanning probe microscopy will be reviewed. Cross-listed with Materials Science & Engineering and Chemical & Biomolecular Engineering.
Instructor(s): Staff.
EN.670.621. NanoBio Laboratory. 3.0 Credits.
This course introduces students to concepts and laboratory techniques in nanobiotechnology. The focus of the laboratory is on nanoparticle carriers for drug delivery and markers for imaging. The laboratory involves the synthesis of nanoparticles using solution phase techniques and characterization by optical techniques such as dynamic light scattering and absorbance spectroscopy. Strategies for functionalization of nanoparticles are covered with focus on methods for attaching biomolecules. The basic aspects of cell culture and optical microscopy techniques will be covered. Nanoparticles functionalized with a drug or gene will be used to perform transfection experiments and compared to standard techniques.
Instructor(s): H. Mao.

EN.670.622. Advanced NanoBio Tutorials I. 1.0 Credit.
As a follow-up to NanoBio Tutorials, INBT training grant students will present scientific articles and reviews related to their current research project. Topics will also be related to nanotechnology applied to biology from scientific literature. At this time all students should be assigned a project and be able to engage participating students in their field of study. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, and Introduction to NanoBio Tutorials and NanoBio Tutorials. Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.623. Advanced NanoBio Tutorials II. 1.0 Credit.
INBT training grant students only. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, and EN.670.619
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.624. NanoBio Tutorials: Special Topics I. 1.0 Credit.
This course is to allow students pursuing a certificate in nanobiotechnology the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623. Certificate of Advanced Studies in Nanobiotechnology only.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.625. NanoBio Tutorials: Special Topics II. 1.0 Credit.
This course is to allow INBT training grant fellows the opportunity each week to review and present on special research topics. The papers and discussions will cover the latest developments in various researches. INBT training grant students only. Recommended Course Background: EN.670.615, EN.670.616, EN.670.618, EN.670.619, EN.670.622, and EN.670.623.
Instructor(s): P. Searson
Area: Engineering, Natural Sciences.

EN.670.626. NanoBio Tutorials II. 1.0 Credit.
As a follow-up to Intro to NanoBio Tutorials, INBT training grant students will conduct extensive article reviews on topics related to the research being conducted in their labs (i.e., nanoparticles synthesis, quantum dots, cancer, etc.). Topics will also be related to nanotechnology applied to biology from scientific literature. Students will present literary reviews, discussions and formal presentations on articles as they relate to research or projects they wish to partake in. Recommended Course Background: EN.670.615/EN.500.615 and EN.670.616/EN.500.616
Instructor(s): P. Searson.

EN.670.642. Lab Course in Nanobiotechnology. 3.0 Credits.
This lab course is a cornerstone of the training that all NTCR fellows acquire. The main objective of the lab course is to reveal the basics of biological systems to engineers in the physical sciences and of physical systems to biologists. This lab course takes place in new state-of-the-art facilities that have been equipped with funding from the HHMI and the NSF. Lab skills learned include: (i) physical and chemical tools to characterize and manipulate the properties of surfaces and nanoparticles; (ii) synthesis, ligand-functionalization, characterization, and targeted cell intake of multi-functional nanoparticles (nanowires and quantum dots); and (iii) atomic force microscopy and quantitative fluorescence microscopy for biological and materials applications.
For fellows coming with a physics/engineering background, they learn basics of mammalian cell culture, molecular biology, cell transfection/ transformation, and blotting techniques. The course captain is Denis Wirtz (Depts. Chemical and Biomolecular Engineering, Oncology, Pathology and Director of the previously NCI-funded NTCR program and PSOC center). Recommended Course Background: EN.670.620 or EN.670.400
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

EN.670.643. Nanotechnology for Cancer Research Tutorial. 1.0 Credit.
Students in the NTCR training grant program study and present topics in nanotechnology applied to biology from the scientific literature. For NTCR Fellows only.
Instructor(s): D. Wirtz
Area: Engineering, Natural Sciences.

EN.670.695. Animation in Nanotechnology & Medicine. 3.0 Credits.
Instructor(s): M. Rietveld; P. Searson
Area: Engineering, Natural Sciences.

EN.670.697. Animation in Nanotechnology & Medicine. 3.0 Credits.
This course involves the use of animation to visualize scientific processes in nanotechnology and medicine. Animation is becoming an increasingly important tool in both research and education, especially in fields such as nanobiotechnology that involve complex processes and occur at multiple length scales. Understanding of the subject matter is gained through interaction with faculty and graduate students in research groups in the Institute for NanoBioTechnology at Hopkins. The course follows the basic animation pipeline from concept to post production.
Instructor(s): M. Rietveld.

EN.670.800. Independent Study: Global Engineering Innovation. 1.0 - 3.0 Credits.
This independent design course presents students with engineering needs in developing countries. Teams of students will work together to design solutions for the proposed needs that are defined in part with our global partners. Students will have to rigorously research the local community and cultural context of the proposed problems to design solutions. Prototypes will be built and some teams may test prototypes in the local community to optimize solution. Permission of Instructor.
Instructor(s): J. Elisseeff
Area: Engineering.

Robotics and Computational Sensing
https://www.lcsr.jhu.edu/Main_Page

The Laboratory for Computational Sensing and Robotics (LCSR) is one of the most technologically advanced robotics research centers worldwide, and is an international leader in the areas of medical robotics, autonomous systems, and bio-inspiration. Within Johns Hopkins, a premiere research university, the LCSR is a hub for innovative and
interdisciplinary robotics engineering, research, and development. The LCSR brings a core group of scholars and students from the Whiting School of Engineering together with researchers from the Johns Hopkins School of Medicine, the Bloomberg School of Public Health, the Krieger School of Arts and Sciences, the Johns Hopkins University Applied Physics Laboratory and the Kennedy Krieger Institute to focus on the common purpose of creating knowledge and fostering innovation.

**Undergraduate Programs**

**Minor in Robotics**

The field of robotics integrates sensing, information processing, and movement to accomplish specific tasks in the physical world. As such, it encompasses several topics, including mechanics and dynamics, kinematics, sensing, signal processing, control systems, planning, and artificial intelligence. Applications of these concepts appear in many areas including medicine, manufacturing, space exploration, disaster recovery, ordnance disposal, deep-sea navigation, home care, and home automation.

The faculty of the Laboratory for Computational Sensing and Robotics (LCSR), in collaboration with the academic departments and centers of the Whiting School of Engineering, offers a robotics minor in order to provide a structure in which undergraduate students at Johns Hopkins University can advance their knowledge in robotics while receiving recognition on their transcript for this pursuit. The minor is not “owned” by any one department, but rather it is managed by the LCSR itself. Any student from any department within the university can work toward the minor.

Robotics is fundamentally integrative and multidisciplinary. Therefore, any candidate for the robotics minor must develop a set of core skills that cut across these disciplines, as well as obtain advanced supplementary skills.

**Core Skills Include the Following**

- Robot kinematics and dynamics (R)
- Systems theory, signal processing and control (S)
- Computation and sensing (C)

Supplementary advanced skills may be obtained in specialized applications, such as space, medicine, or marine systems; or in one of the three core areas listed above.

The full minor course listing, provided below and available at [https://lcsr.jhu.edu/robotics-minor/](https://lcsr.jhu.edu/robotics-minor/), specifies which courses fulfill these requirements. Note that ALL core areas must be covered, but that ANY advanced/supplementary courses can be chosen from the list. This allows students to strike a balance between breadth and depth.

**Requirements**

Undergraduates qualify for the minor provided they have taken at least 18 credits (at the 300-level or above, with a C- or above) from an approved list of courses available below and at [https://lcsr.jhu.edu/robotics-minor/](https://lcsr.jhu.edu/robotics-minor/) with the following requirements and restrictions:

- At least 3 credits of the 18 must be a laboratory course (Lab) (at least 15 hours of laboratory time that includes working with physical hardware and/or real data).

At most 3 credits of the 18 can be an independent research or individual study with a faculty member on the list of approved faculty advisers.

- At least 6 credits must be primarily listed in a department other than the student’s home department (it is acceptable if such a course is cross-listed in the student’s home department).
- At most one course up to 3 credits (including independent research or individual study) may be taken S/U, but all other courses must be taken for a letter grade.

Graduate levels of the same course may be substituted for the undergraduate levels listed below without additional permissions.

The minor is managed by faculty of the LCSR in collaboration with academic departments and centers of the Whiting School of Engineering. If you have suggestions / questions regarding the minor, please direct them to Prof. Noah Cowan.

**Minor in Computer Integrated Surgery**

The Whiting School of Engineering offers a minor in Computer Integrated Surgery (CIS) for full-time, undergraduate students at Johns Hopkins. The minor is particularly well suited for students interested in computer integrated surgery issues who are majoring in a variety of disciplines including biomedical engineering, computer science, computer engineering, electrical engineering, and mechanical engineering. The minor provides formal recognition of the depth and strength of a student's knowledge of the concepts fundamental to CIS beyond the minimal requirements of his/her major.

In order to minor in CIS, a student will require a minor adviser from the Engineering Research Center in Computer Integrated Surgical Systems and Technology (CISST ERC) in the Laboratory for Computational Sensing and Robotics. Current faculty members available as advisers include Professors Russell Taylor (CS), Greg Hager (CS), Jerry Prince (ECE), Ralph Etienne-Cummings (ECE), Louis Whitcomb (ME), Noah Cowan (ME), Marin Kobilarov (ME), Peter Kazanzides (CS), Iulian Iordachita (ME), and Emad Boctor (Radiology).

To satisfy the requirements for the minor in CIS, a student must have a fundamental background in computer programming and computer science, sufficient mathematical background, and also take a minimum of six courses (with a total of at least 18 credits, earning at least a C- in each course) directly related to the concepts relevant to CIS. These six CIS courses must include two fundamental CIS core courses, which provide the student with the fundamental basis for CIS, and four approved upper-level courses (300-level or above) to allow the student to pursue an advanced CIS topic in depth. The additional four upper-level courses must include at least one course designated as an "imaging" course or one course designated as a "robotics" course, as discussed below.

Graduate levels of the same course may be substituted for the undergraduate levels listed below without additional permissions.

### Required Fundamental Computer Science Courses

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Name</th>

<tr>
<td>or AS.110.212</td>
<td>Honors Linear Algebra</td>
<td></td>
</tr>
</tbody>
</table>

Each math requirement listed above may be satisfied by one of the specific courses listed, or by an equivalent course as determined by CIS advisor.
Required Fundamental Computer Integrated Surgery Courses

- EN.601.455 Computer Integrated Surgery I
- A design course in CIS. Either EN.601.456 Computer Integrated Surgery II or a design course in biomedical engineering, electrical and computer engineering, or mechanical engineering with substantial CIS content approved by the student’s faculty adviser in the CIS minor.

Required Four Other Courses Related to CIS

Students must also complete at least four other courses related to CIS. Of these, AT LEAST ONE must be in EITHER the Imaging Subgroup or the Robotics Subgroup.

Imaging

Graduate Program

Robotics M.S.E. Program

For complete and up-to-date M.S.E. information, visit https://lcsr.jhu.edu/mse.

The Master of Science in Engineering in Robotics (Robotics MSE) program at Johns Hopkins University is designed to advance interdisciplinary robotics knowledge in students coming from a wide variety of engineering, scientific, and mathematical backgrounds.

Johns Hopkins University recognizes the growing need in industry for engineers with the broad multi-disciplinary training and fundamental knowledge needed to develop and deploy advanced robotics systems that function effectively in the real world.

Johns Hopkins University’s broad interdisciplinary approach to robotics research makes it uniquely situated to offer such a comprehensive program. The Laboratory for Computational Sensing and Robotics (LCSR), with its reputation as one of the top robotics research sites in the world, particularly in the area of medical robotics, is pleased to offer this MSE in Robotics.

Program Goals

- To provide students with multi-disciplinary engineering education and training that will enable them to develop and deploy innovative advanced robotics systems that function effectively in real-world applications.
- To develop students’ ability to relate individual technical and design elements to the functioning of complete engineered robotic systems.
- To develop students’ ability to work effectively within and to lead multi-disciplinary teams.
- To provide students with a basis for life-long learning and professional growth.

Application Requirements for the M.S.E. in Robotics degree

- Bachelor’s degree in engineering, science, or math. (Or demonstrated knowledge or accomplishment in these fields)
- Statement of Purpose – in your short statement of purpose please take a couple of sentences to explain/answer the following:
  - Why are you interested in doing an MSE in Robotics? No need to over-think this: it is fine if it is as simple as wanting to get a job in this field!
  - Are you interested in a specific Robotics Track? See the Robotics MSE website for more information on tracks.
- Transcript
- Graduate Record Examination (GRE). Current JHU students may request that this requirement be waived. Such requests will be judged on a case-by-case basis.
- IELTS or TOEFL for international applicants. Please note: while the Robotics program accepts both the TOEFL and the IELTS tests, we strongly prefer the IELTS.
- Three letters of reference
- $75.00 Application fee
- The Office of Graduate Admissions and Enrollment strongly recommends you submit a professional evaluation from one of the recommended resources (more information here http://grad.jhu.edu/apply/international-students/) for any academic work completed outside the USA. At this time, however, LCSR does not require the evaluation for the Robotics MSE application package.

To apply, please fill out the application and submit the required documents here (https://app.applyyourself.com/AYApplicantLogin/fl_ApplicantLogin.asp?id=jhu-grad).

In making its final decisions, the Admissions Committee will consider the combination of professional knowledge, academic excellence, letters of reference, and the statement of purpose, as well as GRE, TOEFL, and IELTS scores of the applicants.

M.S.E. Program Prerequisites

Math and Physics Proficiency Prerequisites

Proficiency in undergraduate mathematics and physics is expected for all M.S.E. students in the robotics program.

This includes proficiency in:

- Multivariable integral and differential calculus;
- Linear algebra;
- Ordinary differential equations;
- Physics – undergraduate calculus-based mechanics, electricity, and magnetism;
• Probability and statistics.

Proficiency will be assumed in the prerequisites for the core courses.

Computing Proficiency Prerequisites

Proficiency in computer programming is expected for all M.S.E. students in the robotics program.

This includes proficiency in:

• Basic numerical methods using existing programming environments;
• The ability to write well-structured and documented programs in a standard programming language such as C++, Java, or MATLAB.

M.S.E. Degree Requirements

All incoming M.S.E. students will be assigned an M.S.E. Academic Advisor.

• Course Requirements:
  • **Course Option:** 10 credit-bearing courses that total at least 30 credit-hours.
  • **Essay Option:** 8 credit-bearing courses that total at least 24 credit-hours and a Master’s Essay supervised by a WSE faculty member who has been approved by the Robotics M.S.E. Curriculum Committee to serve as a faculty advisor.

At least 6 of these courses must be at the graduate level as defined by the offering department/center. All courses counted toward the MSE degree requirements must be at the 400 level or above. Any dual listed courses (i.e. listed at both the 600 and 400 level) must be taken at the 600 level. All courses counting towards the foundation, track, or elective requirements must be for a letter grade (i.e. no pass/fail). Any exceptions must be approved in writing by your academic advisor and the LCSR Education Director. Non-credit and one-credit courses such as the weekly seminar courses offered by LCSR may not count toward this course requirement.

• **Foundation Course Requirements:** Two core courses and a weekly seminar course.

• **Track Course Requirement:** Four courses fulfilling one of the following track requirements (see website for track course listings):
  • Medical Robotics and Computer Integrated Surgical Systems (has special track requirements, please see website)
  • Perception and Cognitive Systems
  • Automation Science and Engineering
  • Control and Dynamical Systems
  • BioRobotics
  • General Robotics

Courses counted toward the track requirement may not be used to satisfy the elective requirement.

• **Elective Course Requirement:** Four courses, or two courses and a M.S.E. Essay, fulfilling the elective requirement. Courses may be any engineering or quantitative (designated E or Q in the course catalog) course, subject to the degree requirement limitations, as approved by the student’s M.S.E. academic adviser. Courses counted toward the elective requirement may not be used to satisfy the track requirements.

• **Academic Ethics:** online tutorial required for all incoming M.S.E. students (EN.500.603)

• AS.360.625 Responsible Conduct of Research (online): Online tutorial required for all incoming MSE students.
• AS.360.625 Responsible Conduct of Research (in-person): may be required for certain research projects. More information: (http://eng.jhu.edu/wse/page/conduct-of-research-training).
• EN.500.601 Research Laboratory Safety: required for all incoming M.S.E. students.

• **Course Grade Requirement:** A grade of D or F or second C+ grade results in probation. A second D or F, or a third C+, C, or C- grade typically results in termination from the program.

• **Transfer Courses:** Standard WSE policy and limitations on M.S.E. transfer credits apply (http://engineering.jhu.edu/graduate-studies/academic-policies-procedures-graduate/). In addition, use of each transfer course toward satisfaction of a specific Robotics M.S.E. degree requirement must be approved in writing by both the student’s faculty advisor and the Robotics M.S.E. Curriculum Committee.

• **Double Counting:** Standard WSE policy and limitations on double counting apply (http://engineering.jhu.edu/graduate-studies/academic-policies-procedures-graduate/).

• **Duration:** Students must complete degree within 5 years from matriculation in the M.S.E. program. An university-approved leave of absence does not count toward this limit.

• **Graduate Research Courses:** No more than one 1-semester or 3 credits of a graduate research course (e.g., EN.530.600 MSE Graduate Research) may be counted toward degree requirements.

• **WSE Engineering for Professionals (EP) Courses** may count toward the M.S.E. degree elective requirements. All EP courses must be approved in writing by the student’s faculty advisor.

• **Residency Requirement:** Minimum residency of two full-time academic semesters at WSE (note that summer and intersession terms do not count toward this requirement).

For complete and up-to-date M.S.E. information, visit https://lcsr.jhu.edu/mse/

Courses

**AS.110.106. Calculus I (Biology and Social Sciences). 4.0 Credits.** Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, applications for systems of linear differential equations, probability distributions. Many applications to the biological and social sciences will be discussed.

Instructor(s): B. Smithling; X. Zheng

Area: Quantitative and Mathematical Sciences.

**AS.110.107. Calculus II (For Biological and Social Science). 4.0 Credits.** Differential and integral Calculus. Includes analytic geometry, functions, limits, integrals and derivatives, introduction to differential equations, functions of several variables, linear systems, applications for systems of linear differential equations, probability distributions. Applications to the biological and social sciences will be discussed, and the courses are designed to meet the needs of students in these disciplines.

Instructor(s): L. Sun

Area: Quantitative and Mathematical Sciences.
AS.110.108. Calculus I. 4.0 Credits.
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor’s theorem and applications, infinite sequences and series. Some applications to the physical sciences and engineering will be discussed, and the courses are designed to meet the needs of students in these disciplines.
Instructor(s): Staff
Area: Quantitative and Mathematical Sciences.

AS.110.109. Calculus II (For Physical Sciences and Engineering). 4.0 Credits.
Differential and integral calculus. Includes analytic geometry, functions, limits, integrals and derivatives, polar coordinates, parametric equations, Taylor’s theorem and applications, infinite sequences and series. Some applications to the physical sciences and engineering will be discussed, and the courses are designed to meet the needs of students in these disciplines.
Instructor(s): W. Wilson
Area: Quantitative and Mathematical Sciences.

AS.110.202. Calculus III. 4.0 Credits.
Calculus of functions of more than one variable: partial derivatives, and applications; multiple integrals, line and surface integrals; Green's Theorem, Stokes' Theorem, and Gauss' Divergence Theorem.
Prerequisites: Grade of C- or better in AS.110.201 OR AS.110.212 OR AS.110.302, or a 5 or better on the AP BC exam.
Instructor(s): X. Zheng
Area: Quantitative and Mathematical Sciences.

AS.110.211. Honors Multivariable Calculus. 4.0 Credits.
This course includes the material in AS.110.202 with some additional applications and theory. Recommended for mathematically able students majoring in physical science, engineering, or especially mathematics. AS.110.211-AS.110.212 used to be an integrated yearlong course, but now the two are independent courses and can be taken in either order.
Prerequisites: Grade of C- or better in AS.110.201 OR AS.110.212
Instructor(s): E. Riehl
Area: Quantitative and Mathematical Sciences.

AS.110.212. Honors Linear Algebra. 4.0 Credits.
This course includes the material in AS.110.201 with additional applications and theory, and is recommended only for mathematically able students majoring in physical science, engineering, or mathematics who are interested in a proof-based version of linear algebra. This course can serve as an Introduction to Proofs (IP) course. Prerequisites: Grade of B+ or better in 110.107 or 110.109 or 110.113, or a 5 on the AP BC exam.
Area: Quantitative and Mathematical Sciences.
Prerequisites: Grade of B+ or better in AS.110.107 or AS.110.109 or AS.110.113 or AS.110.202, or AS.110.302, or a 5 on the AP BC exam.
Instructor(s): W. Wilson
Area: Quantitative and Mathematical Sciences.

EN.500.745. Seminar in Computational Sensing and Robotics. 1.0 Credit.
Seminar series in robotics. Topics include: Medical robotics, including computer-integrated surgical systems and image-guided intervention. Sensor based robotics, including computer vision and biomedical image analysis. Algorithmic robotics, robot control and machine learning. Autonomous robotics for monitoring, exploration and manipulation with applications in home, environmental (land, sea, space), and defense areas. Biorobotics and neuromechanics, including devices, algorithms and approaches to robotics inspired by principles in biomechanics and neuroscience. Human-machine systems, including haptic and visual feedback, human perception, cognition and decision making, and human-machine collaborative systems. Cross-listed Mechanical Engineering, Computer Science, Electrical and Computer Engineering, and Biomedical Engineering.
Instructor(s): L. Whitcomb; P. Kazanzides.

EN.520.353. Control Systems. 3.0 Credits.
Modeling, analysis, and an introduction to design for feedback control systems. Topics include state equation and transfer function representations, stability, performance measures, root locus methods, and frequency response methods (Nyquist, Bode).
Prerequisites: Prereqs: EN.530.343 AND EN.520.214
Instructor(s): E. Mallada Garcia
Area: Engineering.

EN.520.413. Control Systems II. 3.0 Credits.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.;Students may earn credit for EN.520.614 or EN.520.414, but not both.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.414. Image Processing & Analysis. 3.0 Credits.
The course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by humans and computers. Topics include elements of visual perception, sampling and quantization, image transforms, image enhancement, color image processing, image restoration, image segmentation, and multiresolution image representation. Laboratory exercises demonstrate key aspects of the course.
Prerequisites: EN.520.214.;Students may earn credit for EN.520.614 or EN.520.414, but not both.
Instructor(s): J. Goutsias
Area: Engineering.

EN.520.415. Image Process & Analysis II. 3.0 Credits.
This course covers fundamental methods for the processing and analysis of images and describes standard and modern techniques for the understanding of images by morphological image processing and analysis, image representation and description, image recognition and interpretation.
Prerequisites: Students may earn credit for EN.520.615 or EN.520.415, but not both.;EN.520.414
Instructor(s): J. Goutsias
Area: Engineering.
EN.520.427. Product Design Lab. 3.0 Credits.
This project-based course is designed to help students learn how to
turn their ideas into commercial products. In the first half of the course,
emphasis will be placed on the product development process: student
teams will gradually build up a complete "contract book" including
a mission statement, competitive analysis, patent review, product
specifications, system schematics, economic analysis, development
schedule, etc. In the second half of the course, each team will be
expected to implement its design and demonstrate a prototype of their
product's core functionality. At the end of the semester, a final written
report will be submitted in the form of a utility patent. Students are
encouraged to take this course in conjunction with Electronic Design
Lab (ECE 520.448) in the Spring semester and leverage the groundwork
developed here to enable production of a fully functional and marketable
prototype by the end of the academic year.
Instructor(s): I. Gannot; S. Ramesh
Area: Engineering.

EN.520.432. Medical Imaging Systems. 3.0 Credits.
This course provides students with an introduction to the physics,
instrumentation, and signal processing methods used in general
radiography, X-ray computed tomography, ultrasound imaging, magnetic
resonance imaging, and nuclear medicine. The primary focus is on the
methods required to reconstruct images within each modality from
a signals and systems perspective, with emphasis on the resolution,
contrast, and signal-to-noise ratio of the resulting images. Students will
Additionally engage in hands-on activities to reconstruct medical images
from raw data.
Prerequisites: Student may earn credit for EN.520.632 or EN.520.432, but
not both.;EN.580.222 OR EN.520.214
Instructor(s): M. Bell
Area: Engineering.

EN.520.433. Medical Image Analysis. 3.0 Credits.
This course covers the principles and algorithms used in the processing
and analysis of medical images. Topics include, interpolation,
registration, enhancement, feature extraction, classification,
segmentation, quantification, shape analysis, motion estimation,
and visualization. Analysis of both anatomical and functional images will
be studied and images from the most common medical imaging modalities
will be used. Projects and assignments will provide students experience
working with actual medical imaging data.
Prerequisites: EN.550.310 OR EN.550.311 OR EN.560.348
Instructor(s): J. Prince
Area: Engineering.

EN.520.435. Digital Signal Processing. 3.0 Credits.
Methods for processing discrete-time signals. Topics include signal
and system representations, z- transforms, sampling, discrete Fourier
transforms, fast Fourier transforms, digital filters.
Prerequisites: EN.520.214.;Students may receive credit for EN.520.435
or EN.520.635, but not both.
Instructor(s): H. Weinert
Area: Engineering.

EN.520.445. Control Systems Design. 3.0 Credits.
Classical and modern control systems design methods. Topics include
formulation of design specifications, classical design of compensators,
state variable and observer based feedback. Computers are used
extensively for design, and laboratory experiments are included.
Prerequisites: Students may earn credit for EN.520.654 or EN.520.454,
but not both.
Instructor(s): P. Iglesias
Area: Engineering.

EN.520.448. Electronics Design Lab. 3.0 Credits.
An advanced laboratory course in which teams of students design,
build, test and document application specific information processing
microsystems. Semester long projects range from sensors/actuators,
mixed signal electronics, embedded microcomputers, algorithms and
robotics systems design. Demonstration and documentation of projects
are important aspects of the evaluation process. Recommended:
EN.600.333, EN.600.334, EN.520.214, EN.520.216, EN.520.349,
EN.520.372, EN.520.490 or EN.520.491.
Prerequisites: (EN.520.230 OR EN.520.213) AND (AS.110.108 AND
AS.110.109 AND AS.171.101) AND EN.520.142
Instructor(s): P. Julian.

EN.520.454. Control Systems Design. 3.0 Credits.
Classical and modern control systems design methods. Topics include
formulation of design specifications, classical design of compensators,
state variable and observer based feedback. Computers are used
extensively for design, and laboratory experiments are included.
Prerequisites: Students may earn credit for EN.520.654 or EN.520.454,
but not both.
Instructor(s): P. Iglesias
Area: Engineering.

EN.520.483. Bio-Photonics Laboratory. 3.0 Credits.
This laboratory course involves designing a set of basic optical
experiments to characterize and understand the optical properties of
biological materials. The course is designed to introduce students to
the basic optical techniques used in medicine, biology, chemistry and
material sciences.
Prerequisites: Students must have completed Lab Safety training prior to
registering for this class.
Instructor(s): J. Kang; S. Ramesh.

EN.520.491. CAD Design of Digital VLSI Systems I (Juniors/Seniors). 3.0
Credits.
Juniors and Seniors Only.
Prerequisites: Student may take EN.520.491 or EN.520.691, but not
both.;AS.110.109 AND AS.171.102 AND EN.520.142 AND EN.520.142
AND ( EN.520.230 OR ( EN.520.213 AND EN.520.345 )
Instructor(s): R. Etienne Cummings
Area: Engineering.

EN.530.343. Design and Analysis of Dynamical Systems. 3.0 Credits.
Modeling and analysis of damped and undamped, forced and free
vibrations in single and multiple degree-of-freedom linear dynamical
systems. Introduction to stability and control of linear dynamical
systems.
Prerequisites: Prereg: (110.108 and 110.109 and (110.202 or 110.211)
and (550.291) or (110.201 and 110.302) or (110.201 and 110.306)),
and C- or better or concurrent enrollment in 530.202 or 560.202. MechE
Majors must also have taken 530.241; Students must have completed Lab
Safety training prior to registering for this class.
Instructor(s): L. Whitcomb; S. Marra
Area: Engineering.

EN.520.444. Electronics Design Lab. 3.0 Credits.
EN.530.414. Computer-Aided Design. 3.0 Credits.
The course outlines a modern design platform for 3D modeling, analysis, simulation, and manufacturing of mechanical systems using the "Pro/E" package by PTC. The package includes the following components: • Pro/ENGINEER: is the kernel of the design process, spanning the entire product development, from creative concept through detailed product definition to serviceability. • Pro/MECHANICA: is the main analysis and simulation component for kinematic, dynamic, structural, thermal and durability performance. • Pro/NC: is a numeric-control manufacturing package. This component provides NC programming capabilities and tool libraries. It creates programs for a large variety of CNC machine tools.
Instructor(s): D. Stoianovici
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4.0 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): D. Kraemer; N. Cowan
Area: Engineering.

EN.530.421. Mechatronics. 3.0 Credits.
Students from various engineering disciplines are divided into groups of two to three students. These groups each develop a microprocessor-controlled electromechanical device, such as a mobile robot. The devices compete against each other in a final design competition. Topics for competition vary from year to year. Class instruction includes fundamentals of mechanism kinematics, creativity in the design process, an overview of motors and sensors, and interfacing and programming microprocessors.
Prerequisites: EN.530.420 or EN.520.240 or permission of instructor; Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): C. Rizk
Area: Engineering.

EN.530.424. Dynamics of Robots and Spacecraft. 3.0 Credits.
An introduction to Lagrangian mechanics with application to robot and spacecraft dynamics and control. Topics include rigid body kinematics, efficient formulation of equations of motion, stability theory, and Hamilton's principle.
Instructor(s): G. Chirikjian; J. Kim
Area: Engineering.

EN.530.420. Robot Sensors/Actuators. 4.0 Credits.
Introduction to modeling and use of actuators and sensors in mechatronic design. Topics include electric motors, solenoids, micro-actuators, position sensors, and proximity sensors.
Prerequisites: Students must have completed Lab Safety training prior to registering for this class. To access the tutorial, login to myLearning and enter 458083 in the Search box to locate the appropriate module.; ((AS.171.101 AND AS.171.102) OR (AS.171.107 AND AS.171.108) OR (EN.530.103 AND EN.530.104) OR (EN.530.123 AND EN.530.124)) AND (AS.110.106 OR AS.110.108) AND AS.110.109 AND (AS.110.202 OR AS.110.211) AND (EN.530.291 OR AS.110.302) AND (EN.530.241 OR EN.520.230 OR (EN.520.132 AND EN.520.345))
Instructor(s): D. Kraemer; N. Cowan
Area: Engineering.

EN.530.495. Microfabrication Laboratory. 4.0 Credits.
This laboratory course is an introduction to the principles of microfabrication for microelectronics, sensors, MEMS, and other synthetic microsystems that have applications in medicine and biology. Course comprises of laboratory work and accompanying lectures that cover silicon oxidation, aluminum evaporation, photoresist deposition, photolithography, plating, etching, packaging, design and analysis CAD tools, and foundry services. Seniors only or Permission Required.
Instructor(s): J. Wang
Area: Engineering, Natural Sciences.

EN.530.646. Robot Devices, Kinematics, Dynamics, and Control. 4.0 Credits.
Graduate-level introduction to the mechanics of robotic systems with emphasis on the mathematical tools for kinematics and dynamics of robot arms and mobile robots. Topics include the geometry and mathematical representation of rigid body motion, forward and inverse kinematics of articulated mechanical arms, trajectory generation, manipulator dynamics, actuation, and design issues, manipulator control, and additional special topics. Recommended course background: multivariable integral and differential calculus, classical physics, linear algebra, ordinary differential equations. Programming: Knowledge of the Matlab programming language including data input/output, 1-D and 2-D arrays, and user-defined function calls. Students with experience with these language elements in other programming languages (C, C++, Python, Java, etc.) should be able to self-tutor themselves in the Matlab language as part of the programming exercises.
Instructor(s): J. Kim

EN.530.653. Advanced Systems Modeling. 3.0 Credits.
This course covers the following topics at an advanced level: Newton's laws and kinematics of systems of particles and rigid bodies; Lagrange's equations for single- and multi-degree-of-freedom systems composed of point masses; normal mode analysis and forced linear systems with damping, the matrix exponential and stability theory for linear systems; nonlinear equations of motion: structure, passivity, PD control, noise models and stochastic equations of motion; manipulator dynamics: Newton-Euler formulation, Lagrange, Kane's formulation of dynamics, computing torques with O(n) recursive manipulator dynamics: Luh-Walker-Paul, Hollerbach, O(n) dynamic simulation: Rodrigues-Jain-Kreutz, Saha, Fixman. There is also an individual course project that each student must do which related the topics of this course to his or her research.
Instructor(s): G. Chirikjian.
EN.530.661. Applied Mathematics for Engineering. 3.0 Credits.
This course presents a broad survey of the basic mathematical methods used in the solution of ordinary and partial differential equations: linear algebra, vector calculus, power series, Fourier series, separation of variables, integral transforms.
Instructor(s): M. HilPERT.

EN.530.767. Locomotion II: Dynamics. 3.0 Credits.
Graduate course on mechanics and control in locomotion. Topics include modeling (e.g. Lagrangian mechanics), dynamical systems theory (nonholonomic systems, limit-cycle behavior, Poincaré analysis, and Floquet theory), design (control synthesis, mechanical design), and data-driven modeling from animal locomotor control experiments.
Prerequisites: A graduate course in linear systems theory (e.g. EN.520.601). Suggested background (not required): 530.475/675.
Instructor(s): N. Cowan.

EN.580.471. Principles of Design of BME Instrumentation. 4.0 Credits.
This core design course will cover lectures and hands-on labs. The material covered will include fundamentals of biomedical sensors and instrumentation, FDA regulations, designing with electronics, biopotentials and ECG amplifier design, recording from heart, muscle, brain, etc., diagnostic and therapeutic devices (including pacemakers and defibrillators), applications in prosthetics and rehabilitation, and safety. The course includes extensive laboratory work involving circuits, electronics, sensor design and interface, and building complete biomedical instrumentation. The students will also carry out design challenge projects, individually or in teams (examples include “smart cane for blind,” “computer interface for quadriplegic”). Students satisfying the design requirement must also register for EN.580.571. Lab Fee: $150. Recommended Course Background: EN.520.345
Prerequisites: Students must have completed Lab Safety training prior to registering for this class.
Instructor(s): N. Thakor
Area: Engineering, Natural Sciences.

EN.553.493. Mathematical Image Analysis. 3.0 Credits.
This course gives an overview of various mathematical methods related to several problems encountered in image processing and analysis, and presents numerical schemes to address them. It will focus on problems like image denoising and deblurring, contrast enhancement, segmentation and registration. The different mathematical concepts shall be introduced during the course; they include in particular functional spaces such as Sobolev and BV, Fourier and wavelet transforms, as well as some notions from convex optimization and numerical analysis. Most of such methods will be illustrated with algorithms and simulations on discrete images, using MATLAB. Prerequisites: linear algebra, multivariate calculus, basic programming in MATLAB. Recommended Course Background: Real analysis
Prerequisites: (AS.110.202 OR AS.110.211 ) AND (EN.550.291 OR AS.110.201 OR AS.110.212 );Students may receive credit for EN.550.493/EN.553.493 or EN.553.693, but not both.
Instructor(s): P. Escande
Area: Engineering, Quantitative and Mathematical Sciences.

EN.530.676. Nonlinear Optimization II. 3.0 Credits.
This course considers algorithms for solving various nonlinear optimization problems and, in parallel, develops the supporting theory. The primary focus will be on constrained optimization problems. Topics for the course will include: necessary and sufficient optimality conditions for constrained optimization; projected-gradient and two-phase accelerated subspace methods for bound-constrained optimization; simplex and interior-point methods for linear programming; duality theory; and penalty, augmented Lagrangian, sequential quadratic programming, and interior-point methods for general nonlinear programming. In addition, we will consider the Alternating Direction Method of Multipliers (ADMM), which is applicable to a huge range of problems including sparse inverse covariance estimation, consensus, and compressed sensing. Recommended Course Background: Multivariable Calculus, Linear Algebra, Real Analysis such as AS.110.405.
Instructor(s): D. Robinson.

EN.580.472. Medical Imaging Systems. 3.0 Credits.
An introduction to the physics, instrumentation, and signal processing methods used in general radiography, X-ray computed tomography, ultrasound imaging, magnetic resonance imaging, and nuclear medicine. The primary focus is on the methods required to reconstruct images within each modality, with emphasis on the resolution, contrast, and signal-to-noise ratio of the resulting images. Cross-listed with Neuroscience and Electrical and Computer Engineering (EN.520.432).
Prerequisites: EN.580.222 OR EN.520.214
Instructor(s): M. Bell
Area: Engineering.

EN.601.464. Artificial Intelligence. 3.0 Credits.
The class is recommended for all scientists and engineers with a genuine curiosity about the fundamental obstacles to getting machines to perform tasks such as learning, planning and prediction. Materials will be primarily based on the popular textbook, Artificial Intelligence: A Modern Approach. Strong programming skills are expected, as well as basic familiarity with probability. For students intending to also take courses in Machine Learning (e.g., 601.475/675, 601.476/676), they may find it beneficial to take this course first, or concurrently. [Applications]
Prerequisites: EN.600.226;Students may receive credit for only one of EN.600.335, EN.600.435, EN.601.464, EN.601.664.
Instructor(s): B. Van Durme
Area: Engineering.
EN.601.220. Intermediate Programming. 4.0 Credits.
This course teaches intermediate to advanced programming, using C and C++. (Prior knowledge of these languages is not expected.) We will cover low-level programming techniques, as well as object-oriented class design, and the use of class libraries. Specific topics include pointers, dynamic memory allocation, polymorphism, overloading, inheritance, templates, collections, exceptions, and others as time permits. Students are expected to learn syntax and some language specific features independently. Course work involves significant programming projects in both languages.
Prerequisites: AP Computer Science, or C+ or better in EN.600.107/EN.601.107 OR EN.580.200 OR EN.600.112.
Instructor(s): J. Selinski; M. Darvish Darab; S. More
Area: Engineering.

EN.601.226. Data Structures. 4.0 Credits.
This course covers the design and implementation of data structures including arrays, stacks, queues, linked lists, binary trees, heaps, balanced trees (e.g. 2-3 trees, AVL-trees) and graphs. Other topics include sorting, hashing, memory allocation, and garbage collection. Course work involves both written homework and Java programming assignments.
Prerequisites: EN.600.120 OR EN.601.220 OR EN.600.107 OR EN.601.107 or equivalent with C+ or better grades.
Instructor(s): M. Schatz
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.455. Computer Integrated Surgery I. 4.0 Credits.
This course focuses on computer-based techniques, systems, and applications exploiting quantitative information from medical images and sensors to assist clinicians in all phases of treatment from diagnosis to preoperative planning, execution, and follow-up. It emphasizes the relationship between problem definition, computer-based technology, and clinical application and includes a number of guest lectures given by surgeons and other experts on requirements and opportunities in particular clinical areas. Recommended Course Background: EN.601.220, EN.601.457, EN.601.461, image processing.
Prerequisites: EN.600.226 AND (AS.110.201 OR AS.110.212) or permission of the instructor; Students may receive credit for only one of EN.600.445, EN.600.645, EN.601.455, EN.601.655.
Instructor(s): R. Taylor
Area: Engineering.

EN.601.456. Computer Integrated Surgery II. 3.0 Credits.
This weekly lecture/seminar course addresses similar material to EN.601.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and provide critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.601.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452.
Prerequisites: EN.600.445 or EN.600.645 or permission; Students may receive credit for only one of EN.600.446, EN.600.646, EN.601.456, EN.601.656.
Instructor(s): R. Taylor
Area: Engineering.

EN.601.461. Computer Vision. 3.0 Credits.
This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included.
Prerequisites: intro programming, linear algebra, and prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.361, EN.600.461, EN.600.661, EN.601.461, EN.601.661.
Area: Engineering, Quantitative and Mathematical Sciences.

EN.601.475. Machine Learning. 3.0 Credits.
Machine learning is subfield of computer science and artificial intelligence, whose goal is to develop computational systems, methods, and algorithms that can learn from data to improve their performance. This course introduces the foundational concepts of modern Machine Learning, including core principles, popular algorithms and modeling platforms. This will include both supervised learning, which includes popular algorithms like SVMs, logistic regression, boosting and deep learning, as well as unsupervised learning frameworks, which include Expectation Maximization and graphical models. Homework assignments include a heavy programming components, requiring students to implement several machine learning algorithms in a common learning framework. Additionally, analytical homework questions will explore various machine learning concepts, building on the pre-requisites that include probability, linear algebra, multi-variate calculus and basic optimization. Students in the course will develop a learning system for a final project.
Prerequisites: EN.600.107 OR EN.601.107 OR EN.600.120 OR EN.601.220 OR EN.600.226/EN.601.226 OR EN.580.200 OR EN.500.200 OR AS.250.205 OR EN.601.107 OR EN.500.112 OR AP Computer Science; Students may receive credit for only one of EN.600.475, EN.601.475, EN.601.675.
Instructor(s): M. Dredze
Area: Engineering.

EN.601.763. Algorithms for Sensor-Based Robotics. 3.0 Credits.
Similar material as EN.601.463 and EN.601.663, covered in more depth. [Applications] Recommended course background: EN.601.226, AS.110.106, probability and statistics.
Prerequisites: Students may only earn credit for one of the following: EN.600.336, EN.600.436/EN.601.463, EN.600.663, or EN.600.636/EN.601.763.
Instructor(s): S. Leonard.
EN.601.656. Computer Integrated Surgery II. 3.0 Credits.
Same material as EN.601.456, for graduate students. This weekly lecture/seminar course addresses similar material to EN.601.445, but covers selected topics in greater depth. In addition to material covered in lectures/seminars by the instructor and other faculty, students are expected to read and prepare critical analysis/presentations of selected papers in recitation sessions. Students taking this course are required to undertake and report on a significant term project under the supervision of the instructor and clinical end users. Typically, this project is an extension of the term project from EN.601.445, although it does not have to be. Grades are based both on the project and on classroom recitations. Students wishing to attend the weekly lectures as a 1-credit seminar should sign up for EN.600.452. [Applications]
Prerequisites: EN.600.445 OR EN.600.645 OR PERMISSION OF INSTRUCTOR; Students may receive credit for only one of EN.600.446, EN.600.646, EN.601.456, EN.601.656.
Instructor(s): R. Taylor.

EN.601.760. FFT in Graphics & Vision. 3.0 Credits.
In this course, we will study the Fourier Transform from the perspective of representation theory. We will begin by considering the standard transform defined by the commutative group of rotations in 2D and translations in two- and three-dimensions, and will proceed to the Fourier Transform of the non-commutative group of 3D rotations. Subjects covered will include correlation of images, shape matching, computation of invariants, and symmetry detection. Recommended Course Background: AS.110.201 and comfort with mathematical derivations.
Instructor(s): M. Kazhdan.

EN.601.661. Computer Vision. 3.0 Credits.
Same material as 601.461, for graduate students. Students may receive credit for at most one of 601.461/661/761. This course gives an overview of fundamental methods in computer vision from a computational perspective. Methods studied include: camera systems and their modeling, computation of 3-D geometry from binocular stereo, motion, and photometric stereo; and object recognition. Edge detection and color perception are covered as well. Elements of machine vision and biological vision are also included. [Applications] Recommended Course Background: intro programming, linear algebra, prob/stat.
Prerequisites: Students may receive credit for only one of EN.600.361, EN.600.461, EN.600.661, EN.601.461, EN.601.661.
Instructor(s): H. Ali
Area: Engineering.

EN.601.463. Algorithms for Sensor-Based Robotics. 3.0 Credits.
This course surveys the development of robotic systems for navigating in an environment from an algorithmic perspective. It will cover basic kinematics, configuration space concepts, motion planning, and localization and mapping. It will describe these concepts in the context of the ROS software system, and will present examples relevant to mobile platforms, manipulation, robotics surgery, and human-machine systems. [Analysis]
Prerequisites: EN.600.226 OR EN.601.226 and Linear Algebra and Probability; Students may receive credit for only one of EN.600.336, EN.600.436, EN.600.636, EN.601.463, EN.601.663.
Instructor(s): S. Leonard
Area: Engineering.

For current faculty and contact information go to https://www.lcsr.jhu.edu/Faculty

Faculty
Professors
Gregory Chirikjian

Noah Cowan
Professor (Mechanical Engineering): Robotics, Neuroscience, Dynamics, Controls, & Locomotion. Courses: System Identification; Robot Devices, Kinematics, Dynamics, and Control; Physics and Feedback in Living Systems; Locomotion in Mechanical and Biological Systems; Linear Systems.
Ralph Etienne-Cummings
Professor (Electrical and Computer Engineering): Neuromorphic Computational Sensing and Integrated Microsystems; Courses: CAD Design of Digital VLSI Systems, Electronics Design Laboratory, Seminar on Large Scale Analog Computation.
Gregory Hager
Professor (Computer Science): Computer Vision, Human-Machine Systems, Medical Applications; Courses: Data Structures, Computer Vision, Sensor-Based Robotics.

Jerry Prince
Professor (Electrical and Computer Engineering): Medical Imaging and Computer Vision; Courses: Medical Imaging Systems.

Russell Taylor
Professor (Computer Science): Medical Robotics and Computer-Integrated Interventional Systems, Medical Imaging and Modeling; Courses: Computer Integrated Surgery I & II.

Rene Vidal
Professor (Biomedical Engineering): Biomedical Imaging, Computer Vision and Machine Intelligence; Courses: Advanced Topics in Computer Vision, Advanced Topics in Machine Learning.

Louis Whitcomb

Associate Professor
Dennice Gayme

Assistant Professors
Jeremy Brown
Assistant Professor (Mechanical Engineering): Haptic feedback, upper-limb prosthetics, surgical robotics, rehabilitation robotics, human-machine interaction; Courses: Haptic Interface Design for Human-Robot Interaction.

Muyinatu (Bisi) Bell
Assistant Professor (Electrical and Computer Engineering): Medical Imaging, Medical Robotics, Image-Guided Surgery; Courses: Introduction to Medical Imaging, Ultrasound and Photoacoustic Beamforming.

Emad Boctor
Assistant Professor (Radiology): Image-Guided Intervention Ultrasound Imaging.

Chien-Ming Huang

Marin Kobilarov
Assistant Professor (Mechanical Engineering): Computational Dynamical Systems, Robot Control and Motion Planning; Courses: Applied Optimal Control, Nonlinear Control and Planning in Robotics.

Chen Li
Assistant Professor (Mechanical Engineering): Terradynamics, Locomotion, Comparative Biomechanics, Bio-Robotics, Robophysics; Courses: Locomotion I: Mechanics, Comparative BioMechanics.

Enrique Mallada
Assistant Professor (Electrical and Computer Engineering): Networked Dynamical Systems, Power Systems, Control Theory, Optimization; Courses: Networked Dynamical Systems.

Research Professor
Peter Kazanzides
Research Professor (Computer Science): Medical Robotics; Space Robots; Software Systems and Architectures; Robot Control Systems, Augmented Reality.

Nassir Navab

Associate Research Professor
Mehran Armand
Associate Research Professor (Mechanical Engineering) and Principal Staff (JHUAPL): Medical Robotics and Computer-Integrated Interventional Systems, Biomechanics; Courses: Kinematics and Dynamics of Robots, Robot Control.

Iulian Iordachita
Associate Research Professor (Mechanical Engineering): Medical Robotics; Mechanical Design, Medical Instrumentation, Sensorized Surgical Tools.

Assistant Research Professor
Simon Leonard

Multi-School Programs of Study
At Johns Hopkins University, some programs are offered through a partnership between two or more of the University’s nine schools.

Space Science and Engineering
This minor is open to all students in the Whiting School of Engineering and the Krieger School of Arts and Sciences who have the prerequisites for the required courses. The objective of the Minor is to prepare students for a career in Space Science and Space Engineering, either directly as an entering professional in industry, government laboratories and other organizations or as a student in a graduate program. The educational goal of the Minor is to enable students to:

• Apply their understanding and mastery of the fundamental scientific, engineering, and mathematical principles obtained through their major subject of study to space science and space engineering.
• Develop an understanding and capacity for interdisciplinary approaches to technical activities.
• Improve their ability to work in multidisciplinary teams, which are typical in space and other complex technical activities, through interdisciplinary education and internship(s) or equivalent experience(s).

Minor in Space Science and Engineering
Requirements for the Minor:

• A Proposal and Course Plan, which must be approved by your adviser for the minor (hereafter referred to as the “Adviser”). The proposal must discuss a theme that unites the individual elements of the program (courses and internship(s)) into an intellectual whole.
• Five courses in Science and Engineering. One course is specified (AS.171.321 Introduction to Space, Science, and Technology) and the remaining four are chosen through your Proposal and Course Plan, which must be approved prior to taking the courses by the Adviser. All courses must be taken for a grade rather than satisfactory/unsatisfactory. A grade of C- or better is required. Courses that are named as requirements for the student’s major may not be used. However, courses that are not named, but satisfy an elective requirement for the major, may be used.
• An internship or equivalent experience in the field of space science and engineering is required. This must have prior approval from the Adviser.
• A brief report on the internship or equivalent experience to the Adviser.

For a detailed explanation of the minor and its requirements, including sample programs of study, please visit the Student Handbook for the Minor in Space Science and Engineering (http://spacestudies.jhu.edu/space-minor).

Business
The Business Minor is a joint program offered by The Whiting School of Engineering, through the Center for Leadership and Education, the Carey Business School and the Krieger School of Arts and Sciences, through the Center of Financial Economics, to Johns Hopkins undergraduates in the KSAS, WSE and Peabody Institute. The minor offers Johns Hopkins Arts & Sciences, Engineering, and Peabody students a focused, quantitative minor that will prepare them more effectively for careers in small companies, major corporations, and consultancies as well as acceptance into graduate programs in accountancy and business.

The primary objective for the minor is to help students position themselves as leaders among their peers in the private sector,
government, the non-profit sector, and the world of social enterprises. At the conclusion of their program, successful students will be able to:

- Enter a variety of careers such as finance, management, real estate, marketing, accounting and consulting.
- Create, analyze, and implement value propositions about projects and products for the benefit of various audiences, from shareholders to local communities.
- Establish and manage brands and products and also institutions and organizations.
- Build, manage and grow valuable and lasting relationships with clients, customers, shareholders, creditors, and local communities.
- Recognize, understand, capitalize on, and generate changing trends in local and global economies.
- Be responsible business leaders who are engaged citizens of their communities, cities and countries.

The joint program plans to achieve its goal of training future leaders by offering an instructional program that combines critical analysis and theoretical grounding in a broad set of core and required courses, some depth through a relevant elective chosen from a list of courses in specialized topics, and hands-on experience through internships, community-based learning, and experiential programs.

Students pursuing a CLE minor who wish to add the Business Minor must take at least three unique courses in the Business Minor that may not be applied to any other CLE minor. Students pursuing a CLE minor who wish to add the Business Minor must take at least three unique courses in the Business Minor that may not be applied to any other CLE minor.

See the Undergraduate tab above for specific requirements for the minor.

**Business Minor Requirements**

- Two foundational courses
- Five core courses
- One elective

Students pursuing a CLE minor who wish to add the Business Minor must take at least three unique courses in the Business Minor that may not be applied to any other CLE minor.

**Foundational Courses:**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.661.380</td>
<td>Business Analytics (*Statistics)</td>
<td>3</td>
</tr>
<tr>
<td>EN.660.105</td>
<td>Introduction to Business</td>
<td>3</td>
</tr>
<tr>
<td>or AS.180.102</td>
<td>Elements of Microeconomics</td>
<td>3-4</td>
</tr>
</tbody>
</table>

*Students are encouraged to fulfill the Business Analytics requirement but will be allowed to substitute statistics course(s) by choosing one of the two options listed below. Students can substitute AP Statistics for Stat I but not Stat II

**Students cannot substitute AP Economics for Microeconomics**

**Option 1:**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.553.111</td>
<td>Statistical Analysis I</td>
<td>4</td>
</tr>
<tr>
<td>or AS.230.205</td>
<td>Introduction to Social Statistics</td>
<td></td>
</tr>
<tr>
<td>or AS.280.345</td>
<td>Public Health Biostatistics</td>
<td></td>
</tr>
<tr>
<td>EN.553.112</td>
<td>Statistical Analysis II</td>
<td>4</td>
</tr>
</tbody>
</table>

**Option 2:**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.540.305</td>
<td>Modeling and Statistical Analysis of Data for Chemical and Biomolecular Engineers</td>
<td>3-4</td>
</tr>
</tbody>
</table>

or EN.553.211 Probability and Statistics for the Life Sciences
or EN.553.310 Probability & Statistics
or EN.553.430 Introduction to Statistics
or EN.560.348 Probability & Statistics in Civil Engineering

**Required Core Courses:**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Course Title</th>
<th>Credits</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN.660.203</td>
<td>Financial Accounting</td>
<td>3</td>
</tr>
<tr>
<td>EN.660.250</td>
<td>Principles Of Marketing</td>
<td>3</td>
</tr>
<tr>
<td>EN.660.200</td>
<td>Principles of Finance</td>
<td>3</td>
</tr>
<tr>
<td>EN.660.340</td>
<td>Principles of Management</td>
<td>3</td>
</tr>
<tr>
<td>EN.660.343</td>
<td>Operations and Service Management</td>
<td>3</td>
</tr>
</tbody>
</table>

**Electives:**

As the Business Minor is under construction, electives are still being developed. Electives offered by the Center for Leadership Education and Economics Department are courses that have been previously offered in other programs; courses from Carey Business School will be decided upon at a later date. Stay up to date by visiting the Center for Leadership Education's website (https://engineering.jhu.edu/cle).

**Course and Grade Rules and Limitations**

The Business minor requires a minimum of 24 credits. A maximum of 6 credits of courses taken from outside WSE and KSAS (including transfer course & study abroad) may be applied to the Business minor.

A maximum of 3 credits may be taken on an S/U basis, after freshman Fall semester. All courses applied to the Business minor must be completed with a grade of C- or above.

**Peabody Double Degree**

The Peabody Conservatory and the Homewood schools offer the opportunity for a select number of academically and musically advanced students to simultaneously pursue a Bachelor of Music degree and either a Bachelor of Arts or Bachelor of Science degree from the Krieger School of Arts and Sciences or the Whiting School of Engineering.

Students must be admitted independently to Peabody by way of audition, and also to one of the Homewood schools to be invited to participate in the Double Degree Program. Audition standards for Peabody Double Degree students are the same as for all students auditioning for the conservatory. The Double Degree program takes a minimum of five years to complete. Students who have begun their junior year of study are not eligible to enter the Double Degree Program, nor may students transfer into the program midyear.

Administrative services such as registration, financial aid, and student health benefits are provided to Double Degree students by the Homewood schools. Consequently, students in the Double Degree Program are not eligible to receive Peabody merit scholarships or any other form of financial aid from Peabody.

**Student Status**

Students in the double degree program are responsible for meeting the requirements of both degree curricula within the published guidelines of the relevant programs. Students’ principal affiliation is with the Krieger School of Arts and Science or the Whiting School of Engineering. All official procedures of registration and records are managed through the Homewood Office of the Registrar. The official transcript for a double
degree student, including all courses at both Peabody and Homewood, is maintained by the Homewood Office of the Registrar.

**Enrollment requirements and limits**
Double Degree students must enroll in private lessons each semester. Instrumental majors are required to enroll each semester for large ensembles and private lessons to maintain their status as Peabody degree candidates in the Double Degree Program. Double Degree students must register for no less than one course at Homewood each semester. Peabody Double Degree students are permitted to enroll in a maximum of 23 credits per semester.

**Residency Requirement for Peabody Double Degree Students**
Peabody Double Degree students must complete at least 48 credits on the Homewood campus, in the Krieger School of Arts & Sciences and/or the Whiting School of Engineering.

**Course changes and withdrawals from Peabody courses**
Students must follow the deadlines and processes for adding, dropping or withdrawing from Peabody courses which are published on the Peabody Academic Affairs website at https://peabody.jhu.edu/academics/academic-calendar-resources/.

**Course changes and withdrawals from Arts and Sciences and Engineering courses**
Students must follow the deadlines and processes for adding, dropping or withdrawing from Arts & Sciences and/or Engineering courses which are published on the Homewood Registrar's Office website at https://studentaffairs.jhu.edu/registrar/students/registration/.

**Leave of Absence**
Double Degree students may request a Leave of Absence (LOA) from the entire program, however, they cannot be granted leave from only one portion of the program. A LOA for Double Degree students is subject to the guidelines of the student's respective academic advising office on the Homewood campus.

**Graduation Policies**
Double Degree students must petition to graduate from the Peabody Conservatory in accordance with information located at https://peabody.jhu.edu/academics/academic-calendar-resources/registrar/, and also adhere to the policies and procedures for applying to graduate from their Homewood school, Arts and Sciences or Engineering as indicated at http://e-catalog.jhu.edu/undergrad-students/academic-policies/graduation-policies/. Both degrees are awarded simultaneously, and degree conferral is available only in May of each academic year.
FACULTY LISTINGS

Select the school faculty tab to view a listing of Johns Hopkins University faculty on the Homewood campus in the Schools of Arts and Sciences and Engineering.

For the most current listing of faculty, please visit individual department pages.

Zanvyl Krieger School of Arts and Sciences

In listing the members of the teaching staff of the School of Arts and Sciences, the date in parentheses indicates the year of original appointment. Joint appointments or directorships are listed last.

Richard Bett (1991)
Professor, Philosophy, Classics
B.A. 1980, University of Oxford
Ph.D. 1986, University of California

Emanuele Berti (2017)
Professor, Physics and Astronomy
Laurea 1998 | Ph.D. 2002, University of Rome, La Sapienza

Luciana Bianchi (2006)
Research Professor, Physics and Astronomy
Ph.D. 1978, University of Padua

Wayne Biddle (1999)
Visiting Associate Professor, The Writing Seminars
B.S. 1970 | M.F.A. 1975, Cornell University

William Blair (1993)
Research Professor, Physics and Astronomy
B.A. 1975, Olivet College
M.S. 1977 | Ph.D. 1981, University of Michigan, Ann Arbor

Justin Bledin (2013)
Assistant Professor, Philosophy
M.Sc. 2006, London School of Economics
Ph.D. 2013, University of California, Berkeley

Barry Blumenfeld (1981)
Professor, Physics and Astronomy
B.S. 1968, Massachusetts Institute of Technology

Kristen Bohn (2014)
Assistant Research Professor, Psychological and Brain Sciences
B.S. 1994, University of California, San Diego
M.S. 1999, Idaho State University
Ph.D. 2005, University of Maryland, College Park

Hilary Bok (2000)
Henry R. Luce Associate Professor of Bioethics and Moral Political Theory, Philosophy
B.A. 1981, Princeton University
Ph.D. 1991, Harvard University

John Boland (2005)
Research Professor, Earth and Planetary Sciences

Alex Bortvin (2004)
Adjunct Assistant Professor, Biology; Carnegie Institution

Kit H. Bowen (1980)
E. Emmet Reid Professor of Chemistry
B.S. 1970, University of Mississippi
Ph.D. 1978, Harvard University

Gregory Bowman (2005)
Associate Professor; Biophysics; Biology
B.S. 1994, University of North Carolina
Ph.D. 2001, Princeton University

Arthur Bragg (2010)
Associate Professor, Chemistry
B.A. 1999, Albion College
Ph.D. 2004, University of California, Berkeley

Philip Brendese (2013)
Assistant Professor, Political Science
B.A. 1998, Siena College
M.A. 2000, University of Albany
Ph.D. 2005, Duke University

Nathan Bridges (2014)
Associate Research Professor, Earth and Planetary Sciences
B.A. 1989, University of Colorado, Boulder
M.S. 1992, Arizona State University
Ph.D. 1997, University of Massachusetts, Amherst

Collin Broholm (1990)
Professor, Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
M.Sc. 1985 | Ph.D. 1986, University of Copenhagen

Jeffrey P. Brooks (1990)
Professor, History
B.A. 1965, Antioch University
Ph.D. 1972, Stanford University

Donald D. Brown (1969)
Adjunct Professor; Biology; Carnegie Institution

Rebecca Brown (2008)
Associate Professor; History of Art
B.A. 1993, Pomona College
M.A. 1995 | Ph.D. 1999, University of Minnesota

Betsy Bryan (1986)
Vice Dean, Humanities and Social Sciences
Alexander Badawy
Professor of Egyptian Art and Archaeology, Near Eastern Studies
Professor; History of Art
B.A. 1971, Mary Washington College
M.A. 1975 | M.Phil. 1976 | Ph.D. 1980, Yale University

Tamas Budavari (2011)
Associate Research Professor, Physics and Astronomy

Maria Bulzacchelli (2016)
Director and Assistant Research Professor, Program in Public Health Studies
A.B. 1995, Bowdoin College
Ph.D. 2007, The Johns Hopkins University

Julia Burdick-Will (2014)
Assistant Professor, Sociology

Shane Butler (2015)
Professor and Chair, Classics
B.A. 1992, Duke University

Ryan Calder (2014)
Assistant Professor, Sociology
B.A. 2001, Harvard University
M.A. 2008 | Ph.D. 2014, University of California, Berkeley

Stephen Campbell (2002)
Henry M. and Elizabeth P. Wiesenfeld Professor, History of Art
B.A. 1985, Trinity College
M.A. 1988, University of North Carolina
Ph.D. 1993, The Johns Hopkins University

Christopher Cannon (2017)
Bloomberg Distinguished Professor, English and Philosophy

Adjunct Assistant Professor, Physics and Astronomy

Christopher Carroll (1995)
Professor, Economics
B.A. 1986, Harvard University
Ph.D. 1990, Massachusetts Institute of Technology

Sara Castro-Klarén (1987)
Professor, German and Romance Languages and Literatures
B.A. 1962 | M.A. 1965 | Ph.D. 1968, University of California, Los Angeles

Samuel Chambers (2008)
Professor, Political Science
B.A. 1993, Pomona College
M.A. 1994, Vanderbilt University
Ph.D. 1998, University of Minnesota

Xin Chen (2008)
Associate Professor, Biology
B.S. 1996, University of Science and Technology, Hefei, China
Ph.D. 2002, University of Texas

Ying Chen (2013)
Assistant Professor, Economics
B.A. 1999, Beijing University
M.A. 2000 | M.Phil. 2001 | Ph.D. 2005, Yale University

Janice Chen (2017) Assistant Professor, Psychological and Brain Sciences
B.S. 2002, Massachusetts Institute of Technology
Ph.D. 2011, Stanford University

Xin Chen (2014)
Associate Professor, Biology
B.S. 1996 | Ph.D. 2001, University of Texas, Austin

Lan Cheng (2016)
Assistant Professor, Chemistry
B.S. 2001, Tsinghua University
Ph.D. 2009, Peking University

Andrew J. Cherlin (1976)
Professor and Chair, Sociology; Institute for Policy Studies
Public Policy Program
Benjamin H. Griswold III Professor of Public Policy
B.S. 1970, Yale University
M.S. 1974 | Ph.D. 1976, University of California, Los Angeles

Chia-Ling Chien (1976)
Professor, Physics and Astronomy
Jacob L. Hain Professor in Arts and Sciences
B.S. 1965 | M.S. 1968, Tunghai University
Ph.D. 1973, Carnegie Mellon

Associate Professor, Political Science
B.A. 1991, University of California
M.A. 1994, University of Washington
Ph.D. 2003, Northwestern University

Orna Cohen-Fix (2012)
Adjunct Professor, Biology
B.A. 1986, Tel-Aviv University
M.S. 1989 | Ph.D. 1994, Weizmann Institute of Science

Jaime Combariza (2014)
Associate Research Professor, Chemistry
Director, Maryland Advanced Research Computing Center
B.S. 1979, Universidad Pedagógica y Tecnológica de Colombia
Ph.D. 1988, Southern Illinois University at Carbondale

Nathan Connolly (2008)
Herbert Baxter Adams Associate Professor, History
B.A. 1999 Thomas University
M.A. 2000, University of Chicago
M.A. 2004 | Ph.D. 2008, University of Michigan

William E. Connolly (1985)
Professor, Political Science
Krieger-Eisenhower Professor
B.A. 1960, University of Michigan, Flint
M.A. 1962 | Ph.D. 1965, University of Michigan, Ann Arbor

Caterina Consani (2005)
Professor, Mathematics
B.S. 1986, University of Genoa
Ph.D. 1993, Universities of Genoa-Turin
Ph.D. 1996, University of Chicago

Victor Corces (2009)
Adjunct Professor, Biology
B.A. 1975, Universidad Complutense de Madrid
Ph.D. 1978, Universidad Autonoma de Madrid

Susan Courtney (1999)
Professor, Psychological and Brain Sciences
B.A. 1988, Williams College, M.S. 1990
Ph.D. 1993, University of Pennsylvania

Jennifer Culbert (2001)
Associate Professor, Political Science
B.S. 1986, Georgetown University
M.S. 1987, London School of Economics and Political Science
M.A. 1991 | Ph.D. 1998, University of California

Jennifer Culbertson (2013)
Adjunct Assistant Professor, Cognitive Science
B.A. 2004, Brown University

Kyle Cunningham (1994)
Professor, Biology
B.A. 1984, The Johns Hopkins University
Ph.D. 1989, University of California, Los Angeles

Annalisa Czeczulin, M.A.
Adjunct Assistant Professor, Center for Language Education

Paul Dagdigian (1974)
Arthur D. Chambers Professor of Chemistry
B.A. 1967, Haverford College
Ph.D. 1972, University of Chicago

Andrew Daniel (2007)
Associate Professor, English
A.B. 1995, University of Oxford
A.B. 1993 | Ph.D. 2006, University of California, Berkeley

Ronald Daniels (2009)
Professor, Political Science
President, Johns Hopkins University
B.A. 1982 | J.D. 1986, University of Toronto
LL.M. Yale Law School

Veena Das (2000)
Krieger-Eisenhower Professor, Anthropology, Comparative Thought and Literature

Steven R. David (1981)
Professor, Political Science
B.A. 1972, Union College
M.A. 1975, Stanford University
M.A. 1977 | Ph.D. 1980, Harvard University

Michael Degani (2015)
Assistant Professor, Anthropology
B.A. 2005, Florida Atlantic University
M.A. 2008, University of Florida
Ph.D. 2015, Yale University

Carlos Del Castillo (2008)
Associate Research Professor, Earth and Planetary Sciences
Ph.D. 1998, University of South Florida

Lisa DeLeonardis (2001)
Austen-Stokes Professor in the Art of the Ancient Americas
Senior Lecturer, History of Art
B.A. 1986, Goucher College

Paul Delnero (2008)
Associate Professor, Near Eastern Studies
B.A. 1994, Purdue University
Ph.D. 2006, University of Pennsylvania

Stefanie DeLuca (2002)
Professor, Sociology
B.A. 1997, University of Chicago
Ph.D. 2002, Northwestern University

Daniel Deudney (1998)
Associate Professor, Political Science
B.A. 1975, Yale University  
Ph.D. 1989, Princeton University

Laura Di Bianco (2016)  
Assistant Professor, German and Romance Languages and Literatures  
Laurea 1999, Università degli studi Romatre, Rome, Italy  
M.A., 2011 | M.Phil 2011 | Ph.D. 2014, City University of New York

Jocelyne DiRuggiero (2008)  
Associate Research Professor, Biology; Earth and Planetary Sciences  
B.Sc. 1984 | Ph.D. 1991, University of Claude Bernard

Toby Ditz (1982)  
Professor, History  
B.A. 1972, Northwestern University  

Benjamin Dodson (2014)  
Assistant Professor, Mathematics  
Ph.D. 2009, University of North Carolina, Chapel Hill

Marton Dornbach (2016)  
Visiting Assistant Professor, German and Romance Languages and Literatures  
B.A. 1995, Washington University in St. Louis  
Ph.D. 2004, Princeton University

Stephen Drigotas (2010)  
Teaching Professor, Psychological and Brain Sciences  
A.B. 1998, Bowdoin College  
Ph.D. 1993, University of North Carolina at Chapel Hill

Gregory Duffee (2008)  
Carl Christ Professor of Economics  
B.A. 1983, Macalester College  
Ph.D. 1990, Harvard University

Kathryn Edin (2014)  
Research Professor, Sociology  
B.A. 1984, North Park University  

Howard Egeth (1965)  
Professor, Psychological and Brain Sciences, Cognitive Science  
A.B. 1961, Rutgers University  
Ph.D. 1966, University of Michigan

William Egginton (2006)  
Professor, German and Romance Languages and Literatures  
Andrew W. Mellon Professor of the Humanities  
A.B. 1991, Dartmouth University  
M.A. 1994, University of Michigan  

Tamer el-Leithy (2015)  
Assistant Professor, History  
B.A. 1994, American University in Cairo  
M.Phil 1997, University of Cambridge  

Danielle Evans (2018)  
Assistant Professor, The Writing Seminars  
B.A. 2004, Columbia University

M.F.A. 2006, University of Iowa

D. Howard Fairbrother (1997)  
Professor, Chemistry  
B.A. 1989, Brasenose College, Oxford  
Ph.D. 1994, Northwestern University

S. Michael Fall (2002)  
Adjunct Professor, Physics and Astronomy  
B.A. 1962, University of Saskatchewan  
Ph.D. 1967, Massachusetts Institute of Technology

Christopher Falzone (2007)  
Teaching Professor, Chemistry; Biophysics  
A.B. 1979, Washington University in St. Louis  
Ph.D. 1985, Clarkson University

Chen-Ming Fan (1997)  
Adjunct Professor, Biology; Carnegie Institution  
Steven Farber (2004)  
Adjunct Associate Professor, Biology  
B.S.E.E. 1986, Rutgers University  
M.S. 1989 | Ph.D. 1993, Massachusetts Institute of Technology

Jon Faust (2006)  
Louis J. Maccini Professor of Economics  
B.S. 1981, University of Iowa  
M. Phil. 1985, Oxford University  
Ph.D. 1988, University of California, Berkeley

Lisa Feigenson (2003)  
Professor, Psychological and Brain Sciences; Cognitive Science  
B.A. 1997, Cornell University  
Ph.D. 2003, New York University

Paul D. Feldman (1967)  
Research Professor, Physics and Astronomy Academy Professor  
A.B. 1960, Columbia College  
Ph.D. 1964, Columbia University

Henry Ferguson (2002)  
Adjunct Professor, Physics and Astronomy  
A.B. 1981, Harvard University  
Ph.D. 1990, The Johns Hopkins University

Research Professor, Earth and Planetary Sciences  
B.S. 1970 | M.S. 1971, Stanford University  
Ph.D. 1975, Harvard University

Marcelo Fernández (2018)  
Assistant Professor, Economics  
B.A. 2010, Pontificia Universidad Católica de Buenos Aires  
M.S. 2015 | Ph.D. 2018, California Institute of Technology

Michael Finkenthal (2003)  
Research Professor, Physics and Astronomy  
B.Sc. / M.Sc. 1968, Babes-Bolyai University  
Ph.D. 1977, The Hebrew University

Emily Fisher (2008)  
Associate Teaching Professor, Biology  
B.S. 2000, University of California at Santa Cruz  
Ph.D. 2008, University of North Carolina, Chapel Hill
Karen Fleming (2000)
Professor, Biophysics; Biology
B.A. 1987, University of Notre Dame
Ph.D. 1993, Georgetown University

Jonathan Flombaum (2008)
Associate Professor, Psychological and Brain Sciences. Cognitive Science
A.B. 2002, Harvard University
M.S. 2004 | M. Phil. 2005 | Ph.D. 2008, Yale University

Holland Ford (1988)
Research Professor, Physics and Astronomy
B.S. 1962, University of Oklahoma
Ph.D. 1970, University of Wisconsin

Pier Massimo Forni (1985)
Professor, German and Romance Languages and Literatures
B.A. 1974, University of Pavia
M.A. 1977, Catholic University, Milan
Ph.D. 1981, University of California, Los Angeles

Eckart Förster (2001)
Professor, Philosophy
Humanities Center, German and Romance Languages and Literatures (2002)
B.Phil. 1979 | D.Phil. 1982, University of Oxford

Ernesto Freire (1986)
Professor, Biology, Biophysics
Henry A. Walters Professor in Biology
B.S. 1972, University Pervana Cayetano Heredia
Medical School, M.S. 1973
Ph.D. 1977, University of Virginia

Stephen Fried (2018)
Assistant Professor, Chemistry
S.Bs. 2009, Massachusetts Institute of Technology
Ph.D. 2014, Stanford University

Yulia Frumer (2012)
Assistant Professor, History of Science and Technology
Bo Jung and Soon Young Kim Professor of East Asian Science and Technology
B.A. 2002, Tel Aviv University
M.A. 2004 | Ph.D. 2012, Princeton University

Francois Furstenberg (2014)
Professor, History
B.A. 1994, Columbia University
Ph.D. 2003, The Johns Hopkins University

Louis P. Galambos (1971)
Research Professor, History
B.A. 1955, Indiana University
M.A. 1957 | Ph.D. 1960, Yale University

Joseph G. Gall (1983)
Adjunct Professor, Biology; Carnegie Institution

Michela Gallagher (1996)
Professor, Psychological and Brain Sciences
Krieger-Eisenhower Professor
B.A. 1969, Colgate University

Ph.D. 1977, University of Vermont

Bertrand Garcia-Moreno (1992)
Professor and Chair of Biophysics; Biology
A.B. 1981, Bowdoin University
Ph.D. 1986, Indiana University

Christian Gavrus (2018)
J.J. Sylvester Assistant Professor of Mathematics
B.A. 2010, University of Bucharest
M.S. 2012, Școala Normală Superioară București
Ph.D. 2017, University of California, Berkeley

Mark Gersovitz (1994)
Professor, Economics
B.A. 1971, McGill University
M.A. 1972 | M.Phil. 1973 | Ph.D. 1975, Yale University

Riccardo Giacconi (1982)
University Professor, Physics and Astronomy

Benjamin Ginsberg (1992)
David H. Bernstein Professor, Political Science

Anand Gnanadesikan (2011)
Professor, Earth and Planetary Sciences
B.A. 1988, Princeton University
Ph.D. 1994, Massachusetts Institute of Technology

Patrick Godon (2010)
Visiting Assistant Research Professor, Physics and Astronomy

David Goldberg (1998)
Professor, Chemistry
B.A. 1989, Williams College
Ph.D. 1995, Massachusetts Institute of Technology

Maya Gomes (2010)
Assistant Professor, Earth and Planetary Sciences
B.A. 2006, Wesleyan University
Ph.D 2014, Northwestern University

Eduardo González (1982)
Professor, German & Romance Languages & Literatures
B.A. 1965 | M.A. 1967, University of South Florida
Ph.D. 1975, Indiana University

Linda Gorman (2010)
Teaching Professor, Psychological and Brain Sciences B.S. 1984, University of Arizona
Ph.D. 1990, University of California, Los Angeles

Jennifer Gosetti-Ferencei (2018)
Professor, German and Romance Languages and Literatures
B.A. 1993, The Ohio State University
M.A. 1995 | Ph.D. 1999, Villanova University
M.F.A 2000, Columbia University

Rachel Green (2017)
Bloomberg Distinguished Professor, Biology; Molecular Biology and Genetics
B.S. 1986, University of Michigan
Ph.D. 1992, Harvard University
Marc Greenberg (2002)
Professor, Chemistry; Biology
B.A. 1982, New York University
B.E. 1982, The Cooper Union School of Engineering
Ph.D. 1988, Yale University

Carol Greider (2014)
Bloomberg Distinguished Professor; Biology; Molecular Biology and Genetics
B.A. 1983, University of California, Santa Barbara
Ph.D. 1987, University of California, Berkeley

Meredith Greif (2014)
Assistant Professor, Sociology
B.S. 2000, Cornell University

Andrei Gritsan (2005)
Professor, Physics and Astronomy
B.S. 1994, Novosibirsk State University, Russia
M.S. 1996 | Ph.D. 2000, University of Colorado

Steven Gross (2006)
Associate Professor, Philosophy; Cognitive Science; PBS

Nilofar Haeri (1990)
Professor and Chair, Anthropology

Thomas Haine (1999)
Morton K. Blaustein Professor and Chair, Earth and Planetary Sciences
B.A. 1988, St. Catharines College, University of Cambridge
Ph.D. 1992, University of Southampton

Justin Halberda (2003)
Professor, Psychological and Brain Sciences, Cognitive Science
B.S. 1997 | B.A. 1997, College of Charleston
Ph.D. 2001, New York University

Marnie Halpern (1994)
Adjunct Professor, Biology; Carnegie Institution

Bruce Hamilton (1973)
Professor Emeritus, Economics
B.A. 1968, Grinnell College
Ph.D. 1972, Princeton University

Clara Han (2007)
Associate Professor, Anthropology
B.A. 1997, Princeton University
M.D. 2007 | Ph.D. 2007, Harvard University

Jingjun Han (2018)
J.J. Sylvester Assistant Professor of Mathematics
B.S. 2013 | Ph.D. 2018, Peking University

Michael Hanchard (2006)
Research Professor, Political Science
B.A. 1981, Tufts University
Ph.D. 1999, Princeton University

Lingxin Hao (1996)
Professor, Sociology

Ru-Chih Huang (1965)
William David McElroy Research Professor, Biology
B.S. 1953, National Taiwan University
M.S. 1956, VPI
Ph.D. 1960, The Ohio State University

Ho-Fung Hung (2011)
Professor, Sociology
B.Soc.Sc. 1995 | M.Phil. 1998, Chinese University of Hong Kong
M.A. 1999, State University of New York
Ph.D. 2004, The Johns Hopkins University

Nicholas Ingolia (2010)
Adjunct Assistant Professor, Biology
B.A. 2006, Drew University
M.Phil 2010 | M.A. 2010 | Ph.D. 2012, Yale University

Olivier Jeanne (2008)
Professor, Economics
B.A. 1987, Graduate, Ecole Nationale des Ponts et Chaussée, Paris
M.Sc 1991, London School of Economics
Ph.D. 1996, Ecole des Hautes Etudes en Sciences Sociales

Peter Jelavich (2001)
Professor, History
B.A. 1975, Amherst College

Margaret Johnson (2012)
Assistant Professor, Biophysics; Biology
B.S. 2004, Columbia University
Ph.D. 2009, University of California-Berkeley

Mayumi (Yuki) Johnson (2010)
Teaching Professor and Director, Center for Language Education
B.A. 1979, Seijo University
M.A. 1989, University of Michigan
Ph.D. 1994, University of Minnesota

Robert J. Johnston, Jr. (2013)
Assistant Professor, Biology

Patricia Kain (2004)
Director and Teaching Professor, Program in Expository Writing
A.B. 1967, Gettysburg College

M.Ed. 1971, Temple University
M.A. 1978, The Johns Hopkins University

Christian Kaiser (2013)
Assistant Professor, Biology

Marc Kamionkowski (2011)
Williams R. Kenan Jr, Professor, Physics and Astronomy
B.A. 1987, Washington University
Ph.D. 1991, University of Chicago

David Kaplan (2002)
Professor, Physics and Astronomy
B.A. 1991 | M.S. 1996, University of California
Ph.D. 1999, University of Washington

Jared Kaplan (2012)
Assistant Professor, Physics and Astronomy
B.S. 2005, Stanford University
Ph.D. 2009, Harvard University

Robert Kargon (1965)
Professor, History of Science and Technology
B.S. 1959, Duke University
M.S. 1960, Yale University
Ph.D. 1964, Cornell University

Kenneth Karlin (1989)
Ira Remsen Professor of Chemistry
B.S. 1970, Stanford University
Ph.D. 1975, Columbia University

Edi Karni (1981)
Professor, Economics
Scott and Barbara Black Professor of Economics
M.A. 1971 | Ph.D. 1971, University of Chicago

David Katz (2006)
Visiting Assistant Professor, Near Eastern Studies

Richard S. Katz (1976)
Professor, Political Science
A.B. 1969, University of Michigan
M.Phil. 1971 | Ph.D. 1974, Yale University

Rebecca E. Kelly (2016)
Associate Teaching Professor, Earth and Planetary Sciences
Director, Global Environmental Change and Sustainability
B.S. 1993, Indiana University, Bloomington
M.S. 1996, University of Oklahoma, Norman
Ph.D. 2000, University of Oregon

Professor, Economics

Abram G. Hutzler Professor of Political Economy
B.S. 1969, London School of Economics
M.Phil. 1972 | Ph.D. 1973, Yale University

Naveeda Khan (2006)
Associate Professor, Anthropology
B.A. 1992, Vassar College
M.A. 1995, New School for Social Research
Ph.D. 2003, Columbia University
Dong-Won Kim (1999)
Visiting Professor, History of Science and Technology

John K. Kim (2014)
Professor, Cognitive Science; Psychological and Brain Sciences
B.S. 1990, Yale University
Ph.D. 2000, University of California, Davis

Yumi Kim (2016)
Assistant Professor, Biology
B.S. 2003, Seoul National University
Ph.D. 2008, University of California, San Diego

Sharon Kingsland (1981)
Professor, History of Science and Technology
B.S. 1973 | M.A. 1977 | Ph.D. 1981, University of Toronto

Nitya Kitchloo (2010)
Professor, Mathematics
B.S. 1993, California Institute of Technology
Ph.D. 1998, Massachusetts Institute of Technology

James Knierim (2009)
Associate Research Professor, Psychological and Brain Sciences

Elena Krasokutskaya (2010)
Associate Professor, Economics
B.A. 1993, Fudan University, B.Ed. 1990
M.A. 1995, University of Virginia
Ph.D. 2000, University of Pennsylvania

Andrea Krauss (2011)
Associate Professor, German and Romance Languages and Literatures
Ph.D. 2001, Freie Universitat Berlin

Professor, Physics and Astronomy
S.B. 1971, Massachusetts Institute of Technology
Ph.D. 1977, University of California

Reiji Kuruvilla (2005)
Associate Professor, Biology
B.Sc. 1987 | B.Ed. 1990, Calcutta University
Ph.D. 1998, University of Houston

Michael Kwass (2011)
Professor and Chair, History
B.A. 1986, University of Pennsylvania
M.A. 1989 | Ph.D. 1994, University of Michigan

Christopher Lakey (2013)
Assistant Professor, History of Art
B.A. 1996, Baylor University
M.A. 1999, University of Toronto
Ph.D. 2009, University of California, Berkeley

Barbara Landau (2000)
Professor, Cognitive Science, Psychological and Brain Sciences
Dick and Lydia Todd Faculty Development Professor of Cognitive Science
Ed.M. 1977, Rutgers University

Pier Larson (1998)
Professor, History

B.A. 1985, University of Minnesota
M.A. 1987 | Ph.D. 1992, University of Wisconsin, Madison

Jacob Lauinger (2010)
Associate Professor, Near Eastern Studies
B.A. 1999, Princeton University
M.A. 2001 | Ph.D. 2007, University of Chicago

Thomas Leckta (1994)
Professor, Chemistry
Jean and Norman Scowe Professor of Chemistry
B.A. 1985, Oberlin University
Ph.D. 1991, Cornell University

Juliette Lecomte (2007)
Professor, Biophysics; Biology
B.S. 1977, Université de Liège, Belgium
M.S. 1979, Carnegie Mellon University, Ph.D. 1982

Yuan Chuan Lee (1965)
Research Professor, Biology McCallum—Pratt Institute
Academy Professor
B.S. 1955 | M.S. 1957, National Taiwan University
Ph.D. 1962, Iowa State University

Young-Sam Lee (2010)
Assistant Research Professor, Biology
B.S. 1995 | M.S. 1997, Seoul National University, Korea
M.S. 2000, Indiana University
Ph.D. 2005, University of Chicago

Geraldine Legendre (1995)
Professor and Chair, Cognitive Science
B.A. 1971, Lycée d'Etat Marguerite de Navarre, Bourges, France
Ph.D. 1987, University of California, San Diego

Robert Leheny (2000)
Associate Professor, Physics and Astronomy
A.B. 1989, Princeton University
Ph.D. 1997, University of Chicago

Brad Leithauser (2007)
Professor, The Writing Seminars
B.A. 1975 | J.D. 1980, Harvard University

Stuart W. Leslie (1984)
Professor, History of Science and Technology History
B.A. 1974, Carleton University
M.A. 1976 | Ph.D. 1980, University of Delaware

Anne Lester (2018)
Associate Professor, History
B.A. 1986, Brown University
M.A. 1999 | Ph.D. 2003, Princeton University

Michael Levien (2013)
Assistant Professor, Sociology
B.A. 2001, Williams College
M.A. 2007 | Ph.D. 2013, University of California-Berkeley

Kevin Lewis (2014)
Assistant Professor, Earth and Planetary Sciences
B.S. 2003, Tufts University
Ph.D. 2009, California Institute of Technology
Theodore Lewis (2002)
Professor, Near Eastern Studies
Blum-Iwry Professor of Near Eastern Studies
B.A. 1978 | M.A. 1979, University of Wisconsin
Ph.D. 1986, Harvard University

Michael Joseph Lichten (2012)
Adjunct Professor, Biology

John Lind (2011)
J.J. Sylvester Assistant Professor, Mathematics

Hans Lindblad (2011)
Professor, Mathematics
M.S. 1985 | Ph.D. 1989, Lund Institute of Technology

Tal Linzen (2017)
Assistant Professor, Cognitive Science
B.Sc. 2010 | M.A. 2010, Tel Aviv University
Ph.D. 2015, New York University

Leonardo Lisi (2008)
Associate Professor and Chair, Comparative Thought and Literature
B.A. 2002, University of York
M.Phil. 2004 | M.A. 2004 | Ph.D. 2008, Yale University

Morris Low (2007)
Adjunct Associate Professor, History of Science and Technology
B.S. 1982 | B.S. 1984, Griffith University
Ph.D. 1993, University of Sydney

Richard Macksey (1958)
Professor, part-time, Comparative Thought and Literature

Petar Maksimovic (2001)
Professor, Physics and Astronomy
B.S. 1992, University of Belgrade
Ph.D. 1997, Massachusetts Institute of Technology

Dora Malech (2014)
Assistant Professor, The Writing Seminars
B.A. 2003, University of Iowa Writers' Workshop
M.F.A. 2005, Yale University

Douglas Mao (2007)
Professor, English
B.A. 1987, Harvard University
Ph.D. 1993, Yale University

Nina Markovic (2002)
Associate Professor, Physics and Astronomy
B.S. 1993, University of Zagreb, Croatia
Ph.D. 1998, University of Minnesota

Alice Mandell (2018)
Assistant Professor, Near Eastern Studies
B.A. 2006 | M.A. 2006 | Ph.D. 2015, University of California, Los Angeles

Renee Marlin-Bennett (2007)
Professor, Political Science
B.A. 1981, Pomona College
S.M. 1983 | Ph.D. 1987, Massachusetts Institute of Technology

Paola Marrati (2003)
Professor, Comparative Thought and Literature; Philosophy
M.A. 1988, Università degli studi di Pisa

D.E.A. 1989, École des Hautes Études en Sciences Sociales
Ph.D. 1995, Université Marc Bloch, Strasbourg

Tobias Marriage (2010)
Associate Professor, Physics and Astronomy
C.A.S.M. 2001, University of Cambridge

Professor, History
B.A. 1983, University of Cambridge
M.A. 1985 | Ph.D. 1990 | The Johns Hopkins University

Sebastian Mazzuca (2015)
Assistant Professor, Political Science
B.A. 1995, Universidad de Buenos Aires

J. Michael McCaffery (2006)
Research Professor, Biology

Stephan McCandliss (1999)
Research Professor, Physics and Astronomy

Michael McCloskey (1978)
Professor, Cognitive Science; Psychological and Brain Sciences
B.A. 1975 | M.A. 1977, Emory University
Ph.D. 1978, Princeton University

Rajiv McCoy (2018)
Assistant Professor, Biology
B.S. 2010, University of Miami
Ph.D. 2015, Stanford University

Peter McCullough (2012)
Adjunct Associate Professor, Physics and Astronomy

Alice McDermott (1999)
Professor, The Writing Seminars
The Richard A. Macksey Professor for Distinguished Teaching in the Humanities
B.A. 1975, State University of New York
M.A. 1978, University of New Hampshire

Katrina Bell McDonald (1994)
Associate Professor, Sociology
Co-Director, Center for Africana Studies
B.A. 1983, Mills College
M.A. 1984, Stanford University
M.A. 1990 | Ph.D. 1995, University of California, Davis

Jean McGarry (1988)
Professor, The Writing Seminars
A.B. 1970, Harvard University
M.A. 1983, The Johns Hopkins University

Deborah McGee Mifflin (2010)
Associate Teaching Professor, German and Romance Languages and Literatures
Ph.D. 2000, Georgetown University

Tyrel McQueen (2009)
Professor, Chemistry, Physics and Astronomy
B.S. 2004, Harvey Mudd College
Faculty Listings

M.A. 2006 | Ph.D. 2009, Princeton University

Yitzhak Melamed (2008)
Associate Professor, Philosophy, Comparative Thought and Literature
B.A. / M.A. 1995 | M.A. 1996, Tel Aviv University
M.Phil. 2000 | Ph.D. 2005, Yale University

Kirill Melnikov (2008)
Associate Professor, Physics and Astronomy
M.Sc 1991, Novosibirsk State University, Russia
Ph.D. 1996, Johannes Gutenberg University, Germany

Brice Menard (2010)
Associate Professor, Physics and Astronomy
Ph.D. 2002, Max Planck Institute

Mitchell Merback (2008)
Professor, History of Art
B.A. 1985, Alfred University
M.A. 1989 | Ph.D. 1995, University of Chicago

Mona Merling (2014)
J.J. Sylvester Assistant Professor of Mathematics
B.A. 2009, Bard College
M.S. 2010 | Ph.D. 2015, University of Chicago

Chikako Mese (2004)
Professor, Mathematics
B.S. 1991, University of Dayton
M.S. 1994 | Ph.D. 1996, Stanford University

Gerald J. Meyer (1991)
Professor, Chemistry Bernard N. Baker Professor in Chemistry
B.S. 1985, SUNY at Albany
Ph.D. 1989, University of Wisconsin

Tobie Meyer-Fong (2000)
Professor, History
Director, Program in East Asian Studies
B.A. 1989, Yale University

Deborah Mifflin (1999)
Associate Teaching Professor, German & Romance Languages and Literatures
Coordinator, German Language Program

William P. Minicozzi II (1994)
Professor, Mathematics
Krieger-Eisenhower Professor
B.A. 1990, Princeton University
Ph.D. 1994, Stanford University

Michele Miozzo (2005)
Assistant Research Professor, Cognitive Science

Robert A. Moffitt (1995)
Professor, Economics; Institute for Policy Studies Public Policy Program
Krieger-Eisenhower Professor
B.A. 1970, Rice University

Silvia Montiglio (2010)
Gildersleeve Professor of Classics
Laurea 1984, University of Pavia

H. Warren Moos (1964)
Research Professor; Physics and Astronomy
Gerhard H. Dieke Professor of Physics and Astronomy
Sc.B. 1957 | M.A. 1959, Brown University
Ph.D. 1961, University of Michigan

Philip Morgan (2000)
Professor, History
Harry C. Black Professor of History
B.A. 1971, University of Cambridge
Ph.D. 1977, University College London

Stephen Morgan (2014)
Bloomberg Distinguished Professor, Sociology and School of Education
M.Phil 1995, Oxford University

Anne Eakin Moss (2012)
Assistant Professor, Comparative Thought and Literature
B.A. 1995, Harvard University

Kenneth Moss (2002)
Associate Professor, History
Felix Posen Professor of Modern Jewish History
B.A. 1996, Rutgers University
Ph.D. 2003, Stanford University

Andrew Motion (2015)
Homewood Professor of the Arts, The Writing Seminars

Evangelos N. Moudrianakis (1965)
Professor, Biology; Biophysics
B.S. 1959, University of Athens

Dean Moyar (2002)
Associate Professor, Philosophy
B.S. 1994, Duke University
M.A. 1998 | Ph.D. 2002, University of Chicago

Ulrich Muller (2002)
Bloomberg Distinguished Professor, Biology; Neuroscience

Stephen Murray (2009)
Research Professor; Physics and Astronomy

Christopher Nealon (2008)
Caroline Donovan Professor of English
B.A. 1989, Williams College
M.F.A. 1993, Warren William College
Ph.D. 1997, Cornell University

David Neufeld (1989)
Professor, Physics and Astronomy
B.A. 1981, Cambridge University
M.Sc. 1983, University of Sussex
Ph.D. 1987, Harvard University

Predrag Nikolic (2009)
Adjunct Assistant Professor, Physics and Astronomy
B.S. 1998, University of Belgrade  
Ph.D. 2004, Massachusetts Institute of Technology

Colin Norman (1983)  
Professor, Physics and Astronomy  
B.E. 1969, University of Melbourne  
D.Phil. 1973, University of Oxford

Juan Obarrio (2009)  
Associate Professor, Anthropology  
Licenciado 1996, University of Buenos Aires  
M. Phil. 2001 | Ph.D. 2006, Columbia University

Peter Lee Olson (1977)  
Research Professor, Earth and Planetary Sciences  
B.A. 1972, University of Colorado  
M.A. 1974 | Ph.D. 1977, University of California, Berkeley

Akira Omaki (2011)  
Adjunct Assistant Professor, Cognitive Science  
B.A. 2002, University of Hawaii  
M.A. 2005, Sofia University  
Ph.D. 2010, University of Maryland

Yi-Ping Ong (2010)  
Assistant Professor, Comparative Thought and Literature  
B.A. 2001, Oxford University  

Katrin Pahl (2005)  
Associate Professor, German and Romance Languages and Literatures  
Maitrise 1992, Universite de Paris, IV, Sorbonne  
Ph.D. 2001, University of California, Berkeley

Anand Pandian (2007)  
Associate Professor, Anthropology  
B.A. 1994, Amherst University  
Ph.D. 2004, University of California, Berkeley

Alison A. Papadakis (2014)  
Associate Teaching Professor, Psychological and Brain Sciences  
A.B. 1997, Princeton University  

Nick Papageorge (2012)  
Broadus Mitchell Assistant Professor of Economics  
B.A. 2000, University of Chicago  
M.A. 2005, Die Humboldt University  
Ph.D. 2012, Washington University

Gabriel Paquette (2011)  
Research Professor, History  
B.A. 1999, Wesleyan University  
M.A. 2001, National University of Island  
M.Phil. 2002 | Ph.D. 2006, University of Cambridge

Soojin Park (2011)  
Adjunct Assistant Professor, Cognitive Science  
B.A. 2004, Yonsei University, Korea  
M.S. 2005 | M.Phil. 2006 | Ph.D. 2008, Yale University

Cedomir Petrovic (2007)  
Adjunct Professor, Physics and Astronomy  
B.Sc. 1996, University of Belgrade  
M.Sc. 1997 | Ph.D. 2000, Florida State University

Stephen Plank (1997)  
Associate Professor, Sociology  
B.A. 1990, Northwestern University  
M.A. 1992 | Ph.D. 1995, University of Chicago

Deborah Poole (2002)  
Professor, Anthropology  
B.A. 1974, University of Michigan  
Ph.D. 1984, University of Illinois

Maria Portuondo (2008)  
Associate Professor and Chair, History of Science and Technology  
B.S.E.E. 1984, University of Miami  
Ph.D. 2005, The Johns Hopkins University

Lawrence Principe (1997)  
Professor, History of Science and Technology; Chemistry; Philosophy  
Drew Family Professor in the Humanities  
B.A. and B.S. 1983, University of Delaware  
Ph.D. 1988, Indiana University  
Ph.D. 1996, The Johns Hopkins University

Peter Privalov (1991)  
Research Professor, Biology; Biophysics  
Faculty of Physics 1956, Tbilisi University, Georgia USSR  
Ph.D. 1964

Lawrence Raifman (1992)  
Adjunct Assistant Professor, Psychological and Brain Sciences  
B.S. 1973, Washington University at St. Louis  
J.D. 1981 | Ph.D. 1982, University of Arizona

Brenda Rapp (1994)  
Professor, Cognitive Science; Psychological and Brain Sciences  
B.S. 1979, University of Maryland  

Peter Rapp (2008)  
Adjunct Professor, Psychological and Brain Sciences  
B.A. 1979, University of Vermont  
Ph.D. 1986, University of North Carolina at Chapel Hill

Kyle Rawlins (2010)  
Associate Professor, Cognitive Science  
Ph.D. 2008, University of California, Santa Cruz

Eugenio Refini (2014)  
Assistant Professor, German and Romance Languages and Literatures  

Daniel Reich (1990)  
Professor, Physics and Astronomy  
B.A. 1977 | M.S. 1985, Harvard University  
Ph.D. 1988, University of Chicago

Adam Riess (2006)  
Bloomberg Distinguished Professor, Physics and Astronomy; Earth and Planetary Sciences  
Thomas J. Barber Professor of Physics and Astronomy  
B.S. 1992, Massachusetts Institute of Technology
Mark O. Robbins (1986)
Professor, Physics and Astronomy
B.A. 1977 | M.A. 1977, Harvard University
Ph.D. 1983, University of California

Elijah Roberts (2012)
Assistant Professor, Biophysics
B.S. 1996, Ohio University
Ph.D. 2010, University of Illinois

Steven Rokita (2012)
Professor, Chemistry
B.S. 1979, University of California-Berkeley
Ph.D. 1983, Massachusetts Institute of Technology

Matthew Roller (1994)
Vice Dean for Graduate Education, and Centers and Programs
Professor, Classics
B.A. 1988, Stanford University
M.A. 1990 | Ph.D. 1994 | University of California, Berkeley

Jesse Rosenthal (2010)
Associate Professor, English
B.A. 1998, Swarthmore College

Erin Rowe (2012)
Assistant Professor, History
Ph.D. 2005, The Johns Hopkins University

William Rowe (1982)
Professor, History
John and Diane Cooke Professor of Chinese History
A.B. 1967, Wesleyan University

Elena Russo (2000)
Professor, German and Romance Languages and Literatures
Baccalaureat 1977, Lycée Chateaubriand
Licence ès Lettres 1982, Université de Genève
Ph.D. 1988, Princeton University

Ünver Rüstem (2015)
Assistant Professor, History of Art
Ph.D. 2013, Harvard University

Robert Rynasiewicz (1986)
Professor, Philosophy
Sc.B. 1974, Brown University
Ph.D. 1981, University of Minnesota

Mary Jo Salter (2007)
Professor, The Writing Seminars
B.A. 1976, Harvard University
M.A. 1978, University of Cambridge

Olya Samilenko (1992)
Adjunct Associate Professor, Center for Language Education-Russian

George Scangos (1992)
Adjunct Professor, Biology

Michael Schatz (2016)
Bloomberg Distinguished Associate Professor, Biology; Computer Science
B.S. 2000, Carnegie Mellon University
M.S. 2008 | Ph.D. 2010, University of Maryland

Joel Schildbach (1996)
Vice Dean for Undergraduate Education
Professor, Biology
B.A. 1986, Oregon State University
Ph.D. 1992, Harvard University

Derek Schilling
Professor and Chair, German and Romance Languages and Literatures
Ph.D.

Robert Schlef (1989)
Professor, Biology, Biophysics
B.S. 1963, Tufts University
Ph.D. 1967, University of California, Berkeley

Daniel Schlozman (2012)
Joseph and Bertha Bernstein Assistant Professor, Political Science
A.B. 2003 | Ph.D. 2011, Harvard University

Trina Schroer (1990)
Professor, Biology
B.S. 1980, Stanford University
Ph.D. 1986, University of California, San Francisco

Glenn Schwartz (1996)
Professor and Chair, Near Eastern Studies
Whiting Professor of Archaeology
B.A. 1976 | M.Phil. 1980 | Ph.D. 1982, Yale University

Loreto Sánchez Serrano (1999)
Associate Teaching Professor, German and Romance Languages and Literatures

Adam Sheingate (2000)
Professor, Political Science
B.S. 1991 | M.A. 1993, University of Wisconsin
Ph.D. 1998, Yale University

Todd Shepard (2008)
Professor, History; German and Romance Languages and Literatures
B.A. 1991, Wesleyan University
Ph.D. 2002 Rutgers University

Bernard Shiffman (1973)
Professor, Mathematics
B.S. 1964, Massachusetts Institute of Technology
Ph.D. 1968, University of California

Robert Shilliam (2018)
Professor, Political Science

Ji-Liang Shiu (2018)
Visiting Associate Professor, Economics
B.S. 1996 | M.S. 1998, National Tsing Hua University
Ph.D. 2004, Indiana University, Bloomberg
Ph.D. 2009, The Johns Hopkins University

Vyacheslav Shokurov (1991)
Professor, Mathematics
D.Sc. 1976, Steklov Institute
Ph.D. 1976, Moscow State University

Harry Sieber (1967)
Professor, German and Romance Languages and Literatures; History
B.A. 1963, Baylor University
Ph.D. 1967, Duke University

Joseph Silk (2010)
Homewood Professor, Physics and Astronomy
Ph.D. 1968, Harvard University

Beverly J. Silver (1992)
Professor, Sociology
B.A. 1980, Barnard College
Ph.D. 1992, SUNY, Binghamton

David K. Sing (2017)
Bloomberg Distinguished Professor, Earth and Planetary Sciences; Physics and Astronomy

Joshua M. Smith (2012)
Assistant Professor, Classics
B.A. 2007, University of North Carolina at Chapel Hill
M.A. 2009 | Ph.D. 2013, University of Wisconsin, Madison

Brian Smithling (2012)
Assistant Professor, Mathematics
S.B. 2001, Massachusetts Institute of Technology
M.S. 2003 | Ph.D. 2007, University of Chicago

Paul Smolensky (1994)
Professor, Cognitive Science
Krieger-Eisenhower Professor
A.B. 1976, Harvard University
M.S. 1977 | Ph.D. 1981, Indiana University

Christopher Sogge (1996)
Professor, Mathematics
J.J. Sylvester Professor
B.A. 1982, University of Chicago
Ph.D. 1985, Princeton University

Santiago Solis (2014)
Visiting Assistant Professor, German and Romance Languages and Literatures
B.A. 1992, University of California, Berkeley
M.A. 1996, Brown University
Ed.D. 2007, Columbia University

Research Professor, Economics
B.A. 1973, Haverford College
Ph.D. 1978, Massachusetts Institute of Technology

Lester Spence (2005)
Associate Professor, Political Science

Forrest Spencer (2014)
Research Professor, Biology
B.A. 1978, Smith College
Ph.D. 1984, Harvard University

Gabrielle Spiegel (1993)
Professor, History
Krieger-Eisenhower Professor
B.A. 1964, Bryn Mawr
M.A.T. 1965, Harvard University

Allan Spradling (1980)
Adjunct Professor, Biology; Carnegie Institution
A.B., University of Chicago
Ph.D., Massachusetts Institute of Technology

Joel Spruck (1992)
Professor, Mathematics
J.J. Sylvester Professor of Mathematics
B.S. 1967, Columbia University
M.S. 1969 | Ph.D. 1971, Stanford University

Jennifer Stager (2018)
Assistant Professor, History of Art
A.B. 2000, University of Cambridge
M.A. 2001, University of Oxford
Ph.D. 2012, University of California, Berkeley

Sabine Stanley (2016)
Bloomberg Distinguished Professor, Earth and Planetary Sciences; Applied Physics Laboratory
B.S. 1999, University of Toronto

Neta Stahl (2008)
Associate Professor, German and Romance Languages and Literatures

Walter Stephens (1999)
Professor, German and Romance Languages and Literatures
Charles S. Singleton Professor of Italian Studies
B.A. 1972 | M.A. 1976, Yale University
Ph.D. 1979, Cornell University

Richard Stolarski (2010)
Research Professor, Earth and Planetary Sciences
B.S. 1963, University of Puget Sound
Ph.D. 1966, University of Florida

Darrell F. Strobel (1984)
Professor, Earth and Planetary Sciences; Physics and Astronomy
B.S. 1964, North Dakota State University
A.M. 1965 | Ph.D. 1969, Harvard University

Elisabeth Strowick (2008)
Professor, German and Romance Languages and Literatures
Ph.D. 1998, University of Hamburg

Associate Professor, Psychological and Brain Sciences; Mind/Brain Institute
Robert G. Merrick Jr. Research Chairholder
B.S. 1993 | Ph.D. 1998, Ruhr-Universitat Bochum, Germany

Dimitri A. Sverjensky (1984)
Professor, Earth and Planetary Sciences
B.S. 1974, University of Sydney
M.Phil. 1977 | Ph.D. 1980, Yale University

Morris Swartz (1998)
Professor, Physics and Astronomy
B.S. 1976, Worcester Polytechnic Institute
Ph.D. 1983, University of Chicago

Alexander Szalay (1989)
Bloomberg Distinguished Professor, Physics and Astronomy
Alumni Centennial Professor
B.Sc. 1969, Kossuth University
M.Sc. 1972 | Ph.D. 1975, Eotvos University

Katalin Szlavecz (1998)
Associate Research Professor, Earth and Planetary Sciences

James Taylor (2014)
Associate Professor, Biology
B.Sc. 1989, The University of Vermont
Ph.D. 2006, The Pennsylvania State University

Oleg Tchernyshyov (2002)
Professor, Physics and Astronomy
Engineer-physicist 1990, Moscow Institute of Physics and Technology
Ph.D. 1998, Columbia University

Steven Teles (2008)
Professor, Political Science and Site Director for the Social Policy Program
B.A. 1989, George Washington University
Ph.D. 1995, University of Virginia

L. Nandi Theunissen (2012)
Assistant Professor, Philosophy
Duane L. Peterson Assistant Professor of Ethics
B.A. 2002, University of Western Australia
B.A. 2003 | M.A. 2006, University of Sydney
Ph.D. 2012, Columbia University

Mark Thompson (2010)
Professor and Chair, English
B.A. 1993, University of Virginia

Christy Thornton (2017)
Assistant Professor, Sociology
B.A. 2002, Barnard College
M.A. 2003, Columbia University
Ph.D. 2015, New York University

Rochelle Tobias (1996)
Professor, German and Romance Languages and Literatures
B.A. 1985, Bryn Mawr College
M.A. 1990 | Ph.D. 1996, University of California, Berkeley

Joel Tolman (2002)
Associate Professor, Chemistry
B.A. 1990, Rutgers University
Ph.D. 1997, Yale University

John Toscano (1995) Vice Dean for Natural Sciences
Professor and Chair, Chemistry
B.A. 1987, Princeton University
Ph.D. 1993, Yale University

John Tovar (2005)
Professor, Chemistry
B.S. 1997, University of California, Los Angeles
Ph.D. 2002, Massachusetts Institute of Technology

Craig Townsend (1976)
Professor, Chemistry; Biology; Biophysics
Alosoph H. Corwin Professor of Chemistry
B.A. 1969, Williams College
Ph.D. 1974, Yale University

Kellee Tsai (2000)
Research Professor, Political Science; Program in East Asian Studies
B.A. 1989, Barnard College
M.Phil. 1996 | Ph.D. 1999, Columbia University

Roel Vandez Marel (2002)
Adjunct Professor, Physics and Astronomy

Mark Van Doren (1999)
Professor, Biology
B.A. 1987, Cornell University
Ph.D. 1994, University of California, San Diego

Daniel Viete (2015)
Assistant Professor, Earth and Planetary Sciences
Ph.D. 2009, The Australian National University

Ronald Walters (1970) Professor, History
A.B. 1963, Stanford University
M.A. 1965 | Ph.D. 1971, University of California, Berkeley

Molly Warnock (2013)
Assistant Professor, History of Art
B.A. 2000, The Ohio State University

Darryn W. Waugh (1997)
Professor, Earth and Planetary Sciences
B.S. 1985 | M.S. 1987, University of Waikato
Ph.D. 1991, University of Cambridge

Hal Weaver (2006)
Research Professor, Physics and Astronomy
B.S. 1975, Duke University

Bernadette Wegenstein (2006)
Professor of Media Studies, German and Romance Languages and Literatures
B.A. 1990 | M.Phil. 1993 | Ph.D. 1998, University of Vienna

Beverly R. Wendland (1998)
James B. Knapp Dean of the Krieger School of Arts and Sciences
Professor, Biology; Biophysics
B.S. 1986, University of California, San Diego
Ph.D. 1994, Stanford University

June K. Wicks (2017)
Assistant Professor, Earth and Planetary Sciences
B.S. 2008 | M.S. 2010 | Ph.D. 2013, California Institute of Technology

Michael Williams (2000)
Krieger-Eisenhower Professor of Philosophy
B.A. 1968, University of Oxford
Ph.D. 1973, Princeton University

Associate Professor, Cognitive Science
B.A. 1995, University of Colorado
Ph.D. 2000, The Johns Hopkins University

W. Stephen Wilson (1977)
Professor, Mathematics
S.B. 1968 | S.B. 1969 | Ph.D. 1972, Massachusetts Institute of Technology

Sarah Woodson (1999)
Professor, Biophysics; Biology
Thomas C. Jenkins Professor of Biophysics
B.A. 1982, Kalamazoo College
Ph.D. 1987, Yale University

Jonathan Wright (2008)
Professor, Economics
B.A. 1990, Trinity College, Dublin
M.Sc. 1992, London School of Economics

Rosemary Wyse (1987)
Professor, Physics and Astronomy
B.Sc. 1978, University of London
Ph.D. 1982, University of Cambridge

David R. Yarkony (1977)
D. Mead Johnson Professor of Chemistry
B.A. 1971, SUNY Stony Brook
Ph.D. 1975, University of California, Berkeley

Dimitrios Yatromanolakis (2003)
Associate Professor, Classics; Anthropology; Comparative Thought and Literature
B.A. 1992, University of Athens
M.St. 1993 | D.Phil. 1998, University of Oxford

David Yezzi (2014)
Associate Professor, The Writing Seminars
B.F.A 1988, Carnegie Mellon University
M.F.A 1995, Columbia University

Alan L. Yuille (2015)
Bloomberg Distinguished Professor, Cognitive Science; Computer Science
B.A. 1976 | Ph.D. 1981 University of Cambridge

Emily Zackin (2013)
Assistant Professor, Political Science
B.A. 2002, Swarthmore College
M.A. 2004, Columbia University
Ph.D. 2010, Princeton University

Benjamin Zaitchik (2008)
Associate Professor, Earth and Planetary Sciences
A.B. 1998, Harvard University
M.S. 2001, Cornell University
Ph.D. 2006, Yale University

Nadia Zakamska (2010)
Associate Professor, Physics and Astronomy
B.Sc. 1999 | M.Sc. 2001, Moscow Institute of Physics and Technology
Ph.D. 2005, Princeton University

Valentin Zakharevich (2018)
J.J. Sylvester Assistant Professor of Mathematics
B.S. 2010, Polytechnic Institute of New York University
M.S. 2012, Université Paris-Sud / Universiteit Leiden (Algant)
Ph.D. 2018, University of Texas, Austin

Alessandro Zannirato (2005)
Associate Teaching Professor, German and Romance Languages and Literatures
B.A. 1999, Scuola Superiore per Interpreti e Traduttori del Comune di Milano
Laurea 2002, Libera Universita degli Studi
Ph.D. 2006, University of Cape Town

Nino Zchomelidse (2002)
Associate Professor, History of Art
M.A. 1987, University of Munich
Ph.D. 1992, University of Bern

Haiqing Zhao (2002)
Professor, Biology
B.S. 1985 | M.S. 1988, Beijing University
Ph.D. 1997, Yale University

Yixian Zheng (1999)
Adjunct Professor, Biology

Steven Zucker (1984)
Professor, Mathematics
Ph.D. 1974, Princeton University

Other Faculty Appointments

Lecturers

Bruce Anderson (2010)
Senior Lecturer, German and Romance Languages and Literatures

Austin Allen (2014)
Lecturer, The Writing Seminars

Flavia Azeredo Cerqueira (2014)
Associate Teaching Professor, German and Romance Languages and Literatures

Sanchita Balachandran, M.A.
Senior Lecturer, Near Eastern Studies
Curator JH Archaeological Museum

Robert J. Barbera (2010)
Lecturer, Economics
Co-Director, Center for Financial Economics

Donald Berger
Lecturer, Program in Expository Writing

Jeffrey Bowen (2017)
Lecturer, Psychological and Brain Sciences
B.S. 2011, Cornell University
Ph.D. 2013, University of California, Santa Barbara

Anne Elizabeth Brodsky (2007)
Lecturer, Program in Expository Writing
Richard Brown
Senior Lecturer, Mathematics

Lucy Bucknell (2000; 2008)
Senior Lecturer, Program in Film and Media Studies

Jerry L. Burgess (2014)
Lecturer, Earth and Planetary Sciences
B.A. 1989, North Carolina State University
M.S. 1994, University of Maryland at College Park

Victoria Cass (2014)
Lecturer, Program in East Asian Studies
B.A. 1967, Cornell University
M.A. 1969, Yale University
Ph.D. 1979, University of California at Berkeley

Aiguo Chen (2008)
Lecturer, Center for Language Education
B.A. 1980 | M.A. 1984, Dalian University
M.A. 1994, Millersville University

Xin Chen, Ph.D.

Grecia Chirinos-Delgado (2017)
Lecturer, German and Romance Languages and Literatures
B.A. 2010, Pontificia Universidad Católica del Perú

Zvi Cohen (2001)
Lecturer, Center for Language Education
B.Sc. 1987, Hebrew University
M.A. 1995 | Ph.D. 1999, University of Pittsburgh

Kristin Cook-Gailloud (2009)
Senior Lecturer, German and Romance Languages and Literatures

Anna Coppola (2015)
Lecturer, Biology
B.Sc., 2001 | Ph.D. 2005, University of Naples

Larissa D’Souza (2013)
Senior Lecturer, Chemistry
B.S. 1992, University of Bombay
M.S. 2003 | Ph.D. 2008, Oklahoma State University, Stillwater

Ana Damjanovic (2004)
Lecturer, Biophysics
B.Sc. 1995, University of Belgrade
Ph.D. 2001, University of Illinois at Urbana-Champaign

Somasree Dasgupta (2018)
Lecturer, Economics
B.S. 2003, University of Calcutta
M.S. 2005, Indian Statistical Institute
M.A. 2006 | Ph.D. 2011, The Ohio State University

Tristan Davies (1987; 1997)
Senior Lecturer, The Writing Seminars

Linda DeLibero (2001)
Special Advocate for Alumni and Outreach, Program in Film and Media Studies
Senior Lecturer, Program in Film and Media Studies
B.A | M.A., Case Western University

M.A., The Johns Hopkins University

Margaret Denithorne (2007)
Lecturer, Program in Theater Arts and Studies

William Evans (2005)
Associate Director and Senior Lecturer, Program in Expository Writing
A.B. 1977, Hobart College
M.A. 1980, University of New Hampshire
M.F.A. 1988, Cornell University

Carolyn Fitch (2012)
Senior Lecturer, Biophysics

Patrick Fleming (2004; 2007)
Senior Lecturer, Biophysics

Heather Roberts Fox, Ph.D.
Psychological and Brain Sciences

Robert Freedman, Ph.D.
Adjunct Professor

Political Science

James Glossman (2004)
Lecturer, Program in Theater Arts and Studies

Claude Guilemmard, D.E.A.
Senior Lecturer, German and Romance Languages and Literatures
D.E.A. 1989, École Normale Supérieure

Iryna Hniadzko (2018)
Lecturer, Center for Language Education
B.A. 2006 | M.A. 2008, St. Petersburg State University

Senior Lecturer, Biology
B.S. 1971, Massachusetts Institute of Technology
Ph.D. 1979, The Johns Hopkins University

Audrey Huang (2005)
Lecturer, Biology
M.A. 2004, The Johns Hopkins University
B.A. 1993 | Ph.D. 2000, University of California, Berkeley

Aránzazu M. Hubbard (2010)
Senior Lecturer, German and Romance Languages and Literatures
B.A. 1999, University of Economy and Business Sciences, Grenada
M.A. 2006, National University in Spain - Institute Cervantes

Muhammad Hussain (2017)
Lecturer, Economics
B.S.S. 2003, University of Dhaka
M.A. 2008 | Ph.D. 2015, Georgia State University

Sana Jafir (2014)
Lecturer, Center for Language Education
M.A. 2008, University of Massachusetts, Boston

Fatma Talaat Ismail (2018)
Lecturer, Center for Language Education

Ann Jarema, M.S.
Psychological and Brain Sciences 2007

Sahar Masri Jendi (2018)
Lecturer, Center for Language Education
B.A. 1985, Damascus University
M.A. 2003, New Jersey City University

Fumiko Joo (2014)
Lecturer, Program in East Asian Studies

Satoko Katagiri (2003)
Lecturer, Center for Language Education
B.A. 1997, University of South Carolina
M.A. 2001 | M.A. 2003, The Ohio State University

Jian Kong (2004)
Senior Lecturer, Mathematics

Chris Kraft (2002)
Psychological and Brain Sciences

Huei-ying Kuo, Ph.D.
Senior Lecturer, Sociology
B.A. 1993 | M.A. 1996, National Taiwan University
M.A. 2002 | Ph.D. 2007, State University of New York, Binghamton

Beatrice Lang (2006)
Lecturer, German and Romance Languages and Literatures
B.A. 1992, University of Oxford

Lynn Johnson Langer (2001)
Senior Lecturer, Advanced Academic Programs; Biology
M.B.A., The Johns Hopkins University
Ph.D., Antioch University

Marc Lapadula (2000)
Lecturer, Summer and Intercession Programs
B.A. 1983, University of Pennsylvania
M.A. 1984, University of East Anglia
M.F.A. 1987, University of Iowa

Soo Yun Lee (2016)
Lecturer, Center for Language Education
B.A. 2007, Chung-Ang University
M.A. 2009, SUNY, Buffalo

Susan S. Lee (2014)
Lecturer, Center for Language Education
B.S. 2004, Northwestern College
M.A. 2013, Hamline University

Andrea Leone-Pizzighella (2014)
Lecturer, Center for Language Education
B.A. 2012, University of Massachusetts, Boston
M.S.Ed. 2015, University of Pennsylvania

Julie Lirot (2014)
Lecturer, German and Romance Languages and Literatures
B.A. 1992, Michigan State University
M.A. 1995 | Ph.D. 2002, University of Arizona

Julio López-Raja (2015)
Lecturer, German and Romance Languages and Literatures
B.A. 2010, University of Murcia
M.A. 2011, University of Valencia

M.A. 2015, West Virginia University

John Mann (2004; 2008)
Senior Lecturer, Program in Film and Media Studies
B.A. 1974 | M.Ed. 1983, University of North Carolina - Chapel Hill
M.A. 1989, Kansas University
Ed.D. 1987, University of North Carolina - Greensboro

Joseph H. Martin (2010)
Lecturer, Program in Theater Arts and Studies
B.A., George Washington University
M.A. | Ph.D., University of British Columbia

Naiara Martinez-Velez (2011)
Lecturer, German and Romance Languages and Literatures
M.A. 2001, West Virginia University

Laura Mason (2011)
Senior Lecturer, Program in Film and Media Studies
B.A. 1981, University of California, Santa Cruz

Barbara Morgan, Ph.D.
Senior Lecturer, Economics
B.A. | M.A., University of Cambridge
Ph.D. 1994, Florida State University

Shani Mott (2016)
Lecturer, Center for Africana Studies
B.A. 1998, Wesleyan University
Ph.D. 2005, University of Michigan, Ann Arbor

Anne-Elizabeth Murdy Brodsky (2007)
Lecturer, Program in Expository Writing
B.A. 1989, Haverford College
M.A. 1990 | Ph.D. 1997, University of Chicago

Makiko Nakao (1994)
Lecturer, Center for Language Education
B.A. 1987, Kansai Gaidai University
M.A. 1989, Miami University
M.A. 1991, Ohio State University

Katharine Noel (2013)
Senior Lecturer, The Writing Seminars
B.A. 1992, Wesleyan University
M.F.A. 1997, University of Arizona

Carolyn Rice Norris (2000)
Senior Lecturer, Biology
B.S. 1984, University of Illinois, Urbana
Ph.D. 1990, University of Wisconsin, Madison

Marie Theresa O’Connor (2010)
Lecturer, Program in Expository Writing
B.S. 1991, Lehigh University
J.D. 1994, University of Chicago Law School
M.A. 2000 | Ph.D. 1009, University of Chicago

Sakiko Olsen (1973)
Senior Lecturer, Earth and Planetary Sciences
B.A. 1955, Northwestern University
Ph.D. 1972, The Johns Hopkins University

George Oppel (2010)
Lecturer, Program in Expository Writing
B.A. 1994, Griffith University
M.A. 2006, The Johns Hopkins University

Marvin C. Ott (2012)
Lecturer, Program in East Asian Studies
B.A. 1963, University of Redlands
M.A. 1969, The Johns Hopkins University School of Advanced International Studies

Louise Pasternack, Ph.D.
Lecturer, Summer and Intercession Programs

Rebecca Pearlman (2001)
Senior Lecturer, Biology
B.S. 1991, University of Michigan, Ann Arbor
Ph.D. 1999, University of Wisconsin, Madison

Ludmila Poliakova (2017)
Lecturer, Economics
B.S. 1998, University of Telecommunications, Russia
M.A. 2006 | Ph.D. 2016, University of California, Davis

Matthew Porterfield (2008)
Lecturer, Program in Film and Media Studies

Maria Procopio (2016)
Lecturer, Biophysics
B.S. 1991, University of Michigan, Ann Arbor
M.Sc. 2004, Ph.D. 2010, University of Bologna

Leonardo Proietti (2015)
Lecturer, German and Romance Languages and Literatures
Laurea 2006, University of Perugia
M.A. 2013, University of California, Los Angeles

Maria del Rosario Ramos (2008)
Senior Lecturer, German and Romance Languages and Literatures
B.S. 1986, University of Puerto Rico
M.A. 1993, University of Maryland, College Park
Ph.D. 1998, The Johns Hopkins University

Christov Roberson (2012)
Senior Lecturer, Biology
B.S. 1995, Northern Arizona University
Ph.D. 2004, Harvard University

Shannon Robinson (2014)
Lecturer, The Writing Seminars
B.A. 1994 | M.A. 1995, University of Toronto
M.F.A. 2011, Washington University in St. Louis

Jimmy J. Roche (2010)
Lecturer, Program in Film and Media Studies
B.F.A. 2004, SUNY Purchase
M.F.A. 2008, Maryland Institute College of Art

Lecturer, Program in Theater Arts and Studies

Suzanne Roos (1993)
Senior Lecturer, German and Romance Languages and Literatures
B.A. 1982, Cornell University
M.Phil. 1990, Yale University

Uma A. Saini (2000)
Senior Lecturer, Center for Language Education
B.A. | M.A. Delhi University
M.A., American University

Richard Shingles (2005)
Lecturer, Biology
B.S. 1979, Carleton University
B.Ed. 1988, University of Toronto
M.S. 1981, University of Manitoba
Ph.D. 1986, University of Guelph

Joanne Cavanagh Simpson (1999)
Lecturer, The Writing Seminars
B.S. 1989, University of Maryland, College Park
M.A. 1997, The Johns Hopkins University
M.F.A. 2018, Goucher College

Jamie Sorenson (2005)
Lecturer, Biophysics
B.S. 2010, University of Rochester
Ph.D. 2016, The Johns Hopkins University

Magali Spiker (2018)
Lecturer, German and Romance Languages and Literatures
B.A. 2011, Unitoledo

Ying Sun (2018)
Lecturer, Center for Language Programs
B.A. 2015, East China Normal University
M.A. 2017, Indiana University, Bloomington

Alexandra Tan, Ph.D.
Senior Lecturer, Biophysics

Sunita Thyagarajan (2015)
Senior Lecturer, Chemistry
B.S. 1993, University of Delaware
M.S. 1995, Indian Institute of Technology
Ph.D. 2002, University of Delaware

Kathryn E. Tifft (2012)
Senior Lecturer, Biology
B.A. 2001, Vassar College
Ph.D. 2009, The Johns Hopkins University

Michelle Tracy (2007)
Senior Lecturer, German and Romance Languages and Literatures
B.A. 1999, Otterbein College
M.A. 2006, The Johns Hopkins University

Jason Trageser, Ph.D.
Senior Lecturer, Psychological and Brain Sciences
B.S. 2000 | B.A. 2000, University of Maryland, Baltimore County
Ph.D. 2005, University of Maryland, School of Medicine

Sydney van Morgan (2014)
International Studies Program Director
Administrative Director, International Centers and Programs
Senior Lecturer, Program in International Studies
B.A. 1993, University of Puget Sound
M.Sc. 1994, University of Edinburgh
Ph.D. 2003, Cornell University

Michelle Walsh (2016)
Lecturer, Center for Language Education
B.A. 2004, Salisbury University

Meredith Ward (2008)
Director and Senior Lecturer, Program in Film and Media Studies
B.A. 2003, The Johns Hopkins University
M.A. 2004 | Ph.D. 2015, Northwestern University

Aliza Hapgood Watters (2013)
Lecturer, Program in Expository Writing Program
B.A. 2005, Middlebury College
M.A. 2006 | Ph.D. 2011, University of Oxford

Heidi Wheeler (1999)
Senior Lecturer, German and Romance Languages and Literatures
B.A. 1987, Southern Illinois University
M.A. 1993, University of Kansas
Ph.D. 1999, The Johns Hopkins University

Greg Williamson (1990)
Senior Lecturer, The Writing Seminar
B.A. 1987, Vanderbilt University
M.A. 1987, University of Wisconsin, Madison
M.A. 1989, The Johns Hopkins University

April Wuensch (2004)
Senior Lecturer, German and Romance Languages and Literatures
B.A. 1994, American University in Paris
M.A. 1995, University of London
Ph.D. 2004, The Johns Hopkins University

Julia Yarmolinskaya (2007)
Lecturer, Center for Language Education
B.B.A. 1999, Russian Institute of Economics and Finance
B.A. 2000, Pacific Union College

Lecturer, Program in Film and Media Studies
B.A. 1998, Duke University
M.F.A. 1990, Yale University

Jin Yin (2016)
Lecturer, Center for Language Education
B.A. 2009, Dalian University of Foreign Languages
M.A. 2012, Sun Yat-sen Universitys
M.A. 2014, Brandeis University

Lu Yin (2016)
Lecturer, Center for Language Education
B.A. 2010, Beijing International Studies University

Nan Zhao (2012)
Lecturer, Center for Language Education
B.A. 1999, Beijing Foreign Studies University
M.Ed. 2005, Boston University

Military Science

Michael Gorreck
Lieutenant Colonel
Director

Russell Buckhalt
Major
Assistant Professor

David Normand
Major
Assistant Professor

David Yi
Captain
Assistant Professor

Erik Mineo
Captain, Director for Scholarship and Enrollment

Rodney Graves
Master Sergeant
Senior Military Instructor

Bart Sime
Sergeant First Class
Military Instructor

Tim O’Neil
Recruiting Officer

Joint Appointments

Marilyn Albert, Ph.D.
Professor (School of Medicine)
Psychological and Brain Sciences

Richard Allen, Ph.D.
Assistant Professor (School of Medicine)
Psychological and Brain Sciences

Nan Marie Astone, Ph.D.
Associate Professor (Bloomberg School of Public Health)
Sociology

Jay Baraban, Ph.D.
Professor (School of Medicine)
Psychological and Brain Sciences

Stanley Becker, Ph.D.
Professor (Bloomberg School of Public Health)
Program in Public Health Studies

David Bishai, Ph.D.
Associate Professor (Bloomberg School of Public Health)
Economics; Program in Public Health Studies

Amanda Blackford, Sc.M.
Biostatistician (School of Medicine)
Program in Public Health Studies Program

Dana F. Boatman
Associate Professor (School of Medicine)
Cognitive Science

Lee Bone, M.P.H., R.N.
Associate Professor (Bloomberg School of Public Health) Program in Public Health Studies

Lawrence Cheskin, M.D. Associate Professor (Bloomberg School of Public Health) Program in Public Health Studies

Nathaniel Comfort, Ph.D. Associate Professor (School of Medicine) History of Science and Technology

Charles Edward Connor, Ph.D. Professor (School of Medicine) Director, Krieger Mind/Brain Institute Psychological and Brain Sciences

Leslie Cope, Ph.D., M.S.E. Assistant Professor (School of Medicine) Public Health Studies Program

John Desmond, Ph.D. Associate Professor (School of Medicine) Cognitive Science

William Eaton, Ph.D. Professor (Bloomberg School of Public Health) Sociology

David Edwin, Ph.D. Associate Professor (School of Medicine) Psychological and Brain Sciences

Jason Eisner, Ph.D. Associate Professor (Whiting School of Engineering) Cognitive Science

Margaret Ensminger, Ph.D. Professor (Bloomberg School of Public Health) Sociology

Joshua M. Epstein, Ph.D. Professor (School of Medicine) Economics

Greg Eyink, Ph.D. Professor (Whiting School Engineering) Mathematics; Physics and Astronomy

Ruth Faden, Ph.D. Professor (Bloomberg School of Public Health) Policy Studies Program, Institute for Policy Studies

Michael Falk, Ph.D. Professor (Whiting School of Engineering) Physics and Astronomy

Mary Fissell, Ph.D. Professor (School of Medicine) History; History of Science and Technology

Kelly Gebo, M.D., M.P.H. Professor (School of Medicine) Sociology; Program in Public Health Studies

Barry Gordon, M.D. Professor (School of Medicine) Cognitive Science

Seth Guikema, Ph.D. Assistant Professor (Whiting School of Engineering) Earth and Planetary Sciences

Steve Hanke, Ph.D. Professor (Whiting School of Engineering) Economics

Marta Hanson, Ph.D. Assistant Professor (School of Medicine) History of Science and Technology

Ciaran Harman, Ph.D. Assistant Professor (Whiting School of Engineering) Earth and Planetary Sciences

Kevin Hemker, Ph.D. Professor (Whiting School of Engineering) Earth and Planetary Sciences

Stewart Hendry, Ph.D. Professor (School of Medicine) Krieger Mind/Brain Institute; Psychological and Brain Sciences

Argye Hillis-Trupe, Ph.D. Professor (School of Medicine) Cognitive Science

Pien-Chien Huang, Ph.D. Professor (Whiting School of Engineering) Biophysics

Takeru Igusa, Ph.D. Professor (Bloomberg School of Public Health) Economics

Scott Kahan, M.D., M.P.H. Instructor (Bloomberg School of Public Health) Program in Public Health Studies

Alfredo Kirkwood, Ph.D. Associate Professor (School of Medicine) Krieger Mind/Brain Institute; Psychological and Brain Sciences

Pravin Krishna, Ph.D. Chung Ju Yung Distinguished Professor of International Economics and Business (SAIS) Economics

Thomas LaVeist, Ph.D. Professor (Bloomberg School of Public Health) Sociology; Program in Public Health Studies

Philip Leaf, Ph.D. Professor (Bloomberg School of Public Health) Program in Public Health Studies

Lori Leonard, Ph.D. Associate Professor (Bloomberg School of Public Health) Sociology

Harry Marks, Ph.D. Associate Professor (School of Medicine)
Anthropology; History; History of Science and Technology

Guy McKhann, M.D.
Professor (School of Medicine)
Krieger Mind/Brain Institute; Cognitive Science; Psychological and Brain Sciences

Graham Mooney, Ph.D.
Assistant Professor (School of Medicine)
History of Science and Technology

Vicente Navarro, Ph.D.
Professor (Bloomberg School of Public Health)
Sociology; Policy Studies Program; Institute for Policy Studies

Sandra Newman, Ph.D.
Professor (Bloomberg School of Public Health)
Sociology

Jian Ni, Ph.D.
Associate Professor (Carey Business School)
Economics

Ernst Niebur, Ph.D.
Professor (School of Medicine)
Krieger Mind/Brain Institute; Psychological and Brain Sciences

Mitsukuni Nishida, Ph.D.
Assistant Professor (Carey Business School)
Economics

Catherine Norman, Ph.D.
Assistant Professor (Whiting School of Engineering)
Economics

Randall Packard, Ph.D.
Professor (School of Medicine)
History; History of Science and Technology

Cindy Parker, M.D., M.P.H.
Assistant Professor (Bloomberg School of Public Health)
Earth and Planetary Sciences

Elizabeth Patton, Ph.D.
Senior Lecturer (Krieger School of Arts and Sciences)
Alexander Grass Humanities Institute; Advanced Academic Programs.

Darcy Phelan, Ph.D.
Assistant Scientist (Bloomberg School of Public Health)
Public Health Studies Program

Paula Pitha-Rowe, Ph.D.
Professor (School of Medicine)
Biology

Gianna Pomata, Ph.D.
Professor (School of Medicine)
German and Romance Languages and Literatures; History of Science and Technology

Alessandro Rebucci, Ph.D.
Associate Professor (Carey Business School)
Economics

Kenneth Rose, Ph.D.
Professor (School of Medicine)

Earth and Planetary Sciences

Erica J. Schoenberger, Ph.D.
Professor (Whiting School of Engineering)
Anthropology

Peter Searson, Ph.D.
Professor (Whiting School of Engineering)
Physics and Astronomy

Robert Siliciano, M.D., Ph.D.
Professor (School of Medicine)
Biology

Emilia Simeonova, Ph.D.
Assistant Professor (Carey Business School)
Economics

Shubhranshu Singh, Ph.D.
Assistant Professor (Carey Business School)
Economics

Katherine Smith, Ph.D.
Associate Professor (Bloomberg School of Public Health)
Sociology

Marc Stein, Ph.D.
Assistant Professor (School of Education)
Sociology

Donald Steinwachs, Ph.D.
Professor (Bloomberg School of Public Health)
Public Health Studies Program

Veit Stuphorn, Ph.D.
Professor (School of Medicine)
Psychological and Brain Sciences

James Tielsch, Ph.D.
Professor (Bloomberg School of Public Health)
Public Health Studies Program

Daniel Todes, Ph.D.
Professor (School of Medicine)
History of Science and Technology

Michael Trush, M.P.H.
Professor (Bloomberg School of Public Health)
Public Health Studies Program

Amy Ong Tsui, Ph.D.
Professor (Bloomberg School of Public Health)
Sociology

Rudiger von der Heydt, Ph.D.
Professor (School of Medicine)
Krieger Mind/Brain Institute; Psychological and Brain Sciences

David Weishample
Professor (School of Medicine)
Earth and Planetary Sciences

Susan Weiss, Ph.D.
Chair/Faculty (Peabody Institute)
German and Romance Languages and Literatures
Peter Wilcock, Ph.D.
Professor (Whiting School of Engineering)
Earth and Planetary Sciences

Michael Yu, Ph.D.
Associate Professor (Whiting School of Engineering)
Chemistry

Scott Zeger, Ph.D.
Professor (Bloomberg School of Public Health)
Program in Public Health Studies Program

Barry Zirkin, M.P.H.
Professor (Bloomberg School of Public Health)
Program Public Health Studies Program

Whiting School of Engineering

In listing the members of the teaching staff of the School of Engineering, the date in parentheses indicates the year of original appointment. Any joint appointments or directorships are listed last.

Professors Emeriti

John Boland, Ph.D.
Environmental Health and Engineering

Grace Brush, Ph.D.
Environmental Health and Engineering

Robert (Tony) Dalrymple, Ph.D.
Civil Engineering

Frederic Davidson, Ph.D.
Electrical and Computer Engineering

Moise H. Goldstein Jr., D.Sc.
Electrical and Computer Engineering

Willis Gore
Electrical and Computer Engineering

Robert Green, Ph.D.
Materials Science and Engineering

Cila Herman, Ph.D.
Mechanical Engineering

Richard I. Joseph, Ph.D.
Electrical and Computer Engineering

Alexander Kaplan, Ph.D.
Electrical and Computer Engineering

Joseph L. Katz, Ph.D.
Chemical and Biomolecular Engineering

Jerome Kruger, Ph.D.
Materials Science and Engineering

Gerard G. L. Meyer, Ph.D.
Electrical and Computer Engineering

C. Harvey Palmer Jr., Ph.D.
Electrical and Computer Engineering

Wilson J. Rugh, Ph.D.
Electrical and Computer Engineering

William Sharpe, PhD.
Mechanical Engineering

Eugene D. Shchukin, Ph.D.; Dr.Sc.
Research Professor Emeritus, Environmental Health and Engineering

Charles (Roger) Westgate, Ph.D.
Electrical and Computer Engineering

Professors

Soumyadipta Acharya (2010)
Assistant Research Professor, Biomedical Engineering

Hedy Alavi (1997)
Associate Teaching Professor and Assistant Dean for International Programs

Environmental Health and Engineering

B.S. 1972, Jundi Shapour University

M.B.A. 2006, The Johns Hopkins University

M.S. 1980, The Ohio State University; Ph.D. 1983

Yair Amir (1995)
Professor, Computer Science

B.S. 1985, Technion, Haifa, M.S. 1990

Ph.D. 1995, Hebrew University of Jerusalem

Andreas Andreou (1987)
Professor, Electrical and Computer Engineering

B.S. 1978, Higher Technical Institute, Cyprus

M.S. 1982, Johns Hopkins University, Ph.D. 1986

Siamak Ardekani (2006)
Assistant Research Professor, Biomedical Engineering

Raman Arora (2014)
Assistant Professor, Computer Science

B.S. 2001, Netaji Subhas Institute of Technology

M.S. 2005, University of Wisconsin, Madison, Ph.D. 2009

Avanti Athreya (2011)
Assistant Research Professor; Applied Mathematics and Statistics

Joel Bader (2003)
Professor, Biomedical Engineering

Computer Science

B.S. 1986, Lehigh University

Ph.D. 1993, UC Berkeley

Ishan Barman (2014)
Assistant Professor, Mechanical Engineering

B.S. 2005, Indian Institute of Technology

M.S. 2007, Massachusetts Institute of Technology; Ph.D. 2011

Amitabh Basu (2018)
Associate Professor, Applied Mathematics and Statistics

B.S. 2004, Indian Institute of Technology

M.S. 2006, Stony Brook University; Ph.D. 2010, Carnegie Mellon University

Alexis Battle (2018)
Associate Professor, Biomedical Engineering

B.S. 2003, Stanford University; Ph.D. 2013

Muyinatu A. Lediju Bell (2016)
Assistant Professor, Electrical and Computer Engineering
B.S. 2006 Massachusetts Institute of Technology
Ph.D. 2012, Duke University

Michael J. Betenbaugh (1988)
Professor, Chemical and Biomolecular Engineering
B.S. 1981, University of Virginia
Ph.D. 1988, University of Delaware

Michael Bevan (2008)
Professor, Chemical and Biomolecular Engineering
B.S. 1994, Lehigh University
Ph.D. 1999, Carnegie Mellon University

Maxim Bichuch (2015)
Assistant Professor, Applied Mathematics and Statistics
B.S. 2001, Tel-Aviv University
M.S. 2003, New York University
Ph.D. 2010, Carnegie Mellon University

Edward J. Bouwer (1985)
Abel Wolman Professor, Environmental Health and Engineering; Civil Engineering
B.S. 1977, Arizona State University
M.S. 1978, Stanford, Ph.D. 1982

Patrick Boyle (2015)
Assistant Research Professor, Biomedical Engineering

Vladimir Braverman (2018)
Associate Professor, Computer Science
B.S. 1998, M.S. 2004, Ben-Gurion University at Negev
Ph.D. 2011, University of California, Los Angeles

Grace S. Brush (1978)
Professor Emeritus, Environmental Health and Engineering
B.S. 1949, St. Francis Xavier University
M.S. 1951, University of Illinois
Ph.D. 1956, Harvard

Tamas Budavari (2014)
Assistant Professor, Applied Mathematics and Statistics
M.S. 1997, Eotvos Lorand University, Budapest; Ph.D. 2001

Randal Burns (2001)
Professor, Computer Science
B.S. 1993, Stanford
M.S. 1997, UC Santa Cruz, Ph.D. 2000

Yinzi Cao (2018)
Assistant Professor, Computer Science
Ph.D. 2014

Nicholas Charon (2015)
Assistant Professor, Applied Mathematics and Statistics

Mingwei Chen (2017)
Professor, Materials Science and Engineering
B.S. 1988, China University of Mining and Technology
M.S. 1991, Taiyuan University
Ph.D. 1995, Shanghai Jiao Tong University

Yun Chen (2015)
Assistant Professor, Mechanical Engineering

B.S. 1998, National Taiwan University, M.S. 2000
Ph.D. 2007, University of North Carolina

Sang (Peter) Chin (2011)
Assistant Research Professor, Electrical and Computer Engineering

Gregory S. Chirikjian (1992)
Professor, Mechanical Engineering; Computer Science; Electrical and Computer Engineering;
Applied Mathematics and Statistics
B.S. 1988, The Johns Hopkins University; M.S. 1988
Ph.D. 1992, California Institute of Technology

Paulette Clancy (2018)
Professor, Head, Chemical and Biomolecular Engineering
Ph.D. 1977

William Cook (2018)
Professor, Applied Mathematics and Statistics
Ph.D. 1983

Noah Cowan (2003)
Professor, Mechanical Engineering;
Computer Science
B.S. 1995, Ohio State, M.S., 1997
Ph.D. 2001 University of Michigan

Honggang Cui (2010)
Associate Professor, Chemical and Biomolecular Engineering
B.S. 1999 Beijing University of Chemical Technology
M.S. 2002, Tsinghua University
Ph.D. 2007, University of Delaware

Nitin Daphalapurkar (2012)
Assistant Research Professor, Mechanical Engineering

Najim Dehak (2016)
Assistant Professor, Electrical and Computer Engineering
B.Eng. 2003, University of Sciences and Technology d'Oran
S.M. 2004, Pierre and Marie Curie University
Ph.D. 2009, Ecole de Technologie

Michael Dinitz (20141)
Assistant Professor, Computer Science
B.S. 2005, Princeton University
Ph.D. 2010, Carnegie Mellon University

Marc D. Donohue (1979)
Professor, Chemical and Biomolecular Engineering Director, Advanced Technology Lab
B.S. 1973, Clarkson College of Technology
Ph.D. 1977, UC Berkeley

Andrew S. Douglas (1983)
Professor, Mechanical Engineering; Biomedical Engineering
Vice Dean for Faculty, Whiting School of Engineering (2007)
B.S. 1975, University of Cape Town, M.S. 1977
Ph.D. 1982, Brown University

Nicholas Durr (2016)
Assistant Professor, Biomedical Engineering
B.S. 2003, University of California, Berkeley; M.S. 2007
Ph.D. 2010, University of Texas, Austin

Jason Eisner (2000)
Faculty Listings

Professor, Computer Science
B.S. 1990, Harvard
M.S. 1993, Cambridge University
Ph.D. 2001, University of Pennsylvania

Jafaar El-Awady (2010)
Associate Professor, Mechanical Engineering
B.S. 2001, Cairo University M.S. 2003
Ph.D. 2008, University of California, Los Angeles

Mounya Elhilali (2008)
Associate Professor, Electrical and Computer Engineering
B.S. 1998, Al Akhawayn University
M.S. 2003, University of Maryland; Ph.D. 2004

J. Hugh Ellis (1984)
Professor, Environmental Health and Engineering, Civil Engineering
B.S. 1979, University of Waterloo, M.S. 1981, Ph.D. 1984

Jonah Erlebacher (2000)
Professor and Chair, Materials Science and Engineering
Chemical and Biomolecular Engineering
B.S. 1991, Yale; Ph.D. 1999, Harvard University

Ralph R. Etienne-Cummings (1998)
Professor and Chair, Electrical and Computer Engineering
Associate Director of Education and Outreach Programs in the
Engineering Research Center for Computer-Integrated Surgical Systems and
Technology.
B.S. 1988, Lincoln University
Ph.D. 1995, University of Pennsylvania

Gregory Eyink (2002)
Professor, Applied Mathematics and Statistics;
Mechanical Engineering; Mathematics (A&S)
B.S. 1981, Ohio State, Ph.D. 1987

Michael Falk (2013)
Professor, Materials Science and Engineering
Vice Dean for Undergraduate Education, Whiting School of Engineering
(2017)
B.A. 1990, The Johns Hopkins University; M.S.E. 1991
Ph.D. 1998, University of California

Andrew Feinberg (2015)
Bloomberg Distinguished Professor; Biomedical Engineering
Inaugural Daniel Coit Gilman Scholar, Johns Hopkins University
King Fahd Professor of Medicine, Oncology, and Molecular Biology &
Genetics, Johns Hopkins University School of Medicine
Professor of Biostatistics, Johns Hopkins Bloomberg School of Public Health
Director, Center for Epigenetics, Johns Hopkins Institute for Basic Biomedical Sciences
Chief, Division of Molecular Medicine, Department of Medicine
B.A. 1973, The Johns Hopkins University School of Medicine; M.D. 1976;
M.PH. 1981

Paul Ferrero (2015)
Bloomberg Distinguished Professor, Environmental Health and Engineering
Bloomberg Distinguished Professor Carey School of Business
B.A. 1990, Duke University; M.S. 1994
Ph.D. 2001, Cornell University

James A. Fill (1988)
Professor, Applied Mathematics and Statistics
Computer Science
B.S. 1976, University of Illinois; M.S. 1979, University of Chicago, Ph.D. 1980

Donniell Fishkind (2001)
Associate Research Professor, Applied Mathematics and Statistics

Amy Foster (2010)
Assistant Professor, Electrical and Computer Engineering
B.S. 2003, State University of New York at Buffalo
M.S. 2007, Cornell University, Ph.D. 2009

Mark Foster (2010)
Associate Professor, Electrical and Computer Engineering

Joëlle Fréchette (2006)
Associate Professor, Chemical and Biomolecular Engineering
B.E. 1998, École Polytechnique de Montréal

Zachary Gagnon (2011)
Assistant Professor, Chemical and Biomolecular Engineering
B.S. 2003, University of Massachusetts
M.S. 2005, Notre Dame; Ph.D. 2009

Stavros Gaitanaros (2015)
Assistant Professor, Civil Engineering
M.Sc. 2007, University of Thessaly, Greece
Ph.D. 2014, University of Texas at Austin

Dennis Gayme (2018)
Associate Professor, Mechanical Engineering
B.S. 1997, McMaster University
M.S. 1998, UC Berkeley
Ph.D. 2010, California Institute of Technology

Donald Geman (2001)
Professor, Applied Mathematics and Statistics
Electrical and Computer Engineering
B.S. 1965, University of Illinois
Ph.D. 1970, Northwestern

Helyette Geman (2011)
Research Professor, Applied Mathematics and Statistics

Sharon Gerecht (2007)
Professor, Chemical and Biomolecular Engineering
B.A. 1994, Technion – Israel Institute of Technology;
M.Sc. 1999, Tel Aviv University; Ph.D. 2004, Technion-Israel Institute of Technology

Kimia Ghobadi (2018)
Assistant Professor, Civil Engineering
Ph.D. 2014

Soudeh Ghorbani (2018)
Assistant Professor, Computer Science
Ph.D. 2016

Somnath Ghosh (2011)
The Michael G. Callas Professor, Civil Engineering
B.S. 1980, Indian Institute of Technology
M.S. 1983, Cornell University
Ph.D. 1988, University of Michigan, Ann Arbor

Edinah Gnang (2017)
Assistant Professor; Applied Mathematics and Statistics
B.S. 2005, Université de Montréal
Ph.D. 2013, Rutgers, The State University of New Jersey

John I. Goutsias (1986)
Professor, Electrical and Computer Engineering; Applied Mathematics and Statistics
B.S. 1981, National Technical University of Athens
M.S. 1982, University of Southern California, Ph.D. 1986

David Gracias (2003)
Professor, Chemical and Biomolecular Engineering
M.S. 1986, Indian Institute of Technology
Ph.D. 1999, UC Berkeley

Lori Graham-Brady (2000)
Professor and Chair, Civil Engineering
B.S. 1990, Dartmouth College

Jeffrey Gray (2002)
Professor, Chemical and Biomolecular Engineering
B.S.E. 1994, University of Michigan
Ph.D. 2000, University of Texas

Matthew Green (2018)
Associate Professor, Computer Science
B.A. 1998, Oberlin College
M.S. 2005, Ph.D. 2008, Johns Hopkins University

Luo Gu (2018)
Assistant Professor, Materials Science and Engineering
Ph.D. 2012

Mengyang Gu (2016)
Assistant Research Professor, Applied Mathematics and Statistics

James K. Guest (2005)
Associate Professor, Civil Engineering
B.S.E. 1998, University of Pennsylvania
M.S.E. 2001; M.A. 2003; Ph.D. 2005, Princeton University

Taekjip (T.J.) Ha (2016)
Bloomberg Distinguished Professor, Biomedical Engineering
Bloomberg Distinguished Professor, Biostatics and Biophysical Chemistry, Johns Hopkins School of Medicine
Bloomberg Distinguished Professor, Biostatics Krieger School of Arts and Sciences
Ph.D. 1996, University of California at Berkeley

Gregory D. Hager (1999)
Mandell Bellmore Professor, Computer Science; Electrical and Computer Engineering
B.S. 1983, Luther College
M.S. 1985, University of Pennsylvania, Ph.D. 1988

A. Shoji Hall (2016)
Assistant Professor, Materials Science and Engineering
B.S. 2010, University of California, Los Angeles
Ph.D. 2014, Pennsylvania State University

Steve H. Hanke (1969)
Professor, Environmental Health and Engineering; Economics
B.S. 1964, University of Colorado, Ph.D. 1969

Ciaran Haman (2012)
Assistant Professor, Environmental Health and Engineering
B.A. 2003, University of Western Australia; B.E. 2003
M.Sc. 2007, Ph.D. 2011, University of Illinois at Urbana-Champaign

Kevin J. Hemker (1993)
Alono G. Decker Professor, Mechanical Engineering
Materials Science and Engineering; Earth and Planetary Sciences
B.S. 1985, University of Cincinnati
M.S. 1987, Stanford University, Ph.D. 1990

Hynek Hermansky (2008)
Julian S. Smith Professor, Electrical and Computer Engineering
M.S. 1972, Technical University Brno
D. Eng. 1983, University of Tokyo

Margarita Herrera-Alonso (2007)
Assistant Professor, Materials Science and Engineering
B.S. 1997, Facultad de Quimica, M.S. 1999
M.S. 2004, University of Massachusetts, Ph.D. 2004

Benjamin F. Hobbs (1996)
Theodore M. and Kay W. Schad Professor, Environmental Health and Engineering
Applied Mathematics and Statistics
B.S. 1976, South Dakota State University
M.S. 1978, SUNY, Syracuse; Ph.D. 1983, Cornell University

Susan Hohenberger-Waters (2007)
Associate Research Professor, Computer Science
B.S. 2000, Ohio State University
M.S. 2003, MIT; Ph.D. 2006, MIT

Kalina Hristova (2001)
Professor, Materials Science and Engineering
B.S. 1987, University of Sofia, M.S. 1988
Ph.D. 1994, Duke University

Chien-Ming Huang (2017)
Assistant Professor, Computer Science
B.S. 2006, National Chiao Yung University
M.S. 2010, Georgia Institute of Technology
Ph.D. 2015, University of Wisconsin, Madison

Peng Huang (2017)
Assistant Professor, Computer Science
B.S./B.A. 2010, Peking University
Ph.D. 2017, University of California, San Diego

Todd Hufnagel (1996)
Professor, Materials Science and Engineering
B.S. 1989, Michigan Technological University
M.S. 1991, Stanford, Ph.D. 1995

S. J. Claire Hur (2017)
Assistant Professor, Mechanical Engineering
B.S. 2005, University of California, Los Angeles;
M.S. 2007, Ph.D. 2011

Pablo Iglesias (1991)
Edward J. Schaefer Professor, Electrical and Computer Engineering
Applied Mathematics and Statistics, Biomedical Engineering
B.S. 1987, University of Toronto
Ph.D. 1991, Cambridge University

Takeru Igusa (1999)
Professor, Civil Engineering
Applied Mathematics and Statistics
B.S. 1977, Harvard University
M.S. 1979, UC Berkeley, Ph.D. 1983

Iulian Iorachita (2010)
Associate Research Professor, Mechanical Engineering

Xin Jin (2017)
Assistant Professor, Computer Science
B.A./B.S. 2011, Peking University
Ph.D. 2016, Princeton University

Abhishek Jain (2014)
Assistant Professor, Computer Science
B.Tech 2006, Indian Institute of Technology
M.S. 2009, University of California, Los Angeles; Ph.D. 2012

Petr Kalab (2016)
Associate Research Professor, Chemical and Biomolecular Engineering

Sung Hoon Kang (2015)
Assistant Professor, Mechanical Engineering
B.S. 2000, Seoul National University;
M.S. 2004, Massachusetts Institute of Technology
Ph.D. 2012, Harvard University

Jin Ung Kang (1999)
Jacob Suter Jammer Professor in Electrical Engineering, Electrical and Computer Engineering
B.S. 1992, Western Washington University
M.S. 1993, University of Central Florida, Ph.D. 1996

Rachel Karchin (2018)
Professor, Biomedical Engineering
B.S. 1998, University of California, Santa Cruz
M.S. 2000, University of California, Santa Cruz
Ph.D. 2003, University of California, Santa Cruz

Professor, Materials Science and Engineering
B.S. 1978, Massachusetts Institute of Technology
Ph.D. 1982, University of California, Los Angeles

Joseph Katz (1987)
William F. Ward Distinguished Professor, Mechanical Engineering
Environmental Health and Engineering
B.S. 1977, Tel Aviv University; M.S. 1978, California Institute of Technology, Ph.D. 1982

Peter Kazanzides (2003)
Research Professor, Computer Science

Associate Professor, Computer Science
B.A. 1997, Harvard

Yannis Kevrekidis (2017)
Bloomberg Distinguished Professor, Chemical and Biomolecular Engineering, WSE
Bloomberg Distinguished Professor, Applied Mathematics and Statistics, WSE
Bloomberg Distinguished Professor, Department of Urology, School of Medicine
M.A. 1986, University of Minnesota; Ph.D. 1986

Sanjeev Khudanpur (2001)
Associate Professor, Electrical and Computer Engineering
Computer Science
B.S. 1988, Indian Institute of Technology
Ph.D. 1997, University of Maryland

Jacob Khurgin (1988)
Professor, Electrical and Computer Engineering
M.S. 1979, Leningrad Institute of Optics
Ph.D. 1987, Polytechnic University of New York

Jin Seob Kim (2014)
Assistant Research Professor, Mechanical Engineering

Marin Kobilarov (2012)
Assistant Professor, Mechanical Engineering
B.Sc. 2003, Trinity College
Ph.D. 2008, University of Southern California, Los Angeles

Philipp Koehn (2014)
Professor, Computer Science
M.S. 1994, University of Tennessee, Knoxville
Ph.D. 2003, University of Southern California

Efrosini Kokkoli (2018)
Professor, Chemical and Biomolecular Engineering
Ph.D. 1998

Konstantinos Konstantopoulos (1997)
Professor, Chemical and Biomolecular Engineering; Biomedical Engineering
B.S. 1989, National Technology University of Athens
Ph.D. 1995, Rice University

Edward J. Schaefer Professor, Computer Science
Applied Mathematics and Statistics
B.S. 1964, Andhra University
M.S. 1966, Indian Institute of Technology
Ph.D. 1969, University of Pennsylvania

David Kraemer (2014)
Associate Teaching Professor, Mechanical Engineering
B.S. 1991, University of Notre Dame
M.S. 1994, University of Michigan;
M.S. 1997, The Johns Hopkins University; Ph.D. 2001

Benjamine Langmead (2012)
Assistant Professor, Computer Science
B.S. 2003, Columbia University
M.Sc. 2009, University of Maryland-College Park; Ph.D. 2012

Teresa Lebair (2016)
Assistant Research Professor, Applied Mathematics and Statistics

Simon Leonard (2011)
Assistant Research Professor, Computer Science

Chen Li (2016)
Assistant Professor, Mechanical Engineering
B.S. 2005, Peking University
Ph.D. 2011, Georgia Institute of Technology

Rong Li (2015)
Bloomberg Distinguished Professor, Chemical and Biomolecular Engineering
Bloomberg Distinguished Professor, Department of Cell Biology, Johns Hopkins School of Medicine
B.S. and M.S. (combined) 1988, Yale University
Ph.D. 1992, University of California, San Francisco

Xin Li (2013)
Assistant Professor, Computer Science
B.S. 2002, Tsinghua University; M.S. 2005; Ph.D. 2011, University of Texas at Austin

En (Evan) Ma (1998)
Professor, Materials Science and Engineering
B.S. 1982, Tsinghua University, China, M.S. 1985
Ph.D. 1989, California Institute of Technology

Feilim Mac Gabhann (2009)
Associate Professor, Biomedical Engineering
Institute for Computational Medicine
B.E. 1997, University College, Dublin
Ph.D. 2006, The Johns Hopkins University

Enrique Mallada (2016)
Assistant Professor, Electrical and Computer Engineering
B.S. 2005, Universidad Uruguay; Ph.D. 2013, Cornell University

Hai-Quan Mao (2002)
Professor, Materials Science and Engineering
B.S. 1988, Wuhan University, Ph.D. 1993

Steven Marra (2015)
Associate Teaching Professor, Mechanical Engineering
B.S. 1993, University of Pittsburgh;
M.S. 1997, The Johns Hopkins University; Ph.D. 2001

David Masica (2013)
Assistant Research Professor, Biomedical Engineering

Patricia McGuiggen (2006)
Associate Research Professor, Materials Science and Engineering

Charles V. Meneveau (1990)
Louis M. Sardella Professor, Mechanical Engineering; Environmental Health and Engineering
B.S. 1985, University Federico Santa Maria, Chile
M.S. 1987, Yale, Ph.D. 1989

Michael I. Miller (1998)
Herschel and Ruth Seder Professor, Biomedical Engineering
Director, Center for Imaging Science
Electrical and Computer Engineering
Applied Mathematics and Statistics; Computer Science
B.S. 1976, SUNY; M.S. 1978, The Johns Hopkins University, Ph.D. 1983

Judith Mitrani-Reiser (2010)
Assistant Professor, Civil Engineering

B.S. 2000, University of Florida
M.S. 2001, University of California, Berkeley
Ph.D. 2007, California Institute of Technology

Rajat Mittal (2009)
Professor, Mechanical Engineering
B.E. 1989, Indian Institute of Technology
M.S. 1991, University of Florida
Ph.D. 1995, University of Illinois at U.C.

Christopher Moen (2016)
Associate Research Professor, Civil Engineering

Sara Miner More (2014)
Associate Teaching Professor, Computer Science
B.S. 1996, University of Dayton;
M.S. 1998, University of California, San Diego; Ph.D. 2003

Timothy Mueller (2012)
Assistant Professor, Materials Science and Engineering
A.B. 1998, Harvard University
Ph.D. 2007, Massachusetts Institute of Technology

Professor, Applied Mathematics and Statistics
B.S. 1977, Cornell; M.S. 1979, University of Illinois, Ph.D. 1982

Nassir Navab (2013)
Research Professor, Computer Science

Thao (Vicky) Nguyen (2018)
Professor, Mechanical Engineering
B.S., 1990, University of Wisconsin
Ph.D. 1996, University of Texas, Austin

Marc Ostermeier (2000)
Professor, Chemical and Biomolecular Engineering
B.S. 1990, University of Wisconsin
Ph.D. 1996, University of Texas, Austin

Vishal Patel (2018)
Assistant Professor, Electrical and Computer Engineering; Ph.D. 2010

Philine Poulilouen (2014)
Assistant Research Professor, Electrical and Computer Engineering

Sara Preheim (2015)
Assistant Professor, Environmental Health and Engineering
B.S. 1997, Carnegie Mellon University
Ph.D. 2010, Massachusetts Institute of Technology

Carey S. Priebe (1994)
Professor, Applied Mathematics and Statistics
Computer Science
B.S. 1984, Purdue
M.S. 1988, San Diego State University
Ph.D. 1993, George Mason University

Jerry L. Prince (1989)
William B. Kouwenhoven Professor and Associate Director for Research in Engineering Research Center for Computer-Integrated Surgical Systems and Technology, Electrical and Computer Engineering; Computer Science; Applied Mathematics and Statistics
B.S. 1979, University of Connecticut
M.S. 1982, M.I.T., Ph.D. 1988
Harihar Rajaram (2018)
Professor, Environmental Health and Engineering; Ph.D. 1991

Kaliat T. Ramesh (1988)
Elonzo G. Decker Jr. Professor in Science and Engineering, Mechanical Engineering
Materials Science and Engineering
B.S. 1982, Bangalore University, India
M.S. 1987, Brown University, Ph.D. 1987

Tilak (John) Ratnanather (1998)
Associate Research Professor, Biomedical Engineering, Center for Imaging Science

Austin Reiter (2014)
Assistant Research Professor, Computer Science

Charbel Rizk (2016)
Associate Research Professor, Electrical and Computer Engineering

A. Lynn Roberts (1993)
Professor, Environmental Health and Engineering
B.S. 1977, Pomona College
M.S. 1984, University of Waterloo
Ph.D. 1993, M.I.T.

Daniel Robinson (2011)
Assistant Professor, Applied Mathematics and Statistics
B.A. 2001, James Madison University
M.A. 2003, University of California-San Diego, Ph.D. 2007

Aviel Rubin (2003)
Professor, Computer Science

Steven Salzberg (2014)
Bloomberg Distinguished Professor Computer Science
Bloomberg Distinguished Professor Biomedical Engineering, Johns Hopkins University School of Medicine,
Bloomberg Distinguished Professor Biostatistics, Bloomberg School of Public Health
B.A. 1980, Yale University; M. Phil. 1984, M.S. 1982
Ph.D. 1989, Harvard University

Suchi Saria (2012)
Assistant Professor, Computer Science
B.A. 2004, Mount Holyoke College
Ph.D. 2011, Stanford University

Sridevi Sarma (2009)
Associate Professor, Biomedical Engineering
Institute for Computational Medicine
B.S. 1994, Cornell University
S.M. 1997, M.I.T; Ph.D. 2006

Benjamin Schafer (2000)
Professor, Civil Engineering
B.S. 1993, University of Iowa
M.S. 1995, Cornell University, Ph.D. 1997

Michael Schatz (2016)
Bloomberg Distinguished Associate Professor, Computer Science
Bloomberg Distinguished Associate Professor, Biology, Krieger School of Arts and Sciences
B.S. 2000, Carnegie Mellon University

Vice Dean for Graduate Education, Whiting School of Engineering (2008)
Professor, Applied Mathematics and Statistics; Computer Science
B.S. 1980, Brown University
M.S. 1981, Princeton University, Ph.D. 1984

T. E. Schlesinger (2013)
Professor, Electrical and Computer Engineering
Benjamin T. Rome Dean, Whiting School of Engineering
B.Sc. 1980, University of Toronto
M.S. 1982 Caltech; Ph.D. 1985

Erica J. Schoenberger (1984)
Professor, Environmental Health and Engineering
B.S. 1974, Stanford University
M.S. 1979, UC Berkeley, Ph.D. 1984

Rebecca Schulman (2018)
Associate Professor, Chemical and Biomolecular Engineering
B.S. 1999, Massachusetts Institute of Technology
Ph.D. 2007, California Institute of Technology

Nathan Scot (2011)
Associate Teaching Professor, Mechanical Engineering

Peter C. Searson (1990)
Joseph R. Reynolds Professor, Materials Science and Engineering
Chemical and Biomolecular Engineering
B.S. 1978, University of Manchester, M.S. 1980, Ph.D. 1982

Joanne Selinski (1996)
Associate Teaching Professor, Computer Science
B.S. 1984, Chestnut Hill College;
M.S.E. 1986, The Johns Hopkins University, Ph.D. 1996

Jung-Hee Seo (2016)
Associate Research Professor, Mechanical Engineering

Michael Shields (2013)
Assistant Professor, Civil Engineering
B.S. 2006, Loyola University
M.S. 2007, Columbia University; Ph.D. 2010

Ilya Shpitser (2015)
John C. Malone Assistant Professor, Computer Science
B.A. 1999, University of California, Berkeley
M.S. 2004, University of California, Los Angeles; Ph.D. 2008

Sauleh Siddiqui (2012)
Assistant Professor, Civil Engineering; Applied Mathematics and Statistics
B.A. 2007, Franklin and Marshall College
Ph.D. 2011, University of Maryland, College Park

Scott F. Smith (1988)
Professor, Computer Science
B.S. 1983, Purdue University
Ph.D. 1989, Cornell University

Stavroula Sofou (2017)
Associate Professor, Chemical and Biomolecular Engineering
M.S. 1997, Columbia University; M.Phil. 2001; Ph.D. 2001

Jamie Spangler (2017)
Assistant Professor, Biomedical Engineering and Chemical and Biomolecular Engineering
B.S. 2006, The Johns Hopkins University
Ph.D. 2011, Massachusetts Institute of Technology
James B. Spicer (1993)
Professor, Materials Science and Engineering
B.S. 1985, Southern Methodist University
Ph.D. 1991, The Johns Hopkins University
Alan Stone (1983)
Professor, Environmental Health and Engineering; Civil Engineering
B.S. 1978, University of Maryland
M.S. 1981, California Institute of Technology, Ph.D. 1983
Sean Sun (2003)
Professor, Mechanical Engineering
B.S. 1994, Pennsylvania State University
Ph.D. 1998, University of California, Berkeley
Alexander Szalay (2015)
Assistant Research Professor, Applied Mathematics and Statistics
B.S. 1994, M.I.T., M.S. 2005, Massachusetts Institute of Technology; Ph.D. 2007
Charles A. Miller Jr. Head and Professor, Mechanical Engineering
B.S. 1980, University of Iceland
Sc.M. 1982, Brown University; Ph.D. 1985
Trac Duy Tran (1998)
Professor, Electrical and Computer Engineering
B.S. 1994, M.I.T., M.S. 1994
Ph.D. 1998, University of Wisconsin
Natalia Trayanova (2006)
Murray B. Sachs Professor, Biomedical Engineering, Institute for Computational Medicine
M.S. 1982, Sofia University, Bulgaria
Ph.D. 1986, Bulgarian Academy of Sciences
Benjamin van Durme (2016)
Assistant Professor, Computer Science
B.A. and B.S. 2001, University of Rochester
M.S. 2004 and 2006, Carnegie Mellon University
Ph.D. 2009, University of Rochester
S. Swaroop Vedula (2012)
Assistant Research Professor, Malone Center for Engineering in Healthcare
Archana Venkataraman (2016)
Assistant Professor, Electrical and Computer Engineering
S.B. 2006, Massachusetts Institute of Technology
M.Eng. 2007; Ph.D. 2012
Professor, Biomedical Engineering
B.S. 1992, National Taiwan University; M.S. 1994
Ph.D. 2002, University of California, Los Angeles
Professor, Mechanical Engineering
B.S. 1983, Dartmouth College; M.S. 1985
Ph.D. 1990, Stanford University
Howard L. Weinert (1974)
Professor, Electrical and Computer Engineering
B.S. 1967, Rice University
M.S. 1968, Stanford University, Ph.D. 1972
John C. Wierman (1981)
Professor, Applied Mathematics and Statistics
B.S. 1984, Yale University
M.S. 1988, Ph.D. 1992
John C. Wierman (1981)
Faculty Listings

B.S. 1971, University of Washington, Ph.D. 1976
Denis Wirtz (1994)
Theophilus Halley Smoot Professor, Chemical and Biomolecular Engineering
Materials Science and Engineering
B.S. 1998, University of Belgium
M.S. 1990, Stanford University, Ph.D. 1993
Yanxun Xu (2015)
Assistant Professor, Applied Mathematics and Statistics
B.S. 2007, Beijing University of Aeronautics
M.S. 2010, Texas Tech University
Ph.D. 2013, Rice University/University of Texas Joint Program
David Yarowsky (1996)
Professor, Computer Science
B.S. 1987, Harvard University
M.S. 1993, University of Pennsylvania, Ph.D. 1996
Laurent Younes (2003)
Professor and Chair, Applied Mathematics and Statistics
M.S. 1985, University Paris Sud, Ph.D. 1988
Alan Yuille (2016)
Bloomberg Distinguished Professor Computer Science
Bloomberg Distinguished Professor Cognitive Science, Krieger School of Arts and Sciences
B.A. 1976, Cambridge University; PhD 1981
Tamer Zaki (2013)
Associate Professor, Mechanical Engineering
B.S. 1998, Pennsylvania State University
M.S. 2001, Stanford University; Ph.D. 2005

Other Faculty Appointments

Lecturers
Michael Agronin, M.S.
Lecturer, Center for Leadership Education, 2012
Lawrence Aronhime, M.B.A.
Senior Lecturer, Center for Leadership Education, 2001
Prashant Athavale, Ph.D.
Lecturer, Applied Mathematics and Statistics, 2015
David Audley, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 1997
Soraya Bailey, M.Sc.
Lecturer, Mechanical Engineering, 2016
Justin Beauchamp, M.S.
Lecturer, Center for Leadership Education, 2015
Jenny Bernstein, M.P.H.
Lecturer, Center for Leadership Education, 2014
Beryl Castello, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2004
Xin Chen, Ph.D.
Lecturer, Civil Engineering, 2012
Joel Coffman, Ph.D
Lecturer, Information Security Institute
Susan Conley, M.S.
Lecturer, Center for Leadership Education, 2016
Lise Dahuron, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2007
Laura Davis, M.A.
Lecturer, Center for Leadership Education, 2011
Lucas deMelo, Ph.D.
Lecturer, Civil Engineering, 2012
Marci De Vries, M.A.
Lecturer, Center for Leadership Education, 2011
Kevin Dungay, Ph.D.
Senior Lecturer, Center for Leadership Education, 1998
David Fisher, J.D.
Lecturer, Center for Leadership Education, 2001
Mark Franceschini
Senior Lecturer, Center for Leadership Education, 2000
Peter Fröhlich, Ph.D.
Senior Lecturer, Computer Science, 2005
Sean Furlong, M.A.
Lecturer, Center for Leadership Education, 2013
Mary Furst, M.S.
Lecturer, Center for Leadership Education
Robert E. Glaser, Ph.D.
Lecturer, Electrical and Computer Engineering, 1987
An Goffin, Ph.D.
Lecturer, Chemical and Biomolecular Engineering, 2008
Jeremy Gorelick, M.S.
Lecturer, Center for Leadership Education
Robert Graham, M.S.
Lecturer, Center for Leadership Education, 2014
Christine Grillo, M.S.
Lecturer, Center for Leadership Education
Eileen Haase, Ph.D.
Senior Lecturer, Biomedical Engineering, 2003
Margaret Hart, M.S.
Lecturer, Center for Leadership Education, 2017
Jason Heiserman, Ph.D.
Lecturer, Center for Leadership Education, 2009
Illysa Izenberg, MBA
Lecturer, Center for Leadership Education, 2010
Michael Jacobs
Lecturer, Computer Science, 1999
Christopher Jeffers, Ph.D.
Lecturer, Center for Leadership Education, 2015

Other Faculty Appointments

Illysa Izenberg, MBA
Lecturer, Center for Leadership Education, 2010
Michael Jacobs
Lecturer, Computer Science, 1999
Christopher Jeffers, Ph.D.
Lecturer, Center for Leadership Education, 2015
Reuben Johnston, M.S.
Lecturer, Information Security Institute, 2016

George Kalb, M.S.
Lecturer, Computer Science, 2000

Michael Karweit, Ph.D.
Senior Lecturer, Environmental Health and Engineering

Leslie Kendrick, M.B.A.
Senior Lecturer, W.P. Center for Leadership Education, 2000

Michael Kociemba, M.S.
Lecturer, JHU Information Security Institute, 2012

Sheela Kosaraju, J.D.
Lecturer, Computer Science, 2008

Andrew F. Kulanko, M.S.
Senior Lecturer, Center for Leadership Education, 2001

Andreas Lares, M.A.
Lecturer, Center for Leadership Education

Harold Lehmann, M.D., Ph.D.
Lecturer, Computer Science, 1993

Seth LeJacq, Ph.D.
Lecturer, Center for Leadership Education

Annette Leps, M.B.A.
Senior Lecturer, Center for Leadership Education, 2006

Xiangyang Li, Ph.D.
Senior Lecturer, JHU Information Security Institute, 2012

Denise Link-Farajali, Ed.M.
Lecturer, Center for Leadership Education, 2011

Elizabeth Logsdon, Ph.D.
Lecturer, Engineering for Professionals

David Mahoney, M.S.
Lecturer, Center for Leadership Education

John Matteo, M.S.E.
Lecturer, Civil Engineering, 2008

Michael Mattia, M.S.
Lecturer, Center for Leadership Education

Anil Maybhate, Ph.D.
Lecturer, Engineering for Professionals

Timothy McGee, Ph.D.
Lecturer, Mechanical Engineering, 2011

Edmund Meade, M.A.
Lecturer, Civil Engineering, 2015

John Miller, Ph.D.
Lecturer, Applied Mathematics and Statistics, 2015

Lindsay Monti, J.D.
Lecturer, Center for Leadership Education

Charlotte O’Donnell, M.F.A.

Lecturer, Center for Leadership Education, 2009

Martin Ozimek, Ph.D.
Lecturer, Mechanical Engineering, 2011

Heather Parker, Ph.D.
Lecturer, Center for Leadership Education

Carmo Pereira, Ph.D.
Senior Lecturer, Chemical and Biomolecular Engineering, 2016

Kerri Phillips, Ph.D.
Lecturer, Mechanical Engineering, 2015

Luc Phinney,
Lecturer, Mechanical Engineering, 2015

Marco Priolo, M.S.
Lecturer, Center for Leadership Education, 2014

Keith Quesenberry, M.S.
Senior Lecturer, Center for Leadership Education, 2012

Brian Rakes, J.D.
Lecturer, Center for Leadership Education, 2012

Julie Reiser, Ph.D.
Senior Lecturer, Center for Leadership Education, 2007

Joshua Reiter, Ed.D.
Senior Lecturer, Center for Leadership Education, 2000

Eric Rice, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006

Elaine Richman, Ph.D.
Lecturer, Center for Leadership Education

Yury Ronzhes, Ph.D.
Lecturer, Mechanical Engineering, 2008

Daniel Saalfeld, M.S.
Lecturer, Center for Leadership Education, 2016

Tiffany Sanchez, M.S.
Lecturer, Center for Leadership Education

Douglas S. Sandhaus, J.D.
Senior Lecturer, Center for Leadership Education, 2002

Rachel Sangree, Ph.D.
Lecturer, Civil Engineering, 2009

William Sander, J.D.
Lecturer, JHU Information Security Institute, 2012

Gary Schultz, Ph.D.
Lecturer, Applied Mathematics and Statistics, 2013

Pamela Sheff, Ph.D.
Senior Lecturer, Center for Leadership Education, 2006

William Smedick, Ed.D.
Senior Lecturer, Center for Leadership Education, 2007

Sarah Smith, M.A.
Lecturer, Center for Leadership Education, 2016
Justin Spivey, M.S.
Lecturer, Civil Engineering, 2015

Dennis Sullivan, M.S.
Lecturer, Center for Leadership Education

Federico Torcaso, Ph.D.
Senior Lecturer, Applied Mathematics and Statistics, 2002

Adam Treiser, J.D.
Lecturer, Center for Leadership Education, 2016

Damon Tull, Ph.D.
Lecturer, Center for Leadership Education, 2016

Tamara Warren-Chinyani, Ph.D.
Lecturer, Center for Leadership Education

Caroline Wilkins, Ph.D.
Lecturer, Center for Leadership Education, 2012

Justin Williams, Ph.D.
Senior Lecturer, Environmental Health and Engineering, 1999

Orla Wilson, Ph.D.
Senior Lecturer, Materials Science and Engineering, 2008

Joint Appointments

Steven An, Ph.D.
Associate Professor, School of Public Health
Chemical and Biomolecular Engineering, 2014

Stephen Belkoff, Ph.D.
Associate Professor, Orthopedic Surgery (Medicine)
Mechanical Engineering 2001

Emad Boctor, Ph.D.
Assistant Professor, Radiology and Radiological Sciences (Medicine)
Computer Science, 2009
Electrical and Computer Engineering, 2013

Paul Bottomly, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering 2000

Kit Bowen, Ph.D.
Professor, Chemistry (KSAS)
Materials Science and Engineering, 2014

Patrick Breysse, Ph.D.
Professor, Environmental Health (Public Health)
Chemical and Biomolecular Engineering

Colin Broholm, Ph.D.
Professor, Physics and Astronomy
Materials Science and Engineering

Chia-Ling Chien, Ph.D.
Professor, Physics and Astronomy (KSAS)
Materials Science and Engineering

Michael Choti, Ph.D.
Associate Professor, Surgery, School of Medicine

Michael Edidin, Ph.D.
Professor, Biology (Arts and Sciences)

Materials Science and Engineering, 2005

Jennifer Elisseeff, Ph.D.
Professor, Biomedical Engineering (Medicine)
Chemical and Biomolecular Engineering, 2012
Materials Science and Engineering, 2014

Laura Ensign-Hodges, Ph.D.
Assistant Professor, Ophthalmology-Nanomedicine, School of Medicine, 2016

Howard Fairbrother, Ph.D.
Professor, Chemistry (KSAS)
Materials Science and Engineering, 2014

Liliana Florea, Ph.D.
Assistant Professor, General Internal Medicine (Medicine)
Computer Science, 2013

Eric Frey, Ph.D.
Professor, Radiology (Medicine)
Electrical and Computer Engineering, 2010

Peter Gehlbach, Ph.D.
Ophthalmology, School of Medicine
Electrical and Computer Engineering, 2014

Daniele Gilkes, Ph.D.
Chemical and Biomolecular Engineering, 2015

Warren Grayson, M.D.
Assistant Professor, Biomedical Engineering, (Medicine);
Materials Science and Engineering, 2014

Jordan Green, M.D.
Associate Professor, Biomedical Engineering, (Medicine);
Materials Science and Engineering, 2014
Chemical and Biomolecular Engineering, 2017

Justin Hanes, Ph.D.
Professor, Ophthalmology (Medicine)
Chemical and Biomolecular Engineering, 2015

John Isaacs, Ph.D.
Professor, Chemical Therapeutics (Medicine)
Chemical and Biomolecular Engineering, 2007

Robert Ivkov, M.D.
Associate Professor, Radiation, Oncology and Molecular Radiation (Medicine);
Materials Science and Engineering, 2014
Mechanical Engineering, 2016

Lynn Jones, M.D.
Associate Professor, Orthopedic Surgery, School of Medicine
Materials Science and Engineering, 2015

Rangaraman Kannan, Ph.D.
Professor, Center for Nanomedicine (Medicine)
Materials Science and Engineering, 2011

Seulki Lee, M.D.
Assistant Professor, Radiology, School of Medicine
Materials Science and Engineering, 2015

Stuart W. Leslie, Ph.D.
Professor, History of Science and Technology (Arts and Sciences)  
Environmental Health and Engineering, 1997

Xingde Li, M.D.  
Professor, Biomedical Engineering, School of Medicine  
Electrical and Computer Engineering, 2014

Mihaela Pertea, M.D.  
Assistant Professor, Department of Medicine, School of Medicine  
Computer Science, 2015

Kenneth Pienta, M.D.  
Professor, Urology, School of Medicine  
Chemical and Biomolecular Engineering, 2014

Martin Pomper, M.D., Ph.D.  
Professor, Radiology (Medicine)  
Chemical and Biomolecular Engineering, 2016

Aleksander S. Popel, Ph.D.  
Professor, Biomedical Engineering (Medicine)  
Chemical and Biomolecular Engineering, 2015

Arman Rahmim, Ph.D.  
Assistant Professor, Radiology (Medicine)  
Electrical and Computer Science 2010

Kannan Rangeramanujam, M.D.  
Professor, Department of Ophthalmology (Medicine);  
Materials Science and Engineering, 2014

Mark Robbins, Ph.D.  
Professor, Physics and Astronomy (Arts and Sciences)  
Mechanical Engineering 2001

Douglas Robinson, M.D.  
Professor, School of Medicine  
Chemical and Biomolecular Engineering, 205

Steven Salzberg, Ph.D.  
Professor, Internal Medicine (Medicine)  
Computer Science, 2011

Jeffrey Siewersdson, Ph.D.  
Professor, Biomedical Engineering (Medicine);  
Computer Science, 2010

J. Webster Stayman, Ph.D..  
Assistant Professor, Biomedical Engineering, School of Medicine  
Electrical and Computer Engineering, 2015

Dan Stoianovici, Ph.D.  
Professor, Urology (Medicine)  
Mechanical Engineering, 2005

James Taylor, Ph.D.  
Associate Professor, Biology  
Computer Science 2014

Nitish Thakor, Ph.D.  
Professor, Biomedical Engineering (Medicine)  
Electrical and Computer Engineering, 2007

John Tovar, Ph.D.  
Associate Professor, Chemistry;  
Materials Science and Engineering, 2014

Benjamin Tsui, Ph.D.  
Professor, Radiology (Medicine)  
Electrical and Computer Engineering 2006

Raimond L. Winslow, Ph.D.  
Professor, Biomedical Engineering (Medicine)  
Director, Center for Cardiovascular Bioinformatics and Modeling,  
Computer Science 1991;  
Electrical and Computer Engineering, 2003

Thomas Woolf  
Professor, Department of Physiology  
Computer Science, 2013

Kevin Yerema, Ph.D.  
Associate Professor, Biomedical Engineering (Medicine)  
Chemical and Biomolecular Engineering, 2017

Hui Zhang, Ph.D.  
Professor, Pathology (Medicine)  
Chemical and Biomolecular Engineering, 2017

Jin Zhang, M.D.  
Professor, Pharmacology and Molecular Sciences, School of Medicine  
Chemical and Biomolecular Engineering, 2015
